THE BRITISH COMMONWEALTH

The British Commonwealth of Nations comprises (a) the Sovereign States of the United Kingdom, Canada, Australia, New Zealand, India, Pakistan, Ceylon, Ghana, Malaya, Cyprus, Nigeria, Sierra Leone, Tanganyika, Uganda, Jamaica, Trinidad and Tobago (including their dependent territories), (b) the Federation of Rhodesia and Nyasaland, (c) the Colonies, Protectorates, Protected States, Trust Territories, Condominiums and leased territories

See also the chapter on the British Commonwealth in Section C which contains definitions of the status of the various countries of the Commonwealth, and the map of the new Africa, K194-6.

I—MEMBERS OF THE COMMONWEALTH, AND THE FEDERATION OF RHODESIA AND NYASALAND (including territories for which members other than the U K are responsible)

Country	Land Area (sq miles)	Recent Population Estimates
United Kingdom	94,209	51,985,000
Canada (incl Newfoundland and Labrador)	3,851,809	18,238,247
Australia (Commonwealth of)	2,974,581	10,508,191
Cocos Islands	5	607
Christmas Island	55	2,919
Norfolk Island—*Colony*	13½	1,048
Papua—*Colony*	90,540	478,595
New Guinea—*Trusteeship*	93,000	1,326,195
Nauru—*Trusteeship with Australia, New Zealand and the U K*	8¼	4,389
Antarctic territory	2,333,624	—
New Zealand	103,736	2,414,064
Island Territories	194	24,121
Ross Dependency	160,000 (estimated)	198
India (Republic of)	1,174,000	436,434,429
Pakistan (Republic of)	360,780	93,812,000
Ceylon	25,332	9,404,000
Ghana (Republic of)	91,843	6,691,000
*Malaya (Federation of)	50,600	6,596,000
Nigeria (Federation of)	356,669	35,752,000
†Cyprus (Republic of)	3,572	550,000
Sierra Leone	27,925	2,400,000
Tanganyika (Republic of)	362,688	9,404,000
Uganda	93,981	6,538,175
Jamaica	4 411	1,613,148
Trinidad and Tobago	1,864	828,000
Rhodesia and Nyasaland (Federation of)	488,000	8,220,000

* Together with Singapore, Brunei, North Borneo and Sarawak to form proposed Malaysian Federation due 31 August 1963, p (estd 1962) 9,700,000

† The United Kingdom retains sovereignty over areas totalling about 99 sq m.

Note The Union of South Africa withdrew from the Commonwealth on becoming a republic, 31 May, 1961

The New Zealand trust territory of Western Samoa became an independent sovereign state on 1 January, 1962, not as a member of the British Commonwealth but treated under New Zealand law as such

II—TERRITORIES FOR WHICH THE U K IS RESPONSIBLE AND WHICH ARE ADMINISTERED THROUGH THE COLONIAL OFFICE

(Some of the very small, or practically uninhabited, islands have been omitted.)

Region and Territory	Status	Land Area (sq miles)	Recent Population Estimates
East Africa			
Kenya	Colony and Protectorate	224,960	6,450,000
Zanzibar and Pemba	Protectorate	1,020	304,000
Central Africa			
*Northern Rhodesia	Protectorate	288,130	2,390,000
*Nyasaland	Protectorate (Intern self-gov.)	49,177	2,800,000
West Africa:			
Gambia	Colony and Protectorate	4,003	300,000
South Africa:			
Basutoland	Colony	11,716	641,674
Bechuanaland	Protectorate	275,000	327,305
Swaziland	Protectorate	6,704	260,000

* Included in the Federation of Rhodesia and Nyasaland. Federal and Southern Rhodesian territorial matters are dealt with through the Central Africa Office.

Region and Territory	Status	Land Area (sq. miles)	Recent Population Estimates
Far East:			
*Singapore	Intern self-gov. St.	291	1,555,000
*Brunei	Protected State	2,226	83,869
*North Borneo	Colony	29,387	454,421
*Sarawak	Colony	47,500	744,391
Hong Kong	Colony	398	2,857,000
Mediterranean			
Gibraltar	Colony	2¼	25,000
Malta and Gozo	Intern self-gov Col	122	328,851
East Caribbean Federation proposed 1963			
Antigua (including dependencies)	Colony	171	57,000
Barbados	Colony	166	241,706
Dominica	Colony	305	64,800
Montserrat	Colony	32	14,600
St Kitts—Nevis—Anguilla	Colony	153	56,433
St. Lucia	Colony	238	91,102
St Vincent	Colony	150	80,000
†Grenada	Colony	133	90,852
Other Caribbean Dependencies			
British Guiana	Intern self-gov Col	83,000	549,000
Cayman Is	Colony	100	8,803
British Honduras	Colony	8,866	90,343
Virgin Islands	Colony	59	7,350
Western Pacific			
Fiji	Colony	7,083	413,872
Pitcairn	Colony	2	143
Tonga	Protected State	269	61,899
Western Pacific High Commission Territories:			
British Solomon Islands Protectorate	Protectorate	11,500	114,000
Gilbert and Ellice Islands Colony	Colony	369	47,508
New Hebrides	Anglo-French Condominium	5,700	60,374
Atlantic Ocean.			
Falkland Islands	Colony	4,618	2,210
Dependencies			
S. Georgia	Dependency of Falkland Islands	1,450	
S Sandwich Is	Dependency of Falkland Islands		Uninhabited
British Antarctic Territory	Colony		Uninhabited
S Shetlands, S Orkneys, Graham's Land			
Bahamas	Colony	4,404	106,677
‡Turks and Caicos Is	Colony	166	5,716
Bermuda	Colony	21	45,491
St Helena	Colony	47	4,648
Ascension	Dependency of St Helena	34	336
Tristan da Cunha	Dependency of St Helena	38	(1961 280)
Indian Ocean			
Aden	Colony and Protectorate	112,115	1,200,000
Mauritius (including dependencies)	Colony	805	687,450
Seychelles	Colony	156	41,424

* To be included in proposed Malaysian Federation due 31 August, 1963.

† Seeking to join Trinidad and Tobago.

‡ Upon Jamaica's attainment of independence (1962) reverted to U.K. administration.

THE NEW AFRICA

Territory	Area (sq. miles)	Population		Status (Jan. 1963)
		Estimated Total	Non-African	
Algeria	919,600	9,529,726	1,250,000	Independent sovereign state since 3 July 1962 (Formerly under French rule)
Angola	481,350	4,500,000	110,000	Portuguese colony ("province")
Basutoland	11,716	641,674	2,800	Territory under protection of the United Kingdom Government.
Bechuanaland Protectorate	275,000	327,305	4,000	ditto
Burundi	10,747	2,213,000		Independent sovereign state since July 1962 (Formerly U N trust territory under Belgian administration)
Cameroun, Fed. Rep. of	168,000	4,907,600	16,000	Independent sovereign state since April 1960, comprising the former U N. trust territories under French administration (French Cameroons, now Eastern Cameroun) and the former U N trust territory under British administration (Southern Cameroons, now Western Cameroun.)
Central African Republic	190,000	1,227 000	6 000	Independent sovereign state within the French Community since August 1960
Chad	495,000	2,675,000	5,000	ditto
Congo (ex-French)	132,000	795,000	10,000	ditto
Congo (ex-Belgian)	905,400	14,150,000		Independent sovereign state since June 1960 (Formerly under Belgian administration)
Dahomey	44,000	1,934,000	3 000	Independent sovereign state since August 1960 (Formerly under French rule)
Ethiopia	400,000	21,800 000		Independent sovereign state.
French Somaliland	8,900	67,000	1,000	Overseas territory of French Republic
Gaboon	103,000	440,000	4,000	Independent sovereign state within the French Community since August 1960
Gambia	4,003	300,000	500	United Kingdom colony and protectorate
Ghana	91,843	6,691,000	7,000	Independent sovereign state within the Commonwealth since March 1957 A Republic since July 1960
Guinea	94,900	3,000 000	0 000	Independent sovereign state since October 1958 (Formerly under French administration)
Ifni	579	[illegible]8,000		Spanish province (Ceuta and Melilla on Mediterranean coast of Morocco, are classed as part of metropolitan Spain)
Ivory Coast	124,000	3,300 000	12,000	Independent sovereign state since August 1960 (Formerly under French rule)
Kenya	224,960	7,287,000	280,000	United Kingdom colony and protectorate.
Liberia	43,000	1,250,000	1,000	Independent sovereign state.
Libya	679,400	1,195,000		Independent sovereign state since December 1951 (Formerly Italian colony, administered after Second World War by Britain and France.)
Malagasy Republic	227,800	5,487,000	71,000	Independent sovereign state within the French Community since June 1960.
Mali, Republic of	460,200	4,100,000	7,000	Independent sovereign state. (The Federation of Mali, consisting of Senegal and French Sudan (now the Rep. of Mali) became an independent sovereign state within the French Community in June 1960 The Federation came to an end as a result of Senegal's withdrawal in August 1960)
Mauritania, Islamic Republic of	430,000	727,000	1,600	Independent sovereign state since 28 November 1960 (Formerly under French rule)

Territory	Area (sq. miles)	Population		Status (Jan. 1963)
		Estimated Total	Non-African	
Morocco	171,000	11,626,000	350,000	Independent sovereign state since March 1956 (Formerly French and Spanish protectorates.)
Mozambique	302,327	6,230,000		Portuguese colony (" province ").
Niger	494,000	2,870,000	3,000	Independent sovereign state since August 1960. (Formerly under French rule.)
Nigeria, Federation of	356,669	35,752,000	16,000	Independent sovereign state within the Commonwealth since 1 October 1960.
Portuguese Guinea	13,900	510,000	2,263	Portuguese colony (" province ").
Rhodesia and Nyasaland, Federation of	487,640	8,220,000	350,100	Territory with responsible powers over a wide range of subjects comprising the self-governing colony of Southern Rhodesia, the self-governing protectorate of Nyasaland and the United Kingdom protectorate of Northern Rhodesia
Rwanda	10,169	2,634,000	2,257	Independent sovereign state since July 1962. (Formerly U N trust territory under Belgian administration)
Senegal	78,000	2,973,000	47,000	Independent sovereign state within the French Community.
Sierra Leone	27,925	2,400,000	2,000	Independent sovereign state within the Commonwealth since 27 April 1961.
Somali Republic	246,200	1,990,000	33,000	Independent sovereign state since July 1960 (Formerly British protectorate and United Nations trust territory under Italian administration.)
South-West Africa	317,725	414,601	50,000	Territory under League of Nations mandate assumed by the Union of South Africa in December 1920 (The present international obligations of the Union in relation to the territory are under consideration by the Union Government and the United Nations.)
Spanish Guinea	10,800	214,000		Spanish province. (Now divided into two provinces: Rio Muni (cap Bata) and Fernando Po (cap Santa Isabel)
Spanish Sahara	102,700	13,000		Spanish province (comprising Rio de Oro and Saguia el Hamra)
Swaziland	6,704	260,000	7,300	Territory under protection of United Kingdom Government.
Tanganyika	362,688	9,404,000	134,000	Independent sovereign state within the Commonwealth since 9 December 1961 (Declared a republic 9 Dec. 1962)
The Sudan	967,500	12,109,000		Independent sovereign state since January 1956. (Formerly Anglo-Egyptian condominium.)
Togo	21,200	1,440,000	1,900	Independent sovereign state since April 1960. (Formerly United Nations trust territory under French administration.)
Tunisia	48,330	4,168,000	250,000	Independent sovereign state since March 1956. (Formerly French protectorate)
Uganda	93,981	6,517,000	88,000	Independent sovereign state within the Commonwealth since 9 Oct. 1962.
Union of South Africa	472,685	15,982,664	5,000,000 (white 3,000,000)	Independent sovereign state (on becoming a republic, May 1961, withdrew from the British Commonwealth).
United Arab Republic (Egypt)	386,100	26,059,000		Independent sovereign state.
Voltaic Republic	122,000	3,635,000	3,400	Independent sovereign state since August 1960. (Formerly under French rule)
Zanzibar	1,020	304,000	70,000	United Kingdom protectorate.

POPULATION: some significant facts and figures.

TABLE 1.—WORLD POPULATION

	Total population (million). 1920	Total population (million). 1959	Percentage rate of increase (average annual, 1950–59)	Birth rate per 1,000	Death rate per 1,000
Africa	140	237	1 9	46	27
North America	117	196	1 8	25	9
Latin America	91	202	2 4	43	19
Asia (excl U S S R)	966	1,622	about 2	44	23
Europe (excl. U S S R)	329	423	0 8	19	10
U S S R	158	211	1 7	25	8
World	1,810	2,907	1 7	36	19

While the population of the world has increased by more than 60 per cent during the last forty years, Europe's share has fallen from 18 per cent to less than 15 per cent The annual rate of increase has now dropped below 1 per cent in Europe, but it approaches or even exceeds 2 per cent over large areas of monsoon Asia, tropical Africa, and Latin America, and in these parts of the world the birth rate is still more than 40 per 1,000.

Different countries are at different stages in a demographic transition from the stability provided by a combination of high birth rate and high death rate to that provided by a combination of low birth rate and low death rate Their recent population history and current trend of growth, the age-structure of their population, and consequently their population potential for the near future are all widely different

In Tables 2 and 3 figures are presented for three groups of countries

TABLE 2

		Births (Rate per 1,000)	Deaths (Rate per 1,000)	Infant mortality rate per 1,000 live births	Expectation of life at birth: Male	Expectation of life at birth: Female	Percentage urban
I	India	39 1	19·4	100 2	32	32	17
	Egypt	40 3	16 6	141	36	41	36
	Br West Indies	38 0	9 6	71	56 *	59 *	29 *
II	U K	16 9	11 7	23 1	68	74	81
	France	18 4	11·3	29 5	65	70	56
	U S A	24 1	9 4	26 4	66	73	64
III	Japan	17 5	7 4	33 7	65	70	56
	U S S R	25 0	7 6	40 6	64	71	48
	Argentina	22 7	8 0	61 1	57	61	63

* Jamaica

TABLE 3.—PERCENTAGE OF TOTAL POPULATION IN THREE AGE-GROUPS

		0–15 years (children).		16–59 years (working age).	Over 60 years (aged).	
I	India	37 4	very high	56 9	5 7	low
	Egypt	38 5		55 7	5·8	
	Jamaica	38 0		55 9	6 1	
II.	U K.	22·8	low	60 2	17 0	high
	France	26·0		57 4	16 6	
	U S.A	31 3		55 9	12 7	
III.	Japan	30 2	high	61 1	8 7	fairly low
	U S S R.	37 4		53 1	9 4	
	Poland	32 0		59 5	8 5	

I India, Egypt, and the West Indies are representative of many countries of Africa, the Middle East, southern Asia, and some other areas which show a high growth potential.

Fertility remains high, with a birth rate of about 40 per 1,000 and, as medical science becomes more effectively applied to reduce the high mortality, especially among babies, rapid increase of a young population may be expected. It will be noticed that the age pyramids (Fig. 1) are broadly based—well over one third of the population are children, and only about 6 per cent are elderly people above 60 years of age.

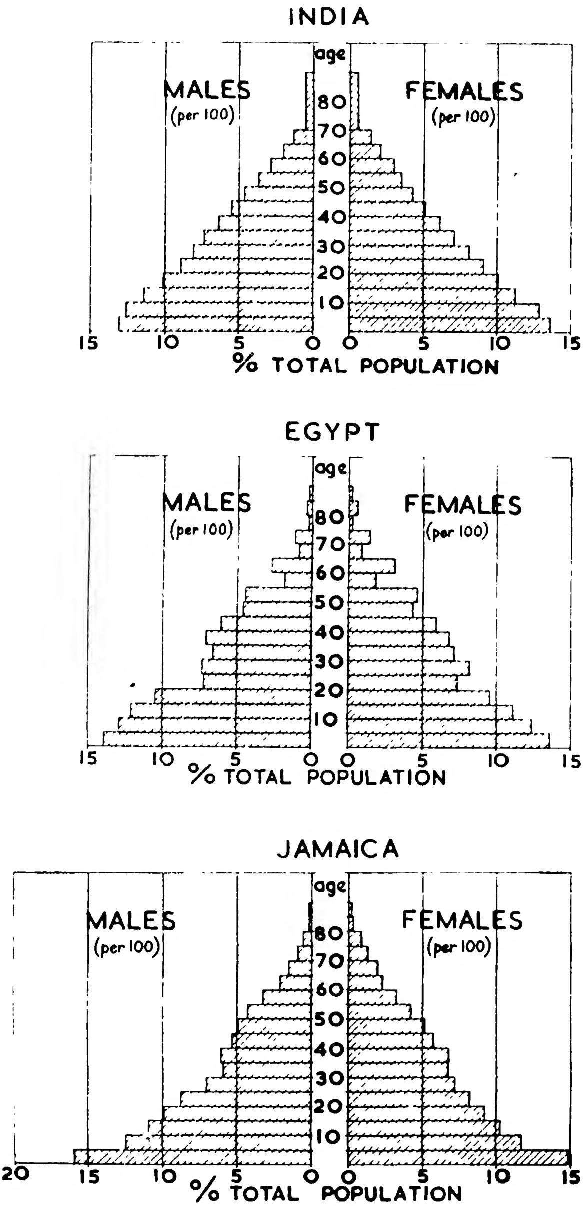

Fig. 1

II. France, the United Kingdom, and the U.S A are at the end of the transition, and now show low death rates and an aged population. In both France and the U K. one in every six persons is over 60 years of age. The present modest growth of population is largely a momentum from the past, with the brakes applied by the widespread practice of birth control, though there has been a noteworthy rise in the birth rate since the War These countries are typical of western and central Europe, and of their derivative populations oversea in North America, Australia, and New Zealand.

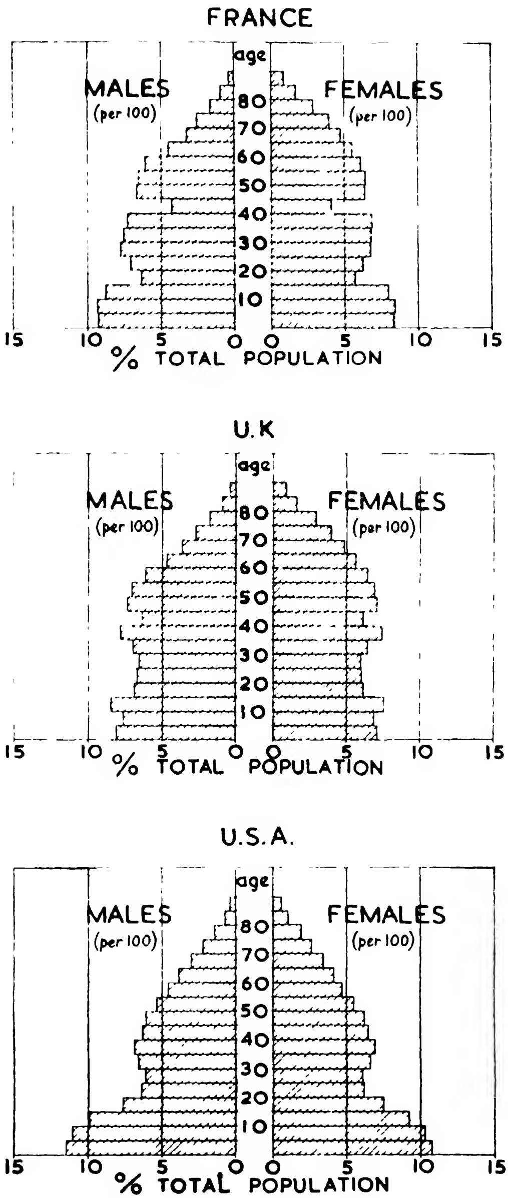

Fig. 2

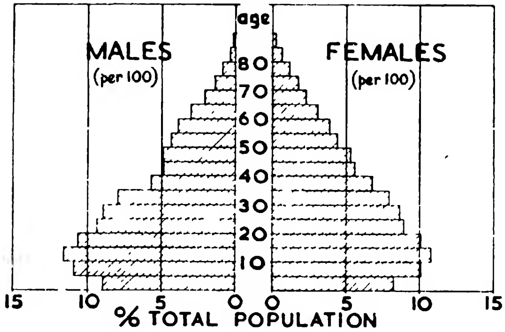
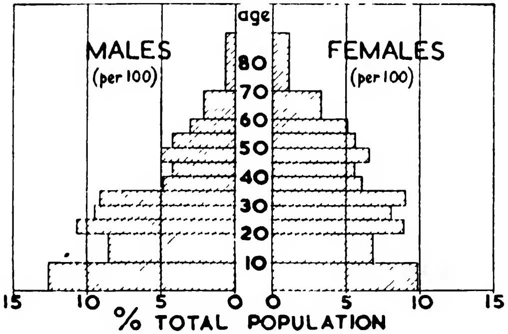
III. Japan, U S S R . and Argentina (typical of much of Latin America) represent intermediate stages in the transition with birth and death rates that have been reduced rapidly in recent decades, but the rate of increase of a young population is still rapid The specially low death rate reflects the weight of young age-groups in the population structure, but infant mortality rates are still substantially higher than in the countries of group II.

JAPAN



U.S.S.R.



ARGENTINA

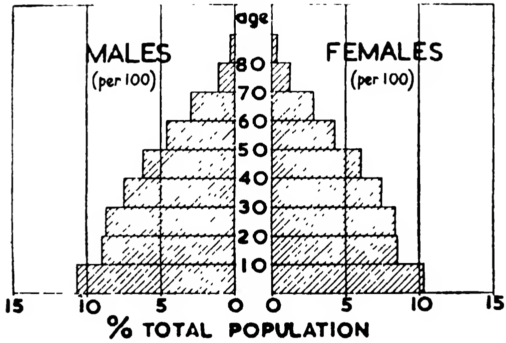


FIG. 3

General Information

Some 3,000 entries on subjects of general interest, alphabetically arranged

General Information

Aard-vark (Dutch *aarde* = earth + *vark* = pig), name given by the Boers to a genus of ant-eating mammals peculiar to Africa They are nocturnal and burrowing, with an arched back, and usually grow to a length of 5 ft

Abacus, a device for making arithmetical calculations, consisting of bars with perforated beads. The earliest form of this instrument was used in Mesopotamia about 3000 B.C., and its use spread westwards throughout the Græco-Roman world and eastwards to China An efficient form of the abacus is still used today in parts of Asia and Russia.

Abdication. The term usually refers to the act of a sovereign who relinquishes the supreme power in a State. There have been only three instances since the Conquest of the abdication of an English monarch· Edward II in 1327, Richard II, in 1399, and Edward VIII in 1936 Defeat in the first and second great wars caused the abdication of many Continental rulers.

Aberration, in astronomy, is the apparent displacement of a star due to the speed of the observer with the earth (see Parallax) In optics (i) spherical aberration, causing blurring of an image, is due to failure of lens to bring light to a single focus, (ii) chromatic aberration, causing coloured fringes to an image, is due to the refractive index of glass being different for light of different colours. For instance, violet light is bent more than red.

Abiogenesis, or spontaneous generation; the origination of living from non-living matter. The term is applied to such discredited ideas as that frogs could be generated spontaneously by the action of sunlight on mud, or maggots arise spontaneously in dead meat without any eggs from which the maggots hatch being present. Spallanzani (1729–99) upset the hypothesis of spontaneous generation, Pasteur dealt it a death-blow

Abominable Snowman. *See* **Yeti.**

Aborigines, a term first applied to an ancient mythical people of central Italy, derives from the Latin *ab origine* = from the beginning It now signifies the original inhabitants of any country, in particular the aboriginal tribes of Australia. In contrast to their highly complex social and religious customs, the material culture of Australian aborigines is very low and ill adapted to stand up to contact with European civilisation. Originally estimated at 300,000, their number has dropped in the last 200 years to some 50,000, concentrated on reservations in the northern part of the continent.

Absolution, an ecclesiastical term denoting the liberation of a person guilty of sin from its consequences by the act or intercession of religious authority. Now confined in its strict form chiefly to the Roman Catholic and Greek Churches, although used to some extent in the Anglican communion.

Abstract Art, a term applied to 20th cent plastic arts in which form and colour possess aesthetic value apart from the subject Usually represented as a modern movement beginning with Cézanne The idea is ancient, abstract design being found in the Neolithic period, in folk-art, and particularly in Moslem art (which forbids naturalistic representations especially of the human figure) Among those in the tradition are Kandinsky, Braque, Piet Mondrian, Alexander Calder.

Acetic Acid, an organic acid produced when ordinary (ethyl) alcohol is fermented by the organism called *Acetobacter aceti*. The same oxidation process yields vinegar; this is a weak and crude solution of acetic acid obtained by trickling dilute alcoholic liquor over beechwood shavings at 35° C. The souring of wine is due to the same process Acetic acid is used as a food preservative and flavouring material, and in the manufacture of cellulose acetate and white lead.

Acetylene, a compound of carbon and hydrogen prepared from calcium carbide and water. A very reactive gas, it is used industrially on a large scale to prepare acetaldehyde, chlorohydrocarbon solvents, and many intermediates for plastics manufacture. Burns in air with a highly luminous flame formerly used for lighting purposes, but is now widely used, with oxygen, in welding. For safe storage and transportation it is dissolved in acetone.

Acids, substances having a tendency to lose a positive ion (a proton). This general definition overcomes difficulties of earlier views which merely described their properties and asserted that they are chemically opposite to bases As a whole acids contain ionisable hydrogen, replaceable by a metal, to form a salt Inorganic acids are compounds of non-metals or metalloids, *e g.,* sulphuric, phosphoric acid. Carboxylic acids contain the group –COOH.

Acolyte, one who assists the priest at Mass by saying the responses and by waiting on him.

Advent, a period devoted to religious preparation for the coming celebration of the Nativity (Christmas). It comprises four Sundays, and commences on the one preceding or following St. Andrew's Day (Nov 30), or on St Andrew's Day itself. Advent was not observed before the 4th cent

Advocatus Diaboli (" the devil's advocate "), a Roman Catholic functionary who presents opposing evidence in regard to the life of any deceased person it may be proposed to canonise

Aeolian Harp, a musical instrument once very popular. It consists of catgut stretched over a wooden sound-box which, when placed out of doors in the wind, can be made to emit many pleasing harmonies

Aerenchyma. Plant tissue which is spongy because there are large air spaces between the cells in which gases can circulate This aerating tissue is characteristic of marsh and water-plants.

Aerodynamics, the science of gases (especially air) in motion, particularly in relation to aircraft (aeronautics) The idea of imitating the birds by the use of wings is of ancient origin It was Leonardo da Vinci, however, who first carried out experiments in a scientific manner The invention of the balloon in 1783 and the researches of scientists and engineers in the 19th cent. ultimately led to the development of the aeroplane

Aerolites, the name given to the class of meteorites composed chiefly of heavy silicates The other two main classes are *siderolites* (nickel-iron and silicates) and *siderites* (nickel-iron)

Aerosol, a suspension of a liquid in a gas; for example, a fog is very small drops of water suspended in air Formed by spraying the liquid in air, aerosols are used to disperse liquids over a wide area in crop spraying, air freshening, and pest control.

Aesthetics, the branch of philosophy dealing with the nature of the individual's appreciation of beauty. Basically there are three theories (1) The theory of Plato that beauty is an objective reality belonging to the ideal world which lies behind our own shadowy existence, essentially this is the view taken by Clive Bell, whose theory of " significant form " (1914) suggests that the aesthetic emotion is a real and specific one, aroused by all true works of art Beauty inheres in the external object, beheld with detachment, not as a means but implicit in itself (2) The subjectivist view of Tolstoy that. (*a*) great art is that which transmits the original emotion felt by the artist to as many people as possible; (*b*) art has a moral function (*e g* , *King Lear* is bad art because its theme is immoral and Russian folk-music is good because it has given æsthetic pleasure to more people than the plays of Shakespeare) (3) The psychological theory of I A Richards and C K Ogden (*c* 1920), which equates beauty with emotional satisfaction. A beautiful object has the effect of temporarily integrating our ordinarily conflicting

impulses, bringing a sense of meaningfulness and cessation of strife.

Afrikander, type of cattle bred in South Africa.

Afrikaner, an Afrikaans-speaking South African, usually of Dutch descent.

After-damp is a mixture of carbon dioxide and nitrogen that occurs in a mine after an explosion and causes suffocation to human beings. It is also called "choke damp" and "black damp".

Agape, a "love-feast" held by the early Christians in commemoration of the Lord's Supper. *See* **J28 (1)**

Agar-agar, a vegetable jelly obtained from seaweeds, widely used in jellies, canned meat and poultry, and as a constituent in medicinal and cosmetic preparations. Used by bacteriologists to solidify broth and blood upon which bacteria are cultivated. Before the war Japan had a virtual monopoly in agar-agar. U.S.A. and the British Commonwealth now make it in quantity.

Agaric, large fungi of the family *Agaricaceae*, which includes the mushroom and what are popularly called "toadstools," though the idea that these two lay terms sharply differentiate between edible and poisonous fungi is an incorrect one. Characteristic of the agarics is the presence of a cap or *pileus* (bearing underneath the spore-shedding gills) and a stalk or *stipe*.

Agate, a variety of chalcedony. Parallel bands of colour are often characteristic. Germany, Brazil, and India furnish the main supplies, and Scotland has a species of agate called Scotch pebble.

Agave, the American aloe or Century Plant which sometimes does not attain to flowering maturity under sixty or seventy years, and then dies. The flower spray may reach a height of 20 feet, and in its development the rush of sap is so great that the Mexicans collect for brewing the strong spirit called mescal. 1,000 litres of sap can be obtained from a single plant. Some species of agave yield sisal used for making cord and rope.

Agnus Dei (Lamb of God), a short anthem said or sung at a certain point of the Roman Catholic Mass or Anglican communion service. (John i. 29.)

Air is a mixture of gases forming the atmosphere we breathe. Nitrogen, oxygen, and argon are always present in air, a typical sample of dry air might contain these gases in the following proportions (by volume): nitrogen, 78·06%; oxygen, 21%; argon, 0·94%. A small quantity of carbon dioxide is present, about 3 parts in 10,000 parts of air. This carbon dioxide is the source of carbon compounds built up by green plants in photosynthesis (**F29**). In the process carbon dioxide is absorbed from the air and oxygen returned, the reverse of the respiratory process of animals. Air also contains a quantity of water vapour, and traces of ammonia, nitrogen oxides, hydrogen, sulphur dioxide, hydrogen sulphide, ozone and of the rare gases helium, krypton, neon, and xenon. In a city smoke and dust particles may be as abundant as 100,000 particles per cubic centimetre. A litre of air at 0° centigrade and 700 millimetres pressure weighs 1·2932 grams.

Alabaster, a soft crystalline form of sulphate of lime, or granulated gypsum, easily worked for statuary and other ornamental articles, and capable of being highly polished. Volterra, in Tuscany, yields the finest, that in highest ancient repute came from Alabastron in Egypt, near to the modern Antinoë.

Alb, white vestment reaching to the feet, worn by priests in religious ceremonies.

Albatross, a large sea-bird of almost pure white, black and white, or brown plumage. It nests in colonies on remote islands, but at other times rarely approaches land. Of the thirteen species, nine are found in the southern oceans, one in the tropics, and the three others in the North Pacific.

Albert Memorial, a large Gothic monument designed by Sir Giles Gilbert Scott, and embellished with sculptures by eminent artists. Erected in memory of Prince Albert in Kensington Gardens at a cost of £120,000.

Alcázar, the palace at Seville, famed for the beauty of its halls and gardens, in ancient days the residence of the Moorish kings.

Alcohols. A class of organic compounds of general formula R–OH, where R is an aliphatic radical. "Alcohol" is the name used for ethyl alcohol (ethanol), this is produced by distilling fermented liquors, and synthetically from ethylene, a product of petroleum cracking. Industrially ethyl alcohol is used in the manufacture of chloroform, ether, perfumes, etc. Diluted with wood alcohol or other denaturants ethyl alcohol is called "methylated spirits", the denaturants are varied according to the industrial purposes for which it is required, the methylated spirits then being largely exempt from duty. Wood alcohol (methyl alcohol or methanol) can be obtained by distilling wood, or synthetically from water gas.

Alcoholic Strength. In Great Britain the standard is the proof gallon which is an imperial gallon of spirits containing 49·28 per cent of alcohol by weight or 57·1 per cent. by volume at 60° F. In Europe the strength of spirits is usually measured by the Gay-Lussac hydrometer. In the U.S.A., because of the smaller gallon, 1·37 U.S. proof gallons = 1 British proof gallon. In Britain the alcoholic content of spirits and liqueurs appears on the bottle in degrees proof. Whisky, for example, at 70° proof (or 30° under proof) contains 70/100 × 57·1 alcohol, or about 40 per cent. The alcoholic content of wines is not shown on the label.

Aldehyde, the generic term for a class of chemical compounds of general formula R–CHO, where R is an organic radical. Except for formaldehyde, which is a gas, aldehydes are volatile liquids. They are produced by oxidation of primary alcohols. Most important aldehyde is formaldehyde used in making the plastics described as formaldehyde resins. Formalin (formaldehyde solution in water) is much used for preserving zoological specimens.

Alder, a river-side tree of the genus *Alnus*, including some 30 species and found in north temperate regions and the Andes. The only species native to Britain is *A. glutinosa*, which has been described as "guardian of river-banks" because of the way its roots bind together the sand and stones, and so slow down erosion. The wood is used for furniture and charcoal.

Aldine Editions are the beautiful books printed in Venice by the Renaissance printer Aldo Pio Manuzio and his family between 1490 and 1597. Italics were first introduced in these books.

Algae, flowerless plants living mostly in water. Seaweeds and the green pond scums are the best known algae. The green powder found on trees is composed of a microscopic alga (*Protococcus*). *See* **F27 (2)**

Algebra, a branch of mathematics in which symbols are used in place of numbers. Sir Isaac Newton styled it the "universal arithmetic". The Chinese were able to solve the quadratic equation before the Christian era but it was Al-Khowarizmi, an Arab mathematician of the early 9th cent. who introduced algebra to Europe.

Alhambra, the ancient palace of the Moorish kings at Granada in Spain, built in the 13th and 14th cent. Though part of the castle was turned into a modern palace under Charles V, the most beautiful parts of the interior are still preserved—the graceful halls and dwelling-rooms grouped round the Court of Alberca and the Court of Lions, with their fountains, arcades, and lovely gardens.

Aliphatic describes derivatives of hydrocarbons having chains of carbon atoms, as distinct from rings of carbon atoms as in benzene (*see* **Aromatic**). The gas butane is aliphatic.

Alkali, the general name given to a number of chemicals which are bases (*q.v.*). The term should be limited to the hydroxides of metals in the first and second group of the periodic table and of ammonia, *e.g.*, NaOH, KOH. They are used commercially in the manufacture of paper, glass, soap, and artificial silk. The word comes from the Arabic *al-kali* meaning calcined wood ashes. Alkalis are extremely soluble in water and neutralise acids to form salts and water.

Alkaloids, a large group of natural products which contain nitrogen, they are usually basic. Isolated from plants and animals, they include some hormones, vitamins, and drugs. Examples are nicotine, adrenalin, and cocaine. Many alkaloids are made synthetically for medicinal use, *e.g.*, morphine, quinine. Their

function in plants is not well understood. *See* **Belladonna.**

Alligator, the crocodile of America, common in the lower Mississippi and adjacent lakes and marshes, varying in length from 2 to 20 feet.

Allopathy, medicine as ordinarily practised in which remedies are given to produce results opposed to the symptoms The name is rarely used save to contrast it with homoeopathy (founded by Hahnemann of Leipzig about 1796) in which remedies are given which produce the *same* effects as the symptoms In fact modern medicine is increasingly based on the results of scientific research and, unlike homoeopathy, is based on no one theory and no single technique

Alloys are combinations of metals They are made because of their valuable special properties, *e.g.*, durability, strength, lightness, magnetism, rust-resistance, etc. Some well-known ones are brass (zinc + copper), coinage bronze (copper + zinc + tin), steels (iron + carbon + various other materials), soft solder (tin + lead), dental fillings (mercury + various ingredients).

All Saints' Day (Nov 1) is common to both the English and Roman Catholic Churches, and is in commemoration of the saints generally, or such as have no special day set apart for them Instituted by Pope Boniface IV., early in the 7th cent , this ecclesiastical festival was formerly called " All Hallows "

All Souls' Day (Nov 2) is a festival of the Roman Church, intended for the mitigation by prayer of the sufferings of souls in purgatory The commemoration was enjoined by Abbot Odilo of Cluny during the 11th cent upon the monastic order over which he presided, and was afterwards adopted generally throughout the Roman Communion

Allspice, a flavouring obtained from a West Indian tree of the myrtle family, *Pimenta officinalis* The essential oil of its unripe fruit is a powerful irritant, and the bruised berries are carminative

Alluvium, accumulations of sand, mud, gravel, etc , washed down by rivers and forming distinct deposits.

Almond, the fruit of the *Amygdalus communis*, originally indigenous to Persia, Asia Minor, and N Africa; now cultivated in Italy, Spain, France, the U S A , and Australia. It yields both bitter and sweet oil Bitter almond oil is obtained by macerating and distilling the ripe seeds. it is used for flavouring and scenting purposes, its fragrant odour being due to the presence of benzaldehyde and hydrogen cyanide When the seeds are pressed sweet almond oil results. this is used in perfumery, and also as a lubricant for very delicate machinery

Almuce, a fur stole worn by certain canons

Aloe, large plants of the lily family, with about 180 species found mainly in the S African veldt and Karroo. The bitter purgative drug (aloes) is prepared by evaporating the plant's sap. *See* **Agave.**

Alpaca, a South American ruminant related to the llama whose long, fine wool is woven into a soft dress fabric known by the same name Sir Titus Salt first manufactured alpaca cloth (1836). Saltaire, near Bradford, remains to evidence the success which for many years attended the enterprise.

Alpha Particle, or alpha-ray, fast-moving helium nucleus ejected by some radioactive atoms, *e.g.*, polonium. It is a combination of 2 neutrons and 2 protons. *See* **F11(1).**

Alphabet (so called from the first two letters of the Greek alphabet—alpha, beta) is the term applied to the collection of letters from which the words of a language are made up. It grew out of the knowledge that all words can be expressed by a limited number of sounds arranged in various combinations. The Phoenicians were the first to make use of an alphabetic script derived from an earlier Semitic alphabet (earliest known inscriptions *c.* 1500–950 B.C.) from which all other alphabets have sprung. The stages in the development of the alphabet were mnemonic (memory aids), pictorial (actual pictures), ideographic (symbols), and lastly phonetic. All the ideographic systems died out, with the exception of that of the Chinese.

Altimeter, an instrument used in aircraft to estimate altitude, its usual essential feature is an aneroid barometer which registers the decrease of pressure with height. Roughly 1 millibar corresponds to 30 ft To read an aircraft altimeter correct for its destination, the zero setting must be adjusted for difference of ground height and difference of surface pressure, especially when pressure is falling or when flying towards low pressure.

Altitude, an astronomical term used to signify the angular elevation of a heavenly body, this is measured with a quadrant or sextant In aeronautics it is the height (in feet or metres) above sea-level

Alto, the second voice of a male-voice church choir, *i.e.*, below treble and above tenor The term may also be applied to an instrument to distinguish it from others of similar design but different register: *e g* , alto saxophone.

Alto-Relievo, a term applied to sculptured designs which are depicted in prominent relief on a flat surface, technically signifying that the projection exceeds one-half the true proportions of the objects represented. Basso-relievo is carving kept lower than one-half such projection

Alum is a compound salt used in various industrial processes, especially dyeing, its constituents being the sulphate of one univalent metal or radical (*e g* , potassium, sodium, ammonium, rubidium, caesium, silver, thallium) and the sulphate of a tervalent metal (*e.g.*, aluminium, iron, chromium, manganese), and water of crystallisation.

Alumina is the oxide of aluminium Very valuable as a refractory material The ruby is almost 100 per cent. alumina, so also are the emerald, oriental amethyst, etc An hydrated aluminium oxide is bauxite, chief ore of aluminium from which the metal is extracted electrolytically.

Aluminium is a light metal which conducts electricity well. Its specific gravity at 20° C is 2 705 Melting point of aluminium is 660 2° C. It is made commercially by electrolysing bauxite dissolved in cryolite (double fluoride of aluminium and sodium). Aluminium alloys because of their strength and lightness are being increasingly used for the construction of railway coaches, automobiles, aeroplanes, etc

Amadavat, a popular cage bird of the weaver family, mainly crimson with white spots, so named because the first specimens came from Ahmadabad in India about 1700

Amalgam is the term applied to any alloy of which mercury forms a part.

Amber, a brittle resinous substance, in origin, fossilised resin. Obtained mostly from the Baltic coasts, and used for ornaments, pipe mouth-pieces, etc

Ambergris is a waxy substance produced in the intestines of the sperm whale, and generally found floating on the sea. It is a valuable perfumery material

Amblycephalus, a genus of homoptera including the froth-fly, which is destructive in many hop gardens in July and August, sucking the sap from the vine

Amblyopsis, a species of fish, practically sightless, and with inoperative organs of hearing and feeling, that inhabit the Mammoth Cave of Kentucky. A remarkable illustration of the failure of senses not brought into use.

America's Cup, a prize trophy first offered in 1851 by the Royal Yacht Squadron and open to yachts of all nations. It was won in the first year by the " America," a New York yacht, and has remained on that side of the ocean ever since, despite attempts to recapture it by Lord Dunraven, Sir Thomas Lipton, Mr T O M Sopwith, and others The last attempt by Great Britain was in 1958, when *Sceptre* was beaten by the American *Columbia* Australia challenged for the first time in 1962 with *Gretel*, but unsuccessfully.

Amethyst, the violet variety of quartz, used as a precious stone, containing traces of manganese, titanium, and iron The finest coloured specimens come from Brazil and the Urals.

Amice, a linen vestment worn about the neck by Roman and many Anglican priests over the alb when officiating at Mass or Holy Eucharist. Formerly worn on the head by priests and pilgrims.

Amines, organic chemicals composed of carbon, hydrogen, and nitrogen. They are derived

from ammonia, which they resemble in smell and chemical characteristics. The smell of bad fish is due to the presence of amines Important industrially as intermediates in a wide variety of products, for example, the synthesis of dyestuffs and man-made fibres such as nylon

Amino-acids, organic compounds containing an amine group and an acid group. They are the "building bricks" of proteins (*q v.*)

Ammeter, an instrument for measuring the current flowing in an electric circuit A contraction of ampere-meter (*See* **Ampere.**)

Ammonia, a colourless gaseous compound comprising three atoms of hydrogen to one of nitrogen Formerly it was made by heating the horns and hoofs of deer, acquiring the name of spirits of hartshorn. The ammonia of commerce is now procured by coal decomposition in the course of gas-making and by direct synthesis In the very important Haber process of ammonia production by fixation of atmospheric nitrogen, the nitrogen is made to combine with hydrogen and the ammonia so prepared is converted into nitric acid, ammonium nitrate or ammonium sulphate. The Haber process made Germany self-sufficient in nitrates in the first world war, and was afterwards exploited all over the world

Ammonites, extinct animals related to the Nautilus The chambered shell is coiled usually in a plane spiral, and they are confined to Mesozoic rocks

Ammonium, the basic radical of ammonium salts, Composed of one atom of nitrogen and four of hydrogen, it behaves chemically like an ion of a monovalent alkali metal Ammonium chloride is known as "sal ammoniac" "Sal volatile" is ammonium carbonate

Amnesty, an act of grace by which a ruler or governing power pardons political offenders

Amorphous, a term used to indicate the absence of crystalline form in any body or substance

Ampere, the most commonly used unit of electric current; often abbreviated to "amp," named after André Marie Ampère, who in the 1820s helped to lay the foundations of modern electro-magnetism *See* **N13(1).**

Amphibia. *See* **F23(1).**

Amphioxus *or* **Lancelet**, a primitive chordate occurring in sand-banks around British shores and elsewhere

Ana, a collection of criticisms, observations, or opinions about a particular person, place or subject. Used as a suffix especially applies to a person's memorable sayings, anecdotes about or publications bearing on, as in *Johnsoniana, Alexandriana, Victoriana.*

Anarchism. *See* **J3.**

Anchor, an instrument used for keeping ships stationary. Great improvements have been introduced in recent years, stockless anchors being now chiefly used, consisting of a shank and a loose fluke. Lloyds' rules prescribe the number and weight of anchors which must be carried by merchant ships

Anchorite is a religious person who retires into solitude to employ himself with holy thoughts. Among the early Christians, anchorites were numerous, but in the Western Church they have been few Their reputation for wisdom and prescience was high, and kings and rulers in olden days would visit their cells for counsel An anchorite or "ankret" was in mediæval times a source of fame and profit to the monastic house within which he was voluntarily immured.

Anchovy, a fish of the herring family, distinguished by its large mouth and projecting snout, plentiful in the Mediterranean and much esteemed when cured.

Ancient Lights are rights of light enjoyed by a property owner over adjoining land Such a right is obtained either by uninterrupted enjoyment for twenty years, or by written authority, and once legally established cannot be upset, no building being permissible that would seriously interfere with the privilege.

Anemometer, an instrument for measuring the strength of the wind. In the most widely u[illegible] pattern the rotation, about a vertical axis, o[illegible] group of hemispherical or conical cups gives a measure of the total flow of air past the cups, various registering devices being employed. The Dines anemograph provides a continuous record of the variation in both velocity and direction; changes of pressure produced in a horizontal tube, kept pointing into the wind by a vane, cause a float, to which a pen is attached, to rise and fall in sympathy with the gusts and lulls. The recently devised hot-wire anemometer, depending upon the change of electrical resistance experienced by a heated wire when cooled, enables very gentle air currents to be investigated

Aneroid is the kind of barometer which does not depend upon atmospheric support of a mercury (or other liquid) column It consists of a metallic box, partially exhausted of air, with a corrugated lid which moves with atmospheric changes A lever system magnifies the lid movements about 200 times and atmospheric pressure is read from a dial The construction of the vacuum chamber provides automatic compensation for temperature changes An aneroid barometer is the basic component of an altimeter.

Angelica, an aromatic plant of the Umbelliferae order, *Angelica officinalis*, valuable as a flavouring and possessing medicinal properties In olden times supposed to protect against poison.

Angelus, a church bell rung in Roman Catholic countries, at morn, noon, and sunset, to remind the faithful to say their Angelic Salutation.

Angevin Dynasty includes the Plantagenet kings from Henry II to Richard II. The name was derived from Henry II.'s father, Geoffrey, Count of Anjou

Angiosperms. *See* **F28 (2).**

Angles, a northern tribe originally settled in Schleswig, who with the Saxons and Jutes invaded Britain in the 5th cent.

Angstrom, a unit of length (formerly Angstrom unit) equal to one-hundredth of a millionth of a centimetre (10^{-8} cm), used in measuring the wavelength of light, X-rays, etc

Aniline, a simple aromatic compound related to benzene and ammonia It is obtained from coal-tar The name recalls the fact that it was first prepared by distilling indigo (*anil* is Portuguese for indigo) In 1856 W. H Perkin (1838–1907) discovered the first aniline or coal-tar dye, mauve, and thus founded the modern dyestuff industry.

Animal Kingdom. *See* **F22–27.**

Anise, an umbelliferous plant (*Pimpinella anisum*) found in Egypt and the Levant, and valued for its fruit, aniseed, possessing certain medicinal properties and yielding an aromatic, volatile oil Also used in cooking The anise of the Bible is *Anethum graveolens*, *i e*, dill

Annates were acknowledgments formerly paid to the pope by way of fee or tax in respect of ecclesiastical preferment, and consisted usually of a proportion of the income ("first-fruits") of the office Introduced into England in the 13th cent , annexed to the Crown under Henry VIII; transferred to a perpetual fund for the benefit of the poorer clergy in 1704. *See* **Queen Anne's Bounty.**

"Annual Register," a yearly record of political and literary events, founded by Edmund Burke (as editor) in 1759 and Robert Dorsley, the bookseller

Annunciation, Feast of the (March 25), is a church festival commemorating the message of the incarnation of Christ brought by the angel Gabriel to the Virgin Mary, hence the title Lady Day

Anointing is the pouring of consecrated oil upon the body as a mark of supreme honour. In England it is restricted chiefly to the ceremony of the monarch's coronation, and the spoon with which the oil is applied forms part of the English regalia In the Roman Catholic Church anointing represents the sacrament of extreme unction.

Ant. There are about 6,000 species of ants, which belong to the same order (Hymenoptera) as the bees, wasps, and ichneumon flies They are social in habit, living in communities of varying size and development. There are three basic castes in ants—the females or *queens*, the *males*, and the *workers* (the last-named being neuter), although specialised forms of workers are sometimes found, *e.g.*, the *soldiers* of the harvesting ants. In the communities of those species of ants which evolved most recently there is a highly complex social life and well-developed division of labour. Some species of

these ants make slaves of other species, stealing the cocoons before the adult forms emerge. Many ants "milk" greenflies, which they protect for their honey-like secretion, and most ants' nests contain many "guests," such as beetles and silver fish. Some ants harvest grains of corn, and others, from S. America, live on fungi which they cultivate in underground "mushroom beds."

Antarctic Exploration. In earlier centuries it was thought that a great continent must exist in the southern hemisphere, around the South Pole, to balance the known land masses in the north. Its supposed extent was greatly reduced in the 18th cent., particularly when Capt. Cook sailed for the first time south of the Antarctic Circle and reached the edge of the ice pack. A portion of the ice-covered continent—the coast of Graham Land—was first sighted by Lieut. Edward Bransfield in 1820. Explorers of several other nations sighted portions of the coast-line in other quarters, but the first extensive exploration was made by Capt. James Clarke Ross, who with the *Erebus* and *Terror* penetrated into the Ross Sea in 1841, and discovered the great Ross Ice Barrier in 78° South lat. Interest in the Antarctic did not revive until after 1890, when an international scheme of research was drawn up. A Norwegian, C. E. Borchgrevink, in 1898–1900, was the first to winter in the Antarctic and to travel on the ice barrier. The British share in this work was carried out by Capt. R. F. Scott's expedition in the *Discovery*, 1901–4. Scott's party sledged across the barrier to 82° 17′ South, then a record "farthest south." A little later, Ernest Shackleton beat this by travelling to within 100 miles of the South Pole. In 1910 Scott organised his second expedition of the *Terra Nova*, and became engaged against his will in a "race for the Pole," when, after his departure, the Norwegian Arctic explorer, Roald Amundsen, suddenly announced that he was sailing for the Antarctic. Amundsen set up his base at the eastern end of the Barrier, and, relying on dog teams for hauling his sledges, reached the Pole on December 14, 1911. Meanwhile Scott and his party, their start delayed by adverse weather, were marching southwards, man-hauling their sledges, for Scott was against the use of dogs. After an arduous journey they reached the Pole one month after Amundsen. The return was a struggle against the weather and increasing weakness, probably due to scurvy, until at last they perished within a few miles of their base. After the First World War the development of the whaling industry greatly stimulated further exploration. Outstanding expeditions included that of Admiral R. E. Byrd, 1929, when he flew over the South Pole; The British Graham Land expedition, 1934, which carried out the first extensive mapping of any part of the Antarctic continent; and the U.S. Navy's Antarctic Expedition of 1940, when the whole continent was circumnavigated and great areas photographed from the air. In recent years valuable work has been done by the first International expedition, the Norwegian–British–Swedish Expedition to Queen Maud Land, and by the French in Adelie Land. The Falkland Island Dependencies Survey, set up during the war, has continued the scientific exploration of Graham Land. The Antarctic was the scene of high adventure during the International Geophysical Year (1957–58), when scientists from many countries participated in the explorations. The Commonwealth Trans-Antarctic Expedition set out from opposite sides of the continent and met at the South Pole, the U.K. party, led by Sir Vivian Fuchs, from the Falklands, and Sir Edmund Hillary and his party from New Zealand. The U.K. party accomplished the first crossing of the White Continent in 99 days. Their scientific work included the making of seismic and complementary gravimetric studies at frequent intervals along the 2,200-mile traverse. Since the Antarctic is becoming important for many reasons, in weather forecasting, in the whaling industry, and as a possible centre for world air routes, the tempo of exploration and research will become even faster in the future.

Anteater. There are two unrelated families of anteaters, the Myrmecophagidae and the Manidae. Among the former the Great Anteater (*Myrmecophaga jubata*) is the largest species, over 6 ft. in length, occurring in Central and S. America. Only half its size is the lesser Anteater (*Tamandua tetradactyla*), this is found in forests of tropical America and Trinidad. The Two-toed Anteater (*Cyclopes didactylus*) belongs to South America and Trinidad. These three animals live mostly on termites, they are adapted to this diet, having large claws for digging out ants, and a tubular mouth with a long sticky tongue. The Manidae are the Scaly Anteaters or Pangolins, widely distributed over Africa and the Orient. The difference between the two families is that the first has hair covering the body, the latter has horny scales instead.

Antennae, paired feelers of insects and crustacea.

Anthem, a choral composition, with or without instrumental accompaniment, usually sung after the third collect in the Church of England service. The words are from the Scriptures, and the composition may be for solo voices only, for full choir, or for both. Among the chief British composers of anthems are Tallis, Purcell, Croft, Boyce, Goss, and Stainer.

Anthracite is a black coal with a brilliant lustre. It contains 92% and over of carbon and burns slowly, without smoke or flame.

Anthropoid, meaning "resembling man," a sub-order of the primate mammals including man and also the gibbon, chimpanzee, orang-utan, and gorilla.

Anticyclone, a region where barometric pressure is greater than that of its surroundings. Such a system is distinguished on weather charts by a pattern of isobars, usually circular or oval-shaped, enclosing the centre of high pressure where the air is calm. In the remaining areas light or moderately strong winds blow spirally outwards, in a clockwise direction in the Northern Hemisphere (and in the reverse direction in the Southern Hemisphere), in accordance with Buy's Ballot's law (an observer with back to wind in Northern Hemisphere has lower pressure to left; in Southern to right). Over the British Isles anticyclonic weather is generally quiet and settled, being fair, warm, and sunny in summer and either very cold and often foggy or overcast and gloomy in winter. These systems move slowly and sometimes remain practically stationary for days at a time, that over Siberia being particularly well defined. Extensive belts of almost permanent anticyclones occur in latitudes 30° N. and 30° S. Persistent anticyclonic weather with easterly winds during the months December to March, 1962–3, brought the coldest and hardest winter to Britain since 1740 (taking the Midlands as representative).

Antimony. Metal element, symbol Sb. In group V of the periodic table. Exists in various forms, the stable form being a grey brittle metal with a layer structure. The other forms are non-conductors. On being burned, it gives off dense fumes of oxide of antimony. By itself it is not of special utility, but as an alloy for hardening other metals, it is much used. As an alloy with lead for type-metal, and with tin and copper or zinc for Britannia-metal, it is of great value. Most important antimony ore is stibnite (antimony sulphide).

Anti-Pope, one elected in opposition to one held to be canonically chosen, commonly applied to the popes Urban VI and Clement VII, who resided at Avignon during the Great Schism (1378–1417).

Anti-proton, the "negative proton," an atomic particle created in high energy collisions of nuclear particles. Its existence was confirmed in Oct. 1955. *See* **F13(1), 14**

Antisemitism. *See* **J3.**

Antlers are the branched horns of deer, the branches being called tines. Antlers originate as outgrowths of the frontal bone, and are usually shed once a year. Except in the reindeer and caribou they are restricted to the male.

Apartheid. *See* **J4**

Ape, a term applied to the gorilla, chimpanzee, orang-utan, and gibbon—the anthropoid apes.

Aphelion, the point in the orbit of a planet farthest from the sun: the opposite of perihelion.

Aphids. *See* **T28 (2).**

Apis, the sacred bull worshipped by the ancient Egyptians; also the scientific name for the bee

Apocalyptic writings are those which deal with revelation and prophecy, more especially the Revelation of St John.

Apocrypha (hidden writings), the books which were included in the Septuagint (Greek) and Vulgate (Latin) versions of the Old Testament but excluded from the sacred canon at the Reformation by the Protestants on the grounds that they were not originally written in Hebrew nor regarded as genuine by the Jews The books include: 1 and 2 Esdras, Tobit, Judith, additions to Esther, Wisdom of Solomon, Ecclesiasticus, Baruch, Song of the Three Holy Children, History of Susannah, Bel and the Dragon, Prayer of Manasses, 1 and 2 Maccabees The term is usually applied to the additions to the old Testament, but there are also numerous Christian writings of the same character

Apogee, that point in the orbit of a heavenly body which is farthest from the earth; used in relation to the sun, moon, and artificial satellites The sun's apogee corresponds to the earth's aphelion, the moon's apogee is the point in its orbit most remote from the earth *See* **Perigee**

Apostasy is a revolt, by an individual or party, from one form of opinions or doctrine to another Julian, the Roman Emperor (331–63), brought up as a Christian, became converted to paganism and on coming to the throne (361), proclaimed religious toleration Hence his name, Julian the Apostate

Apostles. The twelve apostles who were disciples of Jesus were Simon Peter and Andrew (his brother), James and John (sons of Zebedee), Philip, Bartholomew, Thomas, Matthew, James, Thaddaeus, Simon, and Judas Iscariot After the Ascension Matthias was chosen to take the place of Judas St Paul is always referred to as the chief apostle, though he is not one of the twelve St. Barnabas has also been called an apostle

Apostles' Creed, applied to the most ancient of the Church's statements of its belief "I believe in God the Father Almighty, and in Jesus Christ his only Son our Lord, who was born of the Holy Ghost and the Virgin Mary " A later version is used in the Church of England at morning and evening prayer

Apostolic Fathers were the immediate disciples or followers of the Apostles, especially such as left writings behind. They included Barnabas, Clement of Rome, Ignatius of Antioch, Hermas, Papias of Hieropolis, and Polycarp

Appeasement Policy. The name of the policy during 1937 and 1938 of yielding to the demands of Hitler and Mussolini in the hope that a point would be reached when the dictators would co-operate in the maintenance of peace The policy culminated in the Munich Agreement (which was the subject of much criticism) after a series of concessions including the recognition of the Italian conquest of Abyssinia and the German annexation of Austria The policy was finally demonstrated as futile when Hitler seized Czechoslovakia in March 1939

Appian Way, the oldest and finest of the Roman roads originally laid by Appius Claudius (312 B C) from Rome to Capua and thence to Brundisium (Brindisi)

Approved Schools are residential schools for the training of young persons under 17 who, because of disturbed behaviour as a result of unfavourable influences such as bad environment or parental neglect, are guilty of offences or in need of care and protection and have been sent to them by magistrates from juvenile or other courts *See also* **Detention Centre, Borstal**

April, the fourth month of the year, from the Roman *Aprilis* derived from *aperire* " to open " —the period when the buds begin to open

Apse is a semicircular recess, arched or dome-roofed, at the end of the choir, aisles, or nave of a church

Aquatint is a method of etching on copper, by which imitations of drawings in water-colours, Indian ink, bistre, and sepia are produced

Aqueducts are conduits in which water flows or is conveyed from its source to the place where it is to be used. Most famous builders were the Romans and the oldest Roman aqueduct was the Aqua Appia which dates from about 310 B C Among modern aqueducts may be mentioned that of Glasgow, which brings water to that city from Loch Katrine; that of Manchester, which taps Thirlmere, that of Liverpool, with Lake Vyrnwy in North Wales as its source, and the Fron Aqueduct, Radnorshire, which carries water from the Elan Valley to Birmingham.

Arabesque, the term applied to the elaborate decoration based on flowing lines used in Moorish art

Arabian Nights, a collection of fascinating tales of the Orient, of mixed Indian, Persian, Arabic, and Egyptian origination, and first made known in Europe by Antoine Galland, a French Oriental scholar whose original translation was called *The Thousand and One Nights*

Arabic Numerals, consisting of the characters, 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, had their roots in India, whence they passed to Baghdad in the second half of the 8th cent and were introduced by way of Spain to Europe in the 12th cent., taking the place of the Roman numerals

Aragonite, the unstable form of calcium carbonate found as a mineral in some young deposits. It crystallises in the orthorhombic system but tends to revert to calcite (*q v*)

Aramaic Languages, the Semitic dialects current in Mesopotamia and the regions extending south-west from the Euphrates to Palestine from about the 12th cent B C until after the rise of Islam, when Aramaic was superseded by Arabic Both Aramaic and Greek were spoken in Palestine during the time of Christ

Archaeopteryx, a fossil bird providing a connecting link between reptiles and birds It had feathers, jaws with teeth, no bill, reptilian bones and skull, a long tail, and it probably used its fore-limbs for gliding flight The first specimen, found in 1861, in the Solenhofen limestone of Bavaria, is in London's Natural History Museum. *See* **F32(1)**

Archbishop, the chief of the bishops of an ecclesiastical province in the Greek, Roman, and Anglican churches In the Church of England there are two archbishops, the Archbishop of Canterbury, called the Primate of *all* England, and the Archbishop of York, styled the Primate of England

Archimedes' Principle. When a body is weighed in air and then in any fluid, the apparent loss in weight is equal to the weight of fluid displaced This scientific fact was noted by the Syracusan philosopher Archimedes (287–212 B C.) and is frequently used as a basis for density measurements.

Architecture, the art and science of building The provision of shelter for mankind by the orderly arrangement of materials in a manner which expresses man's attitude to living. The forms which buildings take are the outcome of the function for which they are to be used, of the architect's aesthetic sensibility and of the structural method adopted Until the last hundred years structural methods were limited to timber frames, and columns, lintels, load-bearing walls, arches, vaults, and domes in brick or stone From these few basic elements have evolved the great variety of historic styles of building to be found throughout the world To give but one example, the Greeks created those systems of decorated columns and beams, known as the Orders, which were adapted by the Romans, revived decoratively rather than structurally during the Renaissance and are still used in debased form on the more presumptuous type of modern building. In recent years, however, architecture has taken on a new meaning Once confined to the rich, in the form of Church, State, or Commerce, it is now, with the coming of democracy, recognised as an essential social service for all. This, and the development of new structural techniques and materials (steel, aluminium, sheet glass, reinforced concrete, plastics, and plywoods, to name a few), have made the interest in historic styles, the mainstay of the older architect, of secondary importance Modern architecture is the creation of buildings with the highest possible standards of functional performance in terms of efficient planning and structure, good artificial and natural lighting, adequate heating or cooling, and proper acoustic conditions consistent with the price the client can afford to pay. At the

same time the architect's task is to design a structure, and the spaces the structure delimits, internally and externally, which are æsthetically stimulating and satisfying, and well related to the land and buildings around

Arctic Exploration. Modern exploration of the Arctic begins in the 16th cent., when men sought to reach the East Indies by sailing through the Arctic to the Pacific Ocean. The North-east Passage, via the shores of northern Asia, was the first attempted In 1553 and 1554 the English navigators Sir Richard Chancellor and Stephen Burrough sailed into the White Sea, but were prevented by storms and ice from advancing farther eastwards. The project was later revived by the Dutch; Barendts in 1594 discovered Spitsbergen, but also failed to get beyond Novaya Zemlya It was not, in fact, until 1879 that the Swede, A E Nordenskiöld, in the *Vega*, succeeded in reaching the Pacific The attempts to find a North-west Passage were more numerous and determined In 1585 John Davis penetrated Davis Strait and coasted along Baffin Island. Hopes ran high when Henry Hudson discovered Hudson Bay in 1610, but a practicable passage continued to elude explorers. The problem was to find a navigable route through the maze of channels in the short summer season, and to avoid being frozen in with supplies exhausted. After the Napoleonic Wars the Admiralty sent out many naval expeditions which culminated in Sir John Franklin's expedition with the *Erebus* and *Terror* in 1845 The ships were beset by ice in Victoria Channel and, after Franklin's death, were abandoned by their crews, who perished from scurvy and starvation on their march southwards. To ascertain their fate, several further expeditions were despatched, and the crew of the *Investigator*, commanded by R J M'Clure, sailing eastwards from Bering Strait, were the first to make the Passage, though in doing so they were obliged to abandon their ship. It was thirty years before the Norwegian, Roald Amundsen, succeeded in sailing the *Gjoa* from east to west. In the meantime, the North Pole had become the goal of explorers. Nansen, in 1893, put the *Fram* into the ice-pack to drift across the Polar basin, and himself made an unsuccessful attempt on the Pole across the pack This was eventually achieved by the American explorer Robert E Peary, who after several expeditions in the North Greenland region, sledged to the Pole with Eskimo companions in 1909 The next phase was the employment of airships and aeroplanes in Arctic exploration. In 1926 Admiral Byrd made the first flight over the Pole, and in the same year Amundsen and Lincoln Ellsworth flew the airship *Norge* from Spitsbergen to Point Barrow, Alaska. Two years later, the *Italia*, commanded by the Italian, Nobile, was wrecked on a return flight from the Pole, and Amundsen lost his life in an attempt to rescue the survivors With modern developments in aircraft and navigation, flights over the Polar basin are almost a routine matter, and passenger flights between Europe and America via northern Greenland are being pioneered The first voyage under the North Pole was made in August 1958 by the American nuclear-powered submarine *Nautilus*.

Arenaceous Rocks, the rocks composed of grains of sand, chiefly sandstones; quartz is the most abundant mineral in these rocks.

Argillaceous Rocks are a sedimentary group, including the shales and clays

Argon, chemical element, symbol A This was the first of the inert gases (*q v*) to be isolated from air by Rayleigh and Ramsay in 1894 Argon is used for filling gas-filled metal filament electric lamps. In gas discharge tube it gives a blue glow.

Aria, a song consisting of a first part, a second part, and a repetition of the first part. Songs of this type commonly occur in 18th-cent. operas and oratorios. The term has been loosely extended to cover airs rendered solo by principal characters in opera.

Aries, the Ram, the first of the signs of the Zodiac.

Arithmetic, the branch of mathematics that deals with numerical calculations as in counting, measuring, weighing. The early civilisations used simple arithmetic for commercial purposes, employing symbols and later letters of the alphabet as numerals. When Hindu-Arabic numerals replaced Roman numerals in the Middle Ages it meant a great step forward and led to rapid developments—the invention of logarithms, slide-rule, calculating machines.

Ark of the Covenant was the sacred chest, overlaid with gold, which occupied the inner sanctum of the Temple, and symbolised God's covenant with his people.

Armada, Spanish, the naval expedition fitted out by Philip II of Spain in 1588 against England, commanded by the Duke of Medina Sidonia It comprised 120 ships, was manned by 8,000 sailors and carried 19,000 soldiers and more than 2,000 cannon. Against this formidable force Elizabeth had only 80 ships, manned by 9,000 sailors, under Lord Howard of Effingham, under whom served Drake, Hawkins, and Frobisher The British Fleet awaited the Armada off Plymouth, and at Tilbury there was a considerable defensive land force under the command of the Earl of Leicester On July 19 the ships of the Armada were sighted off the Lizard, disposed in a crescent seven miles long from horn to horn The excellent manoeuvring of the English, their fire-ships, and a gale from the N W combined so effectively to cripple the Spanish ships that the Armada was scattered in confusion, a very small remnant contriving to reach home via the North of Scotland It was impossible to embark the army of Parma waiting in the Netherlands Elizabeth had a medal struck bearing in Latin the inscription, "God blew and they were scattered "

Armadillo, a genus of animals related to the sloths and anteaters, belonging to South America, and carrying a hard bony covering over the back, under which one species (*Tolypeutes*) can completely conceal itself when attacked, rolling itself up like a hedgehog

Armageddon, according to the Revelation of St John, the great battle in which the last conflict between good and evil is to be fought

Armillary Sphere, an early form of astronomical apparatus with a number of circles representing equator, meridian, ecliptic, etc Used by Hipparchus and Ptolemy and up to the time of Tycho Brahe for determining the position of the stars.

Aromatic. A term used by chemists, originally to describe compounds like benzene, having a characteristic smell It is a term which implies a collection of chemical characteristics, the salient features being a flat ring structure and a general similarity to benzene.

Arpeggio, a chord whose notes are played in ascending or descending sequence, as on a harp

Arsenic, a metalloid element, symbol As, in group V of the periodic table usually met with as a constituent of other minerals sometimes by itself Its compounds are very poisonous Lead arsenate is a powerful insecticide used for spraying fruit trees. The more stable allotropic form (grey) has a layer structure, and conducts electricity.

Artesian Wells take their name from Artois in France, where the first wells of this kind were constructed in 1126 They are to be found only when a water-bearing bed is sandwiched between two impervious beds When a boring is made to the lower part of the bed, the pressure of water is sufficient to cause the water to overflow at the surface Artesian wells were known to ancient Egypt and China, and have existed in the Sahara since the earliest times The fountains in Trafalgar Square are fed by artesian wells sunk through the London clay into the chalk about 400 ft.

Arthropoda. *See* F22(2).

Arthur's Seat, a hill of volcanic origin, 823 ft high, dominating Holyrood Park, to the south-east of Edinburgh

Articles. The *Six Articles* are those contained in an Act of Henry VIII and were of Roman Catholic origin. The *Thirty-Nine Articles* drawn up in 1563 comprise the doctrines of the Anglican Established Church, and must be subscribed to by all taking holy orders therein

Art Nouveau, a term applied to the "new art" which spread across Europe and the U S.A

during the 1890s It was mainly a style of architecture and interior decoration which attempted to break with the old traditions of darkness and "heaviness" by the use of the new materials of cement, steel, and glass from which it created patterns characterised by (a) over-elaboration, (b) relatively naturalistic but tortuous representations of plants, etc, (c) a ubiquity which left no surface undecorated Typical of the extravagances of Art Nouveau are the cast-iron lilies with copper tendrils, the cupboard doors and chair-backs with heart-shaped holes, and the furniture shaped like animals, examples of which are still with us In Britain the movement was basically a continuation of the Arts and Crafts movement of William Morris, Aubrey Beardsley represented this essentially fin-de-siecle school in his drawings

Arts and Crafts Movement, the English revival of decorative art which began about 1875 as a revolt against the existing vulgarity of internal decoration and furnishings and the pettiness of academic art Inspired by William Morris and Burne-Jones together with Rossetti, it was strongly influenced by the former's mediaevalism, his hatred of industrialism, and his own version of socialism which included the regeneration of man by handicrafts His firm of Morris & Co produced wallpapers, tapestries, furniture, stained-glass windows, carpets, and fabrics in a style totally different from that of contemporary Victorian decoration The V & A Museum in London has a room entirely decorated with Morris products, and his Kelmscott Press did much to raise the standards of book design and printing in its day *See* **Art Nouveau.**

Arum, a genus of plants of the Araceae family, of which there is but one British species, the wake-robin or cuckoo-pint, sometimes also styled "Lords and Ladies" Its pointed leaves and spikes of scarlet poisonous berries are familiar in the hedgerows The starch in the tuber was formerly used as food under the name "Portland arrowroot"

Arundel Marbles, a collection of ancient Greek sculptures formed by Thomas Howard, Earl of Arundel, in the 17th cent and presented to Oxford University by his grandson, Henry Howard, who became Duke of Norfolk

Aryan is a term used to denote the lingual and ethnological groups otherwise known as Indo-European or Indo-Germanic Comprises two branches, Western or European, and Eastern or Armenian The Aryan languages show common origin by their vocabulary, syntax, and inflexions The word *Aryan*, derived from the Sanskrit, means an "honourable lord of the soil", the nearest to the parent tongue is Sanskrit, and the chief divisions in Europe are the Teutonic, Romance, Slav, and Celtic The Turks, Magyars, Basques, and Finns are non-Aryan The common ancestors of the Aryan group dwelt among the Pamirs at a period of remote antiquity

Asafoetida, an acrid, strong-smelling gum resin exuded from the stem of an umbelliferous plant, *Ferula foetida*, found in Persia and Afghanistan Formerly used medicinally to treat hysteria, still used in cooking in India, Iran, and France

Ascension Day, or Holy Thursday, is the 40th day after Easter.

Ascot Races are an annual fashionable function dating from 1711 and taking place on Ascot Heath, only six miles from Windsor, in June Have always had royal patronage. The course is nearly two miles long

Ash, a familiar deciduous tree of the genus *Fraxinus*, of over 60 species, native to North-temperate regions The ash held an important place in Norse mythology, as it was supposed to support the heavens with its roots in Hell. The species native to Britain, and to Europe, is *F excelsior*, a tall tree with compound leaves, greenish flowers, winged seeds, and black buds in winter It is a valuable timber tree, tough and elastic, and largely used for wheels and handles. The rowan, or mountain ash, *Sorbus aucuparia*, with similar leaves and orange berries, belongs to a different family *F pendula* or weeping ash is a weeping strain which makes an ideal natural summer house

Ashes, The, the symbol which distinguishes the winning cricket team in the Australian Test Matches In 1882 the Australians won at the Oval by 7 runs After the match the following epitaph appeared in the *Sporting Times*: "In affectionate remembrance of English Cricket which died at the Oval on Aug. 29, 1882, deeply lamented by a large circle of sorrowing friends and acquaintances R I P. NB. The body will be cremated and the ashes taken to Australia." When the English Eleven went to Australia the same winter it was said that they had come to recover the "ashes" England won two out of three matches, and after the third match the ashes of what is now generally believed to have been a stump were presented in an urn to Ivo Bligh, later Lord Darnley He bequeathed the urn to the M C C, and it now stands in the Memorial Gallery at Lord's.

Ash Wednesday, first day of Lent, on which ashes are sprinkled on the head as sign of penitence under an injunction of Pope Gregory the Great in the 6th cent

Asp, a small poisonous snake, often mentioned in ancient literature and traditionally supposed to have been used by Cleopatra in killing herself Probably the Egyptian Horned Viper (*Cerastes*).

Assassination, treacherous murder for political ends, usually of a ruler or distinguished person Among the most famous assassinations of history were Julius Caesar, 44 B C, Thomas à Becket, 1170, David Rizzio, 1566, William the Silent, 1584, Henry IV of France, 1610, Jean Paul Marat, 1793, Abraham Lincoln, 1865, Alexander II of Russia, 1881, Archduke Francis Ferdinand of Austria, 1914, Dr Dollfuss, 1934, King Alexander of Yugoslavia, 1934, Mahatma Gandhi, 1948, King Abdullah of Jordan, 1951, Liaquat Ali Khan, 1951, King Feisal of Iraq, 1958, Mr Bandaranaike, 1959.

Assassins. *See* **J5**

Asteroids are minor planets most of whose orbits lie between those of Mars and Jupiter, they were unknown until the discovery of Ceres by Piazzi in 1801 More than 1,500 have been recognised and many more are believed to exist, since 1891 their paths have been identified by exposed photographic plates Most of these planetoids or minor planets are mere celestial footballs, the majority having a diameter of well under 50 miles Ceres, with a diameter of c 480 m, is the largest, then there are Pallas (c 304 m), Juno (120 m), Vesta (210 m), Astraea, Adonis, Hermes, Hidalgo, Eros, Amor, Apollo, and the Trojan group which all take their names from Homer's *Iliad*—Achilles, Patroclus, Hector, Nestor, Priam, Agamemnon, Ulysses, Aeneas, Anchises, Troilus, Ajax, and Diomede

Astrolabe, a mediaeval scientific instrument for taking altitudes, observing the sun by day and the stars by night, and used for telling the time and finding the latitude. Used by the ancient Greeks, later by the Arabs and Persians, and introduced into Europe by way of Spain in the 14th cent Chaucer is said to have sent his son Lois, a ten-year-old student at Oxford, an astrolabe with a treatise on its use in 1391.

Astronomical unit, the mean distance from the centre of the earth to the centre of the sun, or half the major axis of the earth's elliptical orbit It has been known for some 300 years that the earth–sun distance is roughly 93 million miles, but over the past 60-odd years astronomers have attempted to determine it with ever-greater accuracy, using various methods of computation Spencer Jones (1931) deduced a value of 93,004,000 miles, the American astronomer E K Rabe (1950) obtained a value of 92,914,800 miles, and data from the *Pioneer V* space probe gave a value of 92,925,100 miles. The earth–sun distance is a fundamental value in astronomy

Astrology. *See* **J4**

Astronomy, the oldest and one of the most fascinating of sciences, was in early times associated with astrology, but by a long series of observations and mathematical calculations a gradual knowledge of the movements of the heavenly bodies grew up **Pythagoras** (520 B C) understood the revolution of the earth upon its axis, but it was not until two thousand years later that his theory gained general acceptance, when the keen and spacious minds, first of Copernicus, and then of Tycho Brahe

and Galileo, demonstrated the truth of the Pythagorean theory With the setting forth of the Copernican system, astronomy was placed on a sure foundation, and the movements of the planets began to be more clearly comprehended The studies of Kepler and Galileo, making their observations with the telescope, resulted in an immense increase of astronomical knowledge. Newton, to whom we owe the discovery of the law of gravitation, the improvement of the telescope and many other discoveries, placed physical astronomy on well-defined lines. Two great landmarks in more recent times were the discovery of Uranus by Herschel in 1781 which extended the solar system as then recognised, and the estimation by Hubble in 1924 of the distance of Andromeda of nearly a million light years (more recent determinations give 1,500,000 light years), which showed that our Galaxy was just one of many. Today radio-astronomy is advancing astronomical knowledge and making it possible to explore regions beyond the scope of optical telescopes *See* **F5–7,** *and* **Radio Astronomy, Part IV, Section F.**

Astrophysics, a branch of astronomy concerned with the physical nature and constitution of celestial bodies Since the second half of the 19th cent the application of spectroscopy and photometry has been responsible for the great advance in this branch of science

Athanasian Creed, one of the three ancient creeds of the Christian Church, often referred to as the *Quicunque Vult*, is a statement of the doctrine of the Trinity and the Incarnation, and though named after St Athanasius, the view is now widely held that it is the work of St Ambrose (339–97). *See also* **Apostles' Creed** and **Nicene Creed.**

Athodyd, also called "Ramjet" or "Propulsive Duct." This can be considered as an extremely simple gas-turbine engine, without any rotating parts A power plant with great possibilities for high-speed aerial flight, it consists of a diffuser, combustion chamber, and exhaust chamber, its thrust results from the fact that the gases leaving the athodyd have a higher velocity than the gases entering it.

Atmosphere is the gaseous envelope of the earth, and consists of a mixture of gases (*see* **Air**) and water vapour, the variability of the latter being of great importance meteorologically At levels accessible to measurement there is no appreciable change in the relative proportions of the gases, but the greatest part of the ozone would seem to occur in a layer 15–25 miles above the earth's surface. The lower level of the atmosphere up to a height of about 7 miles (6 miles at the Poles and 10 miles at the Equator) is known as the *troposphere*, and it is in this region that nearly all weather phenomena occur. This is the region of most interest to the forecaster studying temperature, humidity, wind-speeds, and the movement of air masses Temperature falls with height by about 3° F per 1,000 ft The *tropopause* is the boundary between the troposphere and the *stratosphere* Temperature varies little in the lower levels of this region, it is mainly cloudless, and has no vertical currents. Strangely enough, the lowest temperatures of the atmosphere are to be found not at the Poles, but at about 11 miles above the Equator, where a temperature as low as —110° F. has been recorded! The thickness of the stratosphere is not known exactly, but temperatures begin to rise about 20-25 miles from the earth's surface at about the same rate as they fall in the troposphere, owing to the absorption of solar radiation by the concentration of ozone The stratospheric air is extremely dry The uppermost region of the atmosphere is the *ionosphere*, extending to heights over 500 miles from the earth's surface This layer acts as an electrical radio mirror which makes long-distance radio transmission possible The magnetosphere (Van Allen belt) begins about 400 miles above the earth's surface and extends outwards to about 40,000 miles. It is in this region that the aurorae normally occur. *See* **F9, 45.**

Atmospherics are electrical impulses which are believed to originate in atmospheric electrical discharges such as lightning. They give rise to crashing background noises in the loudspeakers of radio sets, interfering with reception at distances of up to 4,000 miles from the centre of the disturbance. The location of atmospherics with the aid of radio direction-finding methods gives warning of the approach of thunderstorms.

Atom. *See* **F9–14.**

Atomic Pile, an apparatus containing a fissionable element and a moderator, such as heavy water or graphite, in which a self-sustaining fission process proceeds at a controllable rate. The first atomic pile, constructed on a squash court at Chicago, was operated for the first time on December 2, 1942, under the direction of Dr Enrico Fermi. The pile contained 12,400 lb. of uranium *See* **Nuclear Reactors.**

August, named after the Emperor Augustus, because it was his "lucky" month.

Auks, duck-like sea-birds, black and white, with short, narrow wings, compact bodies, and legs set well back. Breed in colonies on rocky coasts of N Europe (incl British Isles) and spend most time in coastal waters. Migrate south in winter The Auk family includes the Razorbill, Little Auk, Guillemot, and Puffin The Great Auk became extinct in the 19th cent. after ruthless hunting for the sake of its feathers. Except for the Black Guillemot, they lay only one egg a year.

Aulic Council, a supreme court of the Holy Roman Empire, established by Maximilian I., in 1501

Aurora polaris. This wonderful phenomenon of the night sky is a common sight in some high latitudes, north and south It is visible less often in temperate latitudes, and only very seldom in the tropics As seen in the northern hemisphere it is called the aurora borealis or northern lights, and in the south, the aurora australis or southern lights The zone of maximum frequency surrounds the north magnetic pole and includes Greenland, northern Canada, and the north coast of Alaska Auroral displays may take several forms, *e g*, a faint glow, a diffuse ribbon of light crossing the heavens, great folded waving curtains like draperies, the whole sky may be a grand panoply of light Both the aurora and the magnetic storm associated with it are ascribed to the envelopment of the earth in a great cloud or stream of solar gas shot out from stormy areas on the sun (sunspots) that has travelled to the earth at a speed of over a thousand miles a second The gas is mainly atomic hydrogen, but the atoms are broken up into their two parts, protons and electrons These are both electrically charged This renders them subject to the influence of the earth's magnetic field, which deflects many of them to the high latitudes where the aurora is most commonly seen The aurora is a kind of light essentially different from that of the rainbow which is a partly subjective phenomenon Each beholder sees his own rainbow, whose light is sunlight refracted and reflected by many raindrops The raindrops that produce his rainbow depend on his position as well as on the direction of the sun The aurora, on the contrary, is a light as objective as that of a candle, though produced differently It is a self-luminescence of the air in particular regions of the atmosphere that lie far above the clouds By simultaneous observation from stations twenty or more miles apart it is possible to locate the position of the luminous air, *i e*, to determine the height of the aurora, its location in plan, and its form and volume

Austerlitz, Battle of, was fought near Brünn, in Moravia, on December 2, 1805, when Napoleon defeated the Russians and Austrians under Kutuzon.

Auto-da-Fé, or Act of Faith, was the ceremony connected with the sentencing of heretics under the Inquisition of Spain and Portugal, the persons found guilty being imprisoned or burned alive The ceremony took place in some public square, sometimes in the presence of the king and court.

Automation is a recently coined word, used to designate the adoption of methods of automatic control either of manufacturing processes or of any business process involving a large mass of routine work The word is used in broader and narrower senses. In its broadest sense it covers any form of mechanisation which largely re-

places human labour by the work of automatic or semi-automatic machines, such as has been in progress continuously since the Industrial Revolution; but it is better kept to a narrower meaning, in which it is confined to the recent development of electronic or similar devices which eliminate human labour, except that needed for watching and maintaining the elaborate machines used. In this sense, automation began mainly in the United States, but has been spreading rapidly to other advanced countries *See* **G16**(2).

Autumn, the third season of the year, begins with the autumnal equinox, and ends with the winter solstice, but the term is generally understood as covering the period from mid-August to mid-November.

Auxins, "plant hormones," organic substances produced by plants to regulate growth Synthetic auxins are now widely used, *e g*, for promotion of root formation in cuttings, differential weed control, prevention of premature dropping of fruit, in storage of potatoes and hard fruit, and to overcome frost damage to fruit buds

Avocet, a graceful wading bird related to the stilts, of black-and-white plumage, bluish legs, and slender upturned bill There are four species Avocets nest in colonies and there is one in the sanctuary on Havergate Island, Suffolk

Avogadro's Hypothesis. This is a fundamental concept of chemistry Equal volumes of all gases under the same conditions of temperature and pressure contain the same number of molecules This law was instrumental in assigning the formulæ of molecules The hypothesis was put forward in 1811, but was not generally accepted until 1860

Aztecs, the name of a native and powerful race found in Mexico when the Spaniards first discovered that country, and with difficulty subdued

B

Babiroussa, a ferocious, long-legged wild pig, native of the Celebes, sometimes called the horned-hog, because of the long upper tusks in the male, which are developments of the canine teeth which grow upwards, piercing the upper lip, and curving backwards, often broken in fighting.

Baboon, monkeys belonging to the African genus *Papio* They are considered the lowest of the Old World (Catarrhine) monkeys, and walk on all fours In the main terrestrial, but take to trees after food. The mandrill is closely related

Babylonian Captivity, the period spent by the Jews in Babylon after Jerusalem was captured by Nebuchadnezzar, the Babylonian emperor in 586 B C. Traditionally the captivity lasted 70 years, but when Babylon was in turn taken by Cyrus in 538 B C, the exiles were permitted to return to Jerusalem The term is also applied in church history to the period 1309–78 when the papacy moved to Avignon, into the control of the French monarchy

Badger, a carnivorous mammal related to the weasel, of nocturnal and burrowing habits, inoffensive, subsisting chiefly on roots and insects, though sometimes mice, young rabbits, and eggs form part of its diet Badger-baiting was a favourite sport in Britain until it was prohibited in the middle of the 19th cent

Bagpipe. Once popular all over Europe, this instrument is still played in Scotland, Ireland, Brittany, and elsewhere. The bag acts as a reservoir of air and, when squeezed by the player's arm, forces air through the pipes One of these, the Chanter pipe, provides the tune and is played by the fingers as in a flageolet The remainder, the Drone pipes, give a continuous, unvarying note.

Bailey Bridge, invented by Sir Donald Bailey and first used in N. African campaign 1942–3 Built up of pre-fabricated girders, it can be easily transported and erected.

Bailie, is a Scottish term for the magistrate of a municipal corporation or royal burgh

Bailiwick, a feudal term denoting the limits of a bailiff's jurisdiction. The term has survived in the Channel Islands, where Jersey and Guernsey are Bailiwicks.

Bakelite. A plastic material made from phenol, formaldehyde, and urea. It is used in the manufacture of electrical fittings because of its insulating properties

Balance of Power was the doctrine in British policy whereby European groups should be so balanced as to prevent the emergence of a dominating Power. Thus the balance was maintained between the Triple Alliance (Germany, Austria and Italy) and the Triple Entente (Great Britain, France and Russia) and preserved peace from 1871 to 1914. After the first world war there was tentative support of Germany's recovery to counterweight a possible French hegemony; but when Germany's power grew under Hitler culminating in the second world war, Britain, France and Russia again became allies With the growing power of Russia, a new system of alliances is being attempted, based on the so-called nuclear deterrent

Baldachin (It. *Baldachino*), a canopy usually supported by four pillars over throne, altar, or other sacred object. The name is also applied to the silken canopy used in processions and borne by the priest who carries the Host

Balearic Crane, the crowned crane of the Balearic Islands in the Mediterranean and the North African mainland, distinguished by its yellowish, black-tipped occipital tuft and by its trumpet note.

Baleen *or* **"whalebone"** the name given to a series of horny plates growing from the roof of the mouth in those whales classified as Whalebone or Baleen Whales (Mystacoceti) There are 300–400 or so plates on each side, and their inner edges are frayed, the whole system constituting a filter for collecting minute organisms used for food The Baleen Whales include the Right-Whales, the Pacific Grey-Whale, and the Rorquals *See* **Whales.**

Ballade, a piece of piano music which may fancifully be regarded as the musical equivalent of the poetic ballad *e g*, the Ballades of Chopin

Ballet is a combination of four arts, dancing, music, painting and drama, each of which is ideally of equal importance The movement of the individual dancers and the "orchestration" of the whole group is in the hands of the choreographer The dancer's training follows certain basic rules but save in classical ballet there is considerable freedom of movement Ballet as we know it today developed professionally at the Court of King Louis XIV of France, though it owes its origins to Italy and in the earliest times to Greece and Rome. Its movements were made up from the dances of courtiers, country folk and tumblers Technique grew more complex as costume became modified, the body gaining complete freedom with the invention of tights A succession of great dancers—French, Italian and latterly Russian left their imprint on the art Contemporary ballet reflects the aesthetic of the Russian, Sergei Diaghilev In England Dame Ninette de Valois has laid the foundation of a national ballet, at Sadler's Wells and Covent Garden, with a personality that reflects the national character A Royal Charter was granted in Jan 1957 setting up the Royal Ballet to co-ordinate the activities of the Sadler's Wells group

Ballistics, the science dealing with the motion of projectiles, especially shells, bombs, and rockets Great advances have been made in this science in recent years

Balloon, the modern balloon consists of a bag of varnished cloth or gold-beater's skin inflated with a gas lighter than air The first ascent by man in a hot-air balloon was made on Nov. 21, 1783, and in a hydrogen balloon on Dec 1, 1783. The most famous of the early scientific flights by manned balloons were those of the Englishmen Coxwell and Glaisher, in 1862, when a height of 7 miles was reached. The first aerial crossing of the English Channel by Blanchard and Jeffries was made on 7 Jan 1785 Piccard's ascent to 10 miles, in 1931, marked the conquest of the stratosphere Four years later the huge American balloon Explorer II inflated with nearly 4 million cubic feet of helium, carried a team of scientists with their floating laboratory to an altitude of 14 miles. In 1957 a pressurised balloon carrying an American doctor rose 19 miles above the Earth. Captive kite-balloons

were widely used in the war as defensive measures against air attack. Meteorologists send their instruments up in balloons to collect data about the upper atmosphere, and of recent years physicists have learned much about cosmic radiation from the study of photographic plates sent to the upper regions in balloons. An American balloon earth satellite, *Echo I*, was carried into orbit 1,000 m. high by a three-stage rocket in Aug. 1960.

Balsam, a big genus (140 species) of flowering plants. Many species are cultivated for their showy flowers, *e.g. Impatiens noli-me-tangere*, the yellow balsam or "touch-me-not," so called because the fruit explodes when touched, slinging out the seeds. Balsam fir is a conifer (*Abies balsamea*) from which Canada balsam gum is obtained.

Baltimore Bird, a lively black-and-orange bird of the oriole sub-family extending from Brazil to Canada, builds a well-constructed hanging nest, and has a fine voice.

Bamboo, a genus of strong grasses, some species growing to over 120 ft. in height, much used by oriental peoples for all kinds of purposes. The young shoots of some species are tender and esculent. *See* **T4**(2).

Banana (family *Musaceae*), a large herbaceous plant cultivated in moist regions of the tropics, and one of the most productive plants known. The main areas of commercial cultivation are in tropical America, the Canary Islands, and West Africa. World production is estimated at 20 million tons, of which only 3 million are for trade.

Bandicoots, Australasian marsupial mammals, of the size of a large rat or rabbit. They are burrowing animals living largely on insects. The rabbit-eared bandicoot, restricted to Australia, has shrew-like snout, long ears like a rabbit, long crested tail, and a silky coat. The long-nosed bandicoot has a spiny coat and comes from E. Australia. The pig-footed bandicoot has two functional toes on the foot, like a pig.

Bantu, ethnic and linguistic group of African Negro peoples, widely spread over Africa south of the Congo. There are an enormous number of Bantu languages and dialects, including Swahili, Zulu, Luba, Kongo, and Ganda. The Bantu tribal groups, of which there are many, include the Zulu, the Matabele, the Basuto, and the Mashona.

Baobab, a tropical African tree. The species *Adansonia digitata* is one of the largest trees known, though not the tallest, the trunk can reach 30 ft. in thickness. The fruit is woody, but its juice provides a cooling beverage. The bark yields a fibre used for making rope and cloth.

Barbary Ape, a large monkey belonging to the genus *Macaca*. It is the only monkey living in relative freedom in Europe, a small colony being found on the Rock of Gibraltar. It has no tail.

Barberry, a genus of berry-producing shrubs containing a hundred species. Several species are cultivated for their flowers and bright berries. Has an interesting pollination mechanism, the base of each stamen is sensitive to touch, and insects probing for nectar cause top of stamen to spring inwards, so dusting visitor's head with pollen which can then be carried to the next flower visited. The common barberry (*Berberis communis*) harbours one stage of the fungus that causes rust of wheat.

Barbican, a fortified entrance to a castle or city, with projecting towers. In the London street called Barbican there was formerly a barbican in front of the city gates.

Barbiturates. A group of drugs derived from a parent compound called barbituric acid. phenobarbitone is the best-known example. They induce sleep and are used in the manufacture of sleeping pills and sometimes as anaesthetics, but they have the disadvantage of being habit forming.

Barbizon School, a school of mid-19th-cent. landscape painters whose main tenet was a return to nature with an exact rendering of peasant life and country scenery painted on the spot. It was named after the village of that name in the Forest of Fontainebleau, where its chief members—Millet, Theodore Rousseau, Daubigny, and Diaz—made their home. Their practice of painting direct from nature, which was far from universal at that time, made them the precursors of **Impressionism** (*q.v.*).

Barcarolle, a Venetian gondolier's song applied to instrumental as well as vocal compositions.

Bard, among the ancient Celts a poet or minstrel whose mission was to sing of heroic deeds. He was supposed to have the gift of prophecy, and was exempt from taxes and military service.

Barilla, soda carbonate or soda ash obtained by burning certain salt-marsh plants (*e.g.* the saltwort, *Salsola kali*). It used to be in great demand, until the product of the Leblanc and then the Solvay ammonia-soda process was made available by the chemical industry.

Baritone, a male voice whose pitch lies between those of a tenor and a bass.

Barium, metal element, symbol Ba. In group II of the periodic table. The metal is soft and easily cut. It occurs as the sulphate and carbonate in nature. It was first prepared by Sir Humphry Davy in 1808, as an amalgam, by electrolysis of barium chloride. The pure metal was not isolated until 1901.

Barium meal. Barium sulphate is opaque to X-rays and before taking X-ray pictures of the alimentary canal radiologists give a "barium meal" to the patients so that the alimentary canal shows up more clearly.

Barnacles constitute a sub-class (*Cirripedia*) of the Crustacea. The barnacle fouling the bottom of ships is the Goose Barnacle, which has a long muscular stalk and a shell composed of five plates. The Acorn Barnacles, which cover rocks, breakwaters, etc., just below high-water mark are similarly constructed, but have no stalk. The manner of feeding of barnacles was vividly described by T. H. Huxley, who said the barnacle is "a crustacean fixed by its head kicking the food into its mouth with its legs." It was a naval surgeon, J. Vaughan Thompson, who discovered in 1830 that barnacles have a free-swimming larva (or nauplius). In the Middle Ages a curious myth grew up to the effect that the Barnacle changed into a sea-bird called, for that reason, the Barnacle Goose.

Barometer is an instrument for measuring atmospheric pressure, invented at Florence by Torricelli, pupil of Galileo, in 1644. The standard method consists of balancing the air column against a column of mercury, used on account of its high density. The mercury is contained in a long glass tube, closed at one end, and inverted in a cistern also containing mercury. The height of the mercury column, supporting the air column, is taken as the pressure at the time, and can be read off very accurately by means of a vernier scale. Present-day tendency is to express the readings in units of pressure instead of length, the millibar being adopted (1 mb = 1000 dynes per sq. cm., 1000 mb = 29·53 inches of mercury approx.). The standard instrument is correct for pressures at 0° C. in Lat. 45°, so that corrections have to be applied for temperatures and latitudes other than these. Also a correction has to be made for reducing the pressure to mean sea level. *See* **Aneroid**.

Baron, title given in feudal England to a man who held his land directly from the king by military or other honourable service. The first baron created by letters patent was John Beauchamp de Holt, Baron of Kidderminster, on Oct. 10, 1387. The title derives from the Latin "baro" meaning "a man." In old legal diction "baron et feme" meant "man and wife." To-day a baron is a member of the fifth and last grade of the peerage and is addressed as "Lord."

Baronet, a title instituted by James I. The first baronet was Sir Nicholas Bacon, but numerous others were made about the same time, the fee charged for the honour in each case being about £1,000. It is the lowest hereditary title, and is freely dispersed among those who distinguish themselves in trade, industry, politics, or special civic service. James I limited the number of baronets to 200, but to-day no number is specified. A royal warrant in 1910 commanded an official list of baronets to be prepared.

Baroque, a term used for the art style of the period *c.* 1600–1720 which was the artistic accompaniment of the Jesuit counter-Reformation. Its

most obvious characteristics are: (a) its emotional appeal and dramatic intensity both related to its deliberate intention as propaganda ("a good picture makes better religious propaganda than a sermon" said one of its exponents), (b) in architecture, a style which is heavily and sometimes almost grotesquely ornate, plentifully covered with voluptuous sculpture on which draperies float rather than hang, with twisted and spiral instead of plain or fluted columns, and unnecessary windows or recesses added for ornament rather than use, (c) its emphasis on the whole at the expense of the parts such that a building's sculpture merges into its architecture and both into its painting (Baroque paintings are as closely knit as a jig-saw puzzle so that one cannot isolate individual figures as would be possible in a Renaissance one). Baroque architecture owing to its origin is found mainly in the Catholic countries, Italy, France, Austria, Bavaria, *e g*, the Barberini Palace, Rome, designed by its greatest exponent Bernini and others, the Church of the Invalides, Paris. Baroque artists include Caravaggio, Guido Reni, Murillo, and Rubens, the greatest Northern Baroque painter. The Baroque style merges gradually into **Rococo** (*q v*)

Barque, a small sailing vessel with three or four masts. A three-masted barque has fore- and mainmasts square-rigged, the mizzenmast fore-and aft-rigged

Barrel Organ, a musical instrument in which the music is made by a barrel or cylinder, set with pins and staples, which rotate so as to open the valves for admitting the wind to the pipes

Barrow is an ancient artificial mound of earth or stone raised over the site of a burial. In Britain barrows were built from 2500 B C until the late Saxon period, but the Egyptian are the earliest barrows known, the great pyramids being a spectacular development of the custom of ceremonial burial

Bartholomew, Massacre of St, occurred in Paris on the night of Aug 24, 1572, when over two thousand Huguenots were massacred by order of the Catholic French Court

Basalt Rocks are fine-grained, dark coloured, of igneous origin and occur either as lava flows as in Mull and Staffa, or as intrusive sheets, like the Edinburgh Castle Rock and Salisbury Craig. One of the most noted examples of columnar basalt is that of the Giant's Causeway in Ireland

Basanite, A smooth black siliceous mineral, or flinty jasper, a crypto-crystalline quartz, sometimes styled the Lydian Stone. An alloyed metal being rubbed across basanite, the mark of colour left will indicate the nature and depth of the alloy, hence it obtains its name, which signifies, in Greek, "a touchstone"

Base, a substance having a tendency to accept a proton (H^+). This is a wide definition and covers unconventional types of compounds. In aqueous solution bases dissolve with formation of hydroxyl ions, and will neutralise an acid to form a salt. In non-aqueous solvents, like liquid ammonia or hydrogen fluoride, compounds classically regarded as salts can be bases, *e.g*, sodium fluoride is a base in hydrogen fluoride solution

Bashi-Bazouks, name formerly given to irregular troops in the pay of the Turkish sultans. They were a rough but brave class of men.

Basilisk, is a lizard of aquatic habits, with an elevated crest (which it can erect or depress at will) down the centre of its back

Basques, people of N Spain and S W France, oldest surviving racial group in Europe, who have preserved their ancient language which is unrelated to any other tongue

Bas-Relief ("low relief") a term used in sculpture to denote a class of sculptures the figures of which are only slightly raised from the surface of the stone or clay upon which the design is wrought

Bass, the fourth or lowest voice in a male voice church choir and therefore the lowest voice in a mixed choir. The term may also be applied to instruments having a lower register than others of their class, *e g*, bass clarinet.

Basset horn (= corno di bassetto). An alto form of the clarinet. This instrument is rarely used in modern orchestras.

Bassoon, a bass version of the oboe in which the tube, being 9 ft long, is bent back on itself for convenience. There is also a double-bass oboe which is called the contra-bassoon

Bastille, a castle or fortress in Paris, built in the 14th cent, and used as a state prison, especially for political offenders. Its bad repute as an instrument of despotism excited the hatred of the populace, who stormed and demolished it on July 14, 1789, at the beginning of the Revolution

Bastinado, an oriental punishment, by beating with a pliable rod or cane on the soles of the feet

Bats. These mammals fly by means of a membrane stretched between each of the long fingers of the hand and between the fifth finger and the body. Another membrane stretches between the legs and the tail. There are twelve British species, namely, the Noctule, Leisler's B, Serotine, Pipistrelle, Long-eared B, Daubenton's B, Natterer's B, Whiskered B, Bechstein's B, Barbastelle, Greater Horseshoe, and Lesser Horseshoe Bats. An interesting and recent discovery is that bats "echo-locate" obstacles by means of supersonic sound waves, this explains their long-admired ability to fly perfectly at night and in dark woods and caves. Bats are mostly insectivorous, catching the insects in their open mouths while flying. Some eat fruit. The Vampire Bats, feeding exclusively on blood, are confined to tropical America

Bath, Order of the, believed to have been established by Henry IV at his coronation in 1399, remodelled in 1725 as a military order, formally instituted in three classes in 1815, civil division added in 1847. In the Order are three classes G C B, or Knight Grand Cross of the Bath, K C B, or Knight Commander of the Bath, C B, or Companion of the Bath. Companionship of the Bath does not carry knighthood nor entitle the holder to the prefix "Sir". The motto of the order is *Tria juncta in uno* (Three joined in one). The insignia for civil and military and the three classes vary. *See* **Knighthood.**

Batteries. A battery is a device for converting stored chemical energy into electricity, which can then be used for heat, light, traction, or any desired purpose. Primary electrical power, from an oil or nuclear station, must first be available, since batteries have to be fabricated in a power-using factory and the necessary chemicals have to be produced. After that, the battery may need charging periodically like the well-known lead-acid accumulator. The most well-known battery is the Leclanché dry cell used in torches. It is interesting that to-day, about a century after it came into common use, it is still the chief source of power in the tactical electronic equipment of the highly mechanised U S army. There are, however, many other types of cell, some under active development as space travel and missile warfare call for batteries of lighter weight and utmost reliability

Bauhaus, a German institution for the training of architects, artists, and industrial designers, founded in 1919 at Weimar by Walter Gropius. It was closed by Hitler in 1932 and re-opened at Chicago in 1937 under the name of The Institute of Design. The Bauhaus doctrine held that there should be no separation between architecture and the fine and applied arts, that art, science, and technology should co-operate to create "the compositely inseparable work of art, the great building". The original institution, at the instigation of Gropius, included on its teaching staff not only architects and technicians but also such noted artists as Paul Klee and Wassily Kandinsky

Bauxite, the chief ore of aluminium. Chemically it is aluminium oxide. Aluminium metal is made industrially by electrolysing purified bauxite dissolved in fused cryolite. Chief producing areas. Surinam, Br. Guiana, U S A, France, Hungary, Indonesia, U S S.R., Yugoslavia, Italy.

Bayeux Tapestry, a famous tapestry representing the conquest of England by William the Conqueror. It is embroidered on a band of linen 231 ft. long and 20 in. wide in blue, green, red, and yellow, divided into 72 scenes ranging over

the whole story of the conquest Tradition attributed it to William's Queen, Matilda, but it is now believed to be of later origin executed for Bayeux Cathedral by English embroiderers A representation can be seen in the Victoria and Albert Museum in London.

Beagle, a small hound that tracks by scent, and formerly used for hare hunting.

Bears belong to the Ursidae family of the Carnivora. They are plantigrade mammals, walking (like man) on the soles of their feet Found in most parts of the world except Australia The common Brown Bear was once spread over the whole of Europe, it became extinct in England about the 11th cent.; 7–8 ft. in length, and stands 3 ft. or more at the shoulder. The Grizzly Bear of N America is larger, and the coat is shorter and greyer. The Polar Bear is remarkable in having a white coat all the year round; it spends much time in water, and unlike the other bears it is entirely carnivorous. Bear-baiting was made illegal in England in 1835.

Beat Generation. *See* **J5.**

Beaufort Scale of wind force is used to specify numerically the strength of the wind Since the introduction of anemometers to measure the actual velocity, equivalent values of the ranges in miles per hour at a standard height in the open have been assigned to the Beaufort numbers *See* **N10.**

Beaver, a genus of mammals of the Rodentia order, with short, scaly ears, webbed hind feet, and a long broad scaly tail They grow up to 4 ft long, and live in communities, constructing dams and lodges where they breed Found in N. America, Russia, and Poland Valuable commercially for their fur.

Bedford Level comprises parts of Norfolk, Suffolk, Huntingdon, Northampton, Lincoln, and Cambridge, generally called the Fens, 70 miles long and 20 to 40 miles broad It was reclaimed and drained in the 17th cent by the Earl of Bedford and the Dutch engineer Cornelius Vermuyden

Bedlam (a corruption of Bethlehem) was a priory in Bishopsgate, afterwards converted into a hospital for lunatics. The asylum was transferred to St. George's Fields, Lambeth, in 1815 The term " bedlamite " came to be applied to any person behaving like a madman

Beech, a deciduous tree belonging to the genus *Fagus* of some eight or nine species found in north temperate regions The common beech, *F. sylvatica*, is believed to be native to Britain and is one of our finest trees, with massive trunk, long, pointed winter buds, and smooth, grey bark. There is little undergrowth under its dense shade It is shorter lived than the oak, taking about 200 years to reach full size and then declining The timber of beech has a variety of uses, *e g*, spoons, handles, tools, and chairs

Bee-eater, name of a family of brilliantly coloured birds closely related to the rollers and kingfishers inhabiting the tropical and sub-tropical parts of Africa, Asia and Europe The European species successfully nested in Britain for the first time in 1955 and a pair nested in Alderney in 1956 With their long curved beaks they catch insects on the wing, especially bees and butterflies, and lay their eggs in dark nest tunnels.

Beefeater. *See* **Yeomen of the Guard.**

Beeswax, the secretion of the bee, used for the formation of the cells or honey-comb of the hive, when melted it is what is commercially known as yellow wax, white wax being made by bleaching. Being impervious to water, it acts as a good resistant and is an article of much utility

Beetles (Coleoptera) constitute one of the biggest orders of insects, numbering over 200,000 species. There are two pairs of wings, the hind pair are used for flight, while the front pair are hardened to form a pair of protective covers (elytra) Some beetles have lost the power of flight and then the elytra are joined together.

Bel and the Dragon is the title of certain supplementary chapters to the " Book of Daniel " of an apocryphal character. First appeared in the Septuagint, but the Jewish Church did not accept it as inspired. In 1546 the Council of Trent declared it to be canonical

Bell, a hollow body of metal used for making sounds Bells are usually made from bell-metal, an alloy of copper and tin. Small bells used for interior functions are often made of silver, gold, or brass. Ordinary hand-bells are of brass. From the 7th cent. large bells have been used in England in cathedrals, churches, and monasteries The greatest bell in the world is the " King of Bells " in the Kremlin at Moscow, which weighs about 198 tons, is 20 ft 7 in high and 22 ft 8 in. in diameter It was cast in 1733, but cracked in the furnace (the broken part weighed 11 tons) and is now preserved as a national treasure Other large bells in Russia, include the 171-ton one at Krasnogvardersk, near Leningrad, and the one of 110 tons at Moscow. The Great Bell (Great Paul) at St Paul's, cast in 1881, weighs 16¾ tons and is the largest in the United Kingdom Other gigantic bells are the Great Bell at Peking (53 tons), Nanking (22 tons), Cologne Cathedral (25 tons), Big Ben, Westminster (13½ tons), Great Peter, York Minster (10 tons). The Curfew bell is rung in some parts of England to this day, notably at Ripon The number of changes that can be rung on a peal of bells is the *factorial* of the number of bells Thus four bells allow 24 and eight bells 40,320

Belladonna *or* **Deadly Nightshade** (*Atropa belladonna*), a well-known poisonous wild plant found in Southern Europe and Western Asia The alkaloid atropine it contains is valuable in medicine, although a large dose is poisonous.

Bell, Book, and Candle. To curse by " bell, book, and candle " was a form of excommunication in the Roman Church ending with the words " Do to the book, quench the candle, ring the bell "

Benedictine or " Song of the Three Holy Children " from the *Apocrypha*, sung in the Anglican Church at Morning Prayer

Benedictines are monks and nuns of the Benedictine Order who live under the rule of St Benedict They are known as Black Monks because of the colour of their dress They were introduced into England in the 7th cent The rule is marked by an absence of extravagant asceticism The order has always been famous for its learning and its promotion of education At the dissolution of the monasteries in the reign of Henry VIII the order had 300 houses

Benedictus, a canticle used in the morning service of the English Church, and deriving its name from the first word of the Latin verse, *Benedictus*, blessed

Benzene. An aromatic hydrocarbon obtained from coal tar and some petroleum fractions It is a volatile inflammable liquid with a characteristic smell. The molecule consists of a flat ring of six carbon atoms, each bound to one hydrogen atom Benzene is the parent member of many aromatic organic compounds and is widely used in industry to synthesise intermediates for fibres, dyestuffs, explosives, and pharmaceutical chemicals

Bergamot, an essential oil obtained from the rind of a species of citrus grown chiefly in Calabria, and largely used in perfumery. Also a hardy herbaceous perennial

Beryl, a mineral, of which the emerald is a grass-green variety Composed of beryllium and aluminium silicates The pure mineral is colourless, the colour of most beryl comes from traces of impurities, notably iron and chromium. Otherwise it is yellowish, greenish-yellow, or blue, and is found in veins which traverse granite or gneiss, or embedded in granite, and sometimes in alluvial soil formed from such rocks

Beryllium. Metallic element, symbol Be. Very similar to aluminium, it is stronger than steel and only one-quarter its weight. It is not very abundant, its main source is the mineral, beryl. Copper containing 2% beryllium is used for making springs The metal is used in atomic piles to make fuel containers which have valuable properties. This accounts for its recent development on a technical scale. The metal powder is toxic.

Bessemer Process, for making steel depends on the forcing of atmospheric air into molten pig iron to burn out the impurities. *See* **Steel.**

Betel, the leaf of an Indian climbing plant, of pungent, narcotic properties It is destructive to the teeth, and reddens the gums and lips

Bhang, the Indian name for the hemp plant *Cannabis sativa*, the leaves and seed-capsules of which are chewed or smoked. The potent drug which comes from flowers of the female plant is called hashish in Arabia and marihuana in the United States and Mexico *See* **P23(2).**

Bible—The Old Testament and the New Testament The Old Testament—the prehistoric portion—consists of 39 books, and is divided into three parts (1) the Law, (2) the Prophets, (3) Miscellaneous Writings The Old Testament was written in Hebrew except for parts of Ezra and Daniel, which were in Aramaic It was not until the 9th cent A D that a complete Hebrew text was made, the so-called Massoretic text Before that the main versions were the Greek Alexandrian Septuagent of the 3rd and 4th cents B C and St Jerome's Latin Vulgate of the 4th cent A D Portions were translated into the Anglo-Saxon In the 8th cent and the Venerable Bede put the greater part of St John's gospel into English, but it was not until 1535 that a complete printed English version appeared -the Coverdale Translation The Authorised Version dates from 1611 in the reign of James I, and because of its beautiful phraseology it has had a lasting appeal The Revised Version dates from 1885 A new translation of the Bible in the English language of today is in progress (*The New English Bible*), the New Testament was published in 1961 and the Old Testament and the Apocrypha will be ready later The finding of the Dead Sea Scrolls (since 1947) has added to our knowledge of Scripture

Bill of Rights, or Declaration of Rights, was the document setting forth the conditions upon which the British throne was offered to William and Mary in 1688 This was accepted and ultimately became an Act of Parliament

Birch, a genus of deciduous trees including about 40 species and found only in northern regions Birches native to Britain, and to Europe generally, are of two species— the silver birch, *Betula pendula*, with its graceful, drooping branches and triangular leaves, and the white birch, *Betula pubescens*, which has erect branches and soft oval leaves Birch timber is an important plywood timber, the bark is used for tanning leather, and wintergreen oil comes from the bark of black birch, *Betula lenta*, a North American species The birch is not a long-lived tree, few standing for more than a hundred years The tallest recorded is at Woburn in Bedfordshire, 102 ft high

Birds, or Aves, are, next to mammals, the highest class of animal life (**F23(2)**. There are two kinds of modern birds—*Carinatae*, possessing keeled breast-bones and having power of flight, *Ratitae*, having raft-like breast-bones, and incapable of flight, and a sub-class of fossil birds, *Archaeornithes* (**F30(2)**) *and* **Archaeopteryx** It is estimated that there are about 120 million land birds breeding in Great Britain, including 10 million each of the chaffinch and blackbird, 7 million each of the starling and robin and about 2 million sparrows

Bird Arrivals The wheatear is usually the first of the migratory birds to return, often reaching Britain at the end of February and always before the middle of March, the sand martin is the first of the "early swallows" to return, followed by the house martin The first cuckoo arrives about the middle of April, and the whinchat, garden warbler, and sedge warbler during the last week in April The nightjar, spotted flycatcher, and red-backed shrike are not seen until the first week in May The swift is among the last to return from Africa and the earliest to depart *See also* **Z21.**

Birds of Paradise, over 40 species of tropical birds inhabiting the dense forests of New Guinea and neighbouring islands. The male birds are remarkable for their brilliant plumage, long tail feathers, and ruffs on wings and neck, which are displayed to advantage during courtship Related to the Bower Birds of Australia, and crows.

Biretta, a four-cornered head-covering worn by ecclesiastics of the Roman Church and varying in colour according to the rank of the wearer A cardinal's biretta is red, a bishop's purple, a priest's black

Bise, a keen dry north wind prevalent in Switzerland and South France.

Bishop is a Christian ecclesiastic, a person consecrated for the spiritual government of an area, a diocese or province, to the spiritual oversight of which he has been appointed (diocesan bishops), or to aid a bishop so appointed (suffragan bishops) In the Church of England there are forty-three diocesan bishops, all nominated by the Crown Two, Canterbury and York, are archbishops having primacy in the respective provinces The archbishops of Canterbury and York and the bishops of London, Durham, and Winchester and twenty-one other diocesan bishops in the order of seniority are spiritual peers, and sit in the House of Lords The (Disestablished) Church of Ireland has two archbishops and twelve bishops, the (Disestablished) Church of Wales an archbishop and five bishops and the Episcopal Church in Scotland seven bishops There are over 120 Anglican bishops of dioceses overseas, including Africa, Australia, Canada, India, New Zealand, the West Indies, and elsewhere

Bismuth, metallic element symbol Bi, in group V of the periodic table Like antimony, the stable form is a grey, brittle, layer structure, electrical conductor It is readily fusible, melting at 264° C and boiling at about 1420° C Wood's metal, an alloy with one of the lowest melting points (under 150° F, so that a spoon made of it will melt when placed in a cup of hot tea), contains four parts bismuth, two parts lead, one part tin, one part cadmium

Bison, a genus of wild cattle, distinguished from the ox by its shorter, wider skull, beard under the chin, high forequarters, and, in winter, a great mane of woolly hair covering head and forequarters There are two species, the European and the American bison, both now protected in game preserves

Bittern, a bird of the heron genus, with long, loose plumage on the front and sides of the neck It is a solitary bird inhabiting marshes, but rare in Britain

Bivalves, shell-fish whose shell consists of two hinged valves, lying one on each side of the body, such as mussels, oysters, and cockles

Blackbird, or Merle, a member of the Thrush family, a familiar song bird in Britain Male is all-black with orange bill, female is mottled brown with brown bill, the young are spotted brown

Blackcock and Greyhen (as the female is called) are closely related to the Capercaillies but smaller They nest on the ground and prefer wooded country to open moors Found in northern half of northern hemisphere Polygamous, they perform excited courtship dances; the male is a handsome blue black bird with white undertail, the female dark brown mottled

Black Death, a fierce epidemic of bubonic plague which swept right across Europe from the Far East reaching England in the winter of 1348-9 and leaving 25 million dead in its wake. The English Statute of Labourers (1351) was a measure to direct labour and regulate wages in an attempt to deal with the dearth of labour The disease raged in England again in 1665, wiping out whole villages and killing one-fifth of London's population Samuel Pepys wrote a grim account of it in his *Diary* The disease was carried by brown rat fleas, though this was not known at the time

Black Hole of Calcutta, the name given to the place where a captured British garrison was confined in 1756, during the struggle for India between the French and British, by order of Suraj-ud-daula, the nawab of Bengal Into a noisome space, about 20 ft square, 146 persons were driven, and only 23 were found alive the next morning

Black-letter, the Old English or Gothic type first used in printing blocks

Black Woodpecker (*Dryocopus martius*), a large, black bird about the size of a rook, with slightly crested scarlet crown, found in many parts of Europe

Blenny, a group of marine fishes with spiny rays,

part of the fin running along the back. Several species are found around the British coast.

Bloody Assizes, the assizes, conducted in 1685 by George Jeffreys, Lord Chief Justice, at which participants in the Duke of Monmouth's rebellion against King James II. were tried They were marked by relentless cruelty.

Bluebird, a migratory bird of North America, deriving its name from its deep blue plumage It is one of the few song birds of America, and familiar in the woods from early spring to November In India and Malaya there is the Fairy Blue-bird: the male is black with shiny blue upper parts. The bluebird was used as the symbol of happiness by Maeterlinck in his play *The Blue Bird*

Blue Peter, a blue flag with a white square in the centre, is hoisted 24 hours before a ship leaves harbour (the letter P in the alphabet of the International Code of Signals)

Blue Ribbon, a term in general use to denote the highest honour or prize attainable in any field or competition. Thus the Derby is the blue ribbon of the turf The expression is derived from the highest Order of Knighthood in the gift of the British Crown, the insignia of which is a garter of blue velvet

Blue Stocking, a term used to describe a learned or literary woman, particularly if pedantic and undomesticated It is said that the term derives from the Bas-Bleu club of Paris, which was attended by the literary savantes of the 17th cent. In England a similar literary club was formed about 1780, whose members were distinguished by their blue stockings.

"Blue" Sun, Moon, etc, a phenomenon caused by the scattering of sunlight by transparent particles suspended in the atmosphere, the effect being that blue light is transmitted and red light extinguished to direct vision The dust from the Krakatoa eruption in 1883 and the drifting layer of smoke from the forest fires in Alberta, Canada, in September 1950 gave rise to "blue" moons and suns, phenomena sufficiently rare to be described as occurring "once in a blue moon." In the cold climatic conditions of the Pamirs and the far north, vegetation is said to look "blue" on account of the rays of high calorific value (red, yellow, green) being absorbed, while only the blue and violet are transmitted It was Tyndall who first explained the blue colour of the sky.

Boa, a term applied to a family of snakes of large size, some attaining a length of 30 ft They are not poisonous, but kill their prey by crushing —constriction—hence the name "boa constrictor" They occur both in the Old World and the New, but are more abundant in the latter Most Boas retain the eggs within the body until young are fully developed, whereas the Pythons almost all lay leather-shelled eggs.

Boar, or Wild Hog, an animal largely distributed over the forest regions of Europe, Asia, Africa, and South America. It has a longer snout and shorter ears than its descendant the domestic hog, and is provided with tusks Having to forage for itself, it is a more active and intelligent animal than the pig of the sty, and offers good sport to the hunter.

Boat, an open vessel, propelled by oars or sails, or both. The boats of a ship of war are the launch, barge, pinnace, yawl, cutters, jolly boat, and gig, of a merchant vessel, the launch, skiff, jolly boat or yawl, stern boat, quarter-boat, and captain's gig Every ship is compelled to carry adequate, fully provisioned and equipped life-boats

Bode's Law, a numerical relationship formulated by Bode in 1772, which states that the relative mean distances of the planets from the sun are found by adding 4 to each of the terms 0, 3, 6, 12, 24, 48, 96. The actual mean distances (in millions of miles) are: Mercury, 36; Venus, 67 2; Earth, 92·9; Mars, 141·6; Jupiter, 483·3; Saturn, 886·0; Uranus, 1782·8 The gap between Mars and Jupiter caused Bode to predict the existence of a planet there, which was later confirmed by the discovery of Ceres and other minor planets. The law breaks down, however, for Neptune and Pluto.

Boer War, lasted from Oct. 11, 1899, when the Boers invaded Natal, to May 31, 1902, when the Peace Treaty was signed at Vereeniging. At first the operations of the British troops in Cape Colony were unsuccessful and disastrous reverses were sustained. Lord Roberts was then sent out as Commander-in-Chief, with Lord Kitchener as Chief-of-Staff, and from February, 1900, when Kimberley was relieved and Cronje was compelled to surrender and Ladysmith and Mafeking were relieved, the struggle was practically over.

Boiling-point is the temperature at which a liquid boils. At that point the pressure of the vapour is equal to the pressure of the atmosphere Under increased pressure the b p rises and under less pressure, as on the top of a mountain, it is lower As represented on the Centigrade scale the b p of water is 100°; alcohol 78·4°, and ether, 35·6° On the Fahrenheit scale, the b p of distilled water is 212° Boiling points are given for a standard pressure (760 millimetres of mercury).

Books are technically described, according to their sizes, as 4to, 8vo, 16mo (*quarto, octavo, duodecimo*), the names indicating the number of folds in a sheet. For Standard Sizes of British Books *see* **N13.**

Books, Classification of. All libraries are classified to facilitate reference, but the favourite system is the Dewey Decimal System, which divides the whole field of knowledge into ten Main Classes General Works, Philosophy, Religion; Sociology, Philology; Natural Science; Useful Arts and Applied Science, Fine Arts, Literature, History (including geography and travel and biography) Each of these Main Classes is again subdivided into ten main divisions As an example the main class of Sociology receives the number 300 This range 300 to 400 (the next main class) is graduated into tens, and Economics is 330 The range 330 to 340 is again graduated, and the subject of Labour and Capital is 331 This process is carried on by decimals so that 331·2 deals with Remuneration for Work, 331·22 with Wage Scales, and 331·225 with Extra Pay

Borax (Sodium Pyroborate) is a white, soluble, crystalline salt. It is widely and diversely used, *e g*, as a mild antiseptic, in glazing pottery, in soldering, in the making of pyrex glass, as a cleansing agent and sometimes as a food preservative Borax occurs naturally in the salt lakes of Tibet, where it is called tincal, in California (Borax Lake, Death Valley), and elsewhere

Boron. A metalloid element, symbol B There are two forms, one crystalline, the other amorphous It is not very abundant in nature but occurs in concentrated deposits It is best known in boric acid, which is used as a mild antiseptic (called boracic acid) and borax (*q v*) Boron compounds are essential to some plants *e g*., beans Used in the preparation of various special-purpose alloys, such as impact resistant steel. Compounds of boron and hydrogen are used as rocket fuels.

Borstal, an institution where young delinquents between 15 and 21 on conviction may be sent for detention and reform by a court of quarter sessions or assize The first was opened in 1902 at the village of Borstal, near Rochester in Kent Admin by the Prison Commission *See* **D34.**

Boston Tea Party, an incident which occurred on Dec 16, 1773, on board some tea-ships in Boston Harbour. High taxation imposed by the British Parliament under George III had caused bitter feelings, and instigated by popular meetings, a party of citizens, disguised as Indians, boarded the tea-ships and threw the tea overboard This incident was a prelude to the American War of Independence (1775–83)

Bounds Beating, an old Anglo-Saxon custom The parish clergyman and officials go round the parish boundaries accompanied by boys, who beat the boundary stones with long sticks of willow The ceremony takes place on the Rogation days preceding Ascension Day

Bourgeoisie, a term used by Marxists to indicate those who do not, like the proletariat, live by the sale of their labour They include, on the one hand, industrialists and financiers or members of the liberal professions and, on the other, small artisans and shop-keepers who, although their standard of living may not be appreciably higher (and today is often lower) than that of

the proletariat, are described as the "petty bourgeoisie." According to the Marxist view of history, the bourgeoisie arose with modern industrialism after it had overthrown the old feudal aristocracy and replaced it as ruling class. It is associated in politics with liberalism—which was necessary to break up the old feudal ideas—and in religion with Protestantism, especially of the nonconformist type. Marxists believe that the bourgeoisie are to be followed by the proletariat as ruling class, that fascism is an attempt by the bourgeoisie to prevent this happening, and that, according to their "law of concentration," at this stage the petty bourgeoisie gradually become proletarianised as capital becomes concentrated in fewer and fewer hands (*e.g.*, combines and trusts).

Bow, an instrument for propelling arrows, and, in the days when it was a weapon of war, was usually made of yew or ash, and was about 6 ft. long, with an arrow 3 ft. long. It was the weapon with which Crécy, Poitiers, and Agincourt were won. The cross-bow was Italian and was adopted in France, but did not become popular in Britain.

Bow Bells is the peal of the London church of St. Mary-le-Bow, Cheapside, within sound of which one must be born to be entitled to be called a "cockney." Bow Bells had not been heard since 1939, but they once again rang out over the City of London on Dec. 20, 1961.

Bowdlerize, to expurgate a book. Derived from Thomas Bowdler (1754–1825), the editor of the Family Shakespeare, in which "those words and expressions are omitted which cannot with propriety be read aloud in a family." He treated Gibbon's *History of the Decline and Fall of the Roman Empire* in the same way, omitting "all passages of an irreligious and immoral tendency." Such prudery met with ridicule and hence the words "bowdlerism," "bowdlerist," etc.

Bower Bird, native to Australia and New Guinea and related to the Bird of Paradise, though often less striking in appearance. In the mating season the male builds a "bower" of sticks and grasses for courtship displays and as a playground. The Gardener Bower Bird of Papua makes a lawn in front of his bower and adorns it with bright coloured pebbles and flowers which are replaced as they wither. The female builds her nest away from the bower.

Boycott, a term used in connection with a person that the general body of people, or a party or society, refuse to have dealings with. Originally used when Captain Boycott (1832–97) was made the victim of a conspiracy by the Irish Land League which prevented him making any purchases or holding any social intercourse in his district. He had incurred the League's hostility by a number of evictions.

Brass, an exceedingly useful alloy of copper and zinc. Much brass is about two-thirds copper, but different proportions give different properties. It is harder than copper and easily worked. Brass in the Bible probably refers to bronze.

Brass-wind, a collective term for those instruments in an orchestra which are made of brass (or other metal) and which are sounded by blowing so as to cause the lips to vibrate within a cup- or funnel-shaped mouthpiece. The shape of the mouthpiece affects the tone, *e.g.*, cornet, trumpet, horn, trombone, tuba.

Breadfruit Tree (*Artocarpus altilis*), a native of the South Sea Islands, the fruits are a brownish green, about the size of a melon, and contain a white pulpy substance which is roasted before being eaten. The tree grows 40 ft. or more. Captain Bligh's ship *Bounty* was on a voyage to Jamaica carrying a cargo of 1,000 breadfruit trees when the mutiny occurred.

Breviary (Lat. *breviarium*=abridgment), the short prayer-book of the Roman Catholic Church which gives the Divine Office, *i.e.*, the canonical hours or services. The directions for Mass are in the Missal. The modern Roman breviary is a reformed version of the 11th-cent. breviary and was produced by Pope Pius V. in 1568 in response to a decree of the Council of Trent. All Roman Catholic priests are required to recite the whole of the breviary services allotted for each day. *See also* **Matins**.

Brick, a moulded block of clay, either burnt in a kiln or sun-dried, used for building. All the ancient nations made bricks, at first only baking them in the sun, and afterwards by means of fire. The Israelites were employed in brick-making during their captivity in Egypt. The Romans used bricks for all ordinary purposes, and introduced them into England. In these days brick-making is mainly done by machinery—digging the clay, grinding, screening, tempering (pugging), moulding, drying, burning (firing). The standard size, proved by centuries of experience to be the easiest to handle and the most economical, is approx. 9 in. × 4½ in. × 3 in. The processes of tile-making are similar. A plain tile is 10½ in. × 6½ in. × ⅜–½ in. Many varieties of bricks and tiles are produced for different purposes.

Bridges are structures for continuing a road, railway, or canal across a river, valley, ravine, or a road or railway at a lower level. From early times bridges were made of timber, stone, or brick, and it was not until the 19th cent. that wrought- and cast-iron were used. Today the materials mostly used are steel and reinforced concrete. Among the most famous of ancient bridges is that of S. Angelo at Rome, built by Hadrian as the Pons Aelius, A.D. 134. The first stone bridge across the Thames was completed in 1209, and upon it were a number of timber houses. This old London Bridge, as it was called, stood until the 18th cent. The Rialto bridge at Venice dates from 1588. The Ponte Santa Trinita at Florence, one of the finest Renaissance bridges and deemed the most beautiful in the world, was destroyed by German mines in 1944 but has now been reconstructed just as it was before. The first cast-iron bridge was Telford's famous Menai suspension bridge with a span of 580 ft., built 1819–26, which lasted until 1940, when it was completely reconstructed. Another example of Britain's supremacy in constructional ironwork was Robert Stephenson's tubular bridge across the Menai Straits, the prototype of all modern plate girder railway bridges. Waterloo bridge, first opened in 1815, has been rebuilt (opened in 1945) and is a fine example of a reinforced-concrete bridge. Other famous bridges are the Niagara (suspension), Forth bridge (cantilever), London Tower bridge (suspension), Tay bridge in Scotland, Victoria Jubilee bridge across the St. Lawrence at Montreal (an open steel structure), Golden Gate suspension bridge, San Francisco (the world's longest single-span bridge), Sydney Harbour bridge, Triborough bridge, New York, Lower Zambesi bridge (longest in the world), Storstrom bridge in Denmark (longest in Europe), Howrah bridge at Calcutta, with the third largest cantilever span in the world, the Volta bridge of Ghana and the Auckland Harbour bridge, both built in recent years. Work started in 1958 on the Forth road bridge, which will have the largest single-span in Europe. *See also* **Bailey Bridges**.

Britannia Metal, an alloy of tin, antimony, and copper, harder than pure tin, corrosion-resistant, and used for teapots, and jugs (often electro-plated).

British Association for the Advancement of Science, The, was founded in 1831 by a group of British scientists under the leadership of Charles Babbage (1792–1871) to stimulate scientific inquiry and promote research in the interest of the nation. Its meetings are held annually in different cities of the United Kingdom. It is divided into sections which include the chief physical and biological sciences, economics, anthropology and archaeology, psychology and education, engineering, forestry, agriculture, and there is also a division for the social and international relations of science. The President each year is one of the most eminent scientists or public men of the time. Sir Eric Ashby succeeded Sir John Cockcroft, O.M. in 1963. New and wider programmes of activity were inaugurated in 1958, including the founding of the Junior B.A. and the setting up of a study group to examine the general education of the scientist through his school and university career. Membership is open to laymen as well as scientists, and particulars can be obtained

from the Secretary, Burlington House, Piccadilly, W.1. *See* **R16.**

British Museum, was created by an Act of Parliament in 1753, when the Sir Hans Sloane collection, which the British Government had acquired for £20,000, was added to the Cottonian Library and the Harleian Manuscripts. It was opened to the public in 1759 at Montagu House, Bloomsbury. The acquisition of the library of George III. (now known as the King's Library) in 1823 made larger premises necessary, and the present building in Great Russell Street was completed in 1847 from designs by Sir Robert Smirke. The great domed Reading Room was opened in 1857, and the Natural History Department was transferred to South Kensington in the eighties. As a museum it is perhaps the most famous in the world, since, apart from its colossal library of books and manuscripts, it has many priceless collections of sculptures, antiquities, prints and drawings, coins and medals. Under the Copyright Acts the British Museum has the right to receive *gratis* a copy of every book published in the United Kingdom. The Reading Room contains original sources, books, and periodicals which cannot be found elsewhere. Because of necessarily limited accommodation the use of the room is restricted to those who require a wider range of books on the subject of their study than can be found in other libraries. Plans have recently been announced (1963) for the modernisation of the British Museum which will include a new library building on a site adjacent. It is proposed that the Natural History Museum at South Kensington shall become a separate institution and be called the British Museum of Natural History.

British Railways. The name under which the railways of Britain were unified on January 1, 1948. Instead of the former four main railway systems six regions were formed: London Midland region (former L M S R) Western (former G W R.), Southern (formerly S R), Eastern (southern area of former L N E R), N.E. region (N E. of former L N E R), Scottish region (Scottish system of the former L M S R and L N E R). In 1955 plans were announced for the modernisation and re-equipment of the railways by 1970, the most far reaching change being the replacement of steam traction by electric and diesel locomotives. The Beeching Report (1963) made detailed proposals for establishing a viable railway system.

Brocken-spectre or Glory. The series of coloured rings which an observer sees around the shadow of his own head (or an aeroplane in which be is travelling) as cast upon a bank of mist or thin cloud. This effect is produced by reflection and refraction of sunlight in minute water-droplets in the air just as in a rainbow.

Bromine. A non-metal element, symbol Br, member of the halogen family (*q v*). It is a red, evil-smelling liquid (Greek *bromos*, a stink). It is an abundant element. In the U S A bromide is extracted from sea-water on a large scale. It unites readily with many other elements, the products being termed bromides. Its derivatives with organic compounds are used in synthetic chemistry. Bromoform is a liquid resembling chloroform. Bromides are used in medicine to calm excitement.

Bronze is primarily an alloy of copper and tin, and was one of the earliest alloys known, the Bronze Age in the evolution of tool-using man coming between the Stone Age and the Iron Age. Some modern bronzes contain zinc or lead also, and a trace of phosphorus is present in "phosphor-bronze."

Bubble Chamber. An instrument used by physicists to reveal the tracks of fast fundamental particles (*e.g.* those produced in large accelerating machines) in a form suitable for photography, closely related to the Wilson cloud chamber (*q.v.*), but the particles leave trails of small bubbles in a liquid (often liquid hydrogen) instead of droplets of liquid in a gas. Invented in 1952 by the American physicist, Dr. D. Glaser, who received the Nobel Prize for it in 1960.

Buckingham Palace, London residence of British sovereigns since 1837. Originally built for the Duke of Buckingham (1703), bought by George III. in 1762 and remodelled by Nash 1825–36.

Buddhism. *See* **J6.**

Bulk Purchase. Arrangements for bulk purchase involve undertakings by a country, or by some agency within it, to buy from another country specified quantities of its products, either at prices fixed in advance or with provision for adjusting the prices at specified intervals to take account of general price movements. Such long-term arrangements may be, but need not be, combined with undertakings by the seller to buy specified quantities, or specified values, of the products of the purchasing country in exchange. The purpose of bulk-purchase arrangements is, on the one hand, to provide the seller of the goods in question with assured markets and, on the other, to assure the buyers of needed supplies of their goods. Bulk-purchase arrangements have usually to be made between governments or government agencies empowered to enter into such undertakings, though there is, of course, nothing to prevent private traders from agreeing to make long-term bulk purchases if they desire to do so.

Buntings, name of a group of finches, seed-eating birds, usually found in open country. The Yellowhammer, Reed Bunting, Corn Bunting, and Cirl Bunting are resident in Britain, the Snow Bunting (which breeds in small numbers in Scotland) and Lapland Bunting are regular winter visitors, and the Ortolan is among the rare visitors.

Busby, a military head-dress of fur. In Great Britain busbies are of two kinds: the fur *busby* worn by the Hussars and the *bearskin* busby, introduced in 1832 and properly called "bearskin," worn by the Guards.

Byzantine Art developed in the eastern part of the Roman empire after Constantine founded the city of Constantinople (A D 330). It has many sources—Greek, Syrian, Egyptian, and Islamic—and reached its zenith in the reign of Justinian (527–65). The major art form was ecclesiastical architecture, the basic plan of which was Roman—either basilican (symmetrical about an axis) or centralised (symmetrical about a point). Arched construction was developed, and the dome became the most typical feature, although, unlike the Roman dome which was placed on a round apartment, the Byzantine dome was placed on a square one on independent pendentives. Frequently small domes were clustered round a large one as in the case of the great church of Santa Sophia (537), the climax of Byzantine architecture. Usually the churches were small and include those of SS Sergius and Bacchus, Sta Irene (in Constantinople), S Vitale in Ravenna, and the much later and larger St Mark's in Venice. Byzantine art also took the form of miniatures, enamels, jewels, and textiles, but mosaics, frescos, and icons (*q v*) are its greatest treasures.

C

Cacao, *Theobroma cacao*, is an evergreen tree, from 15 to 20 ft high, growing abundantly in tropical America, West Africa, the West Indies, Ceylon, etc , yielding seeds, called cocoa beans, from which cocoa and chocolate are manufactured. The fruit is 7–10 in long, hard and ridged, inside are the beans, covered with a reddish-brown skin, which are first fermented, then dried. The trees mature at five to eight years and produce two crops a year.

Cactus, a family of flowering plants numbering about a thousand species adapted to living in very dry situations. The stem is usually fleshy, being composed of succulent tissue, remarkably retentive of water, commonly equipped with sharp thorns which deter animals from eating them. The roots are generally very long, tapping soil water over large area, a "prickly pear" cactus may have roots covering a circular area 25 ft. or more in diameter. The leaves are commonly insignificant or absent, and the stem takes over the photosynthetic leaf function and becomes accordingly flattened to expose greater area to sunlight and air. In some kinds of cactus (*e g. Echinocactus*) the stem is shaped almost like a sea-urchin.

Cadmium. A metallic element, symbol Cd, chemically similar to zinc and mercury. Used in alloys to lower the melting point, as in

Wood's metal with bismuth and tin. Alloyed with copper to make electric cables. Like zinc, it is a protective metal and is used in electroplating. The cadmium-vapour lamp gives a characteristic frequency used in measuring wavelength.

Caesium, also spelt **Cesium**, is an alkali metal element, symbol Cs, in first group of the periodic table. It resembles rubidium and potassium and was discovered by Bunsen and Kirchhoff in 1860. It was the first element whose existence was discovered spectroscopically. The caesium atom consists of a heavy nucleus surrounded by 55 electrons, 54 of which are arranged in stable orbits, and one of which, known as the valency electron, is in a less stable orbit surrounding them. Used in the construction of photo-electric cells and as an accurate time standard (atomic clock).

Calcite, the stable, naturally-occurring form of calcium carbonate. It is a very abundant mineral which crystallises in the hexagonal system.

Calcium, a silvery-white metallic element, symbol Ca. It melts at 810° C and is very reactive. It was discovered by Sir Humphry Davy in 1808, but not until 1898 was it obtained pure, by Moissan. Does not occur as metal in nature, but calcium compounds make up a large part of the earth's crust. Most important calcium sources are marble, limestone, chalk (all three are, chemically, calcium carbonate), dolomite, which is the double carbonate of calcium and magnesium, gypsum, a hydrated calcium sulphate, calcium phosphate and calcium fluoride. Igneous rocks contain much calcium silicate. Calcium compounds are essential to plants and are used in fertilisers. Animals require calcium and phosphorus for bone and teeth formation, deficiency is treated by administration of calcium phosphate. Strontium is chemically similar to calcium, and the radioactive strontium 90 from atomic "fall-out" is therefore easily assimilated by the body.

Calculating machines are inventions to relieve men and women of the tedium of long routine or involved computations. The calculating machine seems to date from 1642, when Pascal constructed one which could be used for addition and subtraction. General interest was lacking, however, and almost two hundred and fifty years elapsed before Ohdner in Sweden produced the first numerical arithmetical machines of the type now in general use. Before very long the electric motor replaced the hand in providing the motive power, and so the electric calculating machine was invented. But at all stages of any calculation on hand-operated or electric machines human operators have to supply them with numbers. The principal feature of the more modern machines is that they are automatic, that is, once a sequence of an arithmetical operation has been decided, and instructions given to the machine in suitable form, such as holes punched into cards or tape, or in some other way, the machine carries out its work without further human intervention. In some calculations these machines frequently give the impression that they are "thinking," or "choosing" a way to carry out the calculations as quickly as possible. But even in such cases the criteria for judgment are actually contained in the initial instructions. The idea of automatic computation by machinery is due to the English mathematician Charles Babbage (1792–1871). He made a small machine of this type, based on the idea of the Jacquard loom for lace-making. He next planned, but never completed, two separate automatic machines, a "difference engine" to help in making mathematical tables, and an "analytical engine," which was to be a general-purpose, programme-controlled, machine possessing all the features of modern calculating machines. But Babbage's inventions were designed to be operated mechanically, it was left to the electronic engineers of the 20th cent. to bring Babbage's ideas to full fruition. The next important step was taken in 1937, when Aiken of Harvard started to construct, and subsequently completed, the first of the electronic machines. In these electricity is conducted either through an evacuated space, or a gas, or a semi-conductor. All calculating machines are of the "Analogue" or "Digital" types. In the analogue type, numbers are represented by physical quantities, for example, electric currents, of which the numbers themselves are the measures. The most important of this class is the Differential Analyser invented by Vannever Bush of America. In the digital machines the numbers are stored in it, and are represented by discrete objects, such as the teeth of a gear-wheel. Most of the important modern machines are of the digital variety. Almost all the ideas underlying the more advanced of these machines can be found in a remarkable mathematical paper published in 1936 by Turing of Manchester. Scientists, engineers, businessmen, administrators, and the fighting services need, and are making considerable use of, these machines. Problems hitherto considered intractable are receiving renewed consideration in view of the possibility of using machines for the numerical calculations required. The electronic computer marks a great advance, and the world is, perhaps, at the threshold of a new era of science, in connection with which the invention of the modern calculating machine may be as important to the world as was that of the Hindu-Arabic numerals to the Middle Ages.

Calendar, a collection of tables showing the days and months of the year, its astronomical recurrences, chronological references, etc. The Julian Calendar, with its leap year, introduced by Julius Cæsar, fixed the average length of the year at 365¼ days, which was about 11 minutes too long (the earth completes its orbit in 365 days 5 hours 48 minutes 46 seconds of mean solar time). The cumulative error was rectified by the Gregorian Calendar, introduced in Italy in 1582, whereby century years do not count as leap years unless divisible by 400. This is the rule we now follow. England did not adopt the reformed calendar until 1752, when she found herself 11 days behind the Continent.

Calends, the first day of the month in the Roman calendar, when interest fell due, and proclamations as to the order of days were made.

Calorie. Unit of quantity of heat. The "small" or fundamental calorie is the amount of heat required to raise the temperature of 1 gram of water from 15° to 16° C. This is the gram-calorie used in physics and chemistry. The large Calorie (written with a capital C), commonly used in nutritional connotations, is equal to 1000 small calories and is called the kilogram-calorie. *See also* P39(2).

Calotype, a wet-plate photographic process invented by H. Fox Talbot about 1840.

Calvinism. *See* J7.

Calypso, West Indian song in the form of a doggerel lampoon composed spontaneously and sung to a guitar.

Cambridge University had a sufficiently good teaching reputation to attract Oxford students in 1209, when lectures at their own university were suspended. In 1226 it had a Chancellor who was recognised by King and Pope. The first college to be founded was Peterhouse in 1284. The university was reorganised and granted a Charter of Incorporation by an act of Elizabeth in 1571. The colleges with their dates of foundation are Christ's (1505), Churchill (1959), Clare (1326), Corpus Christi (1352), Downing (1800), Emmanuel (1584), Gonville and Caius (1348), Jesus (1496), King's (1441), Magdalene (1542), Pembroke (1347), Peterhouse (1284), Queens' (1448), St. Catherine's (1473), St. John's (1511), Selwyn (1882), Sidney Sussex (1596), Trinity (1546), Trinity Hall (1350), Fitzwilliam House (non-collegiate students) (1869) and four women's colleges Girton (1869), Newnham (1875), New Hall (1954), and Hughes Hall (formerly Cambridge T.C.) (1885). Women were admitted to degrees (though not allowed to sit for examination) in 1920, and to full membership of the University in 1948.

Camel, a large ruminant quadruped, inhabiting Asia and Africa, where it is largely used as a beast of burden. There are two species—the Arabian camel or dromedary, with only one hump, and the Bactrian, or double-humped camel. There are no wild dromedaries, and the only wild bactrians occur in the Gobi Desert. The camel is able to go for long periods without

water, not, as was formerly believed, because it stored water in its hump, but because of the unique mechanism of its physiology which enables it to conserve water at the expense of not sweating until 104° F is reached.

Campanile, or bell-tower, is separate from but usually adjoining its parent church The most famous are in Italy. Giotto's tower at Florence, adjoining the cathedral of Santa Maria del Fiore, is architecturally the finest in the world Others are at Cremona, the loftiest in Italy (364 ft.) and Pisa (the leaning tower). The magnificent pointed campanile of St Mark's, Venice, which collapsed in 1902 and has since been rebuilt in its original form, was begun in 902

Canal, an artificial watercourse used for navigation which changes its level by means of locks. Some 2,400 m. are in use in Gt Britain, the English network being based on the four great estuaries Mersey, Humber, Severn, and Thames

Canary, a light, sweet wine from the Canaries and chief export until the grape blight of 1853 Much consumed in Britain from Tudor to Georgian times Also, a popular cage bird bred from a small finch, *Serinus canarius*, found wild in the Canaries, Madeira and the Azores. First brought to Europe for domestication in the 16th cent. *See* **Z22.**

Candela, unit of luminous intensity, replacing the former *international candle* as standard So defined that the brightness of a total radiator, or black body, at the temperature of solidification of molten platinum is 60 candelas per sq cm

Candlemas, an English and Roman Church festival in celebration of the Purification of the Virgin when she presented the Infant Jesus in the Temple, and deriving its name from the great show of candles made on the day (February 2) in the Roman celebrations.

Canon, a term applied to signify a recognised rule for the guide of conduct in matters legal, ecclesiastical, and artistic, or an authoritative ordinance thus we have Canonical Scriptures, Canon Law, etc. A Canon is also a dignitary of the Church, usually a member of a cathedral chapter in the Anglican communion, or in the Roman Church a member of an order standing between regular monks and secular clergy.

Canonical Hours were seven in number in the Western Church, Matins and Lauds, before dawn; Prime, early morning service, Terce, 9 a m ; Sext, noon, Nones 3 p.m , Vespers, 4 p m ; Compline, bed-time

Canonisation, the entering of one of the faithful departed on the list of saints of the Roman Catholic Church, after proof of purity and distinction of life has been accepted. This having been done, a day is named for the future keeping of the anniversary of the saint's death, and thenceforward appears in the Church Calendar Beatification, by which a person is called blessed, is usually followed by canonisation, but not necessarily.

Cantata, originally a long piece for solo voice, *i.e.*, the vocal counterpart of a sonata. The term is now used to cover a small oratorio.

Canticles, the name given to the scriptural passages from the Bible sung by the congregation in the various Christian liturgies They are the *Benedicite, Benedictus, Magnificat, Nunc Dimittis*

Cap, literally any head-covering article of dress The "Cap of Maintenance" is carried before the Sovereign at the Coronation, and is used symbolically in heraldry.

Capercaillie, the largest of the grouse family, found in the Scottish highlands and the pine forests and mountainous regions of Northern and Central Europe and Asia.

Capet, the family name of a race of French kings, founded by Hugh Capet in 987 with its collateral branches. Reigned until 1848, except for the period of the French Revolution and Napoleon

Capitalism. *See* **J7.**

Capricorn, a zodiacal constellation between Sagittarius and Aquarius, figured out in ancient times as having the head of the goat and the hind part shaped like a fish.

Capuchins are members of a mendicant order of Franciscans, founded in the 16th cent. with the aim of restoring the primitive and stricter observance of the rule of St. Francis, so called from the capuce or pointed cowl worn by them.

Carat, a term used in assessing the value of gold and precious stones. In connection with gold, it represents the proportion of pure gold contained in any gold alloy, and for this purpose the metal is divided into 24 parts. Thus 24-carat indicates pure gold, and any lesser number of carats shows the proportion of gold contained in the alloy. The carat as a measure of weight is now obsolete, having been replaced by the *metric carat* of 0 2 grams.

Caravan, a band of travellers or traders journeying together for safety across the Eastern deserts, sometimes numbering many hundreds. There are several allusions to caravans in the Old Testament. The great caravan routes of this period from Egypt to Babylon and from Palestine to Yemen linked up with the Syrian ports and so with western sea commerce Many wars have been fought in the past over their control

Carbohydrates, group of organic compounds composed of carbon, hydrogen and oxygen, *e g*, sugars, starches, cellulose. The carbohydrates play an essential rôle in all living processes. *See* **P39(2)**

Carbon, a non-metallic chemical element which occurs in crystalline form as diamonds and graphite, amorphous forms of carbon include charcoal and soot, while coke consists mainly of elementary carbon The biochemistry of plants and animals largely hinges upon carbon compounds The study of carbon compounds is called Organic Chemistry. **Carbon 14.** A radioactive isotope of carbon used in following the path of compounds and their assimilation in the body (**F21(1)**) Also used in determination of the age of carbon-containing materials such as trees, fossils, and very old documents (*see* **Dead Sea Scrolls**).

Carbonari, members of a secret political society originated in Naples, and at one time very numerous Their chief aim was to free Italy from foreign rule, and they exerted considerable influence in the various revolutionary movements in the first half of the 19th cent Their name was adopted from the charcoal-burners (*carbonari*), and their passwords, signs, etc , were all in the phraseology of the fraternity

Carbon dioxide. Commonest of the oxides of carbon. It is formed when carbon and its compounds are burnt with abundant supply of air, and when carbon compounds are oxidised in the respiration process of animals The atmosphere contains carbon dioxide to the extent of about three parts in 10,000, this figure remains more or less constant because, while carbon dioxide is always being added by animal respiration and the burning of fuels, such as coal and oil by man, plants are constantly removing it in the process known as photosynthesis or carbon assimilation. A heavy gas and obviously not one capable of supporting respiration, it can accumulate in caves, etc , and cause asphyxiation, for instance, in the Grotto del Cane, near Naples, a dog entering the cave is suffocated, whereas a man whose head is above the carbon dioxide level can walk through it unharmed Solid carbon dioxide is called "dry ice" The gas in aerated drinks and soda water is carbon dioxide.

Carbon monoxide is a colourless gas with no taste or smell It is formed when coal and coke are burnt with a restricted supply of air, the blue flame to be seen in a coke brazier, for instance, is the flame of carbon monoxide This gas is very poisonous, forming with the haemoglobin of the blood a compound which is useless for respiration and cherry red in colour, which gives a visible symptom of poisoning by carbon monoxide. With nickel it forms a volatile compound, called nickel carbonyl, and this reaction is the basis of the Mond process for extracting nickel

Cardinal, a Roman Catholic ecclesiastical dignitary of the highest rank The Sacred College of Cardinals, when complete, consists of 6 cardinal bishops, 50 cardinal priests, and 14 cardinal deacons—70 in all. This number was fixed by Pope Sixtus V. in 1586. Pope John XXIII has increased the number to 81 (1958–61). The Cardinals assist the Pope in the government of the Church. A cardinal's dress consists of red cassock, a rochet, a short purple mantle, and a low-crowned red hat with cords and tassels.

Cardinal Virtues, according to Plato these were

justice, prudence, temperance, fortitude—*natural* virtues as distinct from the *theological* virtues of the Roman Catholic Church, faith, hope, charity. The phrase "seven cardinal virtues," combining the two, figures in mediæval literature. *See* **Sins, Seven Deadly.**

Carlovingians, the second dynasty of the French kings (established 751), included such notable rulers as Charles Martel and Charlemagne. In 987 the Capet dynasty succeeded.

Carmelites, a body of mendicant friars taking their name from Mount Carmel, where the order was first established in the 12th cent. The original rule of the order required absolute poverty, abstinence from meat and a hermit life. The rigidity of the rule of the order was mitigated by Innocent IV. They wear a brown habit with white mantle, hence their name of White Friars. The order of Carmelite nuns was instituted in the 15th cent.

Carnivora. *See* **F23(2).**

Carp, a well-known fresh-water fish, found in plenty in most European and Asiatic still waters, reaches a length of about 2 ft. and under favourable conditions lives for about 40 years. Familiar British members of the family are the roach, rudd, dace, chub, gudgeon, tench, minnow, barbel, bream, and bleak. The goldfish, popular in ornamental ponds, is the domesticated variety of a Far Eastern member of the carp family.

Carthusians, an order of monks founded in 1084 by St. Bruno at the Grande Chartreuse near Grenoble, and introduced into England about a century later. They built the Charterhouse (corruption of Chartreuse) in London in 1371. The chief characteristics of the order are a separate dwelling-house in the precincts of the charterhouse for each monk, and the general assembly in the Church twice in the day and once at night. They wear a white habit, with white scapular and hood. The liqueur *Chartreuse* was invented by the order and is still their secret. For many years they have derived large revenues from its sale. The order of Carthusian nuns was founded in the 12th cent.

Casein, the chief protein in milk and cheese. It is coagulated by the action of rennet or acid. An important class of plastics ("casein plastics") are produced from it, and these plastics are converted into buttons, knitting-needles, etc. 8000 gallons of milk yield about a ton of casein.

Cassowary, a genus of ostrich-like birds which, together with the emu, form a separate order found only in Australasia. All species are black, with brightly coloured necks, and with a horny crest on the head. Noted for fleetness.

Castor-oil Plant (*Ricinus communis*), an African shrub now cultivated in most tropical countries. It has broad palmate leaves and bears a spiny fruit containing seeds which when pressed yield the well-known oil.

Cat, the general name for all members of the class *Felidae* of the carnivorous order, from the lion down to the domestic cat. The latter is believed to be descended from the European and African wild cats. Egypt is credited with having been the first country in which the cat was domesticated. *See* **Z9–12.**

Catalyst. A substance which speeds up a chemical reaction without being changed itself. Various aluminium and titanium compounds are catalysts in the formation of polythene from ethylene. Palladium catalyses the reaction of hydrogen with oxygen (hence its use in gas lighters). Enzymes in the body hasten the breakdown of carbohydrates and proteins by catalytic action.

Cataracts are gigantic waterfalls. The most famous are those of Niagara in North America, the Orinoco in South America, the Victoria Falls on the Zambesi in Africa, the Falls of the Rhine at Schaffhausen, and the Cascade of Gavarni in the Pyrenees.

Catechism, an elementary book of principles in any science or art, but more particularly in religion, in the form of questions and answers. There is a great variety of these, including the Lutheran, prepared by Luther in 1529, Calvin's Geneva (in 1536), and the Anglican, in the Book of Common Prayer.

Catechumens, a term applied in the primitive Church to children of Christian parents, who were admitted as neophytes, and occupied a place apart in the church.

Caterpillar, the larva of a butterfly or moth, worm-like in its segmented body, with 3 pairs of jointed true legs, often curiously marked and coloured, and frequently more or less hairy.

Cathedral, the chief church of a diocese, so called from its containing a Bishop's seat, or episcopal chair. The town in which it is situated is a cathedral city. Some celebrated cathedrals are St. John Lateran of Rome, Notre Dame of Paris, the cathedrals of Cologne and Milan, St. Paul's in London, Canterbury Cathedral, York Minster, and the cathedrals of Durham, Bristol, Gloucester, Peterborough, Exeter, Liverpool, and Coventry (destroyed by bombs, now rebuilt).

Catholicism. *See* **J7.**

Cat's-eye, a kind of quartz, much valued as a gem, opalescent, and of various shades.

Cavalier, a name adopted during the troubles of the Civil War to designate the Royalist party; it is also used generally in reference to a knightly, gallant, or imperious personage.

Caves, natural hollow places in the earth, frequently found in limestone, less frequently in volcanic rocks. Popular caves in Britain are Kent's cavern near Torquay, Cheddar and Wookey hole in the Mendips, Fingal's Cave in Staffa (Inner Hebrides) is noted for its splendid range of basalt columns. The scientific study of caves is known as spelaeology. The first discovery of Palæolithic paintings (the celebrated bulls) was made in the Altamira caves in Spain in 1879.

Cedar, a dark-leaved, cone-bearing, horizontal-branched evergreen tree that grows to a considerable height and girth, the best known species in Britain being the Lebanon Cedar, which was introduced in the 17th cent.

'Cello. *See* **Violoncello.**

Celluloid, one of the first synthetic thermoplastic materials, discovered by Alexander Parkes in 1865 when he was attempting to produce synthetic horn. It is made by treating cellulose nitrate with camphor and alcohol. Photographic film is made of a similar, but less-inflammable material, formed by the use of cellulose acetate instead of the nitrate.

Cellulose, a carbohydrate, and a constituent of nearly all plants. Cellulose occurs in an almost pure state in the fibres of linen (flax), absorbent cotton, jute, and filter-paper (used in laboratories).

Celts, an ancient race of W. Europe, originally from southern Germany (2nd millennium B.C.), united by a common language and culture, who spread westward into Spain, northward into Britain, eastward to the Black Sea, reaching Galicia in Asia Minor. The "La Tène" iron age Celts invaded Britain 250 B.C. After Britain was conquered by the Romans and invaded by the Angles and Saxons there remained as areas of Celtic speech only Wales (Brythonic speakers), Ireland, Scotland, Isle of Man (Gaelic speakers). The late Celtic period in Britain produced a distinctive Christian art (*e.g.*, the Lindisfarne Gospel *c.* 700, and the Irish Book of Kells, dating from about the same time).

Cerium, a scarce metallic element discovered by Berzelius in 1803. A mixture of cerium and thorium nitrates is used in the manufacture of gas mantles, which owe their incandescent property to the deposit of cerium and thorium oxide with which they are coated.

Cetacea, the order of mammals including the whales, dolphins, and porpoises, which, though strictly aquatic, breathe air, suckle their young, and are warm-blooded.

Chain reaction. *See* **F12(1).**

Chalcedony, a mixture of crystalline silica and amorphous hydrated silica, *i.e.*, of quartz and opal. It has a waxy lustre, and is much used by jewellers for necklaces, bracelets, etc. Commonly it is white or creamy. Its bright orange-red variety is called carnelian, its brown variety, sard. Chrysoprase, plasma, bloodstone are varieties which are respectively pale apple-green, dark leek-green, green with red spots.

Chalk, a white limestone, calcium carbonate, found in the Upper Cretaceous deposits (formed from the shells of minute marine organisms). In southern England the chalk is a soft rock,

but in Yorkshire, Scotland, and Ireland it is solid limestone. French chalk is hydrated magnesium silicate, a variety of talc.

Chama, a genus of large bivalves, "hoof shells" of the clam family, found in tropical waters, especially amongst coral reefs. *Chama gigas* weigh sometimes as much as 300 lb., and one valve has been employed as the basin of baptismal fonts in various churches

Chamberlain, Lord, the senior officer of The Royal Household who is responsible for all ceremonial within the palace (levées, courts, garden parties, entertainment of foreign royalties and heads of state) but not the coronation or state opening of parliament He is also in charge of appointments to The Royal Household and is examiner and licenser of plays.

Chamberlain, Lord Great, one of the great officers of state whose duties are now mainly ceremonial. He attends the monarch at the state opening of parliament and at the coronation and is custodian of the Palace of Westminster (Houses of Parliament) The office is hereditary, dating from Norman times, and is held for one reign in turn by the descendants of the De Veres, Earls of Oxford.

Chamber Music, strictly, signifies music suitable for playing in a small room, but is used to cover music specially composed for small combinations of instruments, e.g., string quartets, etc

Chameleon, a family of lizards with numerous species Their ability to change colour is well known, but exaggerated, and is due to the movement of pigment cells beneath the skin They are slow in movement, arboreal, and mainly insectivorous Found in Africa, India, Ceylon, Madagascar, and Arabia

Chamois, a species of antelope, native of Western Europe and Asia About the size of a goat, it lives in mountainous regions, and possesses wonderful leaping power, so that it is very difficult to capture. Its flesh is much esteemed, and from its skin chamois leather is made, although to-day sheep and goat skins are usually substituted The mating season is Oct.–Nov and the fawns are born in May or June Live to be 20–25 years old

Channel Tunnel, a scheme to bore a tunnel through 20–30 miles of chalk under the sea between Dover and Calais has been a subject for discussion ever since Albert Mathieu first conceived the idea as a practical possibility in 1802. Investigations have been undertaken from time to time, the most recent being that of the Channel Tunnel Group, composed of British, French, and American interests, which was set up in 1957. New techniques in the field of geophysics and palaeontology are being used to study the soil and rock conditions Whether or not there will be a Channel tunnel or a road-bridge will depend on political and financial considerations

Chapel Royal, the church dedicated to the use of the Sovereign and Court There are, among others, chapels royal at St James's Palace, Buckingham Palace, Windsor, Hampton Court the Tower, and Holyrood

Characterology. *See* J7.

Charcoal, a term applied to wood that has been subjected to a process of slow smothered combustion. More generally it refers to the carbonaceous remains of vegetable, animal, or combustible mineral substances submitted to a similar process Charcoal from special woods (in particular buckthorn) is used in making gunpowder. Bone charcoal finds use in sugar refining, as it removes dark colouring matter present in the crude syrup.

Charterhouse, a famous school that was in Aldersgate Street, London, but removed to Godalming. In connection with the school is an almshouse on the old London site, endowed by Thomas Sutton in 1611. Thackeray as well as Addison, Grote, and other eminent men, were Charterhouse scholars.

Chasuble, a sleeveless vestment worn by ecclesiastics over the alb during the celebration of Mass. It is supposed to symbolise the seamless coat of Christ Its use in English churches was prohibited in 1552, but again permitted after 1559. It gradually fell into disregard, however, but about 100 years ago its use was revived in the Church of England.

Cheese, an article of food made from the curd of milk, which is separated from the whey and pressed in moulds and gradually dried. There are about 500 varieties differing with method of preparation and quality of milk. They used to be made in the regions after which they are named but nowadays many of them are mass-produced, *e.g.*, Cheddar is made not only in all parts of Britain but in Canada, New Zealand, Australia, Holland, and the U S.A Cheeses may be divided into 3 main classes. (1) soft, *e g.*, Camembert, Cambridge, Port l'Evêque, (2) blue-veined, *e g.*, Stilton, Gorgonzola, Wensleydale, Roquefort; (3) hard pressed, *e.g.*, Cheddar, Cheshire, Gruyère, Parmesan, Gouda

Cheetah or "hunting leopard," the large spotted cat of Africa and Southern Asia whose ability to reach a speed of 45 m.p.h. is utilised in hunting

Chemistry is the science of the elements and their compounds It is concerned with the laws of their combination and behaviour under various conditions It had its rise in alchemy (J2) and has gradually developed into a science of vast magnitude and importance Organic chemistry deals with the chemistry of the compounds of carbon, inorganic chemistry is concerned with the chemistry of the elements, physical chemistry is concerned with the study of chemical reactions and with the theories and laws of chemistry

Chestnut, the fruit of the chestnut tree; those of the Spanish chestnut, *Castanea vesca*, furnish a favourite esculent The wood is used in carpentry, while the horse-chestnut (*Esculus hippocastanum*) is much employed in brush-mounting and in cabinet work.

Chiaroscuro, a term used in painting to denote the arrangement of light and shade in a picture On the proper handling of chiaroscuro depends the fidelity of depiction of objects and distances.

Chiltern Hundreds, three hundreds—Stoke, Burnham and Desborough—the stewardship of which is now a nominal office under the Chancellor of the Exchequer Since about 1751 the nomination to it has been used as a method of enabling a member of Parliament to resign his seat on the plea that he holds an office of honour and profit under the crown (This has been a disqualification for Parliament since 1707)

Chimpanzee, a large anthropoid ape, a native of tropical West Africa, of a dark brown colour, with arms reaching to the knee, and capable of walking upright Its brain is about a third of the weight of the human brain, but is anatomically similar The animal has considerable intelligence and powers of learning A suitable subject for space flight experiments

China Lobby, the name applied to the body of opinion and pressure in American politics which strenuously opposes recognition of Communist China, and advocates support of Chiang Kai-shek

Chinchilla, a South American burrowing rodent Grey in colour, and white underneath It is greatly esteemed for its beautiful fur

Chippendale Furniture was introduced in the reign of George I by Thomas Chippendale, a Worcestershire cabinet-maker who migrated to London and set up for himself in St Martin's Lane Charing Cross He was fonder of inventing designs for furniture than of making it, and in 1752 published a book of patterns: the London furniture-makers of the day soon began to model their work upon it

Chirognomy. *See* J8.

Chivalry, an international brotherhood of knights formed primarily during the 13th cent to fight against the infidels in the Crusades For the French the major battle was against the Moslems in the Holy Land and North Africa, the Spaniards fought the same enemy in their own country, and the Germans were concerned with the heathen of Baltic lands, but Chaucer's "very perfect gentle knight" had fought in all these areas One did not easily become a knight who had to be of noble birth and then pass through a period of probation, beginning as a boy page in the castle of some great lord, serving his elders and betters humbly while he was taught good manners, singing, playing musical instruments, and the composition of verse. Probably

he learned Latin, but he certainly learned French, which was the international language of knights as Latin was of scholars. At fourteen he became a squire and learned to fight with sword, battle-axe, and lance, and to endure conditions of hard living while carrying out his duties of waiting on his lord, looking after his horses, and in time accompanying him in battle. Only if he showed himself suitable was he finally knighted by a stroke of the hand or sword on the shoulder from the king or lord. Knighthood was an international order and had its special code of behaviour: to honour one's sworn word, to protect the weak, to respect women, and defend the Faith. To some extent it had a civilising effect on the conduct of war (e.g., knights of opposing sides might slaughter each other in battle but feast together after), but, since war was regarded as the supreme form of sport, it cannot be said to have contributed to peace.

Chlorine, a gaseous element of the halogen family, first isolated in 1774 by Scheele by the action of manganese dioxide on hydrochloric acid. It unites easily with many other elements, the compounds resulting being termed chlorides. The gaseous element is greenish-yellow, with a pungent odour. It is a suffocating gas injuring the lungs at a concentration as low as 1 part in 50,000, and was used during the first world war as a poison gas. Has a powerful bleaching action, usually being used in form of bleaching powder, made by combining lime and chlorine. Also a valuable disinfectant, used, for instance, in rendering water of swimming baths sterile.

Chloroform, a volatile colourless liquid, compounded of carbon, hydrogen, and chlorine. It is a powerful solvent, not naturally occurring but synthesised on a large scale. When the vapour is inhaled it produces unconsciousness and insensibility to pain. It owes its discovery to Liebig, and its first application for medical purposes to Sir James Young Simpson (**P5**(2)).

Chlorophyll, the green pigment contained in the leaves of plants, first discovered by P. J. Pelletier (1788–1829) and J. B. Caventou (1795–1877) in 1818. Enables the plant to absorb sunlight and so to build up sugar. The total synthesis of chlorophyll was reported in 1960 by Prof. R. B. Woodward. This is an outstanding achievement in the field of organic chemistry. *See* **F29**(1).

Chorale. Originally a Lutheran hymn-tune, but used, especially by J. S. Bach, as a basis for instrumental or choral pieces, *e.g.*, Chorales and Choral Preludes.

Chord. A number of notes played simultaneously.

Chordate. *See* **F22**(1).

Chouans, the name given to the band of peasants, mainly smugglers and dealers in contraband salt, who rose in revolt in the west of France in 1793 and joined the royalists of La Vendée. Balzac gives a picture of the people and the country in which they operated in his novel *Les Chouans*. They used the hoot of an owl as a signal—hence the name.

Chough, a member of the crow family, of glossy blue-green-black plumage, whose long curved bill and legs are coral red. It used to be abundant on the cliffs of Cornwall, but its haunts are now restricted to the rocky outcrops of the western coasts and in the mountains near by. It nests in cleft rocks and caves. The Alpine chough with yellow bill inhabits the mountainous districts of Europe and Asia and is not found in Britain. It was found at 27,000 ft on Everest.

Christianity. *See* **J8.**

Christian Science. *See* **J9.**

Christmas means "mass of Christ" from the old English *Cristes maesse*, which is celebrated by the Western church on December 25. The actual day on which Christ was born is not known and there is some uncertainty about the year. December 25 as the day of Nativity was not generally observed until the 5th cent. A.D., though, as the winter solstice, it had long been observed as a pagan festival of *sol invictus* (unconquered sun). The first Christmas card dates from about 1843 and the Christmas tree, of pagan origin, was introduced into England from Germany by Queen Adelaide, wife of William IV. Santa Clause is a corruption of Saint Nicolas, patron saint of children, whose feast day properly falls on December 6.

Chromatic Scale, a scale proceeding in intervals of one semitone. *E.g.*, chromatic scale in C: C–D♭–D–E♭–E–F–G♭–G–A♭–A–B♭–B–C.

Chromium, a very hard, bluish-white metal element, symbol Cr, melting at a very high temperature (above 1900° C). Its chief ore is chromite or chrome iron-ore (ferrous chromite). "Ferro-chrome" is produced by heating chromite and anthracite in an electric furnace, and chrome steels are prepared by adding the pre-calculated amount of ferro-chrome to melted steel. Best known chrome steel is stainless steel first made by Brearley in 1912 and since then developed greatly at Sheffield. A typical formula is 18 per cent. chromium, 8 per cent nickel, 74 per cent iron. Equally important are Stellite alloys, containing chromium, cobalt, tungsten (or molybdenum), which have made possible modern high-speed cutting tools. Dies used in manufacture of plastics are commonly of chrome steel. The elementary metal finds little use alone except in chromium-plating for motor cars etc.

Chromosomes, the bodies contained within the nucleus of every animal or plant cell, each containing several hundreds of the hereditary factors called *genes*. When the cell divides, each chromosome splits, so that every cell contains an identical complement of genes. Human cells have 23 pairs of chromosomes. *See* **F19**(2), **20**(2), **56**(1).

Church Commissioners. The Church Commissioners were established in 1948 by the amalgamation of Queen Anne's Bounty (established 1704) and the Ecclesiastical Commissioners (established 1836) to administer Church revenues and to manage Church property generally. The Commissioners own in investments and real estate a total of over £200 million.

Church of England. *See* **J9.**

Cid, The, a famous Spanish hero of the 11th cent. Don Rodrigo Diaz de Vivar, who, before he was twenty, led a Spanish force against the Moors, and drove them out of Spain. He is celebrated in poem, play, and romance.

Cinchona, the tree native to the Andes which is famous for its bark, source of the drug quinine. It was introduced into Ceylon, India, and Java, the latter becoming the main supplier of quinine.

Cinque Ports, a number of seaport towns on the coast of Kent and Sussex, originally five, Hastings, Romney, Hythe, Dover, and Sandwich. Winchelsea and Rye were added later. These ports were required to furnish a certain number of ships, ready for service, and in return they were granted many privileges. The official residence of the Lord Warden is Walmer Castle. Sir Winston Churchill is the present Lord Warden and Admiral of the Cinque Ports.

Cistercians, an order of monks and nuns taking their names from Cîteaux, near Dijon, where their first monastery was established in 1098. The order was noted for the severity of its rule. They were famous agriculturists. The habit is white, with a black cowl or hood. The order declined, and in the 17th cent. there was a reform movement instituted by the Trappists, who were later organised into a separate order.

Citron, a species of citrus (*Citrus medica*) related to the lemon, whose fruit has thick rind used for candied peel.

Civet, a carnivorous quadruped of the cat family from which civet perfume is obtained.

Civil List is the annual sum payable to the Sovereign to maintain the Royal Household and to uphold the dignity of the Crown. The amount is granted by Parliament upon the recommendation of a Select Committee and has to be settled afresh in the first six months of a new reign. The Civil List of Queen Victoria was £385,000, Edward VII. and George V., £470,000, Edward VIII. and George VI., £410,000, Elizabeth II., £475,000. The annuities payable to members of the Royal Family do not form part of the Civil List but are a charge on the Consolidated Fund. Queen Mother, £70,000, Duke of Edinburgh, £40,000, Duke of Gloucester, £35,000, Princess Royal, £6,000; Princess Margaret and Princess Anne, £6,000 (£15,000 on marriage),

Prince Charles has his own income from the Duchy of Cornwall.

Clarinet, a wood-wind instrument with a single reed which gives forth a rich, smooth tone. The reed is "tongued" and the note selected by operating keys which open or close holes in the wooden tube. A larger instrument of lower pitch is known as the bass clarinet.

Classicism (classic, or classical), a rather vague term often used, especially in the forms in parentheses, to signify that which is of accepted excellence, cited as a model or standard, or of ancient origin. Hence the "classic" horse races—Two and One Thousand Guineas, Derby, Oaks, St. Leger—and classic writers, the former in the sense of standard and accepted, the latter signifying Latin and Greek writers with or without merit. In art the term implies that form of painting or sculpture where the artist is mainly concerned with producing a work based on formal principles rather than with expressing a subjective mood as in Romantic art (*q v*). Classic art is derived (or the artist believes his own version of it to be derived) from the art of classical Greece which is disciplined and primarily intellectual in appeal. Its passion for rules and Academies led to the Romantic reaction with its love of drama and the exotic often carried to an absurd degree. Throughout history art has tended to fluctuate between one attitude or the other, thus in France, Ingres and Delacroix, although contemporaries, were the living embodiments of the two approaches, the former classical, the latter romantic. Similarly, Cubism in its attachment to form is classical, Surrealism in its concern with content, romantic.

Cleopatra's Needle on the Thames Embankment is of the time of Tuthmosis III (1500–1450 B C.) Presented to the British Government by Mehemet Ali in 1819, but not brought to this country until 1878. Its weight is 180 tons and it is 68½ ft. in height.

Climate is a generalised representation of the day-to-day weather conditions throughout the year, the combination of all weathers thus determining the climate of a place. Averages and extremes of temperature, variation of humidity, duration of sunshine and cloud cover, amount of rainfall and frequency of snow, frost, gales, etc., are amongst the data normally investigated. The interiors of great land masses are characterised by large ranges of temperature and low rainfall (continental climate), while proximity to oceans has an ameliorating effect with increase in rainfall (oceanic climate). Presence of mountain ranges and lakes and configuration generally produce local modifications of climate, also apparent between the centre and the outlying suburbs of a city. There is evidence that vast changes of climate have occurred during geological time. Since the mid-19th cent. most of the world has shown a tendency to be warmer, the rise in annual mean temperature is now over 1° C. But this trend now seems to be easing off. Latitude introduces zones of climate, *e g*, tropical rain, subtropical steppe and desert, temperate rain and polar.

Clock, a device for measuring the passage of time. The earliest timekeeper was the shadow-clock, a primitive form of sundial, used in Ancient Egypt about 1500 B C. To find the time at night the water-clock or clepsydra was used. The sand-glass dates from the 15th cent. No one knows when the first mechanical clocks were invented, but it is known that a complicated mechanical clock driven by water and controlled by a weighbridge escapement was built in Peking in 1090. The Dover Clock in the Science Museum is not the earliest surviving clock in England, as was once believed, but early 17th cent. The Salisbury Cathedral clock dates from 1386 and that of Wells Cathedral from 1392. The pendulum clock was invented by the Dutch scientist Christiaan Huygens (1625–95). The first watches were made in Nuremberg shortly after 1500. The marine chronometer is a high-precision timepiece used at sea for giving Greenwich mean time. The quartz-crystal clocks are accurate to one thousandth of a second a day, and the improved atomic clock, recently developed at the British National Physical Laboratory, which makes use of the natural vibrations of the caesium atom, is said to be an almost absolute measure of time (accurate to 1 sec in 300 years). A comparison of the time-keeping of the caesium clock with the quartz-crystal clock reveals that the earth in its rotation about its axis is slowing down by a thousandth of a second in 2 years. What this irregularity is due to is not yet known.

Cloisonné, a kind of fine pottery with enamelled surface, decorated with elaborate designs, the outlines of which are formed by small bands or fillets of metal. The Byzantines excelled in this work, but in the 20th cent. Japan and China led in Cloisonné-ware.

Cloud chamber, an apparatus invented by C. T. R. Wilson in which the tracks of atomic particles can be made visible. Just as the vapour trails tell of the track of an invisible aircraft high up in the air, so the vapour trails of an unseeable particle can tell of its behaviour. The rays under investigation pass through a chamber containing a gas, *e g*, air thoroughly cleansed of dust, supersaturated with water- or alcohol-vapour. As the particle passes through it forms a track of tiny water droplets which can be photographed. Another ingenious device for tracking fast fundamental particles is the Bubble chamber (*q v*).

Clouds are formed by the ascent of moist air, the type depending on the way the air ascends and the height at which condensation occurs. There are three main classes: (1) high cloud (above 20,000 ft.)—cirrus (delicate and fibrous), cirrostratus (thin white veil), and cirrocumulus (delicately rippled) consisting of ice crystals; (2) medium cloud (above 7,000 ft.)—altostratus (dense, greyish veil) and altocumulus (broken flattened cloudlets)—chiefly water particles, often supercooled; (3) low cloud (from near ground to 7,000 ft.)—cumulus (fair weather, broken, dome-topped), cumulonimbus (heavy, towering to great heights), stratocumulus (layer of globular masses or rolls), stratus (like fog but off the ground), nimbostratus (low, rainy cloud).

Clover, plants of the *Trifolium* genus, family *Leguminosae*, with about 250 species. These are "nitrogen fixing" plants and are cultivated extensively for fodder and green manure. The most widely used are Red Clover, White Clover (also an important source of honey), Alsike Clover, and Crimson Clover. Other interesting species are Subterranean Clover whose ripe flower heads reflex and bury themselves in the ground, strawberry clover, tolerant to soil salinity, found on shingle with fruits resembling strawberries, and shamrock.

Cloves are the dried flower-buds of a species of myrtle (*Eugenia caryophyllata*) grown principally in Zanzibar and Madagascar.

Clubmosses *or* **Lycopods.** *See* **F28(1).**

Coal is a carbonaceous mineral substance, commonly black and easily breakable, and may be either dull or shiny. It is very inflammable, and has formed for a long period the most important substance for fuel in employment in most civilised lands. It is composed of chemically altered vegetable matter, chiefly the timber of long extinct lycopodiaceous trees (*see* **Clubmosses**) and is found as a sort of stratified rock in the coal measures. Anthracite coal has lost nearly all its hydrocarbon by change or by pressure, and this and the more highly bituminous coals are greatly employed in manufacturing industries the world over, while those less so are used for household purposes. A ton of coal will yield by high temperature carbonisation from 10,000 to 15,000 cu. ft. of gas, 8 to 12 galls. of tar, 13½ cwts of coke and about 20 galls. of ammoniacal liquor, varying according to the class of coal used. It is calculated that in seams of one foot thickness or more to a depth of 4,000 ft., the proved resources of coal in Great Britain amount to 120,000,000,000 tons and the probable total resources to 170,000,000,000 tons. Production in Great Britain is over 200 million tons a year and most of it is for home use. In 1947 the British coal industry was transferred to the National Coal Board.

Coal Tar. A by-product in coal-gas and coke manufacture, it is a valuable source of organic intermediates, indeed over 20 different compounds have been isolated, many of which

find use in such fields as the manufacture of soaps, fuel, cosmetics, detergents, and drugs as well as dyes. *See* **Benzene, Aniline.**

Coat of Arms, in heraldry, is a device containing a family's armorial bearings. In mediæval times it was an actual coat upon which such device was embroidered, and knights wore it over their armour

Cobalt, a white metal melting at 1490° C Two main ores are *cobalt glance* (in which the element is combined with arsenic and sulphur) and *smaltite* (cobalt arsenide) The principal sources are Ontario and the Congo Various cobalt alloys are important, *e g* , stellite, ferrocobalt and carbolov. Its monoxide is an important colouring medium, and is used for colouring glass and porcelain-blue

Cobra, hooded and very venomous snakes. The best known species are the Indian Cobra, the Egyptian Cobra, and the Black-necked Cobra Their food consists chiefly of small rodents The King Cobra is almost exclusively a snake-eater "Spitting" Cobras (or Ringhals) of S Africa are a related genus, capable of spitting their venom several yards

Coca, a S American shrub, *Erythroxylon coca*, also cultivated in Java The leaves yield cocaine, classified as a dangerous drug, used medicinally as a local anaesthetic, especially on the eyes and in dentistry When the natives chew the leaves they are enabled to withstand astonishing amounts of hunger and fatigue, as cocaine acts both as a mental stimulant and as an anaesthetic on the mucous lining of the stomach *See* **P23(1).**

Cochineal *or* **Carmine**, a dyestuff consisting of the dried bodies of the female scale insect (*Dactylopius coccus*) which feeds on cacti Of ancient origin, the dye was well known to the Aztecs, and was used widely in the Middle Ages The famous scarlet tunics worn by the English during the Napoleonic wars owed their colour to carmine To-day it is almost entirely replaced by aniline dyes

Cockatoo, a member of the parrot family, bearing a crest of feathers on the head, native to Australia and adjacent regions. Predominant colour is white tinged with yellow or scarlet while some species have dark plumage The great black cockatoo of New Guinea is slaty black with pale red cheeks and can crack Kanary nuts which usually require a hammer to break them open

Cockchafer (*Melolontha*), one of the most destructive of beetles, the larvae feeding on roots It is about 1 inch in length, of a brownish colour, and emits a loud whirring sound when flying

Cockle, the popular name of the bi-valve shell-fish of the genus *Cardium*, found plentifully in sandy bays near low-water line, there are numerous British species

Cockroach, inaccurately called the "black beetle", a pest of bakeries and kitchens In Britain two species are commonly found the Common Cockroach (*Blatta orientalis*), resident since the time of Elizabeth I, dark brown, about an inch long, with the wing covers long in the male and short in the female, and the German Cockroach (*Blatta germanica*), now the most common, half the size, dark yellow, with both sexes fully winged All species have long antennae and flattened, leathery, shiny bodies They are nocturnal and omnivorous

Cocoa. *See* **Cacao.**

Coconut Palm (*Cocos nucifera*), a tropical tree, growing to a height of 100 ft , with a slender, leaning trunk surmounted by giant feather-like leaves. One of the most important sources of food and raw material for people living in the tropics The juice of the fruit, or coconut, is drunk, the kernel is eaten fresh or dried to form copra, which yields animal feeding stuffs and oil, used in the manufacture of soap, margarine, cosmetics, synthetic rubber, etc , leaves are used for thatching; leaf stalks for canes, fence posts, needles, etc , and the trunk for houses and bridges. Main producing areas Indonesia, Philippines, Malaya, Ceylon, and S. India

Codes, a term used to designate a system of laws properly classified. The Code of Hammurabi, king of Babylon, c. 1700 B.C., had extensive influence over a long period. The Romans formulated several codes of historic importance including the Theodosian Code which summarised the Roman laws from the time of Constantine to 438 A D The final codification was made under order of the Emperor Justinian by his chief minister Tribonian and published in 529 with a new edition in 534. The most important of modern codes is the *Code Napoléon*, compiled between 1803 and 1810, and still in force It has been used as an example for the codification of the laws of a number of countries from America to Japan Under Frederick the Great the law of Prussia was codified English law has never been codified, although the law on certain subjects has been gathered up into a single statute, which practically amounts to its codification

Codex, a manuscript volume of the Scriptures comprising the Sinaitic codex of the 4th cent , the Vatican codex of the same period, the Alexandrine codex of the 5th cent , and others The British Museum, in 1933, purchased the *Codex Sinaiticus* from the Soviet Government for £100,000

Coffee, a shrub found originally in Arabia and Abyssinia, but now extensively grown in the West Indies, Brazil, India, and Central America It yields a seed or berry which, after undergoing the necessary preparation, is ground and largely used in most countries as a popular breakfast beverage The best coffee is the Mocha, an Arabian variety. The stimulating effect of coffee is due to the caffeine, which is also present in tea The beverage was introduced into Europe in the 16th cent , and the first London coffee shop was opened in 1632.

Coke is the solid residue remaining when coal is carbonised and nearly all the volatile constituents have been driven off Used as fuel, and as an agent for reducing metallic oxides to metals, *e g* , iron ore to iron, in the manufacture of steel

Colorado Beetle, a serious pest of potato crops Both adults and larvae feed on the foliage where the orange eggs are laid The grub is reddish, with two rows of small black spots on each side The adults are about ½ in long with yellow and black striped wing cases The beetle is avoided by birds because of its nasty taste, and is controlled by arsenical sprays

Colosseum, the name of the Flavian amphitheatre at Rome, begun by Vespasian and finished by Titus A D 80 In general outline it still remains one of the most magnificent ruins in the world In the arena of this great building the famous gladiatorial displays and mimic naval battles used to be given, and about 50,000 spectators could be accommodated

Colossus is the name which the ancients gave to any statue of gigantic size The Colossus at Rhodes, which was a bronze statue of the sun god, Helios, was the most famous, and reckoned among the seven wonders of the world It stood over 100 ft high at the mouth of the harbour There is no truth in the legend that ships could pass between its legs It fell in an earthquake in 224 B C

Coluga, also known as "**flying lemur**", **caguan** or **kubuk**, a remarkable mammal which may be regarded as an aberrant insectivore or an aberrant form of the earliest ancestor of the bats It has nothing to do with lemurs There are two genera, one inhabiting the Philippines and one inhabiting Malaya They have a parachute-like membrane which covers them from the neck to the tip of the tail, by means of which they can glide from treetop to ground a distance of up to 70 yards

Column, in architecture, is an upright solid body serving as a support or decoration to a building Columns consist of a pedestal, a shaft, and a capital, over which the supported entablature rises They are named according to the styles of architecture of which they form part, being Doric, Tuscan, Ionic, Corinthian, or Composite as the case may be

Comets are celestial bodies which move about the solar system in elliptical or hyperbolic orbits. Usually these star-like bodies are accompanied by a long shining tail The hyperbolic comets are seen once only, and do not reappear; the elliptical comets are periodic, and their recurrence can be calculated with accuracy The head of a comet is believed to consist of

small lumps of solid matter accompanied by dust particles and gases such as carbon dioxide and methane The tails consist of luminous gases released from the material of the head and driven far into space when the comet approaches the sun. The pressure of radiation from the sun plays a part in forming the tail, which always points away from the sun Chief among the periodic comets is Edmund Halley's, the first to return as predicted in 1757 It reappears about every 76 years and is next due in 1985. The most spectacular comet of the 19th cent was that found by Donati in 1858.

Common Law, *See* D4

Commons are unenclosed tracts of land sometimes dedicated to the use in common of the inhabitants of the township in which they lie Many of these common lands were enclosed during the agrarian revolution in the Tudor period The four chief rights of common are, (1) estovers—the right of taking wood for house building or firewood, (2) pasture, or right of grazing beasts, (3) turbary, or right of digging turf, (4) piscary, or the right to fish

Commons, House of, the Lower House of the British Parliament *See* **C23(2).**

Commune of Paris has twice played a dramatic part in the history of France In 1792 it was able, through its control of the administrative organisation of Paris, to override the National Assembly In 1871, after the withdrawal of the Prussian troops it tried to assert its authority Public buildings were destroyed by members of the Commune and civil war raged during April and half May, but Government troops suppressed the rising

Communism. *See* **J9.**

Compass *or* **Mariner's Compass** is an instrument by which the magnetic meridian is indicated, and comprises a horizontal bowl containing alcohol and water, a card upon which the thirty-two points of the compass are marked, and the steel needle which always points to the meridian Although the discovery of the directive property of a magnet is credited to the Chinese, the first practical use of this property in a compass was made in western Europe in the 12th cent Aircraft and ships now largely employ gyrostatic compasses which are not affected by electrical and magnetic disturbances Sperry, Brown, and Anschutz are three important types of gyroscopic compass

Concerto, a kind of hybrid between the Symphony and the Sonata It may be regarded as a Symphony in which one instrument has a preponderance of solo passages or as a Sonata in which the solo instrument is accompanied by full orchestra

Conclave, an assembly of Roman Catholic cardinals met together to elect a pope The last Conclave was held in the Vatican, Oct 26 28, 1958, when Cardinal Roncalli, Patriarch of Venice, was elected Pope John XXIII

Concordat, an agreement or convention between the pope and a secular government regarding ecclesiastical matters The Concordat of Worms in 1122 between Calixtus II and the Emperor Henry V was famous as deciding a long struggle in regard to investiture In 1801 Napoleon concluded a concordat with Pius VII defining the restored relations between the head of the Church and the French Roman Catholics

Condor, a large vulture of brilliant black plumage with a circlet of white feathers round its neck It is a native of the Andes

Condottieri were mercenary soldiers engaged in the wars of the Italian States in the Middle Ages

Confederation is a free association of sovereign states united for some common purpose It is to be distinguished from a Federation, which is a union of states with one central government, each state relinquishing its sovereignty, though retaining some independence in internal affairs

Confucianism. *See* **J10.**

Coniferae are cone-bearing trees, including firs, pines, cedars, cypresses, junipers, yews, etc, and are widely distributed in temperate regions.

Conservatism. *See* **J10.**

Consistory, a term applied to the private council or state under the Roman Empire, but in later times used to designate the higher ecclesiastical courts and senates of the Anglican and Roman Churches.

Constable, an office of high rank in mediaeval times, and still, in some few offices, representing considerable dignity The office of Lord High Constable of England existed until 1521, since when it has been revived temporarily for special occasions such as Coronations. Before the introduction of the police system in England, every hundred and parish had its constables upon whom devolved the duty of keeping the peace The official designation of a policeman is police constable

Constitution, the fundamental organic law or principles of government of a nation, state, society, or other organised body, embodied in written documents or implied in the institutions and customs of the country or society *See* **C23(2).** The government of the U S A, unlike Great Britain, works upon a written Constitution It was framed when the U S A came into existence as a sovereign body, when the Constitution built a republic out of a federation of thirteen states, based on representative government The constitution was adopted in 1789, and its strength has been tested by the fact that, substantially unchanged, it is now the groundwork for a federation which now comprises fifty states

Continent, a word used in physical geography to denote the larger continuous land masses in contrast to the great oceans of the earth They are Eurasia (conventionally regarded as 2 continents, Europe and Asia), Africa, North America, South America, Australia, and Antarctica

Contralto, the feminine equivalent of the male alto Where altos and contraltos are present in the same choir they sing the same part But, whereas the alto is the highest adult male voice, the contralto is the lowest female voice

Conurbation, a term which has been defined as "an area occupied by a continuous series of dwellings, factories, and other buildings, harbours, and docks, urban parks and playing fields, etc, which are not separated from each other by rural land, though in many cases in this country such an urban area includes enclaves of rural land which is still in agricultural occupation" The term has been widely adopted for the contiguous densely populated areas which form continuous urban areas The seven officially recognised in Britain are Greater London, West Midlands, S E Lancashire, West Yorkshire, Merseyside, Tyneside, Clydeside. *See* **K191.**

Convention is an assembly of delegates, representatives, members of a party met to accomplish some specific civil, social, political, ecclesiastical or other important object

Convocation, an assembly called together to deliberate ecclesiastical affairs In the Church of England the provinces of Canterbury and York each have their convocation The term is also applied to assemblies of the graduates of certain universities

Coot. A very widely distributed bird of the rail family and a common resident of the British Isles The adult is black with a conspicuous white bald shield on the forehead and a white bill The juvenile is brownish grey with whitish breast and throat The coot flies heavily, but swims well It dives frequently and can remain submerged for a considerable time It is pugnacious and in winter gregarious The food is chiefly vegetable The large nest is usually built among aquatic vegetation and the young are fed by both parents Another species, the Crested Coot, occurs in S Europe

Copper, one of the most familiar of metals, symbol Cu, used in ancient times as an alloy with tin in producing bronze, and preceding iron as an industrial material. Copper ores are most abundant in the U S A, Chile, Canada, Northern Rhodesia, and the Congo All copper compounds are poisonous Copper sulphate is largely used in calico-printing and in the production of blue and green pigments

Copyright. Under the Copyright Act, 1956, copyright subsists in every original literary, dramatic, musical, and artistic work if the author is a British subject or a citizen of the Republic of Ireland or resident in the United Kingdom, or if the work is first published in the United Kingdom The Act provides that, except in certain special cases, the author of the work

shall be the first owner of the copyright, and there are no formalities, such as registration or payment of fees, to be accomplished. Copyright includes the right to reproduce the work in any material form, to perform the work in public, or, if the work is unpublished, to publish the work. The Act also protects sound recordings, films, and television and sound broadcasts. Literary, dramatic, musical, and artistic works which enjoy the protection of the Act are automatically protected in those countries which are parties to the Berne Copyright Convention or the Universal Copyright Convention. In general, copyright in literary, dramatic, musical, and artistic works is vested in the author for the period of his lifetime and 50 years following, after which it passes into the public domain and becomes freely available to any who wish to make use of it. The Copyright Libraries, entitled to receive *gratis* copies of books published in the United Kingdom, are the British Museum, the Bodleian at Oxford, the University Library, Cambridge, the Scottish National Library, Edinburgh, Trinity College, Dublin, and with certain exemptions the National Library of Wales. The Government Department responsible for matters in connection with copyright is the Industrial Property Department, Board of Trade, 25, Southampton Buildings, London, W.C.2.

Coral, an order of small marine animals closely related to the sea-anemone, but differing from it in their ability to develop a limy skeleton. They multiply sexually and by budding. The structure of the coral secretions assumes a variety of forms, fan-like, tree-like, mushroom shape, and so forth. Red coral (the skeleton of *Corallium rubrum*) is mainly obtained from the Mediterranean. The coral reefs of the Pacific and Indian Oceans are often many miles in extent. Living corals occur only in warm seas at about 23° C. *See* **F22(2)**.

Cor Anglais (English horn, *corno inglese*). A tenor version of the oboe.

Cordite, a smokeless explosive adopted for small arms and heavy artillery by the British Government in the naval and military services in 1889, and composed of 58 parts of nitro-glycerine, 37 of gun-cotton, and 5 of vaseline. It is a jelly or plastic dough, and used in the form of sticks.

Cork, the bark of a species of oak, *Quercus suber*, grown largely in the South of Europe and North America. The cork tree is said to yield bark every six to ten years for 150 years, and grows to a height of from 20 to 40 ft. Its lightness, impermeability, and elasticity enable it to be used for a variety of commercial purposes, especially for stoppers of bottles.

Cormorant, a large, long-billed water-bird which captures fish by diving. It has bronze-black plumage with white cheeks and sides and is found around the sea coasts of most parts of the world, including the British Isles. It nests in colonies on sea cliffs and rocky ledges. The Shag or Green Cormorant is a smaller bird with green black plumage and a crest.

Corncrake. *See* **Landrail.**

Cornet, an instrument which is fundamentally a small trumpet. Its tone is neither so bold nor so powerful as that of the trumpet, and it is therefore of use in small orchestras whose balance would be upset by the inclusion of trumpets.

Corn Laws were statutes intended for the benefit of British agriculture, and restricted import and export of grain. From the 14th to the mid-19th cent. such laws were in force, and were often of a stringent nature. They became so oppressive and caused corn to reach so high a price that the poorer classes were plunged into distress. A powerful anti-corn law agitation was organised, of which Cobden, Bright, and Villiers were the leaders, and Sir Robert Peel, in 1846, at the time of the Irish potato famine, carried through free trade. The repeal of the Corn Laws marked an important phase in the transformation of an agricultural to an industrial Britain.

Coronae, series of luminous rings surrounding sun or moon produced by the diffraction of light by water droplets in the atmosphere. Usually seen when sun shines through altostratus clouds. The outside of the ring is red and the inside bluish. *See* **Halo**.

Corpus Christi Festival is one of the great celebrations of the Roman Catholic Church, and takes place on the Thursday after Trinity. It was instituted by Pope Urban IV. in 1264.

Cortes, the name of the Parliamentary assemblies of Spain and Portugal.

Cosmic Rays, a form of radiation coming from outer space, of deep penetrating power and of great scientific interest. The rays are believed to consist chiefly of fast protons, with a few α-particles and other positive nuclei. By interacting with the gas of the atmosphere, these rays initiate a complex series of events, in the course of which other particles ("secondary radiations") are generated. The secondary rays contain virtually all the particles listed on **F14** (The Atomic Family); indeed, several particles were first discovered as secondary cosmic rays. Cosmic rays are investigated at and below sea-level, on mountains, in deep mines, in balloons, rockets, and satellites. Their origin is still unknown. *See* **F3(2), 47.**

Cotton, the name of a plant of several species, bearing large yellow flowers with purple centres. These centres expand into pods, which at maturity burst and yield the white fibrous substance known as cotton. The raw cotton contains a large proportion of seeds which are removed by "ginning." Long before the Christian era, cotton had been grown and used with great skill in India to make fabrics. The industry was not introduced into England until the middle of the 17th cent. when Protestant refugees from Flanders came to settle in the wool textile districts of East Anglia and Lancashire. With improvements in machinery and expansion of overseas trade in the 18th and 19th cent., Lancashire became the centre of the world's cotton industry. Since the first world war there has been a marked decline in Britain's cotton industry. Cotton reacts with nitric acid to form gun cotton, which is combined with more sensitive explosives to give a more safely handled substance.

Counterpoint (adj. contrapuntal). The weaving together of two or more distinct melodies to create harmony.

County. The geographical counties of England are of very early origin and the word "county" was first introduced after the Norman conquest as an equivalent of the old English "shire." The 52 ancient or geographical counties of England and Wales should not be confused with the 62 administrative counties (created by the Local Government Act of 1888 when several of the geographical counties were subdivided) which themselves exclude the 83 county boroughs or towns with the status of a county. Scotland has 33 and Ireland 32 counties.

Coup d'Etat, a violent change in the government of a state carried out by force or illegally. Examples are the overthrow of the French Republic in 1851 by Louis Napoleon, who then became Emperor, and more recently the military *coups* in the Middle East which brought about the abdication of King Farouk of Egypt in 1952 and the assassination of King Feisal of Iraq in 1958.

Court Leet, a court of record held annually before the steward of any particular manor or lordship; originally there was only one court for a manor, but in the time of Edward I. it branched into two, the court baron and the court leet.

Coypu or **Nutria rat,** a large beaver-like rodent found in S. America, now wild in E. Anglia, where it is causing damage to dykes, reeds, and crops, having escaped from farms where it is bred for its fur.

Crane, a large, graceful wading-bird with elegant long legs and neck, greyish plumage, superficially resembling the heron and related to the bustard. They migrate in V or W formation and have trumpet-like voices. There are several species, found in all continents except S. America, including the Crowned Crane with golden coronet and the Demoiselle with tuft-like crest of white feathers. The Common Crane nested in East Anglia in mediaeval times but now comes only as a rare visitor from the Continent.

Credit is an advance of money or of goods or services in consideration of a promise of payment later. Trade credit is such an advance from trader to customer; bank credit is an advance of money by a bank to a client, whether a

business firm or a private person, in consideration of an interest payment by the borrower

Creed, a brief enumeration of a particular belief or religion The three important Christian creeds are the Apostles' Creed, the Nicene Creed, and the Athanasian Creed

Cremation, the ancient custom, revived in modern times, of burning the dead Many scientific men commend the practice on hygienic grounds, particularly in densely populated countries Cremation was first legalised in Great Britain in 1885 and the first crematorium opened at Woking in that year Application for cremation must be accompanied by two medical certificates *See* Q13(1).

Cricket, a genus of insects of the grasshopper order which move by leaps The male produces a chirping noise by rubbing its wing covers together

Crimean War (1853-56). This war between Russia and the allied powers of Turkey, England, France, and Sardinia, was connected with the Eastern Question (*q v*) and the desire of Russia for a port on the Mediterranean Chief engagements were the Alma, Balaclava, and Inkerman Fighting virtually ceased with fall of Sevastopol in Sept 1855 Treaty of Paris signed March 30, 1856

Crocodile, the name of the largest existing reptile, and classed with the alligator and the gavial The crocodile inhabits the Nile region, the alligator the lower Mississippi, and the gavial is found in many Indian rivers

Crow, a family of birds including many well-known species such as the rook, raven, jackdaw, carrion crow, hooded crow, magpie, nutcracker, jay, and chough

Crusades were military expeditions undertaken by some of the Christian nations of Europe with the object of ensuring the safety of pilgrims visiting the Holy Sepulchre and to retain in Christian hands the Holy Places For two centuries nine crusades were undertaken First, 1095-99, under Godfrey of Bouillon, which succeeded in capturing Jerusalem, Second, 1147-49, led by Louis VII of France, a dismal failure, which ended with the fall of Jerusalem, Third, 1189-92, in which Richard I of England took part, making a truce with Saladin, Fourth, 1202-4, led by French and Flemish nobles, a shameful expedition, resulting in the founding of a Latin empire in Constantinople, Fifth, 1217-21, led by John of Brienne, Sixth, 1228-29 under the Emperor Frederick II, Seventh, 1148-54, under St Louis of France, Eighth, 1270, under the same leadership, but cut short by his death on an ill-judged expedition to Tunis, Ninth, 1271-72, led by Prince Edward of England, which accomplished nothing Millions of lives and an enormous amount of treasure were sacrificed in these enterprises and Jerusalem remained in the possession of the "infidels" The chief material beneficiaries were the Italian maritime cities; the chief spiritual beneficiary was the pope, but in literature and the arts both Europe and the Levant benefited enormously from the bringing together of the different cultures

Crystal, in everyday usage, a solid chemical substance bounded by plane surfaces which show a regular geometrical arrangement as, *e g*, quartz crystals, rock salt, snow flakes In physics the term means any solid whose atoms are arranged in a regular three-dimensional array. This includes most solids, even those not particularly crystalline in appearance, *e g*, a lump of lead Common *non*-crystalline substances are liquids, jellies, glass

Cubism, the name of a revolutionary movement in art created in the years 1907-9 by the two painters Picasso and Braque Rejecting purely visual effects, they approached nature from an intellectual point of view, reducing it to mathematical orderliness Its respectable grandparent was Cézanne who had once written "you must see in nature the cylinder, the sphere, and the cone"—a concept which, together with the contemporary interest in Negro sculpture, moved the two founders of the movement to experiment with the reduction of natural forms to their basic geometrical shapes. In practice, this meant combining several views of the object all more or less superimposed in order to express the idea of the object rather than any one view of it The name Cubism was derisive and the movement aroused the same opposition as Impressionism, Fauvism, and the later Futurism Picasso's *Young Ladies of Avignon* was the first Cubist painting and his "Head" (1909) the first Cubist sculpture Three phases are recognised (1) Cubism under the influence of Cézanne, (2) high or analytical Cubism (*c* 1909-12) concentrating on the breaking-down of form to the exclusion of interest in colour, (3) synthetic Cubism (*c* 1913) making use of *collage* in which pieces of pasted-on paper (illustrations, wallpaper, newspaper) and other materials were used in addition to paint Amongst other Cubist painters are Villon, Gleizes, Picabia Jeanneret (now the architect Le Corbusier), Duchamp Gris, sculptors include Picasso himself, Brancusi, Lipchitz, Laurens, and Archipenko

Cuckoo, a well-known migratory bird which is found in Great Britain from April to July, hawk-like in shape, with a very characteristic note, uttered during the mating season only by the male The hen has a soft bubbling call It lays its eggs in the nests of other birds, *e g*, the meadow pipit and hedge sparrow, but only one egg in each nest Feeds mainly on insects, particularly hairy caterpillars

Cuneiform, the term applied to the written arrow headed characters found in Assyria, Persia, and Mesopotamia Good examples may be seen in the British Museum, some of them several thousand years old

Curfew, the bell which William the Conqueror ordered to be rung at eight o'clock each night in the towns and villages of Britain, as a signal to the inhabitants to extinguish lights and go to bed It originated in the fear of fire when most cities were built of timber It was abolished in 1100, but at Ripon, Sandbach, Chesham Penrith, Ibberton, Wokingham, it is still rung as a matter of custom

Curlew, a wading-bird of which there are several species It frequents marshy places, feeds on worms, insects, molluscs, and berries and possesses a very long down-curved bill

Currency is the name given to the types of cash money metal or paper in use in an area (*e g* pound, sterling, dollar, franc) It also designates the actual coins or notes issued Its amount is usually subject to regulation by the Government, or by a Central Bank acting on the Government's behalf *See also* N9, 22.

Cybernetics (derived from the Greek word meaning "governor") is the American term for the science of automatic control by machines The work of the American scientist, Dr Norbert Wiener, has led to great advances in the construction of electronic computers and to interesting speculations in the field of sociology *See* **Calculating Machines**

Cyclone, a term usually applied to a tropical revolving storm Cyclones often occur towards the end of the hot seasons and are mainly confined to tracks in the western areas of the oceans, being known as hurricanes (Caribbean and Pacific), cyclones (Indian Ocean), and typhoons (China Seas). The circulation of air in a cyclone is similar to that in the *depression* of temperate latitudes, but the region of low pressure is much more localised and the pressure gradients steeper Winds of hurricane strength and torrential rain occur generally, although at the centre of the storm there is a small area, known as the "eye," where fair, calm weather prevails

Cyclotron, a machine for accelerating charged particles such as protons to very high energies Devised by E. O. Lawrence in California in 1930, it uses a magnetic field to make the particles traverse nearly circular paths and an electric field to give them an additional pulse of energy each time round The accelerated particles impinge on targets, and the resulting events are a basic source of information for nuclear physicists. The cyclotron is obsolescent and has led to the development of other machines, *e.g.*, betatrons, synchrotrons.

D

Dacoits, Indian brigands, or professional robbers, who were formerly very numerous and ter-

rorised the districts they infested, especially Lower Bengal. Mansingh, "the greatest dacoit of all time," was killed by the Uttar Pradesh police in 1955 after a man hunt lasting many years

Dactylopterus, a fish of the gurnard family, with wing-like pectoral fins, sometimes known as the flying fish, though that appellation is more generally given to *Exocaetus exiliens*

Dadaism (French *Dada* = hobby-horse) was a hysterical and nihilistic precursor of **Surrealism** (*q v*) resulting from the shock produced by the first world war Beginning in Zurich about 1915, it spread to other continental cities, such as Berlin and Paris, dying out in 1922 The movement was deliberately anti-art, destructive, and without meaning, it intended to scandalise by such tricks as "compositions" made out of anything that came to hand—buttons, bus tickets, pieces of wire, bits of tin, etc Other excesses included incoherent poetry, Dada night-clubs, plays, and short-lived newspapers Many Dadaist painters became Surrealists at a later stage, but where Surrealism is a deliberate attempt to present subconscious and dream-like images, Dadaism was sheer anarchism Among its chief exponents were Hans Arp, Marcel Duchamp, Andre Breton, Guillaume Apollinaire, and Max Ernst, all of whom subsequently became noted in more reputable ways

Daddy Longlegs, or Crane-fly, a slender long-legged fly of the family Tipulidae The larvae which do damage to lawns and plants are called leather-jackets The Americans call Harvest men (*q v*) daddy longlegs

Dafila, a genus of river duck, with long, supple tail, found in Europe, Asia, and America, related to the pintail duck

Daguerreotype, a first practical photographic process, invented in Paris by M Daguerre during the years 1824–39 The light-sensitive plate was prepared by bringing iodine in contact with a plate of silver After exposure a positive image came by development of the plate in mercury vapour Even for open-air scenes the first daguerreotypes involved exposure of 5–10 minutes The wet collodion process (1851) rendered the technique obsolete

Dail Eireann, the name of the national parliament of the Irish Republic

Dalmatic, a wide-sleeved ecclesiastical vestment, reaching below the knee Worn by bishops and deacons over the alb or stole

Dama, the generic name of the fallow deer, which is fawn coloured or brown, with white spots

Damaskeening, the art of inlaying one metal upon another, largely practised in the East in mediaeval times, especially in the decoration of sword blades

Dandies, the name given to a class of exquisites prominent in early Victorian days, and who attracted attention by excessive regard for dress Their feminine counterparts were the dandizettes

Danegeld, a tax imposed in England in Anglo-Saxon times to raise funds for resisting the Danes or to buy them off Edward the Confessor abolished the tax, but it was revived by the Conqueror and subsequently retained, under another name, after the danger from the Danes was past. It is the basis of all taxation in this country. Domesday Book (*q v*) was originally drawn up for the purpose of teaching the State how to levy the tax

Danelaw, the law enforced by the Danes in the kingdoms of Northumbria, East Anglia, and in the districts of the five (Danish) boroughs—lands grouped round Leicester, Nottingham, Derby, Stamford, and Lincoln—which they occupied during the Viking invasions of the 9th and 10th cent The country occupied was also called the Danelaw or Danelagh

Darter, 1 Snakebirds, a genus of the pelican family, with long, pointed bill and serpent-like neck and resembling cormorants in appearance There are 5 species 2 Numerous species of small freshwater fish belonging to the Perch family, found in N America

Date Palm, *Phoenix dactylifera*, one of the oldest known food plants widely cultivated in N Africa and W Asia. It grows to 100 ft. and continues to bear for 2 or 3 centuries, its fruit being of great value as a food From the leaves the Africans make roofs for their huts, ropes are made from the fibrous parts of the stalks; and the sap furnishes a stimulating beverage

Dauphin, the title borne by the eldest sons of the Kings of France from 1349 to the Revolution of 1830

Day is the most natural unit of time and may be defined as the period of rotation of the earth relative to any selected heavenly body Relative to the sun it is called the *solar day* Relative to a fixed star it is called the *sidereal day*. Owing to irregularities in the earth's movements, the time taken for the earth to rotate through 360° relative to the sun is variable, and so the *mean solar day* of 24 hours has been introduced, which is the average throughout the year The *mean solar day* is our standard, used for purposes of the calendar, and astronomers use *sidereal* clocks to check mean solar time In practice, for convenience, the sidereal day is determined by the earth's rotation relative to the vernal equinox or first point of Aries, and is equal to 23 hours 56 minutes and 4 091 seconds of mean solar time (*i e*, about 4 minutes shorter than a solar day)

D.D T (dichloro-diphenyl-trichloroethane) A very powerful insecticide which has had wide success in the control of diseases, such as malaria and typhus, which is carried by insects. Mosquito swamps are sprayed with D D T. to kill the carriers

Deacon, an ecclesiastical official, who assists in some of the smaller ministerial duties in church or chapel, in the Anglican Church he ranks below a priest

Dead Languages are such as the ancient Greek and Roman tongues, which are no longer spoken but are preserved in literature

Dead Sea Scrolls, a group of ancient Jewish documents, consisting of scrolls and fragments which have been recovered since 1947 in the vicinity of Qumran near the Dead Sea and which represent one of the most important finds ever made in the field of biblical archaeology and Christian origins The scrolls, written in Hebrew or Aramaic, were found in caves, the first by chance by an Arab shepherd in 1947. These consisted of biblical texts older by a thousand years than the earliest Hebrew manuscript of the Old Testament (A D 895) Many fragments have since been discovered, comprising the whole of the Old Testament with the exception of Esther In addition there are commentaries and other non-biblical writings, including one called "The War of the Sons of Light with the Sons of Darkness" The writing on the scrolls indicates that they were written over a period of two centuries, the greater proportion before the birth of Christ A nearby ruin is believed to have been the home of a religious sect to whom the scrolls belonged By the aid of the latest scientific techniques, including radiocarbon tests, the age of the scrolls is being accurately determined

Dean, a Church of England dignitary, ranking below a bishop, and the head of the chapter of a cathedral A rural Dean supervises a *deanery* or group of parishes There are also Deans of Faculties in some universities, and at Oxford and Cambridge the *Dean* is in charge of chapel services and disciplinary arrangements.

Death-watch. The so-called death-watch, with its mysterious ticking in the night-time, is due to nothing more serious than the furniture-beetle. The larva of this insect burrows in the furniture making the pinholes which are often to be seen in old furniture It is three years in its pupal stage, and at last becomes a little brown insect with a great talent for shamming dead, so that it is not very much observed These beetles often strike the wood of their galleries with their heads, and so produce a ticking sound which is a call to the mate The ticking is most frequent in the summer months, but in warmed rooms it may be heard at any time

Decapods. Crustacea with ten (five pairs of) appendages *e g*, lobsters, crabs, shrimps, and prawns.

December, the twelfth month of the year, and the tenth of the old Latin calendar The Anglo-Saxons called it Mid-winter monath and Yule monath

Deciduous Trees are such as shed their leaves at

certain seasons as distinguished from evergreens or permanent foliaged trees or shrubs.

Decimal System is based on the unit of **10.** **Duodecimal System** is based on the unit of **12.** Fractional numbers are expressed as divisions of 10 and 12 respectively. Thus

Fraction	*Decimal*	*Duodecimal*
$\frac{1}{2}$	0.5	0.6
$\frac{1}{3}$	0.3333	0.4
$\frac{1}{4}$	0.25	0.3
$\frac{1}{5}$	0.2	0.2497
$\frac{1}{6}$	0.1666	0.2
$\frac{1}{8}$	0.125	0.16
$\frac{1}{12}$	0.0833	0.1
$\frac{1}{24}$	0.04166	0.06

Decimal currency was imposed on France in 1795. A changeover to decimal coinage has been accepted in principle by the British government. *See* **Metric System.**

Declaration of Independence was an Act by which the American Congress, on July 4, 1776, declared the American colonies to be independent of Great Britain. "Independence Day" is a holiday in the United States.

Deemster is the title of the two judges in the Isle of Man.

Defender of the Faith (*Defensor Fidei*), a title conferred upon Henry VIII by Pope Leo X in 1521 for entering the lists against Luther with his book on *The Assertion of the Seven Sacraments*. In 1554 the title was confirmed by Parliament and has been used ever since by English sovereigns.

Deflation is a policy designed to bring down costs by reducing the supply of means of payment. It is usually advocated as a remedy for inflation, and in this connection is often referred to as Disinflation. It usually results in a fall in employment. The "credit squeezes" in Great Britain were designed to have a disinflationary effect.

Dehydrate, to remove all the water from a substance. The process of dehydration is now used in the food industry, as a result of wartime research, in making such things as dried egg and packet soups. Most vegetables contain over 90% of water, and much of this can be removed under vacuum at low temperatures without appreciably impairing the flavour. The lightness of the dehydrated products is an advantage to expeditions and the army in transporting supplies.

Deliquescence, the process of dissolving by the absorption of moisture from the atmosphere. For instance, chromic acid crystals on exposure to the air quickly deliquesce.

Delta, a triangular tract of land between diverging branches of a river at its mouth, and so called from its general resemblance to the Greek letter Δ *delta*. The best-known examples are the deltas of the Nile, the Ganges, the Niger, and the Mississippi.

Deluge, a flood, commonly applied to the story of the Deluge in the Bible, in which Noah and the Ark figure. A similar tradition lingers in the mythologies of all ancient peoples.

Democratic Party, one of the two great American political parties, originated about 1787, advocating restrictions on the federal governments and in opposition to the federalists. It was in 1825 that a group who were in favour of high tariffs seceded later to become the Republican Party. Kennedy, Democrat, became President in 1961 after Eisenhower, Republican, had been President for eight years.

Demoiselle, the Numidian crane, a wading-bird. Also, a sub-order of dragon flies which close their wings over their backs when at rest.

Dendrite, any stone or mineral on or in which appears natural tracery resembling trees, leaves, or flowers, the result of the action of the hydrous oxide of manganese.

Density, a measure of the mass per unit volume of a material, usually expressed in grams per cubic centimetre. *Specific gravity* is the ratio of the density of a material at the temperature under consideration to that of water at the temperature of its maximum density (4° C.). In grams per cubic centimetre the density of gold is 19·3, silver 10·5, lead 11·3, water 0·99997, air 0·00129.

Depreciation of a currency is a fall in its relative value in terms of gold or of other currencies. The term is most often used to indicate a fall in the value of one country's money in relation to others.

Depression, a region where barometric pressure is lower than that of its surroundings. These areas of low pressure enclosed by the isobars are usually less extensive than anticyclones and may vary from 100 to 1,000 miles in diameter. The winds, often of gale force when the depression is deep, blow round the system in an anticlockwise direction in the Northern Hemisphere (in the reverse direction in the Southern Hemisphere) and inwards across the isobars. The majority of depressions which cross the British Isles travel from the Atlantic, sometimes in series or families, at rates of between a few miles and 700 miles in a day, bringing their generally unsettled weather with them.

De Profundis (out of the depths), the first two words of the Latin version of the 130th Psalm, and commonly used to designate this psalm.

Descant. An additional contrapuntal part, often much ornamented, woven in with an existing part. The vocal descant is one of the earliest uses of counterpoint.

Deserts, vast, barren, stone or sandy wastes where there is almost no rainfall and little or no vegetation. These regions are found in the interior of the continents Africa, Asia, and America between 20° and 30° north and south of the equator. Europe is the only continent without deserts. The most famous are the Sahara, the largest in the world, the Gobi desert of central Asia, the Kalahari desert of south-west Africa, and the great Australian desert.

Detention Centres in Britain are for young people (boys and girls) aged at least 14 but under 21 who have been found guilty of an offence for which an adult could be sent to prison. They provide an additional means of treating young offenders who do not need a long period of residential training but cannot be taught respect for the law by such measures as fines or probation.

Detergent, a cleansing agent. Grease and fats are not soluble in water, but detergents cause water to spread out (*see* **Surface Tension**) and wet the surface of greasy articles, so dissolving the grease and removing dirt. Detergent molecules have two distinct parts: one is water soluble, the other is fat soluble, and they act by dissolving in both fat and water and taking the fat, as a fine suspension, into the water.

Determinism and Free-will. *See* **J11.**

Deuterium or "heavy hydrogen." The second isotope of hydrogen, the third is called tritium. Deuterium atoms have in their nuclei a neutron as well as a proton, tritium nuclei have two neutrons and one proton. In ordinary hydrogen gas about one out of every 5,000 atoms is a deuterium atom. Deuterium was discovered in 1932 by Professor Harold Urey. The oxide of deuterium corresponding to water is called "heavy water." The nucleus of the deuterium atom is called a deuteron.

Devaluation is a definite, official downward valuation of a country's currency in terms of its exchange value with other currencies.

Devil-fish, a strange marine fish of large size and of several species. As it is met with in European waters it is called the fishing frog, and the chief American species is the giant ray.

Devonian System in geology refers to the strata between the Silurian and the Carboniferous Formations. It includes the Old Red Sandstone Formation. The fauna of the Devonian include the group of fishes known as the Rhipidistra (on the evolutionary route towards the amphibians), Actinistia (coelacanth), and the Dipnoi or lung fishes. *See* **F30.**

Dew, moisture deposited by condensation of water vapour on exposed objects especially during calm, cloudless nights. The loss of heat from the ground after sunset, by radiation, causes the layer of atmosphere close to the surface to be chilled below the temperature, known as the dew-point, at which the air is saturated with vapour. Part of the vapour condensed may be transpired from blades of grass and foliage of plants.

Dew Pond is a shallow artificial pond which is on high ground and rarely dries up, even during prolonged droughts, despite being used by cattle and sheep as a drinking source. The name arose from the belief that dew deposits at night provided the moisture for replenishment.

Drainage of rain-water and mist condensed on neighbouring trees and shrubs are probably more important factors.

Dextrin, a white, odourless, viscid substance of the same composition as starch, from which it is obtained. It is used as gum, being the material put on the backs of postage stamps and other articles which are required to be made adhesive. It also is utilised in calico printing.

Dhole, *Cuon javanicus*, the wild dog of the Deccan, of a bright bay colour, and living on game, which it hunts in packs.

Dialectical Materialism. *See* J12.

Diapason. The concord of the first and last tones of an octave and the fixed rule by which organ pipes are arranged to proper pitch. The open metal flue pipes which form the basis of an organ are called the diapason "stops." Their pitch is expressed in terms of length, *e.g.*, 4-ft diapason, 8-ft diapason, 16-ft diapason. The pitch of other pipes is related to that of the diapason: *e.g.*, a trumpet, which is a reed stop, may be said to have an 8-ft tone, *i.e.*, its pitch is the equivalent of an 8-ft diapason.

Diatoms. One-celled algae, common in fresh and salt water. Distinctive feature is the siliceous wall which is in two halves, one fitting over the other like the lid of a box. These walls are often very finely and beautifully sculptured. The diatoms constitute a class of the plant kingdom known as the Bacillariophyta. *Diatom ooze* is a deep-sea deposit made up of diatom shells. *Diatomite* or *diatomaceous earth* is the mineral form that such diatom oozes assume (sometimes known as kieselguhr which mixed with nitroglycerine yields dynamite).

Diatonic Scale. The ordinary major and minor scales on which most European music is built, *e.g.*,

C major	C – D – E – F – G – A – B – C
Tone intervals	1 – 1 – ½ – 1 – 1 – 1 – ½
C minor	C – D – E♭ – F – G – A♭ – B – C
Tone intervals	1 – ½ – 1 – 1 – ½ – 1½ – ½

Dies Irae (the Day of Wrath), a famous 13th-cent. Latin hymn, sung at burial services, and taking its place in translated form in the English hymnology.

Diesel Engine. A compression-ignition engine. The air in the cylinder is compressed to over 500 lb per sq in and its temperature is about 800° F., oil injected into the hot compressed air ignites immediately. The modern oil engine has been evolved mainly from the principles enunciated by Herbert Akroyd-Stuart in his patent of 1890 and, like the steam and other inventions, represents the improvements achieved by many men including those by Rudolf Diesel of Germany, in respect of high compression pressures and greater fuel economy.

Diet, in German history, an assembly of dignitaries or delegates called together to debate upon and decide important political or ecclesiastical questions. The most famous imperial Diets were those held at Worms (1521), Speyer (1529), and Augsburg (1530), all of which dealt with matters of religious conflict arising from the Reformation.

Diffusion is the process of mixing which occurs when two liquids or gases are in contact. It is most rapid between gases, and, as laid down by Graham's law, "the rates of diffusion of different gases are in the inverse proportion to the square roots of their relative densities." Diffusion arises through the continual movement of molecules. Even in solids diffusion can occur. If a block of gold and a block of silver are welded together, after some time particles of gold are found in the silver, and *vice versa*.

Dimensions in common speech are the magnitudes of length, breadth, and thickness giving the size of an object, thus a line has only one dimension: length, a plane surface two: length and breadth, and a solid three: length, breadth, and thickness. In mathematics, hypothetical objects with any number of dimensions are considered. In physics and mechanics, dimensions are numbers which relate the units in which any quantity is measured to the so-called fundamental units. The latter are usually but not necessarily those of length, mass, and time. "Dimensional analysis" is an important technique of scientific reasoning. *See* N28.

Dimorphism, the quality of assuming two distinct forms. For instance, carbon, which is graphite in one form, is the diamond in another.

Dingo (*Canis dingo*), the wild dog of Australia, which is very like a wolf. It is sandy brown with a bushy tail and is very destructive to sheep.

Dinosaur, the name given to a group of extinct reptiles of the Mesozoic period, some of which were of immense size—much larger than crocodiles. *See* **Diplodocus**.

Diocese, a territory under the pastoral authority of a bishop. The term originated in the time of the Roman Empire, and represented then rather an administrative territory than an ecclesiastical one.

Diopside, a variety of pyroxene occurring in prismatic crystals, chemically calcium magnesium silicate. Two light-green varieties, malacolite and alalite, are gemstones.

Dioptase, or emerald copper, a scarce copper ore occurring in prismatic emerald green crystals, and composed of silicate of copper.

Diorite, an igneous rock of crystalline structure composed of felspar and hornblende. It used to be classed as greenstone.

Dip Needle. Instrument for measuring the *dip* or inclination of the earth's magnetic field.

Diplodocus, one of the best known of the extinct mammoth dinosaurs. Fossil remains have been discovered in the Jurassic rocks of the United States. Some reached a length of over 80 ft.

Dipnoi *or* **Lung Fishes**. These have the air bladder adapted to function as a lung, and they can remain alive when the stream or marsh in which they live dries up. Species of lung fish occur in Australia, Africa, and S. America. *See* **Devonian System**.

Diptera, an order of insects. Their main characteristic is that they are two-winged, and the common house-fly is the best-known example. There are at least 50,000 species of these insects, including gnats, blow-flies, mosquitoes, tsetses.

Diptych was a folding two-leaved tablet of wood, ivory, or metal, with polished inner surfaces, utilised for writing with the style by the ancient Greeks and Romans. The same term was applied to the tablets on which the names of the persons to be commemorated were inscribed in the early Church. In art any pair of pictures hinged together is styled a diptych.

Dirge, a hymn or song of mourning and lamentation, which may be music only, or a song only, but is usually a combination of music and words.

Discus, a circular piece of metal or stone about 12 in in diameter, used in athletic contests by the ancient Greeks and Romans. Throwing the discus was a very favourite game, which was deemed worthy of celebration in Myron's famous *Discobolus* (*c.* 460 B.C.–450 B.C.), the best copy of which is in Rome.

Disk, an astronomical term denoting the seemingly flat surface of celestial bodies as seen by the eye.

Distillation, a process used to separate liquids of different boiling points. This is effected by placing the mixture in a distillation apparatus and heating. The liquid with the lower boiling point distils over first, the vapour being condensed and collected, forming the first *fraction*. With continued heating the second liquid reaches its boiling point, distils over and the mixture is said to be *fractionated*. Mixtures of liquids with close very high boiling points require more elaborate apparatus. Fractional distillation is a common process in the chemical industry, particularly in the refining of petroleum.

Divertissement, a short musical entertainment which is usually accompanied by dancing.

D.N.A. (**Deoxyribonucleic acids**). *See* **Nucleic Acids**.

Docket, a summary copy of any decree, a brief list, or label: derived from dock, to curtail.

Docks are enclosed water spaces where ships rest while being loaded or unloaded, or waiting for cargo. There are three main types: the wet dock (*e.g.*, King George V dock, London) is for loading and unloading, the dry dock, or graving dock (*e.g.*, King George V dock, Southampton) is for overhauling and repairing vessels, and is

so constructed that, after a ship has been docked, the water can be drawn off, the floating dock is a type of dry dock.

Dodo, an extinct bird, giant and flightless, which lived on the island of Mauritius up until 250 years ago. Another species, the white dodo, lived on Réunion. Some reached exceptional sizes. By the end of the 17th cent. Mauritius, Rodriguez, and Réunion had all been colonised, and the dodo along with many other birds vanished forever because of their inability to stand up to man and the animals imported into the islands.

Dog-days, a period of 40 days (3 July–11 Aug.) when Sirius rises and sets with the sun. The ancient superstition, which can be traced back in Greek literature to Hesiod (8th cent. B.C.), was that this star exercised direct influence over the canine race.

Doge, the chief magistrate in the former republics of Venice (697–1797) and Genoa (1339–1797, 1802–5).

Dogfish, a large family of small sharks, seldom more than 3 ft. in length. The flesh is sold as "rock salmon." The eggs are contained in horny cases called "mermaid's purses."

Dog Licences are necessary for household dogs of six months of age or over. The cost per dog is 7s. 6d., and the licence can be obtained at any Post Office. Dogs for tending sheep or cattle, or for leading blind persons, are exempt.

Dolce, a musical term indicating that the music has to be rendered softly and sweetly.

Doldrums, a nautical term applied to those areas of the Atlantic and Pacific towards which the trade winds blow and where the weather is calm, hot, and sultry but liable to change suddenly to squall, rendering navigation difficult. To be "in the doldrums" is to be "down in the dumps."

Dolomite, a name applied to a limestone containing appreciable magnesium, also the mineral dolomite, a double carbonate of magnesium and calcium.

Doloroso, a musical term denoting a sorrowful or plaintive style of playing.

Dolphin, an ocean mammal of the whale order, from 6 to 8 ft. long, with a long, sharp snout, and of an active disposition. They abound in most temperate seas and swim in shoals. A few species live in large rivers (Ganges and Amazon). They can cruise for long periods at around 15 knots and produce bursts of speed in the region of 20 knots, the water apparently flowing smoothly past their bodies.

Dome, a large cupola, hemispherical in form, rising over the main building of a cathedral or other prominent structure. The finest existing dome, that of the Pantheon at Rome, is also the oldest, dating from the time of the Emperor Hadrian. It is 142 ft. in diameter and about the same in height. The dome of St. Peter's, in the same city, has a double shell, is 330 ft. high and 140 ft. in diameter. The dome of the cathedral at Florence is 139 ft. in diameter and 310 ft. high, and that of St. Paul's, London, has 3 shells and is 112 ft. in diameter and 215 ft. high. The circular reading-room of the British Museum has a dome 140 ft. in diameter and is 106 ft. high. Malta's Mosta dome is also famous.

Domesday Book is the famous register of the lands of England framed by order of William the Conqueror. According to Stowe, the name was derived from *Domus dei*, the name of the place where the book was deposited in Winchester Cathedral; though by others it is connected with doom in the sense of judgment. Its compilation was determined upon in 1084, in order that William might compute what he considered to be due to him in the way of tax from his subjects. William sent into each county commissioners to make survey. They were to inquire the name of each place, the possessor, how many hides of land were in the manor, how many ploughs were in demesne, how many homagers, villeins, cottars, serving men, free tenants, and tenants in soccage, how much wood, meadow, and pasture, the number of mills and fish ponds, what had been added to or taken away from the place; what was the gross value at the time of Edward the Confessor. So minute was the survey that the Saxon chronicler of the time reports "there was not a single hide, nor one vintage of land, nor even, it is shame to tell, though it seemed no shame to do, an ox, nor a cow, nor a swine was left that was not set down." The record, which did not take in Northumberland, Cumberland, Durham, and parts of Lancashire and Westmorland, was completed on Nov. 15, 1085, and was comprised in two volumes—one a large folio, sometimes called the Little Domesday, which deals with Essex, Norfolk, and Suffolk, the other a quarto, sometimes called the Great Domesday. The first is written on 384 double pages of vellum in one and the same hand, and in a small but plain character, each page having a double column. The quarto is written on 450 pages of vellum, but in a single column and in a large, fair character. The original is preserved in the Public Record Office. *See also* Danegeld.

Domesday Machine, a hypothetical weapon which would give its owners the power to wipe out the whole of humanity. This evil idea follows logically from present-day arms-race military thinking. The argument is that with the development of nuclear weapons of ever greater explosive power one or both sides in the "cold-war" may become so powerful that only a weapon so terrible could act as the ultimate "deterrent." The A-bomb (now a mere "tactical" weapon) and the H-bomb have also played this rôle.

Dominant, in music, the fifth tone of the modern scale, and the reciting tone in the Gregorian scale.

Dominicans, an order of mendicant preaching friars founded by St. Dominic in Languedoc in 1215 and confirmed by the Pope in 1216. The rule of the order was rigorous. The dress was a white habit and scapular with a long black mantle. This gave them the name of Black Friars. Their official name is Friars Preachers.

Don, originally a Spanish title of nobility, but now accorded as a courtesy title. Also applied to a person with an academic appointment at the Universities of Oxford and Cambridge.

Donjon, the keep, or inner tower of a castle, and the strongest and most secure portion of the structure. This was the last refuge of the garrison, and there was usually a prison on the lower floor, hence the name *dungeon*.

Don Juan, the legendary hero of many famous works, supposedly based on the life and character of the unscrupulous gallant Don Juan Tenorio of 14th-cent. Seville. The first dramatisation of the legend and the most famous is Tirso de Molina's *El Burlador de Sevilla*. Don Juan was also the subject of Molière's *Le Festin de Pierre*, Mozart's *Don Giovanni*, Byron's *Don Juan*, and Jose Zorilla's *Don Juan Tenorio*. The latter is played on All Saints' Day throughout Spanish-speaking countries.

Don Quixote, the "knight of the doleful countenance," the hero and title of Cervantes' classic novel of 16th-cent. Spain. Don Quijote de la Mancha, a gentle country gentleman of lofty but unpractical ideals, having read many chivalric romances, believes he is called upon to redress the wrongs of the world. Mounted on his nag Rosinante and accompanied by his companion Sancho Panza, a hard-headed and practical peasant, he sets out on his journeys of knight-errantry.

Dormouse, a family of small, squirrel-like rodents widely distributed throughout Europe and Asia, and living mainly on fruit and nuts. It is of nocturnal habits and sleeps through the winter.

Dot, a French term indicating the property which a wife brings to her husband on marriage and is usually settled on the woman, being her separate property, though the income from it may go towards the general household expenses.

Dotterel, a handsome bird of the plover family found in northern Europe and Siberia. Nests in the Cairngorms, the Grampians, and E. Ross. Very tame.

Double-Bass. The largest and deepest-toned instrument of the Violin family. The Violoncello corresponds with the vocal bass so that the pitch of the Double Bass has no vocal counterpart—hence its name.

Double-entendre, a corruption of the French phrase "double entente," and used in English to indicate a word or sentence of indelicate double meaning.

Doukhobors. *See* **J12.**

Drachm (or **Drachma**), an ancient Greek silver coin and weight. One drachma was equivalent to six obols. The word has survived as the name of a weight: Avoirdupois, one-sixteenth part of an ounce. Apothecaries' Weight, one-eighth part of an ounce.

Drag. Term used in mechanics for resistance offered by a fluid to the passage of a body moving through it. When speed of sound is reached drag increases abruptly. The lift/drag ratio gives the aeroplane designer his measure of aerodynamic efficiency.

Dragon, a fabulous monster common to folk-lore in most countries, generally represented as a winged reptile with fiery eyes and breath of flame. A dragon guarded the garden of the Hesperides, in the New Testament there is mention of the "dragon, that old serpent, which is the devil". St George, England's patron saint, is supposed to have overcome the dragon. mediaeval legend abounds in dragons. In heraldry it has also a conspicuous place, and in China was the imperial emblem.

Dragonade, the term given to the series of persecutions of Huguenots in France in the reign of Louis XIV, just before and after the revocation of the edict of Nantes, dragoons being chiefly employed in the work. Since then the term has been used in reference to any onslaught on the people by soldiers.

Dragonet, the name of the fish of the *Callionymus* genus, beautifully coloured, and about a foot in length. They are common on the British coast and in the Mediterranean.

Dragon Fly, the common name of a well-known order of insects having two pairs of membraneous wings, and often of very brilliant colours. They are swift of flight and may be seen hovering over sheets of water in the sunshine all through the summer. Their chief food is mosquitoes.

Dragon's Blood, a dark-red resinous substance obtained from the fruit of a Malay palm, and possessing medicinal virtues. In a special technique used for making line blocks in printing, dragon's blood is used.

Drama. The word *drama* comes from a Greek word meaning to do or to act, and it is from Greece that the play originates (at least, so far as the West is concerned). Plays have their origin in the long-ago past when players dressed up as various supernatural beings to perform rituals designed to make the gods carry out desired actions. Three or four hundred years B.C. such playwrights as Aeschylus, Sophocles, and Euripides began to write plays partly religious and partly secular for the pleasure of their audiences: this was one of the greatest periods the theatre has seen, and such plays as *Oedipus Rex* and *Antigone* still give pleasure in our own theatres. Roman drama was of little significance in general, and the next important stage in the history of the theatre is the Catholic mystery play of the Middle Ages, which, at the time of the Renaissance, developed into the play as we know it now. In England the great Elizabethan playwrights Webster, Ford, Shakespeare were in the forefront of this movement. Cromwell disapproved of the theatre, and the next important stage is the Restoration Drama following the Restoration of the monarchy in 1660. The only European achievement comparable to that of Britain in the history of the stage is that of France with such great playwrights as Molière and Racine. In the 19th and 20th cent. the great playwrights have been Oscar Wilde, Shaw, and others in Britain, Pirandello in Italy, Ibsen in Norway, Strindberg in Sweden, Hauptmann in Germany; Chekov and Turgenev in Russia. There are signs that the drama in verse is once more becoming popular in this country with such writers as T. S. Eliot and Christopher Fry. A summary such as the foregoing cannot include the great dramas stemming from another tradition in Asia—the plays of Japan, China, and India. The characteristics of modern English drama are dealt with in **Section I.**

Drawbridge, a bridge that can be lifted up so that no passage can be made across it. It was a usual feature of a fortified castle in the Middle Ages, and was raised or lowered by chains and levers. It spanned the fosse, and on the approach of an attacking party was raised and formed a special barricade to the gate. Modern drawbridges are such as are raised to allow of the passage of boats up and down a river or estuary. The Tower Bridge is a famous London bridge of this type.

Drongo. The King Crow or Indian Black Drongo is frequently seen in India perched on branches or telegraph wires, darting suddenly to catch insects and to attack crows and hawks. Other members of the family are found in Asia, Africa, and Australia. Its plumage is black with steel-blue gloss.

Drosophila *or* **Fruit Fly.** More has been learnt by geneticists from breeding experiments with this insect than with any other.

Dross, the name generally applied to the refuse of molten metal, composed of slag, scales, and cinders.

Drought, a period of dry weather, is a normal and recurring condition in many warm climates, and is frequently provided against by irrigation. In the British Isles really long rainless spells are somewhat rare, and an "absolute drought" is defined officially as a period of at least fifteen days on each of which the rainfall is less than $\frac{1}{100}$ inch. The summer of 1959 was wholly without precedent in all parts of Britain for lack of rainfall, abundant sunshine, and warm weather. In South Yorkshire an absolute drought lasted 59 days, the longest period in British records.

Drum. There are three main kinds of drum: the bass drum, the side drum, and the kettle drum.

BASS DRUM: a large shallow wooden cylinder whose ends are covered with skin or parchment rendered taut. It is used in a vertical position and beaten on both sides with padded leather hammers. Much used by military bands to beat out the rhythm of a march.

SIDE DRUM. A smaller version of the bass drum, sometimes with a metal body. It is used horizontally and played on the upper side with a pair of wooden drumsticks or, in dance bands, with a wire brush. Jazz-drummers use a combination of bass drum and several side drums on which complicated solo passages may be performed. To increase the rattle, strings of catgut may be strung across the lower parchment. The drum is then called a snare drum.

KETTLE DRUM: a large copper bowl whose mouth is covered with parchment. The tension of the parchment may be altered by means of hand-screws so that the drum may be tuned to a particular note. In a normal orchestra there are two kettle drums known collectively as the tympani.

Drupe is the scientific term for stone fruit. The stone forms the inner part (endocarp) of the fruit, and encloses a seed or kernel which is liberated after the fleshy part (pericarp) has rotted.

Dry-rot, the term was first used about 1775 to describe the fungal decay of timber in buildings. Creosote distilled from coal tar is the standard material for preservation of timber, and pentachlorophenol and copper naphthenate are two compounds now extensively used. Dry wood always escapes dry-rot. Chief fungi causing dry-rot are *Merulius* and *Poria*. *See* **Q18.**

Duck, water bird smaller than the related goose and swan, which together form the family Anatidae. Duck refers to the female, drake to the male. The duck family falls into two separate groups: the river or freshwater (surface feeding) ducks, such as the mallard, pintail, wigeon, shoveler, mandarin, teal, garganey, and the sea (diving) ducks, such as the goldeneye, pochard, scoter, eider, and the fish-eating mergansers or "sawbills". The ancestor of all domestic breeds, with the exception of the muscovy, is the mallard.

Duck-bill, *Ornithorhynchus anatinus*, also duck-billed platypus, a fur-covered, egg-laying, nest-building mammal inhabiting Australia and Tasmania. It has webbed feet and a muzzle like a duck's bill and is about 20 in. long.

Ductility is a property possessed by most metals which renders them capable of being stretched without breaking. Gold is the most, and lead the least ductile of metals, the order being gold, silver, platinum, iron, copper, palladium, alu-

minium, zinc, tin, lead. In animated nature the spider and the silkworm produce secretions of notable ductility.

Duet A musical composition for two voices or two instruments. A pianoforte duet may be performed by two players on the same instrument.

Dugong A marine mammal belonging to the order Sirenia (sea-cows). Inhabits Red Sea and Indian Ocean, also found as far East as the Philippines and Australia Lives on sea-weed. Related to the Manatee.

Duke, the highest rank in the British peerage next to that of a royal prince Edward, the Black Prince, eldest son of Edward III, who died before his father, was the first English duke, being created Duke of Cornwall in 1337 Since then all Princes of Wales have held that title.

Dukeries, a range of English woodland and park country, mainly in Nottinghamshire, comprising the adjacent demesnes of several English dukes and nobles. The Dukeries include Sherwood Forest and the estates of Welbeck Abbey, Clumber Park, Worksop Manor, and Thoresby Hall.

Dulcimer. An instrument of stretched wires which are struck by hammers held in the hands. It is the logical precursor of the pianoforte.

Dunes. Sand dunes are elliptical or crescent-shaped mounds of loose sand produced by wind action. The dune has a gentle slope on windward side; a steep slope on the leeward side

Dunlin, very common small wading-bird of the Sandpiper family nesting in Britain. Its range extends to other areas where it also breeds

Dunmow Flitch, a custom which originated in the parish of Little Dunmow, Essex, in the reign of Henry III, which was that the husband who was prepared to swear before the prior, convent, and townsfolk of Dunmow that he had not repented of marriage or quarrelled with his wife for a year and a day, should be rewarded with the gift of a flitch of bacon The custom has frequently been revived, the most recent being that held at Great Dunmow on 29 June 1963

Dunnock (*Prunella modularis*), a small bird of rich brown and dark grey plumage common in gardens and hedgerows Sings a cheerful song all the year round Called hedge-sparrow in southern England Another member of the same family, the larger Alpine Accentor (*Prunella collaris*), is found on rocky mountain slopes of Europe and Asia

Duodecimo a sheet of paper folded into twelve leaves, written " 12mo "

Durbar, a term used in India for a State reception, from the Persian word *darbár* meaning " court " or " audience " It may be either a council for administering affairs of state, or a purely ceremonial gathering Native rulers of India received visitors and conducted business in durbar. The word was applied to great ceremonial gatherings like Lord Lytton's durbar for the proclamation of the Queen-Empress in 1877 and the Delhi durbar of 1911

Dust, solid particles of matter floating in the atmosphere, produced chiefly by volcanic eruptions, sand-storms in desert regions, and industrial and domestic smoke When the island of Krakatoa erupted in 1883, more than 1 cubic mile of dust was thrown into the air and carried three times round the earth by the explosion wave The particles in dust-storms are much finer than those in sand-storms and are swept up to far greater heights The local whirlwinds which form over loose dry soils are termed dust-devils

Dyke A wall-like intrusion of igneous rock which cuts across the bedding or other layered structure of the country rock, the word also signifies in alternative usage, a sea-wall and an open drain.

Dynamite, a powerful explosive whose chief element is nitro-glycerine. It was discovered by Nobel in 1867, who absorbed nitro-glycerine in kieselguhr; has a disruptive force of about eight times that of gunpowder.

Dynamo. Machine for transforming mechanical energy into electrical energy Depends on principle of electromagnetic induction whereby a current is produced in a conductor (*e g.*, copper wire) traversing a magnetic field The two essential parts of a dynamo are the conductors or *armature* and the *field magnets*.

Dynasty, a succession of monarchs of the same family, as the Carlovingian dynasty, the Bourbon dynasty, the Plantagenet dynasty, etc.

E

Eagle, large bird of prey with huge hooked bill, related to the buzzard, kite, hawk, harrier, falcon, and vulture, together forming the family Falconidae There are many species to be found throughout the world, the Golden, Imperial, Tawny, Spotted, and Lesser Spotted being found in Europe The Golden Eagle, a magnificent-looking bird, nests in the Scottish Highlands, and the White-tailed Sea Eagle, which used to breed in Britain, is now only an occasional visitor The eagle has been the symbol of royal power since the earliest times, and the American or Bald Eagle is the emblem of the United States.

Earl, a British title of nobility of the third rank, duke and marquis coming first and second The title dates from Saxon times, and until 1337 ranked highest in our peerage

Earl-Marshal, in England ranks as the eighth of the great officers of state, is head of the College of Arms, attends the sovereign in opening and closing the session of Parliament, arranges state processions (especially coronations) and assists in introducing newly created peers in the House of Lords. The office is hereditary in the family of the Dukes of Norfolk

Earth, our habitable globe, is the third of the planets of the solar system in order from the sun, and on an average throughout the year takes 24 hours to turn completely round relative to the sun, the whole earth revolving round the sun in a slightly elliptical orbit once in a year of 365 2564 days The mean distance of the earth from the sun is 93,004,000 miles. The shape of the earth is that of an oblate spheroid its equatorial and polar axes measuring 7 926 miles and 7,900 miles respectively The crust consists of an outer layer of surface soil of varying thickness, beneath which there is a mass of hard rock several miles deep, the percentage (by weight) of the principal elements present being oxygen 47 silicon 28, aluminium 8, sodium and potassium 5, iron 4·5 calcium 3·5, magnesium 2·2, titanium 0·5, hydrogen 0·2, carbon 0·2, phosphorus and sulphur 0 2 Mass of the earth is estimated to be 6,000 million million million tons. Two-thirds of the earth's surface is covered with water. It has only one satellite, the moon A recent estimate of the age of the earth's crust is 5,300 million years Recent discoveries suggest that the earth is embedded in the atmosphere of the sun and that some of the heat that reaches us from the sun gets here by direct conduction through interplanetary space *See* F8–9, 43

Earthquake, a sudden violent disturbance of the earth's crust, the region of the surface immediately above the " focus " or source where the earthquake originates, is termed the " epicentre " On account of their destructive power earthquakes have attracted attention from the earliest times, but accurate study dates only from the last century and the development of a world-wide network of recording stations from the present one The majority of severe earthquakes result from fractures, usually along existing faults, in underlying rock strata subjected to great strains, the shearing movement sometimes extending to the surface These dislocations set up vibrations which are propagated as waves throughout the bulk of the earth or round the crust Frequently the main shock is followed by a series of smaller aftershocks Minor local earthquakes may be attributed to the effects of volcanic activity, but most of the larger ones originate in non-volcanic regions along well-marked lines of weakness in the earth's crust Generally the ground is felt to tremble, undergoing oscillations which may gradually or suddenly increase to a maximum and accompanied by sounds Where there is movement of the sea-bed a tidal wave may result. One of the greatest of historic times was that which destroyed and flooded Lisbon in 1755 Among the notable shocks of the present century rank those of San Francisco (1906), Messina, Italy (1908),

Tokyo, Japan (1923), Napier New Zealand (1931), N E. Assam (1950), South Ionian Is (1953), Agadir (1960), Chile (1960)

Earth Satellites. *See* **F44, 47.**

Earthworm, of which there are several species, has a cylindrical body, tapering at both ends, and segmented into rings It moves by contraction of its rings, aided by retractive bristles, is eyeless, but has a mouth, gullet, and stomach Earthworms exist in immense numbers, and perform an important part in the scheme of nature by loosening the soil and rendering it more amenable to tillage They also form a valuable food for birds and many mammals and are unequalled as bait for certain kinds of fish *See* **F22(2).**

Earwig, a genus of insects possessing two pairs of wings and anal forceps It is nocturnal lives on vegetable matter, and hides by day under stones or in flowers, *e g*, dahlias The old belief that it deliberately creeps into people's ears is altogether unfounded *See* **T29(2).**

Easter, the annual Christian festival in commemoration of the resurrection of Christ, the English name being derived from Eostre, goddess of Spring. The date cannot fall earlier than March 22 nor later than April 25 Many disputes arose among the early Christians as to the proper time to celebrate this day which governs all other movable feasts It was eventually ruled at the Council of Nicaea in 325 that Easter Day should be the first Sunday after the full moon following the vernal equinox If this happens to be a Sunday, then Easter Day is the Sunday after It should be remembered, however, that this moon is a hypothetical moon of the ecclesiastical calendar, quite imaginary, and generally one or two days later than the real moon we see in the heavens In fact the reverend fathers at Nicaea did us a bad turn in having anything to do with the moon but then they had no Astronomer Royal to advise them of the complications *See also* **N20.**

Eastern Question, a term formerly applied to the problems arising from the instability of the Mohammedan power of Turkey and its relations with the other nations of Europe Later connected with other problems of the Near East, such as the possession of Constantinople and the position of the Balkan states

East India Company was incorporated by Elizabeth in 1600 In 1613 the Company set up a factory at Surat, India, and in 1662 Bombay came under the Company's influence and developed into an important trading port Dupleix wanted to establish French power in India and a struggle for supremacy took place Clive gained the victory for England and thenceforward British dominion in India remained undisputed except by native princes In 1772 Warren Hastings was appointed the first Governor-General and in 1784 Pitt's India Act established a Board of Control for the India Company A great increase of trade resulted, and this rule continued down to 1858, when, as a result of the mutiny, the Crown assumed the sovereignty With the passing of the Indian Independence Act of 1947, British dominion ended and India was handed back to the Indians

Eau-de-Cologne, a popular distilled perfume first manufactured at Cologne in the 18th cent by Johann Maria Farina, an Italian, and since made in large quantities in Cologne and elsewhere

Ebony, a name applied to various hard black woods, the best of which are grown in Mauritius and Ceylon. There are also Indian and American varieties. Only the inner portions, the heartwood, of the trees are of the necessary hardness and blackness Ebony is largely used in ornamental cabinet work, for piano keys, canes, etc

Ecce Homo (" Behold the Man! "), used in reference to the pictures and sculptures representing Christ crowned with thorns.

Ecclesiastical Courts, dealing exclusively with Church affairs, are those of the Archdeacons, the Bishops, and the Metropolitan (York or Canterbury), with the Judicial Committee of the Privy Council as the final Court of Appeal.

Echidna. *See* **F23(2).**

Echinodermata. *See* **F23(1).**

Eclipse, an obscuration of the light of the sun, moon, or other heavenly body by the passing of another body either between it and the eye or between it and the source of its light The sun is eclipsed by the moon intervening between it and the earth; the moon by the earth passing between it and the sun Total eclipses of the sun have occurred over parts of the British Isles in the years 1424, 1433, 1598, 1652, 1715, 1724, 1927, 1954 (visible from the Shetland Is), and the next will be seen only from near Land's End on Aug 11, 1999

Ecliptic is the sun's apparent path in the sky, the great circle described by the sun from west to east in the course of a year The sun is exactly on the equator on approx March 21, and Sept 23, and the points where the celestial equator and ecliptic intersect on these days are called the *equinoctial points* On approx. June 21 and Dec 22 the sun reaches its greatest and least midday elevation and its greatest distance north and south of the equator, and the points on the ecliptic on these days are called the *solstices* (*see* **Seasons, N20**) These four points are equidistant from each other by 90° The equinoctial points are not fixed The angle of inclination of the ecliptic to the equator is called the obliquity of the ecliptic, which is also variable, being influenced by the gravitational action of the other planets on the earth. At present the angle is 23½°

Ecumenical Council. *See* **Oecumenical Council.**

Edda, the name given to two important collections of early Icelandic literature—*the Elder or Poetic Edda*, poems handed down from the 9th and 10th cent , probably Norwegian in origin, and the *Younger* or *Prose Edda* of Snorri Sturluson compiled about 1230 They treat of mythical and religious legends of an early Scandinavian civilisation

Eddystone Lighthouse stands on a group of rocks about 9 miles from the Cornish coast and 14 from Plymouth The present structure is the fourth that has occupied this dangerous position The first was of wood, completed by Winstanley in 1700, but three years later washed away, its architect with it In 1709 a second and stronger wood lighthouse was built by Rudyard This lasted until 1755, when it was destroyed by fire Smeaton built the third lighthouse, of granite and Portland stone, on the model of an oak trunk, and this, which was finished in 1759, withstood the storm and tempest for over a hundred years, being superseded by the present building, erected in 1879–82 by Sir James Douglas It is wholly of granite Its light can be seen over 17 miles, and in foggy weather it gives an explosive signal every 5 minutes

Edelweiss, a white perennial flower of the daisy order, common in Alpine regions.

Edentata. *See* **F23(2).**

Education, History of. *See* **J13.**

Eels, edible fishes of the order Apodes, with snakelike body covered with minute scales embedded in the skin The common or freshwater eel *Anguilla anguilla* is found in the Atlantic coastal areas of N America and Europe and in the Mediterranean, and breeds S E of Bermuda The electric eel of S America is a variety of great interest, being able to cause electric shocks.

Egg-plant *or* **Aubergine,** a plant cultivated for its ovate fruit, varying in colour from dark purple to white

Egret, a slender, graceful bird of the heron family, of pure white plumage, famed for its beautiful silky plumes (aigrettes), which appear in the breeding season, and for which it was ruthlessly hunted and would have been exterminated had not international action been taken to protect it The Little Egret with black bill, black legs, and yellow feet breeds in the Mediterranean countries

Egyptian Vulture is smaller than other vultures Found in S Europe, frequents native villages and scavanges for offal

Elder, a large diving duck, found along the rocky coasts of northern latitudes, well known for the beautifully warm soft down, called " elder down," which the female bird plucks from her breast to line her nest. In Norway and Iceland the haunts of the elder are preserved and the birds protected by law on account of the much prized " elder down," which is collected from the nests just before the breeding season. " Elder

down" is so elastic that a pound or two of it will fill an ordinary bed covering.

Eiffel Tower, built by the French engineer Alexandre Gustave Eiffel (1832–1923) for the Paris Exhibition of 1889. The tower which is made of iron is 985 ft high and weighs about 7,000 tons

Eisteddfod (a sitting) was originally a congress of Welsh bards and minstrels, and dates from before the 12th cent These assemblies, discontinued for a long period, were resumed in 1819, and have been held yearly since, each lasting three or four days Their object is to foster the Welsh patriotic spirit, they are devoted to orations and competitions in poetry, singing, and harp-playing, prizes being awarded to the successful contestants

Eland, the largest species of antelope, a native of Africa, has large pointed horns, stands 5 feet high at the withers, and weighs several hundred pounds

Elateridae, a family of beetles of numerous species with short legs and indented antennae Commonly known as Click-beetles or Skipjacks Their larvae are the wireworms which cause so much damage to farm crops

Elder, small trees of the *Sambucus* genus, with pinnate leaves, and clusters of white flowers and, later, small purplish-black berries The black elder, the best known, is common in most parts of Europe, and thrives in Britain A wine is made from its berries, and the juice is used as aperient.

El Dorado, a "golden land," was an idea much favoured in the days of the early Spanish explorers. It was believed that somewhere on the South American continent there was a country abounding in gold and precious stones Many expeditions were fitted out to discover it Sir Walter Raleigh also went forth on this illusive quest. The term is still used in regard to any place of rich promise

Electret, a piece of solid matter which retains a permanent electric polarisation analogous to the magnetic polarisation of a permanent magnet There are various recipes for making them, carnauba wax is a common constituent

Electric Light is produced in several ways, commonly by causing a tungsten wire to heat up to incandescence by passing a current through it Current may also be forced through ionised gases, causing them to glow Such discharges include neon lights, sodium and mercury-vapour street-lamps, and various intense electric arcs used for technical purposes In fluorescent lights an electric discharge causes ultra-violet (invisible) light, which then excites luminosity in certain chemical substances called luminescent materials Other forms of electric lighting are being investigated

Electric Telegraph may be said to date from 1836, when Sir Charles Wheatstone and his co-inventor Cooke introduced their Single-Needle instrument, which was soon followed by the Double-Needle apparatus Morse, in 1837, invented his famous recording instrument The first electric cable was between Dover and France, and was laid in 1850 The first Atlantic cable was laid in 1858, and the second in 1866 It was in 1899 that the first Marconi wireless telegraph messages were sent between England and France

Electrolysis is the condition established when an electric current passes through a conducting substance, between electrodes, resulting in decomposition and separation into constituents Water thus becomes decomposed into hydrogen and oxygen

Electrometer, an instrument for measuring differences of electrical potential The moving part, perhaps a needle, is affected by electrostatic forces and no current flows through the instrument. Electrometers are often used in physics and geophysics, *e g*, for measuring the earth's electric field

Electron. *See* **F10, 14**

Electron Microscope. A microscope in which beams of electrons are focused by magnetic lenses in a manner analogous to the focusing of light beams in the ordinary optical microscope Modern electron microscopes have very high resolving power and can magnify up to 1,500,000 times. *See also* **F20(1)**

Electronics. The science which deals with the behaviour and control of free electrons It started with the discovery of the electron by Sir J J Thomson in 1897. The practical applications, constituting electronic engineering, have given us radio, radar, photo-electric cells, cathode-ray oscillographs, electron microscopes, television Nowadays electronics uses devices like transistors such that the electrons move inside solid matter instead of *in vacuo* This is sometimes referred to as "solid state electronics."

Electrophorus, a simple device for producing static electricity, consisting of a smooth disc of resin or ebonite mounted on a metal base and with a metal cover carrying an insulated handle The disc is first electrified (negatively) by rubbing it with a dry catskin or flannel and the cover replaced, the upper surface receiving a positive charge and the lower a negative On lifting off the cover, after having touched it with the finger, the negative charge leaks away to earth and the positive charge is isolated on the cover The action may be repeated a number of times before it is necessary to replenish the original charge on the disc Of historical interest only

Electroplating is the process of coating metals or other substances with a metallic film, applied in a bath of the solution of the coating material by the action of an electric current

Elements. In chemistry, an element is a substance in the simplest form to which it has been reduced Ninety elements are found naturally on the earth, one is observed spectroscopically in the stars, and a further eleven have been made artificially Between them these elements can appear in some 1,200 different isotopes, of which 317 occur in Nature (There are 274 stable isotopes among 81 stable elements) *See* **F9(2) N30.**

Elephant, a proboscidian mammal of which only two species survive—the Asiatic, in India, and the African elephant. No other animals possess a trunk Both males and females have large ivory tusks, of considerable commercial value The Indian elephant is usually about 9 ft high and weighs about 3 tons. African elephants are larger, weigh about 6 tons, and are usually much fiercer Several fossil elephants of still larger bulk have been discovered, including the mammoth and the mastodon The Indian elephant is domesticated and used as a beast of burden, and may live 70 years

Eleusinian Mysteries, festivals common throughout ancient Greece, agricultural in their symbolism

Elgin Marbles, a collection of ancient Greek sculptures and architectural fragments got together by the 7th Earl of Elgin and brought to England between 1802 and 1812 These celebrated treasures had originally formed part of the Parthenon at Athens, and were probably carved by pupils of the sculptor Phidias Lord Elgin expended over £70,000 upon them, and they were purchased for £35,000 for the British Museum, where they can now be seen displayed

Elk, the largest animal of the deer family, possessing enormous antlers, and standing, when mature, about seven feet high. The American moose is of the same family.

Elm, a stately, wide-spreading tree having some 20 species spread over north-temperate regions, several of which are native and peculiar to Britain. The grandest of the field elms is the English elm, *Ulmus procera*, which may reach a height of 140 ft and a girth of 25 ft The wych elm, *U. glabra*, or Scots elm, is a valuable hardwood and used in boat-building

Elzevir, the name of a celebrated family of Dutch printers, who produced editions of Latin, French, and German classics, which were highly valued for their beauty of type and accuracy of printing They flourished in the 17th cent

Embalming, the process by which dead bodies are preserved from decay by means of spices and drugs The art reached perfection in ancient Egypt, as the mummies which still exist so powerfully testify. In modern times many experiments in embalming have been tried, with various degrees of success

Ember-days are set apart for fasting and prayer in the Western Church, at the periods appointed for ordination, viz , the Wednesday, Friday, and Saturday after the first Sunday in Lent, Whit-

Sunday, Sept 14 (Holy Cross Day), and Dec. 13 (St Lucia's Day) They are of very ancient origin

Embossing, the art of stamping in relief letters or designs upon pliant substances

Embryology, that branch of biology which deals with embryos, tracing their development from fertilisation of the germ or seed to birth

Emerald. The rich green variety of beryl (beryllium aluminium silicate). The colour is due to the presence of chromium oxide

Emery, a granular substance of the corundum order, generally mixed with other metallic substances, and used in a powdered state for polishing and grinding purposes. Emery is mined in Asia Minor and the Grecian archipelago

Enamel, a vitrified substance applied as a coating to pottery and porcelain The art was practised by the Assyrians and Egyptians, and was introduced into Europe by way of Greece Enamels are all either of the transparent or opaque kind, and are susceptible to an immense variety of colouring, according to the metallic oxides introduced

Encaenia, a festival commemorating a dedication; at Oxford University the annual commemoration of benefactors, accompanied by the conferring of honorary degrees, is held in June

Encyclical Letters, a term used in reference to letters addressed by the Pope to his bishops upon matters of doctrine or discipline

Encyclopaedists, a term first applied to the eminent writers who collaborated in the French *Encyclopédie* (1751–65) They included Diderot, D'Alembert, Voltaire, Helvetius, their writings generally were sceptical as to religion, destructive as to politics, and had great influence in popularising the social ideas which afterwards resulted in the French Revolution

Energy. One of the most fundamental concepts of science A body in motion possesses *kinetic energy* as a result of the *work* done by the forces creating the motion But a force which does work to stretch a spring does not create motion. Instead, the work is stored up in the spring and is one example of *potential energy* A raised body also possesses potential energy which turns into kinetic when the body falls The *heat energy* contained in a body is the sum of the kinetic and potential energy of the constituent atoms which are vibrating all the time Heat and motion are obtainable from electrical, magnetic, chemical, atomic, and other sources, and physicists therefore define corresponding forms of energy The vital point is that all forms of energy are transferable into one another *without loss or gain* This is the Law of Conservation of Energy It is one of the most fundamental laws of science, and its general validity is the reason why energy is an important idea Since Einstein, it has been recognised that mass also is interchangeable with energy. *See* **F15**, *also* **Nuclear Energy.**

English Language is composed of many elements Anglian, Saxon, Norman French, Scandinavian, Dutch, and the various underlying contributions from Latin and Celtic sources The result is a strong, expressive, composite language now spoken by all races of English descent, and is the mother tongue of over 200 million people living in Britain and the Commonwealth and the United States of America

Engraving is the art of cutting or otherwise forming designs of pictures on wood, stone, or metal surfaces for reproduction by some method of printing Wood-engraving was the earliest in the field, dating from the 15th cent Later, engraving on steel and copper plates was introduced, and mezzotint, lithography, stipple, aquatint, etc. With the development of photography, and an increased knowledge of the use of acids, many readier methods of engraving were adopted, and now wood-engraving, which was formerly resorted to for all general engraving purposes, is comparatively little used. What is styled "process" engraving is the most utilised.

Ensilage, a method of storing and preserving fodder, vegetables, etc , in pits dug in the ground and excluded from air or light. The system was practised in ancient Rome and revived in England in the 19th cent.

Entablature, that portion of a building which surmounts the columns and extends to the roof of the tympana of the pediments It comprises three parts, the architrave, the frieze, and the cornice

Entomology is the study of insects *See* **Insects.**

Entozoa is a term used to designate generally internal parasites, such as intestinal worms.

Entrepreneur. An entrepreneur or undertaker, is a firm which brings together the factors of production needed for producing goods or services, undertaking the risks and uncertainties involved—though it may transfer some of them by insurance or by other methods The entrepreneur may be either an individual or a company or corporation, private or public

Enzyme. Organic catalysts which accelerate chemical processes occurring in living organisms. Examples are *lipase*, which speeds the hydrolysis of fats, *diastase*, which is involved in the conversion of starch to glucose Fermentation of sugars to alcohol requires the presence of the enzyme *zymase* *See* **Catalyst**, *also* **F21(1)**, **P33(2)**

Epaulette, a shoulder badge fringed with cord, worn by English army officers until 1855, now confined to naval officers, and varying in form and richness according to the rank of the wearers

Ephemoptera *or* **May-flies**, an order of insects. In the larval condition they exist from two to three years aquatically, but no sooner do they arrive at maturity than their lives are hurried to a close They rise up in pyramids on warm summer nights, take no food, propagate, and perish The Latin name expresses the fact that the adults have an ephemeral existence

Ephod, a vestment worn by a Jewish high priest, and sometimes by priests of lower rank In olden times it was of rich texture and set with gems

Epiglottis, a lamella or cartilage in mammals, designed to cover and protect the entrance to the larynx during the process of food swallowing

Epiphany, a church festival celebrated on January 6, Twelfth Day

Equator, the imaginary great circle of the earth, every point of which is 90 degrees from the earth's poles, and dividing the northern from the southern hemisphere It is from this circle that the latitude of places north and south is reckoned The celestial equator is the circle in which the plane of the earth's equator meets the celestial sphere

Equinox, the time when the sun crosses the plane of the earth's equator, making day and night of equal length *See* **N20.**

Eras are distinctive periods of time associated with some remarkable historical event or personage *The Christian era* is computed according to a 6th-cent reckoning to begin with Jesus's birth, A D 1 The date is placed some years too late It is now generally understood that Jesus was born, 4 B C The *Jewish era* dates from 3761 B C , the *Julian era* from the alteration of the calendar by Julius Caesar, 45 B C , the *Mohammedan era* from the date of the *Hejira*, or the flight of Mohammed from Mecca to Medina, which is A D 622, July 16, in the Gregorian Calendar

Erbium, belongs to the group of rare-earth metals discovered by Mosander in 1842

Erg, the unit of work and energy in the centimetre-gram-second system, the energy involved when a force of 1 dyne moves its point of application through a distance of 1 cm

Erl-King, a forest fiend of German mythology, who lured children from their homes and carried them off In Goethe's ballad the "Erlkönig" it is a traveller's child who is lured to destruction.

Ermine. *See* **Stoat.**

Ernie, the name given to the "electronic random number indicator equipment", the electronic machine which selected the prizewinning numbers in the first Premium Bond draw held June 1–2, 1957.

Eros. This asteroid is 15–20 miles in diameter. It comes closer to the earth than any other member of the solar system with the exception of the moon and several very small asteroids. Determination of solar parallax based on observations of Eros in 1930–31 yielded the most accurate estimate of the distance of the sun from the earth (93,004,000 miles).

Erse, a term used by Lowland Scottish, and English writers for the Gaelic language spoken in the Highlands of Scotland. Sometimes erroneously applied to Irish, the Gaelic language as spoken in Ireland and revived as an official language in recent times Dr Johnson, Sir Walter Scott, and other writers used "Erse" to signify Scottish Gaelic The language of the Scottish Lowlands (that used by Robert Burns) is related to the English language and not to Gaelic and is variously termed Scots, Braid Scots, the Doric, the Scottish vernacular, and, fashionably of late, Lallans

Escutcheon, a shield-shaped surface called a field, upon which a man's armorial bearings are represented. A woman's escutcheon is lozenge-shaped.

Espalier, lattice work upon which to train fruiting or ornamental trees

Esparto Grass grows in great abundance in Spain and North Africa, and the pulp is largely used for paper-making as well as for other purposes

Esperanto, an artificial international language created by L Zamenhof of Warsaw and first published in 1887 It does not seek to replace national languages but to serve as a second language for international communication It is based on the internationality of many words in The principal modern languages, and is entirely phonetic in spelling and pronunciation

Esquire, formerly a title applied to a young man of noble birth who attended on a knight and carried his shield The title ranked next below that of knight and was applied to the eldest sons of knights and the younger sons of peers Later it became a courtesy title and given to any man as a mark of respect

Essential Oils are oils derived from plants by distillation or expression, and much used in perfumery as well as to some extent in medicine

Estate Duty is the duty payable upon the value of all property passing on the death of any person As from 4 April 1963 the rates are not exceeding £5,000, nil, £5,000 £6,000, 1%, £6,000-£7,000, 2%, £7,000 £8,000, 3% rising gradually to 80% on estates exceeding £1,000,000 Gifts made by deceased during his life for public or charitable purposes are liable for duty, unless made more than 1 year before death, other gifts are liable for duty, unless made more than 5 years before death, although there are graduated rates for gifts made more than two, three, or four years before death of 15 per cent, 30 per cent, and 60 per cent respectively Gifts made in consideration of marriage (parties to the marriage and their issue) are exempt from estate duty as are buildings and land of special interest bequeathed to non-profit making bodies for preservation Gifts not exceeding £100 in value (or in certain circumstances £500) also exempt

Estates of the Realm in Great Britain are the Lords Spiritual, the Lords Temporal, and the Commons They are the great classes invested with distinct political powers, and whose concurrence is necessary to legislation

Esters. Organic chemicals formed by combining an alcohol with an acid They have a pleasant smell, and occur naturally in plants as the scent of flowers Manufactured for use in the perfumery industry, and as flavourings in food Some esters are used as solvents, notably amyl-acetate ("pear drops") in quick-drying paints The polymeric fibre "Terylene" consists of chains of molecules containing many ester groups, formed by reacting an alcohol having two alcoholic (OH) groups with an acid having two acid (COOH) groups

Etching, a process of engraving, on copper usually, the design being drawn with a steel needle, and the lines produced by the action of an acid or mordant

Ether, a volatile liquid, composed of carbon, oxygen, and hydrogen It is a valuable anaesthetic obtained by heating alcohol with sulphuric acid

Ethylene. A gas compounded of carbon and hydrogen, it is related to acetylene and ethane Industrially it is obtained as a by-product in petroleum refining. It has wide uses as a starting material in the industrial manufacture of intermediates, especially alcohol Its most important application is in the production of polythene (poly-ethylene) *See* **Catalyst.**

Etruscans, people believed to have come from Asia Minor who colonised Italy about 900 B.C., settled in what is now Tuscany and part of Umbria, reached the height of their civilisation about 500 B C , and were ultimately absorbed by the Romans They were skilled technicians in bronze, silver, and goldwork, and excelled in the art of granular decoration

Etude. *See* **Study.**

Etymology treats of the science and structure of words, including classification and derivation

Eucalyptus. This genus includes 300 species of evergreen, leathery-leaved trees native to Australia. The oils yielded by different species vary a great deal in their scent and other properties and are chiefly used in pharmacy and perfumery, about 30 species produce oils suitable for medicinal purposes Various species produce timber

Euphonium, alternative name for the Bass Saxhorn in B♭ A large brass instrument of the trumpet type played by operating three valves

Eurasian, a half-caste or person of mixed European and Asiatic parentage

Europium, element discovered by Demarcay in 1906 A member of the rare-earth metal group

Evaporation is the process by which a solid or liquid is resolved into vapour by heat As it is rarely that the atmosphere is completely saturated, evaporation is nearly always going on at the surface of the earth, especially over the sea and other water surfaces, the vapour rising and, being lighter than the air, forming clouds which afterwards break, the vapour thereupon falling to earth again as rain The same process occurs over smaller surfaces, the rate of evaporation being dependent on the general atmospheric conditions

Everest Expeditions. For many years after Mt Everest had been shown to be the highest mountain in the world, political conditions in Nepal, lying south of the summit, and in Tibet to the north, prevented mountaineers from attempting an ascent At last in 1921 the Tibetan authorities gave permission, and the first expedition, organised, as were all subsequent British expeditions, by a joint committee of the Royal Geographical Society and the Alpine Club, and led by Col C K Howard-Bury, was sent out This was primarily a reconnaissance, besides mapping the northern flanks, it found a practicable route up the mountain. By 1939, six further expeditions had climbed on the northern face Some were baulked by bad weather, others by problems previously little known, such as the effect of high altitudes on the human body and spirit Nevertheless, notable climbs were accomplished In 1924, for example, Col E F Norton reached 28,163 ft , and it was on this expedition that G L Mallory and Andrew Irvine were seen going well at about the same height They never returned, however, and what disaster befell them is not known After the war political conditions again closed the Tibet route permission was eventually obtained from the Nepalese Government to make the attempt from the south In 1951 a reconnaissance expedition under Eric Shipton reached the ice-fall at the exit of the Western Cwm (a high valley lying south-west of the massif), and reported favourably on the prospects for an ascent The first attempt from this side was made the following year by a Swiss expedition led by Dr E Wyss-Dunant, two members of which made an attempt on the summit, but were stopped at approx 28,200 ft by the intense cold and the very strong winds When the British 1953 Expedition, led by Col (now Brig Sir) John Hunt, was being organised, stress was laid on three main points, proper acclimatisation of the climbers, use of oxygen for the final stages, and the establishment of very high altitude camps, so that the final assault parties would set out fresh and unencumbered Great attention was also paid to recent developments in diet, clothing, and equipment In all these matters the 1953 expedition was able to draw on the accumulated experience of their predecessors. By the end of April, a base camp had been established below the ice-fall, and with the aid of thirty-four Sherpa porters supplies had been carried up into the Western Cwm The next critical stage was the ascent of the

steep head of the cwm the Lhotse face, with the threat of avalanches always present By most strenuous efforts, a camp was established on the South Col (25,800 ft) on May 21 From this camp on May 26, T D Bourdillon and R C Evans climbed the South Peak of Everest (28,720 ft), then the highest altitude ever attained On May 28 Edmund Hillary and the Sherpa leader, Tenzing Norkey, spent the night at the highest camp (27,900 ft) and on the following day, May 29, climbed to the South Summit, negotiated the difficult final ridge, and reached the summit of Everest—the climax of a long, arduous, and stirring endeavour

Evolution, in the words of Sir Julian Huxley, "a natural process of irreversible change which generates novelty, variety, and increase of organisation" The theory, as laid down by Darwin, is that all existing species, genera, and classes of animals and plants have developed from a few simple forms by processes of change and selection Up to the time of Darwin a large part of the civilised world believed that life had been created suddenly at the beginning of the world which God had created, according to Archbishop Usher, on 22 Oct 4004 B C The evidence of the rocks, however, has given a more convincing theory of creation, and by studying the fossils preserved in the various layers of the earth's crust the past history of the earth's life has been pieced together Darwin has been called the Newton of biology *See* **F31 33**

Excommunication, exclusion from the rights and privileges of the Church It is of two kinds—the major, which means a total cutting off, and the minor, which shuts out only from participation in the Eucharist In mediaeval times, major excommunications were often launched against rulers and leaders

Exchequer, which derives its name from the checkered tablecloth on which accounts were calculated in early Norman times, is a term connected with the revenues of the Crown In former times it had jurisdiction in all revenue matters The term Exchequer is now applied to the Governmental department which deals with the public revenues the working head of which is the Chancellor of the Exchequer

Existentialism. *See* **J15.**

Exploration. Modern exploration began in the second half of the 15th cent with the voyages of the great Portuguese and Spanish discoverers They were followed by sailors of other European nations, who profited from their developments in navigation and from their charts, and in less than one hundred years the coast-lines of much of the Americas, Africa, and south-west Asia had been revealed and the globe circumnavigated The motives of these early explorers were mixed they were seeking adventure, trade, plunder, national power, and the conversion of the heathen Few if any were directly interested in advancing scientific knowledge But from the reports of their voyages and travels scholars at home compiled descriptions of the strange new world which stimulated their successors to undertake more systematic enquiries One of the earliest English expeditions to be despatched for scientific research was that of William Dampier on the *Roebuck*, which was sent out by the Admiralty in 1699 to examine the coasts of North-west Australia In the 18th cent British explorers were at work mainly in the Pacific Ocean, with the object of breaking the Spanish monopoly of trade Capt James Cook sailed thither in 1769 to observe first the transit of Venus at Tahiti, and then to search for the alleged great southern continent On this voyage he discovered and charted much of the coasts of New Zealand and the east coast of Australia On his second voyage he was the first to sail across the Antarctic Circle, and he showed that the southern continent was much smaller than had been supposed By 1800 the general outlines of the continents, except for Antarctica were known, and explorers in the 19th cent were largely engaged in opening up the interiors In Africa British explorers solved two problems which had puzzled men for centuries Mungo Park and Richard Lander established the true course of the River Niger, and Sir Richard Burton, J H Speke, Sir Samuel Baker, and others revealed the true sources of the Nile The greatest African explorer of that age was undoubtedly David Livingstone, the missionary, who in three great journeys explored the Zambesi and the region of the Great Lakes, spreading the Gospel, fighting the slave trade, and opening up the interior to settlement and trade In North America Alexander Mackenzie was the first to cross the main breadth of the continent from sea to sea In Asia motives were also mixed, men like Charles Doughty, who explored in Arabia, and Sir Francis Younghusband, who journeyed from China to India across the Gobi and the Himalaya, were impelled by a love of adventure and the quest for knowledge, but political considerations were often involved In recent years, with the main features of the world's surface known, exploration has become more intensive Teams of scientists go out to study restricted areas in detail An Antarctic expedition can contribute to our knowledge of world weather, or by biological research into the life history of whales, can help to improve our food supplies Similarly, expeditions in Africa can help to check the loss of valuable agricultural land through soil erosion, or to develop areas of settlement by schemes for irrigation and power And there are still great areas to be adequately mapped All these problems are inter-related, and in solving them the modern explorer can call on many improved techniques and instruments—the aeroplane, the aerial camera, tracked motor vehicles, radio, in fact all the resources of modern science But the human element is still vital, and for those with the old explorers' spirit there will always be problems left to solve

Explosives, substances which burn violently to produce gases in such volume that an explosion is induced Gunpowder was the first explosive to be used, Roger Bacon's powder, consisting of charcoal, sulphur, and nitre, was the only practical explosive for centuries 1845 brought gun-cotton, made by treating cotton with a mixture of sulphuric and nitric acids, but it was not until 1865 that Sir Frederick Abel perfected the process of manufacture that made it safe enough to store and use In 1867 Alfred Nobel discovered how to make dynamite by absorbing nitro-glycerine in kieselguhr, in 1880 he produced cordite, evaporating a solution of gun cotton and nitro-glycerine in acetone, the resultant jelly being squeezed through jets to form cords Cordite came into general use as a propellant High explosives, providing bursting charge for shells and bombs, include T N T (trinitrotoluol), picric acid (known as lyddite, melinite, etc), cyclonite (R D X) Chemical explosives have been eclipsed by nuclear explosives

Expressionism, a modern art movement confined primarily to the non-Latin countries of Europe which sought to give expression to intimate and personal emotions by means of distortions of line and colour and simplified style which carried a greater impact in terms of feeling Broadly speaking, this has been characteristic of northern art in general (*See* **Gothic**) The term is usually used of the modern movement which influenced the Post-impressionists and subsequent movements in France Tired of the naturalism of the Impressionists, such artists as van Gogh, Gauguin, Matisse, and Rouault together with the Fauvists (*q v*) made use of simple outlines and strong colours Apart from Toulouse-Lautrec, the principal Expressionists were Norwegian, like Munch, or German, like the painters of *Die Brücke* and *Der Blaue Reiter* groups Individual artists were Ensor, Kokoschka, Nolde, Rouault, and Soutine A later Negro influence explains in part Hitler's wild denunciations of it as "degenerate art" and its present popularity

Extreme Unction, the final sacrament of the Roman Catholic and Greek Churches, administered to a dying person, and consisting of the anointing with holy oil, after confession and absolution.

F

Fabian Society. *See* **J16.**

Fables are fictitious narratives intended to enforce some moral precept, and may be either in prose

or verse, and deal with personified animals and objects or with human beings. Aesop in ancient times and Hans Christian Andersen and the Brothers Grimm (in many of their stories) in later days, have given fables. Mention must also be made of La Fontaine's and Krylov's fables.

Faience, a kind of decorated glazed earthenware invented in Faenza, Italy, about the end of the 13th cent. Wedgwood-ware is a notable example of modern faience.

Fairs were established in mediæval times as a means of bringing traders and customers together at stated periods, and formed the chief means of distribution. The great English fairs of early times were those of Winchester and Stourbridge near Cambridge. Traders from the Netherlands and the Baltic gathered there with the great merchants of London, and goods of every kind, wholesale and retail, were sold. The British Industries Fair is the modern counterpart of the mediaeval trade fair. One of the biggest trade fairs was at Nijni-Novgorod, founded in the 17th cent.; other big continental fairs are those of Leipzig (founded in the 12th cent.), Lyons, and Prague.

Fairy Rings are the circles caused in grassland by certain fungi. The circles expand outwards as the fungus spreads, the fruiting bodies being at the periphery. Farther inward where the fungi are decaying the grass grows more strongly, fertilised by the nitrogen released from the rotting fungi. In olden times these rings were held to be the scene of fairy dances.

Falcon, name given to diurnal birds of prey which belong to the same family, *Falconidae*, as the hawk, eagle, buzzard, kite, and harrier. They are swift of wing and feed on birds and small mammals. These birds have long, pointed wings, strong, hooked and notched bill, long, curved claws, and an eye of great power. They are found all over the world. Those that breed in Britain are the Kestrel (the most common), Hobby (one of the swiftest of European birds), Merlin, and Peregrine, a swift and magnificent bird with slate-grey back, blackish crown, black "moustache" and whitish breast. Other members of the family are the Gyr Falcon from northern latitudes, Iceland and Greenland, which is a winter visitor to Britain, the Lanner, Saker, Eleonora's falcon, Red-footed falcon, and the Lesser Kestrel. The Gyr Falcon and the Peregrine were used in the sport of falconry in olden times. Because of its fearlessness and larger size, the female bird was used. When the quarry was sighted, the bird was unhooded, set free, and after mounting high into the air would dart swiftly down to strike the prey. The heron was the usual victim.

Falculha, a black-and-white bird only found in Madagascar, possessing a bill shaped like a sickle.

Fall-out. Radioactive material produced by nuclear explosions which may cause bodily and genetic damage. (1) *Local fall-out*, due to the return to earth of larger particles, occurs locally, and within a few hours after the explosion. (2) *Tropospheric fall-out*, due to particles which remain in the troposphere and come down within a month or so, possibly all over the world, but within the altitude in which the explosion occurred. (3) *Stratospheric fall-out*, which comes from fragments taken up into the stratosphere and then deposited, in the course of many years uniformly all over the globe. The two radioactive materials which have given rise to the greatest concern for the health of the individual are strontium-90 and iodine-131. Both these materials are liable to become concentrated in certain parts of the human body, strontium-90 in bone and iodine-131 in the thyroid gland. Iodine-131 gives off radiation, but after a few weeks this becomes negligible, the risk is likely to be limited to children under one year old. Strontium-90 continues to give off radiation for many years, and particular attention is therefore paid to levels of strontium-90 in milk and in the bones of young children who are growing rapidly. Radiation exposure may produce genetic effects, that is effects which may show up in succeeding generations. So far as these genetic effects are concerned, the most important components of fall-out are caesium-137 and carbon-14. *See also* C16.

Fallow Deer received its name from its fallow or yellow colour. It is smaller than the red deer, and has cylindrical antlers with palmated ends. It is native to many parts of Europe.

Falsetto, tones of a voice, particularly the male voice, which are pitched higher than the natural tones of the voice. Used in choral singing by male altos.

Fandango, a lively Spanish dance executed by two persons, who usually mark time with castanets.

Fantail, a variety of the domestic pigeon; also a genus of Australian birds of the *Muscicapidae* family. A small New Zealand bird is called a fantail.

Fantasia, a composition for orchestra or solo pianoforte which is not bound by the rules governing formal compositions, *i.e.*, symphonies, sonatas, etc.

Fan Tracery, a complicated style of roof-vaulting elaborately moulded, in which the lines of the curves in the masonry or other material employed diverge equally in every direction. It is characteristic of the late Perpendicular period of Gothic architecture, and may be seen in St. George's Chapel at Windsor and the Chapel of Henry VIII at Westminster Abbey.

F.A.O. (Food and Agricultural Organisation of the United Nations) *See* C8.

Farmer-General, the name given to the financiers who in the days of the old French monarchy farmed certain taxes, contracting to pay the Government a fixed sum yearly, on condition that the specified taxes were collected and appropriated by themselves. The revolution of 1789 swept Farmers-General away.

Fascism. *See* J16.

Fata Morgana, the name given to a curious mirage often observed over the Straits of Messina, attributed to the magic of the fairy Morgana half-sister of King Arthur, who was fabled to live in Calabria.

Fathers of the Church were early writers who laid the foundations of Christian ritual and doctrine. The earliest were the Apostolic Fathers, (*q.v.*) The Four Fathers of the Latin Church were St. Ambrose, St. Jerome, St. Augustine, and St. Gregory the Great. The Four Fathers of the Greek Church were St. Basil, St. Gregory Nazianzen, St. John Chrysostom, and St. Athanasius.

Fats are important foodstuffs. In physiology they constitute a valuable form of reserve food. They contain carbon, hydrogen and oxygen; chemically they are described as esters of glycerol (glycerine). Commonest fats are stearin, palmitin, and olein, esters formed by the combination of glycerol with stearic, palmitic, and oleic acid respectively. Fats are converted into soap by alkali; this process (saponification) also releases glycerol.

Fault, a term designating a breakage coupled with displacement of geological strata.

Fauvism (Fr. *fauve* = wild beast), a term contemptuously applied to the work of a group of French painters led by Matisse who exhibited at the Salon d'Automne in Paris in 1905. Their belief was that a painting must be not only a consistent and harmonious decoration but the expression of an idea or feeling. Forms and colours are emotive in their own right. The objects painted by the Fauves, though simplified, distorted, and often violently coloured, are easily recognisable. Inspiration for their highly decorative canvasses came from many sources: Byzantine and Persian art in the case of Matisse, German Expressionism in the case of Derain and Vlaminck. The Fauves paved the way for the Cubists (Braque joined Picasso in 1909) who approached nature in more arrogant mood, from a more intellectual point of view.

February, the second month of the year, contains in ordinary years 28 days, but in leap years 29 days. When first introduced into the Roman calendar by Numa c. 700 B.C. it was made the last month of the year, preceding January, but in 452 B.C. the position of the two months was changed, February following January.

Federation. *See under* Confederation.

Félibrige, a movement founded in 1854 to revive the ancient glories of Provence, initiated by the French poet Frédéric Mistral.

Felspar, the name given to a group of minerals silicates of aluminium with some calcium and sodium, or potassium, which make up probably

more than half of the earth's crust. It is formed in granite and other rocks, both igneous and metamorphic

Fenestella, the niche set apart on the south side of the altar for the piscina in Roman Catholic churches.

Fermentation, the action of chemical ferments or *enzymes* in bringing about chemical changes in the materials of living animals and plants, *e g*, the breaking-down of sugar by yeast into alcohol

Ferret, a carnivorous animal of the Pole-cat family, with a pointed head and long sinuous body, well adapted for following rabbits and game into their burrows and hiding-places, it being kept in this country for that purpose. It is a native of Spain and Africa, and does not exist in England in a condition of natural freedom *See* **Z12.**

Ferrites are compounds containing iron, oxygen, and one or two of a certain range of other possible metallic elements Ferrites have recently become very important technically, because, unlike ordinary magnetic materials, they combine strong magnetism with electrical insulating properties Ferrite-rod aerials are now common in portable radios, and ferrite devices are used in radar

Feudalism. *See* **J17.**

Fieldfare, the largest member of the thrush family, a regular winter visitor to Britain from Scandinavia It is brown in colour with a lighter spotted breast and a grey head

Field-Marshal, the highest ranking title in the British army, and only bestowed on royal personages and generals who have attained great distinction The first British Field-Marshal was created in 1736, when John, Duke of Argyll, had the title conferred upon him by George II

Fife A small flute with a compass of about two octaves used only in military drum-and-fife bands

Fifth Column When Franco, the Spanish dictator, revolted against the Spanish Republic in 1936 and attacked Madrid with four armies, he declared that a group of fascists within the city was assisting the besiegers The term is used to describe a body of spies behind a fighting front

Figaro, a well-known comic character in drama and opera, invented by Beaumarchais, adopted by Mozart, and the name of a popular paper of Paris

Fighting-Fish, small pugnacious Siamese fish with long caudal and ventral fins They are kept in glass globes in Siam, and when brought into contact will fight to the death, these encounters being the occasion of much gambling

Filibuster, a name first given to pirates and buccaneers in the 17th cent who took possession of small islands or lonely coast lands, and there maintained themselves apart from any governing authority In later times the term was used to specify men taking part in expeditions whose object was to appropriate tracts of country, and settle upon them in disregard of international law The most notable expeditions of this kind in modern times were those of Narcisco Lopez against Cuba in 1850–51, and of William Walker against Nicaragua, between 1855 and 1860 Both leaders were captured and executed The term is also used to express the right of a minority in the United States Senate for unlimited debate, which is used on occasions to delay legislation for an unlimited period

Finches, a large family of small birds belonging to the Passerine or perching order of birds There are about 200 species, including greenfinch, hawfinch, chaffinch, goldfinch, siskin, bullfinch, crossbill, linnet, twite, and buntings

Fir, a cone-bearing tree with small evergreen leaves and of considerable use as timber There are two types the Silver Firs and the Douglas Firs numbering about 25 species All these firs attain to a considerable height, and all yield turpentine or other resinous material

Fire-Fly, a small winged insect of the *Eleteridae* family, is able to throw out a strong phosphorescent light in the dark There are some remarkable specimens in tropical countries.

Fire of London, of 1666, extended from East to West, from the Tower to the Temple church, and northward to Holborn Bridge It broke out in a baker's shop in Pudding Lane, and lasted four days, and destroyed 87 churches, including St. Paul's Cathedral, and many public buildings, among them the Royal Exchange, the Custom House, and the Guildhall In the ruins were involved 13,200 houses and 400 streets The plague had not disappeared from London when the fire occurred

Firkin, a former measure of capacity, the fourth part of a barrel, now only used in reference to a small cask or tub for butter, lard, tallow, etc.

Fischer-Tropsch Process. A process for making synthetic petrol from carbon monoxide and hydrogen The synthesis is accelerated by cobalt-thoria and nickel-thoria catalysts

Fish Louse. Parasitic crustacea found on marine and fresh-water fishes and whales.

Fission, Nuclear. A nuclear reaction in which the nucleus of an atom (*e g*, uranium 235, plutonium) captures a neutron, and the unstable nucleus so produced breaks into two nearly equal fragments and throws out several neutrons as well In biology the term fission is applied to reproduction by fragmentation of a single-cell organism as in amoeba *See* **F12(1).**

Flageolet. A sweet-toned instrument which is in effect a portable organ pipe whose length, and therefore pitch, may be varied by opening or closing holes in the pipe with the fingers Sometimes called the English Flute or " Penny Whistle "

Flag Officer, a British naval officer who enjoys the right of carrying a flag at the mast-head of his ship, and is of the rank of Admiral, Vice-Admiral, or Rear-Admiral

Flagship, the ship that flies the Admiral's flag, and from which all orders proceed

Flamingo, a strangely beautiful, extremely slender wading bird of white and rose-pink plumage with long, slender legs and neck and a long, down-curved bill with which it rakes the mud and obtains its food of worms and molluscs The wings are bright crimson, bordered with black, and a flock in flight is a picture of singular beauty There is a large and famous colony in the Camargue

Flash-Point This is found by heating an oil in a special cup and taking the temperature at which sufficient vapour is produced to ignite when a small flame is applied It is an index of the inflammability of oils

Flat A keyboard instrument has white keys and black keys The notes played by the white keys are called " naturals " There are eight of these to each octave and they are called A, B, C, D, E, F, G, A The black key immediately below a natural (one semitone interval) is called its " flat," *e g*, the black note below B is B flat and is written B♭. Conversely the black key above a natural (one semitone interval) is known as its " sharp," *e g*, the black note above A is A sharp and is written A♯ Since B natural is a full tone above A natural, it follows that B flat and A sharp are the same note

Flea. Fleas are small parasitic insects belonging to the order *Aphaniptera* (so called because these creatures have no wings) They obtain their food by sucking blood from their host They are laterally compressed, which immediately distinguishes them from lice The human flea (*Pulex irritans*) is able to jump vertically a distance of over 7 in

Fleet Prison, a noted debtors' prison that stood in Farringdon Street, London, where the Congregational Memorial Hall now stands, taking its name from the Fleet Ditch Notorious for the cruelties inflicted on prisoners. It was pulled down in 1846.

Fleet Street, a famous thoroughfare in London, now the centre of journalism and newspaperdom, though it was long celebrated for its taverns where the literary coteries of the day were wont to meet It takes its name from the Fleet stream which used to run from Hampstead through Holborn to the Thames at Blackfriars

Flemings, the people of Flanders, whose ancestors of mediaeval times excelled in the textile arts; England owes its early eminence as a manufacturing nation to the migration of numbers of

Flemings to this country in the 16th and 17th cent.

Fleur de Lis, the former national emblem of France, the flower of the lily It was superseded by the Tricolour in 1789, but is still adhered to by the supporters of the old French royalties.

Flint, consists of granular chalcedony with some opaline silica, and occurs as nodules and bands in the Chalk It is hard and has a conchoidal fracture, so enabling it to be used in making cutting implements in prehistoric times Before the invention of lucifer matches, it was used along with steel for striking lights.

Flint implements are objects found in the younger geological strata, and constituting evidence of the condition and life of the period They include knives, clubs, arrow-heads, scrapers, etc, used as weapons, tools and possibly as surgical instruments and in religious ceremonies. At the end of the Neolithic Period and the beginning of the Bronze Age a people using a new type of stone axe became evident in Europe, advancing towards the south and central regions, and supposed by many to be the ancestors of the present European stock, or Aryans Similar to prehistoric specimens are the flint and obsidian implements of some of the primitive peoples of today. Ritual weapons and sacrificial knives continued to be made of stone long after the introduction of metals for practical purposes.

Flounder, one of the most familiar of the smaller flat fishes common round the British coasts, and seldom attaining a weight of over three pounds

Fluorine, a chemical element, member of the halogen family, symbol F, it is found in combination with calcium in fluorspar, and occurs in minute quantities in certain other minerals Discovered by Scheele in 1771, it was first obtained by Moissan in 1886 A pale yellow gas, it is very reactive and combines with most elements except oxygen Its acid, hydrogen fluoride, etches glass, the fluorine combining with the silicon to form volatile silicon fluoride Organic fluorine compounds have found use as very stable polymers which resist a wide variety of chemical actions.

Fluorescent Lamp. *See* **Electric Light and Ultra-Violet Rays.**

Fluorspar, a mineral, chemically, calcium fluoride Can be colourless, green, or yellow, but is most commonly purple Blue fluorspar under the name of Derbyshire "blue John" has been used for ornamental purposes

Flute. A wooden musical instrument, part of the wood-wind of an orchestra, played by blowing across a mouth-hole, the notes being produced by pressing the fingers on finger-holes or keys It has a compass of three octaves and a singular purity of tone In simple form the flute has been known since Greek times, but the modern flute dates from the 18th cent

Fly, the popular name for a large number of insects with one pair of wings and a proboscis terminating in a sucker through which fluid substances can be drawn up The best-known species are the common house-fly, the bluebottle, and the blow-fly In the larval form flies are maggots, and feed upon decaying substances, animal flesh, etc Flies are able to walk upon ceilings or upright surfaces by having suckers at the soles of their feet *See* **Diptera**

Flycatcher, name of a large family of small birds, the Muscicapidae. They are insect feeders, catch their food in the air, and are distributed over most countries of the world The spotted and the pied nest in Britain, which they visit from April to September.

Flying Fish are frequently to be seen in southern waters, and are capable of gliding considerable distances without touching the water To build up speed for its "take-off" the fish swims rapidly, to break the surface at 15–20 miles an hour Maximum air speed is about 40 m p h

Flying Fox, a member of the bat family, but of much larger size, and confined to the tropical and sub-tropical Old World Like the bats, it is nocturnal, but it feeds entirely on fruits.

Flying Lemur. *See* **Colugo**

Flying Lizard, or *Draco*, an Asiatic lizard, possessing wing-like projections from each side, which enable it to make flying leaps through the air, though not sufficient for continuous flight

Flying Saucers, the name given to certain saucer-like shapes which have on occasion been seen travelling through the atmosphere For some time speculation was rife, especially in America, but it is now believed that when not hallucinations, meteorological or cosmic-ray balloons, they are nothing more than atmospheric phenomena like mirages or mock suns caused by unusual atmospheric conditions. Described by Dr Menzel, astrophysics professor at Harvard, "as real as rainbows are real, and no more dangerous"

Flying Squirrel, rodents of which there are several species in Europe, Asia and America It possesses a parachute-like fold of skin by means of which it projects itself through the air In appearance they are much like ordinary squirrels, to which they are related The African flying squirrels belong to a different family

Fog is caused by the presence of particles of condensed water vapour or smoke in the surface layers of the atmosphere, the term being applied meteorologically when the resulting obscurity is such as to render objects invisible at distances of up to 1 km Fogs are frequently formed when the air near the ground is cooled below its dew-point temperature by radiation on a still cloudless night, by flowing over a relatively cold land or water mass, or by mixing with a colder air stream An accumulation of smoke over a large city may cause a high fog cutting off the daylight and producing gloom *See* **Aerosol.**

Foliation, a geological term applied to rocks whose component minerals are arranged in parallel layers as the result of strong metamorphic action

Folio, a printing term for a sheet of paper folded once, a half sheet constituting a leaf

Folklore concerns itself with the mental and spiritual life of the people—both civilised and primitive—as expressed in the traditional beliefs, customs, institutions, and sayings that have been handed down from generation to generation by word of mouth, and with the observation, recording, and interpretation of such traditions (The word *folklore* itself was first suggested and used - as two words *Folk Lore* - by W J Thoms in the *Athenaeum* of August 22nd, 1846, and was at once absorbed into the English language) Traditional lore of the kind included in the term folklore takes many forms and ranges from omens of good and bad luck (spilling the salt breaking a mirror, dropping an umbrella, etc) and the wearing of amulets or the possession of talismans (such as the horseshoe) as protection against misfortune, to elaborate ceremonial dances such as the Abbots Bromley Horn Dance, the Hobby horses of Padstow and Minehead, the Northern sword-dances, and the Christmas mummers' plays Especially important are the beliefs and customs associated with birth, babyhood, marriage, and death such being occasions when the individuals concerned require special protection or when unusual happenings can be used for foretelling their future The child born on a Sunday will be the luckiest, rocking an empty cradle will ensure the speedy arrival of a new baby, throwing an old shoe after a newly-married couple brings them luck, the bride should be carried over the threshold of the new home, on the sea-coast, death is believed to take place at the ebb-tide, the bees must be told of the death of the master of the house, or they will leave the hive Another very large section of the subject deals with the traditional sayings and practices associated with particular days and seasons of the year—calendar customs, as they are called The eating of pancakes on Shrove Tuesday, Mother Sunday customs and the simnel cake Good Friday as the right day for planting potatoes, but emphatically the wrong day for washing clothes or cutting one's finger-nails, the necessity of wearing something new on Easter Sunday, the children's maypole dances and May garlands, midsummer fires, All Hallowe'en as the most favourable occasion for divining the future—especially in respect of marriage—and for games and sports such as apple-bobbing, the numerous practices accompanying the harvest All these are examples of

calendar customs, their full story would occupy several volumes Folklorists are interested in all such oral tradition because they think that to a large extent it represents what folk have mentally stored up from the past and transmitted to their descendants throughout the centuries, and because therefore it is able to assist other historic methods ethnographical linguistic, archaeological, etc — in the elucidation of the early story of man In those countries with a great diversity of peoples in all stages of culture a knowledge of folklore and what it can teach of the mind of man is of great importance to administrators The Folk-Lore Society was founded in 1878, and that part of the subject represented by song and dance has now its own organisation in the English Folk Dance and Song Society

Force, as a term in physics, signifies an influence or exertion which, when made to act upon a body, tends to move it if at rest, or to affect or stop its progress if it be already in motion. The c g s unit of force is the dyne, the practical unit 1 gram wt = 980·616 dynes at sea-level Lat 45°

Formaldehyde. Chemically it lies between methyl alcohol and formic acid, oxidation of methyl alcohol yields formaldehyde, and oxidation of formaldehyde produces formic acid It is used as a disinfectant, in silvering mirrors, and in the manufacture of phenol-formaldehyde plastics (of which bakelite is the best-known example) Solutions of formaldehyde in water, formalin, are used to preserve biological specimens

Forme, a body of letterpress type, composed and secured for printing from, or a stereotype or electrotype The former is used more for newspaper formes and the latter in good book work

Formic Acid can be obtained from a colourless fluid secreted by ants and other insects and plants It is a strong irritant Commercially it is obtained from sodium formate, which is synthesised by the absorption of carbon monoxide in caustic soda It is used in the electroplating, tanning, and textile industries

Formula, in mathematics and physics a statement of certain facts in symbolical form In chemistry a representation of the composition of a compound

Forte, a musical term signifying "loud," and represented by the letter "f", "ff" (fortissimo) indicating "very loud"

Forth Bridge *See* **Bridges.**

Fossils Remains of animals and plants, or direct evidence of their presence, preserved in rocks They include petrified skeletons and shells, leaf imprints, footprints, etc *See* **F29(1)**

Four Freedoms, a phrase coined by President Roosevelt in January, 1941, embodying what should be the goal of the Allies They were (1) Freedom of speech and expression, (2) Freedom of every person to worship God in his own way, (3) Freedom from want, (4) Freedom from fear

Fox, carnivorous animal of the canine family, found in considerable numbers in most parts of the world The common fox *Vulpes vulpes* of Europe is a burrowing animal of nocturnal habits, living upon birds, rabbits, and domestic poultry, in the capture of which it displays much cunning The fox in Britain is preserved from extinction chiefly for hunting purposes Among other notable species are the Arctic fox and the red fox of North America, of which the valuable silver fox, coveted for its fur, is a variety

Fox-Shark, *or* **Thresher Shark,** a large species of shark common in the Atlantic and in the Mediterranean It is very destructive to small fish, but although it attains a length of 15 ft it is not dangerous to man

Franciscans. *See* **Friars.**

Franco-German War (1870–71) was opened by a declaration of war by Napoleon III, but the Germans who were better prepared than the French, won victory after victory In September Napoleon and the whole French army were made prisoners at Sedan, a republic was then proclaimed, and Paris sustained a four months' siege In the end France ceded Alsace and part of Lorraine to Germany, who claimed a war indemnity of over £20 million

Francolin, a genus of birds closely related to the common partridge, belonging to Africa It includes the spur-legged partridge, and the black partridge which ranges from Cyprus to Assam

Frankincense is of two kinds, one being used as incense in certain religious services and obtained from olibanum, an Eastern shrub, the other is a resinous exudation derived from firs and pines, and largely used in pharmacy.

Franklin, the name given in feudal times to a country landowner who was independent of the territorial lord, and performed many of the minor functions of local government, such as serving as magistrate

Fresco, a painting executed upon plaster walls or ceilings, a technique which has remained unchanged since it was practised by the great Renaissance artists

Freshwater Shrimp, a small crustacean abounding in British streams, and feeding on dead fish or other decomposing matter Although of shrimp-like form it is not closely related to salt-water shrimps Its generic name is *Gammarus*

Friars, members of certain mendicant orders of the Roman Catholic Church The four chief orders are the Franciscans or Grey Friars, the Dominicans or Black Friars, the Carmelites or White Friars, and the Augustinians (Austin Friars)

Friday, the 6th day of the week, named after Frigga, the wife of Odin It is the Mohammedan Sabbath, a general abstinence day of the Roman Catholic Church, and according to popular superstition, an unlucky day

Friends, The Society of. *See* **J17.**

Frigate-Bird, a web-footed bird widely distributed over tropical latitudes, and deriving its name from its great expanse of wing and forked tail, resembling the shape of a swift vessel It feeds on flying fish mostly, being unable to dive and also steals from other birds A frigate-bird was found dying on the Hebridean island of Tiree in July 1953 only twice previously had one been recorded in Europe the first on the German coast in 1792, and the second on the coast of France in 1902

Frog, a familiar amphibian, breathing through gills in the earlier (tadpole) part of its existence and through lungs later It remains three months in the tadpole stage The frog hibernates underwater in the mud during the winter

Frost occurs when the temperature falls to, or below, 0° C, which is freezing point Hoar frost is applied to the needles or feather-like crystals of ice deposited on the ground, in the same manner as dew Glazed frost is the clear icy coating which may be formed as a result of rain falling on objects whose temperatures are below the freezing point These layers of ice, often rendering roads impassable for traffic, damaging overhead power and communication systems and endangering aircraft, can also be caused by condensation from warm, damp winds coming into contact with very cold air and freezing surfaces

Froth-Hopper *or* **Frog-Hopper** A family of bugs (belonging to the insect order *Hemiptera*) which in the larval stage surround themselves with a protective mass of froth ("cuckoo spit") These insects, which suck the sap of plants, bear a faint resemblance to frogs, and the adults possess great leaping powers

Fuel Cells. A recent development is a type of battery into which the active chemicals are fed from external fuel tanks This is the *fuel cell*, which is being developed in several countries In August 1959 F T Bacon of Cambridge University demonstrated his fuel cell driving a fork-lift truck and a welding machine The Bacon fuel cell consists of two electrodes of porous nickel dipping into a solution of caustic potash in water One electrode is supplied with hydrogen gas from an outside cylinder and the other with oxygen. These gases, forming layers on the nickel, are the active chemicals The oxygen combines with water to make two negatively charged ions, each consisting of an oxygen and a hydrogen atom joined together (a hydroxyl ion) The hydroxyl ions travel through the solution to the hydrogen electrode, where they combine with hydrogen to form neutral water Their negative charge (one electron per ion involved) has now arrived at the hydrogen electrode and is ready to flow back to the other electrode through any outside circuit that is provided This flow constitutes the

useful electric current, and it has been provided at the expense of creating water out of the original hydrogen and oxygen. The water can be removed in the form of steam. What is the advantage of all this? In the first place the fuel gases are easy to make and to store in cylinders. Supplying a new gas cylinder is easier and quicker than recharging an ordinary accumulator. Furthermore, a fuel cell is lighter for a given power than an accumulator. satellite designers may find them useful. The fuel cell is not damaged by heavy overloading, and this is valuable for application to vehicle driving. Fuel-cell-driven buses could combine the advantages of diesel buses and trolleybuses. Fuel cells are still in the development stage. It is not certain how they will compete with combustion engines or, in the oil-less future, with improved ordinary batteries.

Fugue. A contrapuntal piece of music in which the several " voices " take up the theme in turn.

Fulani, a non-Negro people of Hamitic stock widely distributed in N.W. Africa, chiefly in Nigeria. There are two main branches: the dark-skinned Fulani, settled farmers and city dwellers, Moslem in religion, and the light-coloured Bororo'en who are semi-nomadic herdsmen. The Fulani are different from any tribe in W. Africa though they resemble in some ways the Masai of E. Africa. The Fulani conquered the Hausa states at the beginning of the 19th cent. which passed under British suzerainty after 1903. Sokoto, built in 1810, was capital of the Fulani empire.

Fuller's Earth, a special kind of clay or marl possessing highly absorbent qualities, and used from ancient times in the " fulling "—that is, cleansing and felting—of cloth. It is common in certain parts of the south of England, and is valued as a skin emolient.

Functionalism, in architecture, a movement originated by Le Corbusier, Swiss-born French architect and town-planner, who applied the austere principles of the Purist movement in painting to his own art. From about 1924 he designed in concrete, steel, and glass, buildings in which every part had a significance in terms of function on the theory that objects created to carry out their particular function to perfection cannot help being beautiful. " A house is a machine for living in ". The style was in vogue between the two wars, and although its severity became somewhat modified, it is still the basis of most modern architecture. In town planning Le Corbusier is noted for his *ville radieuse* conception of a city, and his blocks of flats at Marseilles (*L'Unité d'Habitation*) and the new city of Chandigarh in the E. Punjab, of which it is the capital, bear witness to his architectural genius.

Fungi, a class of simple plants, which reproduce from spores and lack the green colouring matter *chlorophyll*. It includes moulds, rusts, mildews, smuts, mushrooms, etc. Potato blight is a fungus disease which caused the failure of the potato crop in Ireland in 1846. 50,000 different fungi are known. *See also* **F27(2), P8(1)**.

Fustic, a dyewood yielding various shades of yellow according to the mordants used. The wood of the Venetian sumach, *Rhus cotinus*, yields young fustic, old fustic comes from the wood of *Clastrastis tinctoria*, which grows in tropical America and the West Indies.

Futurism, the only important modern art movement to arise outside France, initiated by Marinetti, an Italian writer and mountebank friend of Mussolini at a later period. Its origin took the form of a manifesto published in Paris in 1909 in which Marinetti glorified violence, war, and the machine age. In its aggression it favoured the growth of fascism. One of the distinctive features of Futurist art was the use of the principle of " simultaneity " in which the same figure (*e.g.*, a woman descending a flight of stairs) is represented in successive positions like film " stills " superimposed on each other. In spite of two further manifestos it was not until 1911 that the first examples of Futurist painting and sculpture appeared by the artists Severini, Balla, and Boccioni. Apart from the principle of simultaneity, Futurism derived from Cubist and Post-impressionist techniques. The movement faded out early in the first world war.

G

Gabardine, a long, loose, coarse, over-garment, worn by men of the common class in the Middle Ages, and prescribed by law as the distinctive garment of the Jews. The name is now given to a closely woven cloth of wool and cotton used to make raincoats.

Gabbro, a kind of igneous rock, often very coarse-grained, containing a good deal of plagioclase felspar, and monoclinic pyroxene. it may occasionally also include biotite, magnetite, ilmenite, and hornblende. A gabbro containing nickel at Sudbury in Canada is one of the richest sources known of that metal.

Gadfly, a widely distributed family of flies with only one pair of wings, including the horse fly. The females are very voracious, being able to bite through the skin and suck the blood of animals. The males are harmless.

Gadolinium. An element belonging to the rare-earths metals discovered in 1886 by Marignac.

Gaelic, relating to the Gaels and their language, a term now applied only to the Celtic people inhabiting the Highlands of Scotland, but formerly also to the Celts of Ireland and the Isle of Man.

Galago, " Bush Babies," related to the lemur, native to Africa, large-eyed, in keeping with its nocturnal characteristics.

Galaxy *or* **Milky Way Galaxy** is the huge disk-shaped cloud of gas and stars (some 100,000 million, one of which is the sun) that is turning in space like a great wheel, with a diameter of about 100,000 light years. The Milky Way (that part of the heavens in Milton's words " powdered with stars ") is really only a small part of this disk, and every star in the galaxy is moving round the centre under the gravitational control of the whole. The sun and planets lie near the edge of the disk, and it takes them about 250 million years to travel once round. The number of stars that can be seen with the unaided eye is about 3,000, and they all belong to the Milky Way Galaxy, as do most of the stars that can be seen with anything but the greatest telescopes. With the large modern optical and radar telescopes many other systems, similar in size and weight to our galaxy, have been discovered, scattered more or less uniformly through space, and the universe is said to include at least 10,000 million such galaxies. *See also* **F3–6, 48–50.**

Gale, a high wind now technically defined as one of at least Beaufort force 8. Between thirty and forty gales a year occur on the north and west coasts of the British Isles and only about half of this number in the south-east. At St. Ann's Head, Pembroke, the anemometer registered a gust of 113 m.p.h. on Jan. 18, 1945, which is a record for these islands. Gusts exceeding 70 m.p.h. are rarely experienced in London. Gale warnings are issued for specified areas by the Meteorological Office, the warnings taking the form of radio broadcasts and the hoisting of storm signals at certain points on the coast. *See* Beaufort Wind Scale, **N10.**

Gall, abnormal vegetable growths caused by insects, mites, bacteria, or fungi, found on all parts of the plant. Oak-apples, Robin's pincushion (on wild rose), " witches brooms " (on trees) are examples. Some are useful commercially, *e.g.*, oak apples yield tannic acid and the black oak gall is used in America as animal food.

Galleon, the name given to the old three-decked Spanish treasure vessels employed in conveying the precious minerals from the American colonies to Spain. The term is often applied to any large, especially stately, sailing vessel.

Galley, an oar-propelled sea-boat used by the ancient Greeks and Romans for transport purposes, manned by slaves. Boats of a similar class were used by the French down to the middle of the 18th cent., and manned by convicts.

Gallic Acid, obtained from gall nuts, sumach, tea, coffee, and the seeds of the mango, is used in the manufacture of inks and as an astringent in medicine. It was discovered by C. W. Scheele (1742–86), a Swedish chemist.

Gallium, a white metal, symbol Ga, related to aluminium, but which can be cut with a knife. It was discovered spectroscopically by L. de Boisbaudran in 1875. Long before Mendeleyev

had predicted that an element with its properties would be found to fill the then existing gap in the Periodic Table. this gap came immediately below aluminium, so he suggested the name "eka aluminium" for it.

Gallup Poll, a system, introduced by Dr Gallup of the United States, for testing public opinion on topical subjects by taking a test poll on questions framed to elicit opinions.

Galvanised Iron is iron coated with zinc. The name comes from the fact that such a coat protective against rust could be deposited electrolytically. Electrodeposition is sometimes used, but the cheaper and more common process depends on dipping the iron in a bath of molten zinc.

Gamboge, a resinous gum obtained from certain trees native to Thailand, Indo-China, and Ceylon, and used as a yellow pigment in paints and also as a purgative.

Game is the term applied to wild animals which are protected from indiscriminate slaughter by Game Laws. In the United Kingdom game comprehends deer, hares, pheasants, partridges, grouse, black game, moor game, woodcocks, bustards and certain other birds and animals of the chase. Game can only be killed (with few exceptions) by persons holding game licences. Occupiers of land and one other person authorised by them in each case are allowed to kill hares and rabbits on their land without licence. Game cannot be sold except by a person holding a proper licence. There is a "close time" prescribed for the different classes of game. for instance, the selling or exposing for sale of any hare or leveret during March, April, May, June, or July is prohibited by law. Grouse cannot be shot between Dec 11 and Aug 11. patridges between Feb 2 and Aug 31. pheasants between Feb 2 and Sept 30, and black game between Dec 11 and Aug 10. In regard to foxes, stags, and otters, custom and not Parliament prescribes a certain law which sportsmen rigidly adhere to. Game reserves are legally protected areas where natural vegetation and wild life are allowed to remain unmolested by sportsmen or those who might destroy for economic ends. *See* **British Game Seasons, N20**

Gaming, *or* **Gambling**—*i e*, staking money on the chances of a game—differs from betting in that it depends upon the result of a trial of skill or a turn of chance. The Betting and Gaming Act of 1959 replaced all the old laws on gaming, which went back to an Act of 1541 entitled "An Acte for Mayntenance of Artyllarie and debarringe of unlauful games," under which some games were unlawful if played for money in any circumstances. Roulette and any game of dice were among such games. Under the new Act any game is lawful, subject to certain conditions.

Gammexane, a powerful insecticide, used particularly to kill the tsetse fly and mosquito.

Gamut. The set of lines and spaces on which music is written.

Gangue. Useless minerals associated with metallic ores.

Gannet, a fish-eating bird which dives on its prey from a great height, swallowing it under water, is found in large numbers off the coast of Scotland, and has breeding stations in the Hebrides, St Kilda, Ailsa Craig, the Bass Rock, Grassholme Island, and on Ortac and Les Etacs (rocks off Alderney). It is a bird of white plumage, black tips to long narrow wings and wedge-shaped tail, and weighs about 7 lb. The gannet breeds in colonies on ledges of steep, rocky, island cliffs. Related to the cormorants, pelicans, and frigate-birds.

Garden Cities in England were founded by Ebenezer Howard (1850–1928), and his ideas were put forward in his book *Tomorrow—A Peaceful Path to Real Reform* (later re-issued as *Garden Cities of Tomorrow*). New towns should be so placed and planned as to get the best of town and country life, an adaptation of the model villages of certain industrial philanthropists such as Salt, Richardson, Cadbury, Leverhulme, and others. The Garden City Association (later the Town and Country Planning Association) was formed in 1899, and the first garden city was begun at Letchworth in 1904 and successfully established. Welwyn Garden City was also Howard's foundation, established in 1919.

Gardener-Bird, a bird possessing many of the characteristics of the bower-bird, and found only in Papua–New Guinea. *See also* **Bower Bird.**

Gargantua, the giant hero of Rabelais' satire, of immense eating and drinking capacity, symbolical of an antagonistic ideal of the greed of the Church.

Gargoyle, a projecting spout for carrying off water from the roof gutter of a building. Gargoyles are only found in old structures, modern water-pipe systems having rendered them unnecessary. In Gothic architecture they were turned to architectural account and made to take all kinds of grotesque forms—grinning goblins, hideous monsters, dragons, and so forth.

Garlic, a bulbous plant of the same genus as the onion and the leek, and a favourite condiment among the people of Southern Europe. It possesses a very strong odour and pungent taste and its culinary use is agelong.

Garnet, a group of minerals, chemically they are orthosilicates of the metals calcium, magnesium, titanium, iron, aluminium. Garnets can be coloured yellow, brown, black, green, or red, the blood-red garnet is an important gemstone.

Garrotte, a method of strangulation used as capital punishment in Spain, and consisting of a collar which is compressed by a screw that causes death by piercing the spinal marrow. Garroting was also applied to a system of highway robbery common in England in 1862–63, the assailants seizing their victims from behind, and by a sudden compression of the windpipe disabling them until the robbery was completed.

Garter. The Most Noble Order of the Garter was founded (*c* 1348) by King Edward III, and is the premier order of knighthood in Great Britain. The traditional story associating the garter and the motto with the Countess of Salisbury, who it was said dropped her garter while dancing with the King, who remarked "honi soit qui mal y pense" cannot be accepted. The order was originally limited to the Sovereign and 25 knights, but the number has been extended, and it may now be bestowed on royal personages and leading representatives of the British peerage. The insignia of the order are the garter of dark-blue velvet with the motto in letters of gold, the mantle of dark-blue velvet lined with white silk, the surcoat and hood, and the gold-and-enamel collar. The garter is worn on the left leg below the knee and by women as a sash over the left shoulder. *See* **Knighthood.**

Gas is an elastic fluid substance, the molecules of which are in constant rapid motion, and exerting pressure. The technique whereby gases are liquefied depends on increasing pressure and diminishing temperature. Each gas has a critical point, unless the temperature is brought down to this point no amount of pressure will bring about liquefaction. Last gas to be liquefied was helium (1908) which boils at −269° C. *See* **Gas Laws, N30,** *and* **F16**(2).

Gas from Coal for lighting and heating purposes is obtained from bituminous coal. Such a gas was produced and used for illuminating purposes by William Murdoch towards the end of the 18th cent in Birmingham, and about 1807 the illuminant was introduced in London, one side of Pall Mall being lighted with it. It soon supplanted oil and candles for outdoor and indoor lighting, and is still, in spite of the advances of electric light, a common illuminant, its power having been greatly increased by the incandescent burner. It is widely used for space heating and cooking. *See* **Underground Gasification.**

Gas, Natural, natural mixture of gases often present with deposits of petroleum, found issuing from the ground in many parts of the world—in the oilfields of Venezuela and the Caucasus, in China, Saudi-Arabia, but chiefly in North America. Its chief component is methane. Large industrial centres have made use of this gas since the latter part of the 19th cent, but much of this valuable fuel still goes to waste. Pipelines have been constructed to deliver the gas to where it is wanted. Britain plans to ship

liquid methane from the Saharan oilfield by 1964 *See also* **Methane**

Gas Turbine. This kind of engine has recently become a competitor of the internal combustion engine Mechanical movement is produced by a jet of gas impinging on a turbine wheel Gas turbines are being used in aeroplanes, locomotives, and ships These engines are mechanically simple compared with internal combustion engines, and require less maintenance It has been stated that the jet-propelled Comet cruises at 450 m p h burning less than ½ lb of kerosene per passenger mile

Gastropoda *See* **F23(1).**

Gauge, a standard dimension or measurement, applied in various branches of construction Thus, the standard railway gauge is 4 ft 8½ in in the United Kingdom, United States, Canada, France, Germany, Austria, Holland, Egypt, Belgium, Denmark, Italy, Hungary, Sweden, Switzerland, and Turkey In India, Ceylon, and Spain the gauge is 5 ft 6 in In Soviet Russia and Finland, 5 ft, Ireland, 5 ft 3 in Narrow railway gauges of different standards are in use on very steep inclines in various countries Other standard gauges are fixed in building and gun-boring

Gauls were inhabitants of ancient Gaul, the country which comprised what is now France, Belgium, and parts of the Netherlands, Switzerland, and Germany

Gault, a stratum of blue clay between the Lower Greensand and the Chalk A typical section of the Gault can be seen at Folkestone

Gavelkind, an old English custom of land tenure in Kent and other places in England, whereby on the death, intestate of a property owner his property is divided equally among his children and not according to the law of primogeniture Abolished by the Law of Property Act, 1922, and the Administration of Estates Act, 1925

Gazelle, an animal of the antelope family, of small and delicate shape, with large eyes and short cylindrical horns It is of a fawn colour, a native of North Africa, and easily domesticated

Gecko, the name of a family of drab lizards common in or near the tropics They are nocturnal, insectivorous, and harmless

Geiger Counter, an electrical device, invented by Geiger, which can detect individual atomic particles, *e g*, electrons, protons, etc It often consists of a tube of gas at a few cm Hg pressure, fitted with two electrodes —a cylinder and an axial wire A high voltage is kept across the electrodes, and the passage of a charged particle through the gas releases ions which permit a momentary discharge between the electrodes Electronic circuits register this discharge as a "count" Geiger counters are widely used to detect and measure radioactivity and cosmic rays, both for technical and research purposes

Gelatine, a transparent, tasteless, organic substance obtained from animal membranes, bones tendons, etc, by boiling in water It is of various kinds, according to the substance used in making it Isinglass, the purest form of it, is made from air-bladders and other membranes of fish, while the coarser kind—glue—is made from hoofs, skin, hides, etc Its constituents are carbon, hydrogen, oxygen, and nitrogen Gelatine is applied to an immense variety of purposes, from the making of food jellies to photographic materials

Gemini, one of the signs of the Zodiac lying east of Taurus and containing numerous stars, only two of which—Castor, the upper and brighter one, and Pollux, the lower one—are visible to the naked eye The stars are named after twin divinities of classical mythology

Gemsbok, a large South African antelope, with long straight horns and tufted tail Light fawn in colour, it has a black streak across its face, and is very fleet of foot

General, a military title next in rank to that of Field-Marshal, the highest officer in the army Ranking below full General are Lieutenant-General, Major-General, and Brigadier

Generation a time-measure reckoned at about 30 years when children are ready to replace parents, also the body of persons existing at the same time or period

Generation, Spontaneous. *See* **Abiogenesis.**

Genesis, the first book of the Pentateuch, compiled in the 5th cent B C from earlier documents, which carries the scriptural narrative from the creation to the death of Joseph Sometimes there is disagreement, as in the story of the creation, Gen i and ii Gen i reflects the views of the ancient Greek scientist Thales (*c* 640–546 B C) and may be said to be the first scientific account of the creation of the world The conditions described around the figures of Abraham, Isaac, Jacob, and Joseph have a genuine historical basis

Genet one of the smaller carnivorous animals, about the size of a cat, but with longer tail and spotted body It is a native of Southern Europe, North Africa, and Western Asia, and is valued for its fine soft fur, and also for a perfume it produces

Genes, the elementary units of heredity They exist as highly differentiated regions arranged along the length of the chromosomes A chromosome may carry hundreds or even thousands of genes, each with its own particular structure and specific properties The position of a particular gene on a chromosome is called its locus *See* **Cell Division F19–21** *and* **The Genetic Code F55–7.**

Geneva Convention, an agreement made by the European Powers at Geneva in 1864, establishing humane regulations regarding the treatment of the sick and wounded in war and the status of those who minister to them All persons, hospitals, hospital ships are required to display the Geneva cross— a red cross on a white ground A second conference held at Geneva in 1868 drew up a supplementary agreement An important result of this Convention was the establishment of the Red Cross Society in 1870

Genouillieres, ancient metal caps for covering the knees of an armed man, an example may be seen on the Black Prince's monument in Canterbury Cathedral

Genre, an art term used to describe a style of painting which deals with subjects of homely life, but also applied in France in connection with other kinds of paintings as genre du paysage (landscape painting), genre historique (historical painting), etc

Gentian, the name for plants of the *Gentiana* genus many of which have intensely blue flowers The gentian-root of *G lutea* is used in pharmacy

Genus, a term applied in biology to designate a group of similar species A group of similar genera is called a family

Geodesy, the science of calculating the configuration and extent of the earth's surface, and determining exact geographical positions and directions, with variations of gravity, etc Land-surveying is a branch of geodesy

Geography, the science which describes the earth's surface, its physical peculiarities, and the distribution of the various animals and plants upon it It is usual to divide the subject into two main branches—physical geography, which deals with the composition of the earth's surface and the distribution of its living occupants, animate and inanimate, and human geography, which includes economic, political, and social geography

Geology, the science which deals with the condition and structure of the earth, and the evidence afforded of ancient forms of life The geological strata are classified in the following categories *Primary* or *Palaeozoic* (the oldest fossil-bearing rocks including the Cambrian, Ordovician, Silurian, Devonian, Carboniferous, Permian), *Secondary* or *Mesozoic* (Triassic, Jurassic, Cretaceous), *Tertiary* or *Cainozoic* (Eocene, Oligocene, Miocene, Pliocene, Pleistocene), *Post tertiary* (most recent rocks) *See* **F30.**

Geometrical Progression is a term used to indicate a succession of numbers which increase or decrease at an equal ratio—as 3, 9, 27, or 64, 16, 4

Geometry is the branch of mathematics which demonstrates the properties of figures, and the distances of points of space from each other by means of deductions It is a science of reason from fundamental axioms, and was perfected by Euclid about 300 B C The books of Euclid contain a full elucidation of the science, though supplemented in modern times by Descartes

Newton and Carnot Of recent years non-Euclidean geometry has been developed.

Geophysics, the branches of physics which are concerned with the earth and its atmosphere Meteorology, geomagnetism, aurora and air-glow, ionosphere, solar activity, cosmic rays, glaciology, oceanography, seismology, nuclear radiation in the atmosphere, rockets, and satellites—all these are geophysical subjects The object of the International Geophysical Year, 1957–58, was to investigate the physical phenomena occurring on and around the earth by means of carefully co-ordinated observations made simultaneously all over the globe. *See also* **F43**.

George-Noble, a gold coin, so called from St George and the dragon depicted on its obverse First issued in the reign of Henry VIII

German Silver, an alloy of copper, zinc, and nickel, and used in the manufacture of table-ware, such as spoons forks, etc

Germanium. A grey, hard, brittle chemical element, symbol Ge, chemically related to silicon and tin Discovered by Winkler in 1886 Its richest ore is germanite containing 6% of the metal Coal is also a relatively rich source Since 1948 it has assumed great importance as a semi-conducting material for making transistors (*q v*) Because of this it has been so intensively studied that more is known about it than about any other element.

Gesta Romanorum (Latin = deeds of the Romans), a mediaeval collection of Latin stories of unknown authorship which circulated widely in Europe during the Middle Ages First printed in the 15th cent The stories were used by Chaucer, Shakespeare and other writers who found many romantic incidents and legends which they were able to turn to good account.

Gestation, the carrying of young in animals during pregnancy, varies considerably in its length In the case of an elephant, the period is 21 months, a camel, 12 months, a cow, 9 months, a cat, 8 weeks, a horse, 48 weeks, a dog, 9 weeks, and a pig, 16 weeks Hens "sit" for 21 days, geese, 30, swans, 42 turkeys, 28, pigeons, 18.

Geysers, hot springs of volcanic origination and action, are remarkable for the fact that they throw out huge streams of boiling water instead of lava as in the case of a volcano The most famous geysers are those of Iceland, which number over a hundred, the principal one having an opening 70 ft in diameter and discharging a column of water to a height of 200 ft There are also geysers in the Yellowstone region of America, and some in New Zealand Also a device now in common domestic use for heating running water quickly by gas or electricity

Ghost-Moth or **Ghost Swift**, an interesting nocturnal insect (*Hepialus humuli*), common in England, possessing in the male a white collar and known for its habit of hovering with a pendulum-like action in the twilight over a particular spot where the female is concealed

Giambeaux, metal armour for the legs and shins, worn by the warriors of Richard II 's reign

Gibbon, the name of a long-armed ape mainly inhabiting S E Asia It is without tail, and possesses the power of very rapid movement among the trees of the forests

Gin, a well-known spirit distilled from malt or barley and flavoured with the juniper berry The principal varieties are the English and American, known as "Gin" or "Dry Gin", and the Dutch, referred to as "Jenever" or "Hollandse jenever". In Germany and Austria it is called "Schnapps" The word "Gin" is an abbreviation of "Geneva", both being primarily derived from the French genièvre (juniper)

Ginger is obtained from a reed-like perennial plant grown in tropical countries There are two varieties, black ginger and grey ginger The former is obtained by peeling and drying the root, the latter by scalding and drying Ginger is largely used as a condiment

Giraffe, the tallest of existing animals, reaching a height of from 18 to 20 ft when full grown. Its sloping back and elongated neck seem to be the natural evolution of an animal that has to feed on the branches of trees It is a native of Africa, is of a light fawn colour marked with darker spots, and has a prehensile tongue

Giralda, a beautiful and remarkable example of Arabian art, erected in 1195 at Seville, still in existence Minarets similar to the Giralda are to be found at Morocco, Tunis, and Tetuan

Glaciers form in the higher Alpine ranges, and are immense consolidated masses of snow, which are gradually impelled by their force down the mountain-sides until they reach a point where the temperature causes them to melt, and they run off in streams From such glaciers the five great rivers, the Rhine, the Po, the Rhône, the Inn, and the Adige, have their source The longest of the Swiss glaciers is the Gross Aletsch which sometimes extends over 10 miles. Some of the glaciers of the Himalayas are four times as long The Muir in Alaska is of enormous magnitude, and that of Justeldals Brae in Norway is the largest in Europe

Gladiators were professional athletes and combatants in ancient Rome, contesting with each other or with wild beasts At first they were drawn from the slave and prisoner classes exclusively, but so much were the successful gladiators held in esteem that men came to make a profession of athletics and gladiatorial training schools were established When a gladiator was vanquished without being killed in combat, it was left with the spectators to decide his fate, death being voted by holding the hands out with the thumb turned inward, and life by putting forth the hands with the thumb extended. Gladiatorial shows were the chief public displays in Rome from the 3rd to the 4th cent A D.

Glass, a substance obtained from the fusion of silica (sand) with various bases, and is more or less transparent There are numerous kinds of glass, but they group themselves under one or other of the following classifications —Flint glass, or crystal, whose components are potash, silica, and oxide of lead, window glass, made from soda, lime, and silica, Bohemian glass, containing potash, lime, and silica, and bottle glass, composed of soda, lime, alumina, silica, and oxide of iron Heat-proof glasses used for making cooking utensils contain boron. Glass was made by the Phoenicians, and was familiar in ancient Egypt The Egyptians introduced it into Rome In the Middle Ages Venice was famed for its glass manufactures, but after the 17th cent Bohemia acquired pre-eminence English glass reached its highest level of artistic design in the 17th and 18th cent Window glass was not used in this country for dwellings until the end of the Middle Ages.

Glass-Snake, genus, *Ophisaurus*, of legless lizards with long fragile tails capable of re-generation when broken Six species are known, in S E. Europe, S W Asia, Indo-China, and N America. Attains a length of about 2 ft , main colouring, green, with black and yellow markings

Glauconite. A green mineral, chemically a hydrated silicate of potassium and iron Commonly found in marine sands (hence these rocks are known as "greensands") and sandstones

Glaucus is a curious genus of sea slugs often called the Sea Lizard belonging to the molluscs It is without shell and has a soft body, with horny mouth and four tentacles It is a native of the Atlantic, and is not more than 12 in in length.

Glee, an unaccompanied piece for three or more voices. Glee-singing was popular in England during the 18th and early 19th cent and glee-clubs are still in existence

Globigerina, an oceanic unicellular animalcule with a perforated shell, and occurring in certain parts of the Atlantic in such vast numbers as to form a bed of chalk ooze with their empty shells

Glockenspiel, an instrument composed of metal bars each of which is tuned to a note The bars are struck by hand-hammers and give forth chiming sounds.

Gloria in Excelsis ("Glory to God in the highest") is the opening of the Latin hymn adapted from Luke ii 4, and the most prominent hymn of the ecclesiastical rites in the Christian liturgies

Gloria Patri, the lesser Doxology, with which chants are generally concluded in the English Church service—"Glory be to the Father, and to the Son."

Glow-worm, a beetle, possessing the power (much stronger in the female than the male) of emitting

phosphorescent light from the hind end of the body The female is wingless.

Glucinium. *See* **Beryllium.**

Glucose, Dextrose *or* **Grape Sugar** is a carbohydrate (*q v*). It is produced by hydrolysis from cane sugar, dextrine, starch, cellulose, etc, by the action of reagents It also occurs in many plants, fruits, and honey For brewing purposes glucose is prepared by the conversion of starch by sulphuric acid. Malt also converts starch into glucose

Glutton *or* **Wolverine,** the biggest animal of the weasel family, inhabits the northernmost parts of Europe and America In build it resembles the bear, and is rather larger than a badger Its fur is of a brown-black hue, but coarse

Glycerine *or* **Glycerol,** occurs in natural fats combined with fatty acids, and is obtained by decomposing those substances with alkalies or by superheated steam. It is colourless and oily and sweet, and is put to a variety of commercial uses, being widely utilised for medicaments, for lubricating purposes, and in the manufacture of nitro-glycerine

Glycols. Organic compounds containing two alcohol groups Ethylene glycol is the most widely known example it is used as an anti-freeze in motor-car radiators on account of its property of greatly reducing the freezing point of water Also used in the manufacture of "Terylene". *See* **Esters.**

Glyptodon, an extinct species of gigantic armadillo, fossil remains of which have been discovered in S America It was some 9 ft long, carried a huge tortoise-like shell, and had fluted teeth

Gneiss, a metamorphic rock usually containing quartz, felspar, and mica It is banded, the light-coloured minerals being concentrated apart from the dark minerals

Gnosticism. *See* **J18.**

Gnu, an animal of the antelope family combining the characteristics of the buffalo in its head and horns, the ass in its neck and mane, and the horse in its long and bushy tail There are two species, the common and the brindled, and they are about the size of an ass They abound in Africa and congregate in herds

Goat-Moth (*Cossus cossus*), a large moth of the *Cossidae* family, common in Britain, evil-smelling, and very destructive in the larval stage to trees of the poplar and willow genus, into the wood of which the caterpillar bores during its three years' period of development

Goats are horned ruminant quadrupeds, indigenous to the Eastern Hemisphere, but now domesticated in all parts of the world Though related to the sheep, they are a much hardier and more active animal The male has a tuft of hair under the chin Many species, including those of Cashmere and Angora, are valuable for their hair, which is used for fine textile fabrics The milk of the goat is nutritive, and goat-skins are in good demand for leather for gloves, shoes, etc

Gobelin Tapestry was originated by a family of dyers named Gobelin in the 15th cent in Paris The Gobelin establishment, which produced this beautiful tapestry, made of silk and wool, or silk and cotton, was taken over by the Government of Louis XIV, in 1662, and since then has been the French national factory for that class of fabric

God and Man. *See* **J18.**

Gog and Magog, two legendary City of London giants, supposed to be the offspring of certain wicked daughters of the Emperor Diocletian and a band of demons They were brought captive to London and made to serve as prisoners at the Palace of Brute, which stood on the site of Guildhall Effigies of the giants have stood in Guildhall since the time of Henry V They were destroyed in the Great Fire of 1666, replaced in 1672, and used to be carried through the streets of London in the Lord Mayor's Show The present figures, newly carved in lime wood by Mr David Evans, replaced those carved in 1708 by Richard Saunders, which were destroyed in an air raid during the last war

Gold. Metallic element, symbol Au (Latin *Aurum*) related to silver and copper, the coinage metals The greatest amount of gold is obtained by treating gold-bearing quartz by the cyanide process. The gold is dissolved out by cyanide solution, which is then run into long boxes filled with zinc shavings when the gold is precipitated as a black slime This is melted with an oxidising agent which removes the zinc

Gold-Beaters' Skin is the outside membrane of the large intestine of the ox, specially prepared and used by gold-beaters for placing between the leaves of gold while they beat them This membrane is of great tenacity, and gets beaten to such extreme thinness that it is used to put on cuts and bruises

Gold Standard. This consists in the fixing of the value of a currency in terms of a weight of gold of a certain fineness Countries working under the gold standard lay down a fixed (or only slightly varying) weight of gold as equivalent to a unit of their currency, and their Central Banks undertake to supply gold, either freely or subject to certain limitations, in exchange for the national currency at this rate Accordingly, their Central Banks need to keep a Gold Reserve sufficient to meet demands for such exchanges of the currency for gold In practice under present conditions, the possession of dollars or of other gold-standard money is treated as equivalent to that of gold

Golden Age, according to the Greek and Roman poets, was the age of peace and innocence when mankind lived in a state of ideal prosperity and happiness

Goldeneye, a species of wild duck, widely distributed over Arctic regions It is a passage-migrant and winter-visitor to the British Isles Has nested in Cheshire Distinguished by a large white spot in front of each eye on a dark ground

Golden Number, the number of any year in the metonic cycle of 19 years, deriving its name from the fact that in the old calendars it was always printed in gold It is found by adding 1 to the number of the year A D and dividing by 19, the remainder being the Golden Number, or, if no remainder, the Golden Number is 19 The only use to which the Golden Number is put now is in making ecclesiastical calculations for determining movable feasts

Goldsmiths Company, one of the richest London City Companies, the official assayers of gold and silver, invested with the power of "hall-marking" the quality of objects made from these metals First charter granted in 1327

Gondola, the old regulation black boats so common on the canals of Venice, propelled by a gondolier with one oar who stands at the stern, his passengers being accommodated in a covered space in the centre

Gonfalon, the pennon affixed to a lance, spear, or standard, consisting usually of two or three streamers, and made to turn like a weather-cock

Gophers. Rodent mammals The pocket gophers are stout-bodied burrowers common in the U S A The slender burrowing gophers, also called "ground squirrels" occur in central and western U S A The sisel or suslik is a related European species They are a great pest among grain crops

Gordon Riots of 1780 were an anti-popery agitation fomented by Lord George Gordon. Called also "No-Popery Riots"

Gorilla, the largest of the anthropoid apes, found in the forests of Equatorial Africa, and at maturity standing from 4 to 5 ft high

Goshawk (*Accipiter gentilis*), a diurnal bird of prey, fearless and extremely agile, loves wooded country and is very destructive of poultry and game-birds It resembles the peregrine falcon in appearance, but has shorter, rounded wings This bird was a great favourite of falconers in mediaeval times It is still a familiar sight in parts of Europe, was once common in England, where it is said to have bred again in recent years.

Gospels are those portions of the New Testament which deal with the life, death, resurrection, and teachings of Christ They are the gospels of Matthew, Mark, Luke, and John, and the first three are called the *synoptic gospels* because of their general unity of narrative That of John is of somewhat wider scope, and gives in addition to the story of the Passion an account of the ministry in Judaea.

Gothic. A term applied to a style of architecture which followed the Romanesque, appeared in

France during the 12th cent., and is typical of northern Europe. It was not generally appreciated south of the Alps. The high and sharply pointed arches, the walls supported outside by flying buttresses, the traceried windows, often filled with stained glass, and the lofty spires are in sharp distinction to the semicircular arches and the massive walls characteristic of the more sturdy Romanesque style. Yet the transition was gradual. The cathedrals of Chartres, Laon, and the Benedictine church of St Denis just outside Paris are typical of early Gothic. The style found its full expression in the French cathedrals of the 13th and 14th cent.: Reims, Notre Dame, Beauvais, Bourges, and Amiens. From France the style spread to other lands in each of which it developed its own characteristics, thus the English churches tended to have massive towers and delicate spires and, as at Salisbury, were often set in open grounds surrounded by lawns. Flemish and Dutch churches were sometimes built of brick, as were those in north Germany and Scandinavia; in Spain the Flamboyant style was followed. The main Gothic cathedral in Italy, that of Milan, although begun in 1386 was not completed until the early 19th cent. The lofty character of Gothic has been attributed by the romantic to pious aspiration, as if the spires were striving towards heaven and this concept may well have played a part. The more concrete reasons however were somewhat different. Romanesque churches were thick-walled, sturdy, small-windowed and set often in open country or on heights (*a*) because architects had not yet discovered how to support a heavy roof without massive walls and (*b*) because, being built in dangerous times, they had a defensive function. Gothic churches began to be raised in less troublesome times and were tall for the same reason that New York skyscrapers are tall (*i.e.*, the increasing price of land). Also they were built in growing cities where not much space was available and they were lavish in style because wealth was increasing and rich merchants were willing to contribute. Late English Gothic is seen, for example, at King's College Chapel, Cambridge, Henry's Chapel at Westminster, and St George's Chapel at Windsor (all *c.* 1500). Gothic is also found in secular buildings, *e.g.*, Little Wenham Hall in Suffolk, the castle at Ghent, the town halls of Louvain and Middelburg, and the streets of Gothic houses in Bruges still in use today. Virtually Gothic as a style (excluding the "Gothic revival" of 19th cent. England) ended at the close of the 15th cent. Gothic art is best seen in the illuminated manuscripts of the 13th and 14th cent. and in the church sculpture. Its characteristic is a complete departure from the cool, perfectionist realism of classical times with distortion to produce emotional effects. The human figures are not ideal forms but recognisable as people we might meet in the street, yet there was also the element of wild imagination, intricate design, and a wealth of feeling which might be grotesque, humorous, macabre, or even obscene. This element of distortion and sometimes wildly "unrealistic" colouring which produced an effect more dramatic than the literal representation of the classic schools remained an important element in German art (*see* Expressionism) right up to modern times and is used by other modern schools.

Goths. A Teutonic people who originally came from southern Sweden (Gotland) and by the 3rd cent. were settled in the region north of the Black Sea. They began to encroach on the Roman Empire and early in the 4th cent. split into two divisions: the Visigoths or West Goths, and the Ostrogoths or East Goths. The Ostrogoths were conquered by the Huns *c.* 370, while the Visigoths under Alaric devastated Greece and sacked Rome in 410. Eventually the Visigoths spread to France and Spain and their last king Roderick fell in battle against the Moors in 711. The Ostrogoths regained their independence on the death of Attila in 453 and under their king Theodoric the Great conquered Italy in 493. They lost their identity after Justinian regained Italy, 525–552.

Gourd Family *or* Cucurbitaceæ. This family of about 650 species of flowering plants includes the gourds, pumpkins, cantaloupes, cucumber, gherkin, water-melon and squashes. Most abundant in the tropics, the cucurbits are mainly climbing annuals with very rapid growth. The bath-room loofah is the skeleton of one curcurbit fruit, *Luffa cylindrica*. The squirting cucumber is another member of the family.

Governor. A device attached to an engine, turbine, compressor, etc., which automatically controls the engine's speed in accordance with power demand. Most governors depend upon the centrifugal action of two or more balls which are thrown outwards as their speed of rotation increases and actuate a throttle valve or cut-off. The centrifugal governor was invented by Thomas Mead, patented by him in 1787, and used on windmills. Watt adapted it to the steam engine.

Grail, Legend of the Holy, a tale of Celtic origin which became part of Arthurian legend and the subject of many mediaeval quest-romances. According to the Christian version the grail was the cup which Christ used at the Last Supper, brought to England by St. Joseph of Arimathea.

Grand Prix, the "French Derby," was established by Napoleon III, in 1863. It is the chief French race and is an international competition of three-year-olds.

Granite is a coarsely crystalline igneous rock consisting of quartz and alkali felspars plus mica or hornblende. It is a much used ornamental and building stone, it forms the high ground of Dartmoor and Bodmin Moor.

Graphite *or* Plumbago, commonly called black-lead, is a form of carbon occurring in foliated masses in marble, schist, etc. It is soft, will make black marks on paper or other plain surfaces, and is mainly used for lead pencils. It is also a valuable lubricant. Pure graphite has found a new use with the construction of atomic piles. Important deposits occur in Siberia, Ceylon, Madagascar, Canada, and the U.S.A.

Graptolites, fossil animals confined to Cambrian, Ordovician and Silurian strata. Once classified as hydrozoa but now considered more likely to be hemichordates.

Grasshopper. There are many species of these leaping insects which are related to the locusts and crickets. Most are vegetarians, some eat flies and caterpillars also. The chirping sound they make is made by scraping the hind legs against the wings; in some species a noise is produced by rubbing the wings together.

Gravitation. *See* F15(2), 44(1).

Graylag, the ordinary wild grey goose of Europe, the species from which domestic geese are derived; frequents fens and marshes, breeds in Iceland, Scandinavia, and Scotland; distinguished by pinkish legs and feet and lack of black markings on bill.

Grayling, a fresh-water fish of the salmon family having a large dorsal fin, and averaging about 1 lb in weight.

Grebe, a diving bird of beautiful plumage found over a great part of the world on lakes and oceans. The two species familiar in Great Britain are the Dabchick or Little Grebe and the Large and handsome Great Crested Grebe, which has a feathery tuft, lost in the autumn, on each side of the head. Grebes have remarkable courtship displays. The breast feathers are of a downy softness and silver lustre, for which they were formerly much hunted.

Greek Art. *See* **Hellenic Art.**

Greek Fire, a combustible, supposed to have been composed of sulphur, nitre, naphtha, and asphalt, used with destructive effect by the Greeks of the Eastern Empire in their wars.

Greek Kalends, equivalent to never, as only the Romans, not the Greeks, had kalends.

Green Room, the common assembling room for actors and actresses behind the stage, so called from the first room of the kind being decorated in green.

Gregorian Calendar, introduced by Pope Gregory XIII in A.D. 1582 to replace the inexact Julian calendar. Great Britain did not adopt it until 1752 when eleven days were dropped in the month of September. *See* **Calendar.**

Gregorian Chant, ritual music with a system of harmony suitable for church use. First established by Pope Gregory I.

Gresham's Law states that if good money, money with the higher intrinsic value, and bad money are in circulation together, the bad money will tend to drive out the good money from circulation. For instance, the good money is more likely to be melted down or demanded in payment by foreign creditors.

Gretna Green, a celebrated village in Dumfries, just over the border from England, where run-away marriages were performed from 1754 to 1856, though only completely stopped during present century.

Griffin, in ancient mythology, a winged creature with an eagle's head and body of a lion, found in ancient sculptures of Persia and Assyria. Its origin is traced to the Hittites. It had the same religious significance as the winged sphinx of Egypt. The griffin vulture is a bird named after the mythological creature, found in Europe, Africa and India.

Grilse, a young salmon that has only been once to the sea.

Grimm's Law, formulated by Jacob Grimm, an eminent German philologist, lays down a principle of consonantal change in the Germanic languages. For instance, Lat. *pater*, Eng. *father*, Ger. *Vater*; Lat. *frater*, Eng. *brother*, Ger. *Bruder*; Lat. *decem*, Eng. *ten*, Ger. *zehn*.

Grog, the beverage served out to sailors, and compounded of spirit and water in prescribed proportions. The name, it is said, was derived from the fact that Admiral Vernon, who introduced it into the English navy in 1745, wore Grogram breeches.

Grogram (French — *gros grain*), a kind of rough fabric made of wool and some other fibre, such as silk, mohair, or cotton, formerly much used for commoner kinds of wearing apparel.

Grotto, a natural or artificial cave. Among the most famous are the blue grotto of Capri and the stalactite grotto of Antiparos. The latter has been known since 1673 and is of singular picturesqueness.

Ground Wave, that part of the energy emitted by a radio transmitter which travels along the ground, as opposed to the sky wave which is reflected back to earth by the ionosphere. With the lower radio-frequencies, the ground wave can be picked up over several thousand miles, in the broadcasting band, over a hundred or so miles, it is virtually useless at high frequencies.

Grouse, game bird of the northern latitudes where some 20 species occur. They are stout, compact, ground-dwelling birds, protectively plumaged (the willow grouse turns white in winter), the male usually being larger and more brightly coloured than the female. The red grouse of the British moorlands has been introduced into Belgium and W. Germany. Of the same family are the blackcock, ptarmigan, capercaillie, American prairie-hen, and the common partridge. Grouse shooting begins in Britain on Aug. 12.

Guanaco, a large species of llama, common to South America, and utilised as a beast of burden.

Guano, the excrement of sea birds, found in large quantities on the rocky islands of the western coasts of South America and Nauru Is. It forms a useful fertilising agent, being rich in phosphate and ammonia, and first came into use in 1841, since which time Peruvian guano has been a recognised article of commerce. Beds of guano from 50 to 60 ft. in thickness are not uncommon. Fish guano and bat guano from caves in South America and the Bahamas are also used as fertilisers.

Gudgeon, a small fresh-water fish of the carp family with 2 small barbels on the upper lip.

Guelph and Ghibelline, italianised forms of the German words "Welf" and "Waiblingen," the names of two rival princely families whose conflicts made much of the history of Germany and Italy during the Middle Ages. The feuds between these two factions continued in Italy during the campaigns of Emperor Frederick I., and later developed into the fierce struggles of the 13th cent. between emperor and pope. In Italy the Ghibellines supported the side of the German emperors and the Guelphs the cause of the pope. The present Royal Family of England is descended from the Guelphs, through the ducal House of Brunswick (the name of Windsor was assumed during the first world war).

Guildhall, the place of assembly of the members of a guild, and at one time, when guilds were in full strength, was practically the Town Hall. The London Guildhall is to-day the hall of meeting for the City of London Corporation.

Guilds for the fostering and protection of various trades have existed in England since Anglo-Saxon times, and from the 12th to the 16th cent. exercised great influence and enjoyed many privileges. There were traders' guilds and craftsmen's guilds, and in all large cities and towns there was a guild hall. Their successes in the Middle Ages led to many monopolistic abuses, and in the end it became necessary to free the country from their restrictive power. The City Guilds (Livery Companies of the City of London) derive their name from the distinctive dress assumed by their members in the 14th cent. There are 82 Guilds in existence.

Guild Socialism. *See* **J21**.

Guillemot, a genus of sea-birds of the auk family, common in Northern Europe, two species—the Common Guillemot and the Black Guillemot—being natives of our own sea coasts, nesting on the cliffs. Brünnich's Guillemot, an Arctic species, is a rare straggler in the British Isles.

Guinea, an English gold coin of the value of twenty-one shillings, current from 1663 to 1817, and deriving its name from the first guinea coinage having been struck from gold obtained on the coast of Guinea.

Guinea-Pig, a rodent of the cavy family about 10 in. in length and with a tail so short that it does not project outside the body. It makes an excellent pet, though easily frightened. Its ancestors were species of the wild cavy of S. America said to have been domesticated by the Incas of Peru. *See* **Z15(2)**.

Guitar, a six-stringed instrument with a hollow resonant body, the strings being plucked by the fingers. The instrument seems to have originated in Spain, but there is a variant known as the Hawaiian Guitar. A recent development is the Electric Guitar, in which the mechanical vibrations of the strings are converted into electromagnetic vibrations, amplified, and reproduced by a loud-speaker.

Gules, a heraldic term, denoting a rose of red tincture, indicated by vertical lines drawn or engraved without colour.

Gulf Stream is confined entirely to the western side of the N. Atlantic and is the warm-water current flowing through the Straits of Florida from the Gulf of Mexico parallel to the American coast up as far as Cape Hatteras. From there it continues north-eastwards as a slower, broader, cooler (yet even so, relatively warm) drift of water, merging with the North Atlantic Drift and losing its identity about 40° N. Lat., 60° W. Long. It is a common error to attribute the warmth of the British Isles and Western Europe generally to the Gulf Stream but this has no influence whatever except in so far as it feeds the North Atlantic Drift. Both the Gulf Stream and the North Atlantic Drift owe their movement to the direction of the prevailing winds and it is the south-westerly airstream coming from warmer regions and passing over the surface waters of the Atlantic Drift that brings the warmth inland to influence the climate of Western Europe.

Gull. An extremely well-known, long-winged sea-bird with rather short legs and webbed feet. In almost all adults the body and tail are white whilst the back and most of the wings are grey or black. In the majority of cases the plumage of juveniles is partly or entirely dusky. Gulls are omnivorous, and are very useful as scavengers. They follow ships and quickly seize upon any refuse which may be thrown overboard. There are 41 species, which vary in size from moderately small to large. With certain exceptions, such as the Kittiwake in the North Atlantic, they are not found very far from land. They are sociable and mostly breed in colonies on cliff-ledges, on islands, beaches and sandhills and among vegetation in swamps, sometimes a long way from the sea. The nest is usually substantial, and the eggs generally number from two to three. Of the 29 species breeding in the northern hemisphere, 14 occur in the British

Isles The pure white Ivory Gull is the most northerly of birds Sabine's and the Swallow-tailed Gull have forked tails Ross's Gull has a black ring round the neck and one species, Franklin's Gull, migrates from the North where it breeds, to pass the winter in the Southern hemisphere

Gulliver, the hero of Swift's satire, *Gulliver's Travels*, who, in Lilliput and Brobdingnag, passed through a series of adventures which were so contrived as to reflect the humour, follies, and shortcomings of Swift's day

Gums are glutinous compounds obtained from vegetable sources, soluble in cold or hot water, but not in alcohol There are innumerable varieties Gum Arabic is exuded from a species of acacia grown in Senegal, the Sudan, Arabia, India and other countries, and is a valuable commercial product, used in dyeing, ink-making, as a mucilage, and in medicine India-rubber is an elastic gum Gums are also made from starch, potatoes, wheat, etc, from seeds, bark, roots, and weeds Many so-called gums are resins

Gun-Cotton, a powerful explosive manufactured by subjecting a prepared cotton to the prolonged action of a mixture of three parts sulphuric acid and one part of nitric acid It burns without explosion on ignition, but by percussion explodes with a force five times greater than that of gunpowder

Gunpowder, also called "black powder," the oldest of explosive mixtures, consists of saltpetre, sulphur, and charcoal, intimately mixed, the proportions being varied for different intended uses

Gunpowder Plot was a conspiracy by a desperate band of Roman Catholics in the reign of James I to avenge the harsh treatment to which Catholics were subjected Barrels of gunpowder were secreted in the vaults underneath the Houses of Parliament and it was proposed to fire these when the King and his Ministers assembled on Nov 5, 1605 The plot was betrayed and Guy Fawkes and his co-conspirators were arrested and executed The date serves to perpetuate the ancient custom of burning the effigy of Fawkes, a custom in which young people are the most enthusiastic participants, with bonfires, fireworks, etc

Gunter's Chain, a surveyor's chain 22 yd long divided into 100 links, invented by Edmund Gunter (1581–1626), Professor of Astronomy at Gresham College, for the measurement of areas 1 acre contains 100,000 square links

Gurnard, a sea-fish, with large, bony head and diminutive body, of which there are some forty species They are plentiful in British waters

Gymnasium, originally the name given in ancient Greece to the public places where Greek youth used to exercise and receive instruction Plato, Aristotle and other great teachers lectured there The Greek institution was never very popular with the Romans, and it was not until the 18th and 19th cent that the cult of combining physical with intellectual activity again found a place in educational systems In Germany the name was applied to the classical grammar school, in this country and America to the halls where gymnastics were practised

Gymnosperms *See* **F28(1)**

Gypsies, a nomadic race, believed to be of Indian origin, their language, Romany, certainly seems related to Hindustani They are spread over many parts of the world, but are most common in Europe, having appeared in Western Europe in 1417, finding their way to England at the beginning of the 16th cent They give evidence of their Eastern origin in their dark skins, large black eyes, black hair, and pearly white teeth They are born wanderers, and pass from place to place following certain small occupations such as tinkering, basket-making, and the like

Gypsum, a whitish mineral consisting of hydrated sulphate of calcium The finest gypsum is alabaster. When heated gypsum is converted into the powder called Plaster of Paris, the water it loses can be taken up when the plaster is wetted, and the reconversion of Plaster of Paris into gypsum accounts for the way in which the former sets hard The name "Plaster of Paris" came from the location of important gypsum quarries in the Montmartre district of Paris It was found after the flood disasters of Jan 1953 that gypsum could undo the effect of sea-water By spreading it for the rain to wash into the soil, thousands of acres of farmland in Holland and Britain were made productive again.

Gyroscope, an application of the principle of the spinning top to a single-rail railway, the steering of ships, and the steadying of torpedoes A high-accuracy gyroscope combined with a highly sensitive accelerometer in what is known as an inertial navigation system was used by the *Nautilus* when it made its journey under the North Pole in 1958

H

Habeas Corpus, the name given to a writ ordering the body of a person under restraint or imprisonment to be brought into court for full inquiry into the legality of the restraint to be made The first Habeas Corpus Act was passed in 1679, though nominally such a right had existed from Magna Carta, but some of the more despotic kings had disregarded it In times of public peril the privilege of *habeas corpus* is sometimes temporarily suspended, many instances occurring in the history of Ireland and during the First and Second World Wars.

Haber Process, the important industrial process for synthesising ammonia from atmospheric nitrogen Nitrogen and hydrogen are made to combine at high pressure (200 atmospheres or upwards) in an electric arc

Haddock, one of the best-known fishes abounding in northern seas and averaging about 4 lb in weight Related to the cod Largely used for curing, and sold as "finnan haddies"

Hade of veins, a mining term indicating the particular inclination that any vein, seam, or strata may have from the perpendicular, thus, in Weardale the veins mainly "hade" to the north

Hadrian's Wall *See* **Roman Walls.**

Haematite, ferric oxide, one of the principal iron ores, containing about 70% of the metal It is usually found in kidney-shaped masses, and is specular, red or brown, in thin fragments, but greyish in bulk

Haemocyanin, the respiratory pigment of crustaceans and molluscs It functions like haemoglobin, from which it differs in containing copper instead of iron and being blue when oxidised instead of red

Haemoglobin, the pigment containing iron which gives red blood corpuscles their colour It is a respiratory pigment, having the property of picking up oxygen when the blood passes through the lungs to produce the compound known as oxyhaemoglobin In other parts of the body the oxyhaemoglobin breaks down, liberating oxygen, which is used in the oxidation process (respiration) that the body tissues carry on *See also* **F25.**

Hafiz, besides being the pseudonym of a famous Persian poet, is a title conferred upon any Mohammedan who has committed the whole of the Koran to memory

Hafnium, a metallic element discovered by Coster and Hevesy in 1922 and important in the atomic-energy field It occurs in most zirconium minerals to the extent of about 5 per cent

Hag-fish, a blind, eel-like parasitic sea-fish with soft backbone, found within the bodies of other fish, and called sometimes the "borer," or "the glutinous hag-fish" Related to the Lamprey

Hagiarchy, the rule or order of Saints

Hagiology, a branch of literature that is wholly given up to the history of the saints, and the setting forth of the stories and legends associated with their names.

Hail, hard, roughly spherical balls of ice, consisting of white cores covered by layers of both transparent and opaque ice, frequently falling during thunderstorms. They usually do not exceed 1 in. in size, but hailstones larger than apples and weighing more than 2 lb have been observed. The general theory of a hailstone is that near the top of a cumulonimbus cloud a raindrop becomes frozen, grows in size by condensation and through collisions with snow

particles, and eventually becomes so weighty as to overcome the ascending air currents in the cloud Falling, it first encounters supercooled water drops, immediately freezing on it, increasing the white core, and then at lower levels ordinary water drops, freezing more slowly, producing a layer of clear ice Before the hailstone arrives at the ground gusts and lulls may transport it several times up and down both regions, adding alternate coatings of soft white and hard clear ice

Hake, a fish of the cod family, found in large numbers in the seas of Europe, but not in high favour for the table with fastidious feeders

Halcyon, a term associated in olden times with the kingfisher and days of soothing calm, "halcyon days" being a frequently used expression The legend was that the kingfisher laid its eggs on the surface of the sea at the time of the winter solstice when the sea was specially calm

Halibut, one of the largest of the flat fishes, averaging when full grown from 4 to 6 ft in length, and highly esteemed for the table Specimens of still larger size occasionally occur. It is plentifully distributed Its two eyes are on the right side of the head.

Hall-mark. A mark or group of marks, impressed by an assay office on gold or silver articles guaranteeing the standard of fineness of the precious metal used in them. These marks, which have been applied to silver made in London since the beginning of the 14th cent and perhaps earlier, make it possible to establish the year and place of assay as also the name of the maker English pieces of silver usually have not less than four marks, viz, (1) town mark; (2) maker's mark, (3) date letter, (4) sterling mark

The town mark is rarely changed, in London a crowned leopard's head was used from the earliest days until 1820 with only minor modifications, except for the period 1697–1720 when a lion's head erased was substituted, since 1820 the crown has been omitted

Until the late 17th cent a symbol was often used as a maker's mark, from 1696 to 1720 the first two letters of the maker's surname, and subsequently the maker's initials Owing to the destruction of the earlier mark plates at Goldsmiths' Hall no maker's name prior to the late 17th cent can be identified with certainty

The London date letter is changed at the end of May each year, so each letter covers seven months of one year and five months of the following. The London date cycle has usually consisted of twenty letters the alphabet of each cycle is of different style, and the letters are enclosed in shields of different shape

The sterling mark, the lion passant, was introduced in 1544 and continued in use until 1697, when the higher Britannia standard was introduced in order to discourage the practice current amongst goldsmiths of melting down coin of the realm to make plate The leopard's head crowned and the lion passant were then replaced by a figure of Britannia and a lion's head erased Though the regulation imposing the higher standard was withdrawn in 1720, a small amount of Britannia standard silver continued to be made and still is made

From 1784 until 1890 a plate tax was levied on all silver assayed in Great Britain and an additional duty mark, the sovereign's head, was used during this period A Jubilee mark bearing the head of George V and of Queen Mary was used in between the years 1933 and 1935, and in 1953 a coronation mark with the head of Queen Elizabeth was introduced

The tables of hall-marks in Gen Comp give the London date letter cycles from 1598 to the present day The form of town mark and sterling mark used during each cycle is given at the head of each column Where a major alteration took place in either of these marks during a date-letter cycle, the alternative forms are also shown The date of the change can be established by reference to the notes above At the bottom of each page the marks used by the major provincial, Scottish and Irish assay offices are shown Owing to lack of space, the complete date-letter cycles are not shown, but two examples only from the 17th, 18th or 19th cent. Where a provincial assay office was established in the 17th cent or earlier, the marks of one year in the 17th and 18th cent respectively are shown, where the office was not established until the 18th cent, the marks of one year in the 18th and 19th cent are given

Halloween (Oct 31), the eve of All Saints' Day, a time associated especially in Scotland, with certain pleasing superstitions attractively set forth in Burns's famous poem "Hallowe'en" It is the night when young men and maidens are supposed, by observing certain rites, to have their future wives and husbands disclosed to them

Halo, a luminous circle usually of 22° radius, surrounding sun or moon, produced by the refraction and reflection of light by ice crystals of high cirrus cloud It is a very common occurrence, in the British Isles almost one day in three The inner side is red and the outer a whitish-yellow colour "Mock suns," *i e*, patches of light at the same elevation as the sun are much rarer occurrences, sometimes being of great beauty and brilliance. *See* **Coronae.**

Halogens, the group name for the four non-metallic elements fluorine, chlorine, bromine, and iodine. The term "halogen" means "salt-producer"

Halteres, the modified hind-wings of the two-winged flies or *Diptera* (*e g*, the house-fly) The equilibrium in flight of these insects depends on the halteres, which are commonly called "balancers"

Hampton Court Conference, presided over at Hampton Court Palace by James I in 1604 and which brought about his authorised translation of the Bible, had an important bearing on the religious differences of the time James refused to grant tolerations to the Puritans This sowed the seeds of civil war Following the conference three hundred English Puritan clergy were ejected from their livings

Hanaper Office, a former Chancery office deriving its name from the fact that its writs and papers were kept in a hanaper (hamper) The Chancellor's officer thus came to be known as the Hanaper The Comptrollers of the Hanaper were abolished in England in 1842

Hand, a measure of four inches, the average size of the palm, used in reckoning height of horses

Handfasting, an informal marriage custom once prevalent in Scotland whereby a man and woman bound themselves to cohabit for a year and a day, and at the end of that period either confirmed their contract by a regular marriage or separated

Hansard, the title given to the official reports of Parliamentary debates, so named after Luke Hansard who in 1774 became partner in a firm of printers to the House of Commons His son T C Hansard was first the printer and then the publisher of an unofficial series of parliamentary debates inaugurated by William Cobbett in 1803. In 1909 production was taken over by H M Stationery Office and today's volumes contain full substantially verbatim reports of what is said in both Houses of Parliament

Hanseatic League was a confederation of North German towns established about 1241 for purposes of mutual protection in carrying on international commerce The League became so powerful that it was able to dominate the foreign trade of Norway, Sweden, Denmark, and even to some extent of London A branch was established in London and had its guild hall in Cannon Street for hundreds of years The League existed down to the middle of the 17th cent Hamburg, Lubeck, and Bremen are the only cities which, as free ports, still by commercial courtesy retain the name of Hanse towns

Hansom, a two-wheeled one-horse cab, invented by Joseph A Hansom in 1843 It was, until the introduction of the taxi, the cab in most ordinary use in London and other large cities. Lord Beaconsfield styled it the "gondola of London" The driver sat on a "dickey" behind, level with the roof of the cab

Hara-kiri, the custom of suicide by compulsion, or "happy despatch," once common in Japan, but no longer permitted The condemned person gave himself the first cut, and if his courage then failed him, the fatal blow was dealt by a friend.

Hard Water. Water containing appreciable quantities of dissolved salts of calcium and

magnesium It is difficult to form a lather with soap in hard water, and the impurities block up water pipes. *See* Water

Hare, species of the *Lepus genus*, distributed widely through the N hemisphere Noted for having four upper front teeth, one pair behind the other, short tufted tail, a cleft upper lip and longer ears and limbs than the rabbit It does not burrow The young are born with hair and able to see A swift animal hunted with greyhounds in the sport called "coursing" *See also* **Game**.

Harleian MSS. comprise some thousands of volumes of MSS and documents, collected by the first Earl of Oxford (1661–1724) and his son Edward After the death of the latter, his widow handed the MSS over to the nation for £10,000, a sum that did not represent a quarter of their value, and they are deposited in the British Museum

Harlequin, the buffoon of ancient Italian comedy As adapted to the British stage, however, harlequin is a pantomime character only, in love with Columbine, appearing in parti-coloured garments and carrying a wand, by which he exercises a magic influence in thwarting the fantastic tricks of the clown and pantaloon

Harmattan, a dry wind which may blow between January and May across the Sahara to the Gulf of Guinea Although affording relief from the tropical heat, vegetation withers because of its extreme dryness and much irritation is caused by the clouds of fine dust which it carries

Harmonic Motion, regular periodic motion of the kind exemplified by a ball bobbing up and down at the end of a spring, and by the piston in a steam engine It may be simple (simple harmonic motion) or composed of two or more simple harmonic motions. In simple harmonic motion the acceleration is proportional to the distance of the moving body from its original rest position

Harmonics, Flute-like tones which can be produced by touching the strings of a violin in a certain way The effect is due to the suppression of the fundamental frequency at which the string would normally vibrate In consequence only the harmonics or overtones (notes one octave or more above the fundamental which combine to give the characteristic timbre of the instrument) are heard

Harmonica *or* **Mouth Organ**, a small instrument consisting of reeds enclosed in separate chambers through which air is blown or sucked by the mouth Recent improvements and elaborations have made of it a versatile solo instrument in the hands of an expert

Harmonium *or* **American Organ**, a small organ of one or two manuals consisting entirely of reed stops There is no pedal organ, the feet being used to operate the bellows.

Harp, a musical instrument of ancient origin consisting of many strings stretched on a frame The player stands beside it and plucks the strings with his fingers Used orchestrally in early Italian operas (17th cent)

Harp-seal, the ordinary Greenland seal, with a dark harp-shaped marking on its back, hence its name It abounds in Newfoundland waters and further northward towards the Arctic

Harpsichord, a keyboard instrument with a compass of up to six octaves in which stretched strings are plucked by quills The harpsichord was an instrument of great importance from the 16th to the 18th cent, but it was eventually eclipsed by the pianoforte, in which the plucking action (*cf* **Harp**) was replaced by a striking action (*cf* **Dulcimer**)

Harpy Eagle, a large bird of prey named from the winged monsters of Greek mythology, inhabiting the forest regions of Central and South America There are eight species, one with handsome grey plumage and large crest which attacks and kills animals much larger than itself, and was called by the Aztecs "winged wolf"

Harrier, a bird of prey of the falcon family, of the various species distributed over the world, three breed in Britain. the moorland Hen harrier, the Marsh harrier, and Montagu's harrier They are large birds with long tails, long legs, long wings, and gliding flight They nest on the ground and eat small mammals, frogs, lizards, and small birds

Hartebeest, common African antelope of a greybrown colour, with ringed and knotted horns bending backward and tapering to sharp points, gregarious, of large size, and capable of domestication. There are several species

Harvest Bug, a very small insect, of a dark red colour, which appears in large numbers in the fields in autumn, and is peculiarly irritating to animals and man by the tenacity with which it attaches itself to the skin and burrows underneath Probably the larvae of spinning mites (Trombidoids) In the U S A. they are called "chiggers."

Harvest Moon, the full moon that occurs nearest to the autumn equinox, in September It rises for several nights running about the same time and yields an unusually brilliant series of moonlight nights.

Harvestmen are, like spiders, members of the arachnid class but belong to the distinctly different order of Phalangida They are common in the countryside in autumn and have small oval bodies and eight long slender legs which besides being mere organs of locomotion also act as sense organs Known as "daddy longlegs" in America

Hashish, an Arabic word for the narcotic substance prepared from the hemp plant (*Cannabis sativa*) It is known by a variety of names, *e g*, bhang in India and marijuana in America

Hatchment, in heraldry, is a square board, in vertical diagonal position, placed outside a house or on the tomb at the death of a member of a family and so arranged that it indicates the sex and condition of the deceased

Hawfinch, a well-known European bird of the finch family, having a variegated plumage, a sturdy bill and black-and-white tail. In England it is found in the Midland and Eastern Counties, and locally in Scotland

Hawk This name is applied to almost any diurnal bird of prey other than eagle, falcon, or vulture, but in its strict sense applies only to the *Accipiter* genus—the small Sparrow Hawk and the larger Goshawk, round-winged, long-tailed birds with barred under-parts They prey upon small birds captured in flight and small mammals

Hawk-moths, large species of moths, thick of body and strong of wing, which fly with rapid swooping motion, hence its name There are numerous handsome species in Britain

Hearth-Money was a tax laid on hearths (in all houses paying the church and poor rates) Charles II introduced it in 1662, and it was repealed in the reign of William and Mary

Heat, after prolonged controversy over whether or not heat is a "substance" (formerly called "caloric"), it was established in the 19th cent that heat is a form of energy, it is in fact the combined kinetic and potential energy of the atoms of which a body is composed Heat can be turned into other forms of energy, *e g*, a red hot body loses heat by radiating it in the form of electromagnetic waves ("radiant heat"—chiefly infra-red rays) Heat may also be transferred from one place to another by conduction and, in fluids, by convection All three processes occur when a glowing fire heats a room A unit quantity of heat is the calorie, which is the amount of heat sufficient to raise the temperature of 1 gm of water by 1° C In general, adding heat to a body raises its temperature The number of calories required per gm of material to raise the temperature 1° C is called the *specific heat* of the material However, adding heat may not raise the temperature but may instead cause a change of state, *e g* from solid to liquid (melting) or liquid to gas (evaporation) The amount of heat required to melt 1 gm. of a solid is called the latent heat of melting Similarly, there is a latent heat of evaporation Strictly speaking, the specific and latent heats of a substance depend on how much its pressure and volume are allowed to vary during the measurements Water has a high specific heat, and this makes the oceans a vast heat reservoir, a factor of great meteorological significance. The science of heat is called thermodynamics, and is of great importance in physics and chemistry. *See* **F16**.

Heath, flowering plants of the *Ericaceae* family. Heaths are widely distributed over uncultivated

spaces of Europe and Africa. In Britain they are represented by heather (of which there are several species) and ling (*Calluna vulgaris*), which cover thousands of acres of moorland. Some of the African or Cape heaths are very beautiful and much prized by florists. One species of heath (*Erica arborea*) which grows in S. Europe and N. Africa has close-grained woody root-stock used for making briar pipes. See T6(2).

Heat Wave is a spell of very hot weather, due chiefly in the British Isles to a warm southerly current of air caused by the presence of an anticyclone over western or central Europe at the same time as a depression is stationary over the Atlantic. High humidity increases the discomfort.

Hegira, an Arab term signifying departure or flight, and used in reference to Mohammed's departure from Mecca for Medina, A.D. 622, from which date the Mohammedan era is reckoned.

Helicopter, heavier-than-air aircraft which obtains its lift from blades rotating above the fuselage in windmill-fashion. The first successful helicopters were the Focke-Wulf 61, a German machine (1936), and the VS-300, designed by Igor Sikorsky, flown in 1937. Helicopters can hover, and rise and descend vertically, in addition to being capable of horizontal flight.

Heliotrope, a favourite sweet-scented flowering plant, common in tropical and sub-tropical countries, the Peruvian heliotrope is the "cherry pie" of our summer garden borders. See T8(1).

Helium, a gaseous element first discovered by means of the spectroscope in the sun's atmosphere. This discovery, made in 1868 by the astronomer Sir Norman Lockyer, was followed in 1895 by Sir William Ramsay's proof that the element existed on earth. He found it in the uranium ore, clevite. Later it was established that helium is formed by the radioactive decay of many elements which emit α-particles (nuclei of helium atoms) and is contained in all radioactive minerals. The largest source of helium is natural gas, the richest in helium being the gas from certain wells in Utah, U.S.A. Next to hydrogen, helium is the lightest gas known, has a lifting power equal to 92% of hydrogen and the advantage that it is inert and non-inflammable. It is used for inflating airships. Ordinary air contains 1 part in 200,000 of helium. It was the last gaseous element to be liquefied, this being achieved by Onnes in 1908 in Leyden. Hydrogen fusion in the "H bomb" produces helium.

Hellebore, a plant of the *Ranunculaceae* (buttercup) family. The best-known British examples are the green and stinking varieties. There is also a garden kind which flowers in December called the Christmas Rose. Hellebore yields a bitter substance which forms a drastic purgative, but is now little used. See T8(1).

Hellenic Art. The art of ancient Greece may be roughly divided into three periods: the prehistoric period (c. 1500–1000 B.C.) of the bronze age Mycenaeans, the archaic period (c. 600–500 B.C.); and the classical period (c. 500–300 B.C.). Of the first period centred on Mycenae in Peloponnesus but extending to the coasts of Asia and the city of Troy we can mention only the massive stone gateways and the shaft graves of Mycenae, where the archaeologist Schliemann discovered painted vases, gold cups, bronze swords, and ornaments of what had once been a great, if primitive, civilisation. During the archaic period sculpture was the principal form of art expression. The magnificent male and female figures are reminiscent of Egyptian art, but are distinctive in liveliness of facial expression. The vase-paintings of this period became more elaborate, depicting scenes from mythology or ceremonial events. Typical of classical Greek art is the representation of the beautiful and healthy human body deliberately posed and often carrying out heroic or athletic acts. The vast majority of these statues are known to us only through Roman copies. The *Hermes* of Praxiteles (born c. 385 B.C.) is possibly the only existing statue which can be assigned with any degree of certainty to an individual artist. Almost the whole of the Greek genius in architecture was expended on temples which are all basically similar in design—a rectangle with a low-pitched gabled roof resting on side walls. The three orders Doric, Corinthian, and Ionic mainly referred to the type of column used, but naturally the whole building was influenced thereby. Some of the main buildings are on the Acropolis, a hill outside Athens, on which stand the Parthenon (from the outer frieze of which the Elgin marbles, now mostly in the British Museum, were taken), the Erechtheum, famous for its Porch of Maidens, and the gateway known as the Propylaea with its broad flight of marble steps. Apart from that on vases, no Greek painting has come down to us, although Greek painters existed and were noted in their time. All we have are copies in mosaic and fresco made by the Romans, at Naples and Pompeii. Of Greek literature in prose, verse, and the drama little can be said here. To the early period (i.e., the archaic age) belong Homer's *Iliad* and *Odyssey*, Hesiod's long poem *Work and Days*, and Sappho's love poems, and Pindar's Odes. The period of Pericles in the 5th cent. B.C. produced more great literature than any comparable period in history: the philosophical writings of Plato and Aristotle, the tragedies of Aeschylus, Euripides, and Sophocles, the comedies of Aristophanes—all these are still part of the European tradition, and together with Greek architecture played a major part in the Renaissance (see J38).

Hellenistic Art, the art of the period of Greek civilisation which began with the conquests of Alexander the Great (356–323 B.C.) and lasted until his former empire (which encompassed most of the Middle East and part of North Africa) was conquered by the Romans in 146 B.C. Culturally it was an important period because it spread Greek culture far beyond its original boundaries—even as far as the north of India, and its centres spread from Athens to the cities of Alexandria in Egypt, Antioch in Syria, and Pergamum in Asia Minor. But equally Eastern culture spread to the West: democracy was replaced by absolute monarchy, cosmopolitanism took the place of the Greek tendency to believe that all who were not Greeks were barbarians, and mystical philosophies took the place of Greek rationalism. This was a sensuous, secular, pleasure-loving, rootless society, and these tendencies were reflected in its art. Hellenistic sculpture was sensual, effeminate, and violently emotional, yet it depicted individuals and not always noble or beautiful ones. (Classical Greek sculpture was idealistic, showed types rather than individuals, and appealed to the intellect rather than the emotions.) Some of the best examples came from the school at Pergamum and later from the island of Rhodes, and the titles themselves speak of their nature: *The Dying Gaul*, *Gaul Slaying his Wife and Himself*, and the famous *Laocoon* (representing Laocoon and his two sons being crushed by two enormous serpents). All these date from about 240 to 50 B.C.—for the culture did not immediately end with the Roman conquest. The enormous frieze of the altar of the temple in Pergamum depicts a battle between gods and giants with tremendous realism and brutal violence far removed from the serene art of classical times. Portrait sculpture is typical of Hellenistic art, where it may almost be said to have been invented, since such ventures in the past had been idealistic rather than realistic. The great Hellenistic cities were geometrically planned and fine public buildings made their appearance in which the slender and graceful Ionic or the ornate Corinthian columns took the place of the more austere and heavy classical ones. Alexandria was famed for its library of 700,000 books and was the centre of philosophical schools such as the Stoics and Epicureans. Here too worked the mathematicians Euclid and Archimedes, the physicians Erasistratus and Herophilus, and the geographer Pytheas. But Hellenistic literature was a pale reflection of the glories of the past and we mention only the comedies of Menander and the pastoral verse of Theocritus of Syracuse.

Hemiptera, the order of insects to which belong the true bugs. Their wing structure is in most species incomplete, hence the term hemiptera. This order includes the familiar water insects, the water boatman and water skater, also the

aphids, cicadas, leaf hoppers, scale insects *See* **T28**(2)

Hemlock, a plant of the *Umbelliferae* family, growing in all parts of Britain, and containing a strong alkaloid poison Used medicinally, this alkaline substance is of considerable service, being a powerful sedative According to Pliny, hemlock was the poison used by the Athenians in putting criminals to death

Hemp (*Cannabis sativa*), name of a plant native to Asia, now cultivated widely for the valuable fibre contained in the stalk or in some species in the leaves Hemp fibre has been replaced by cotton for textiles and jute for sacks and is now chiefly used for cordage and twine It contains a resinous substance from which the narcotic hashish is made The seed yields a valuable oil The term hemp is also used for other fibre plants, including manila hemp from the Philippines, sunn hemp from India, sisal from W and E Africa and phormium from New Zealand

Henbane, a plant found in Britain and other parts of Europe and Northern Asia It belongs to the potato family *Solanaceae*, grows mostly on waste ground, and bears yellow-brown flowers veined with purple The leaves yield a poisonous alkaloid substance which, medicinally prepared and administered, is of great use Tincture of henbane is often preferred to laudanum

Heptarchy, a word derived from the Greek *hepta*, seven and denoting the seven kingdoms (*archai*) into which Anglo-Saxon England was divided before 900 The seven were Kent, Essex, Sussex, Wessex, Mercia, East Anglia, and Northumbria

Heracleum, a plant of the *Umbelliferae* family, common in southern and central Europe, though only one species, the cow parsnip, grows in England It has a bitter root and from the juice of the stem an intoxicating liquor is occasionally prepared.

Herald, an officer of state empowered to make formal proclamations and deliver messages from the sovereign or other high personage whom he serves In the developments which took place in armorial bearings, the herald was the functionary charged with the duty of their proper depiction

Heraldry, the knowledge of armorial bearings, was mainly the outcome of the love of outward distinction which prevailed in mediaeval times "Heraldry," says Stubbs, "became a handmaid of chivalry, and the marshalling of badges, crests, coat-armour, pennons, helmets, and other devices of distinction grew into an important branch of knowledge" The *shield*, or *escutcheon*, is the ground upon which armorial signs are traced, the colour of the shield being called the *tincture*, the signs recorded the *charges* There are seven *tinctures* or (gold), *argent* (silver), *gules* (red), *azure* (blue), *vert* (green), *purpure* (purple), and *sable* (black) The *charges* are classed as "Honourable" and "Subordinate" ordinaries, comprising lines and geometrical forms, and "Common" ordinaries, which latter includes all representations of natural objects There is also a system of external signs, such as crowns, coronets, mitres, helmets, mantlings, wreaths, and crests, each having its distinctive significance For other distinguishing marks see **Hatchments, Quartering, Rampant, Pean**

Heralds' College or **College of Arms**, was incorporated by Richard III in 1483 Its head is the Earl Marshal (an office hereditary in the family of the Dukes of Norfolk), and there are three Kings of Arms, six Heralds, and four Pursuivants The business transacted is wholly connected with the tracing of genealogies and the granting of armorial bearings In Scotland the Heraldic functions are performed by the Lord Lyon King of Arms

Herbarium, a systematically classified collection of preserved plants One of the largest herbaria in the world belongs to the Royal Botanic Gardens at Kew

Heredity is the study of the transmission of physical and mental characteristics from one generation to another Gregor Mendel (1822–84), a great experimenter in the field of inheritance, established the principle embodied in Mendel's law in his work published in 1866 The ideas which he then put forward were forgotten until the early years of this century, but today they form the basis of the modern study of genetics Genes are the units of heredity. They are contained in the chromosomes of the cell nucleus. It is in the field of disease that the interplay between heredity and environment becomes most apparent *See* **The Evolution of Organisms, F31–2,** *and* **The Genetic Code, F55–9.**

Hermaphrodite, animals or plants possessing both male and female reproductive organs, *e g*, snail, earthworms, most flowering plants

Hermit Crab, a decapod, with a soft asymmetrical body which it protects by thrusting it into an empty gastropod shell, *e g*, whelk, which it carries about, only abandoning it when necessary for a larger one Found in all seas, many live in commensal relationship with sea anemones, etc

Heron, a large wading bird with long curved neck and pointed bill is a member of the *Ardeidae* family, of which there are many species Egrets and bitterns are included as herons Herons are to be met with in marsh lands and near rivers and lakes, where they feed on fish and frogs They nest in trees in large numbers, these colonies being called heronries The common heron is native to England, and other species from the Continent are frequent visitors

Herring, a common sea-fish, related to the sardine and pilchard, abounding in northern seas and found in large numbers round the British coasts The herring fishing is the most important fish industry in this country, a large fleet being engaged in it The fishing season proper lasts from May to October, the enormous shoals being followed as they move from place to place The spawning season is about the end of August One female herring may produce 20 to 50 thousand eggs, which sink to the sea-bed, where they develop

Hibernation, the dormant condition in which numerous mammals, reptiles, amphibians, insects plants, etc , pass the winter The rate of metabolism slows down, and the body temperature drops to that of the surroundings Work on these low temperatures and their physiological effect has led to improved surgical techniques (*see* **P30**) Animals of the torrid regions pass through an analogous period (aestivation) during the hot season, when the sources of food are dried up

Hickory, several species of American tree of the walnut family, remarkable for its very hard, solid, heavy white wood, and bearing an edible, four-lobed nut

Hieratic Art, a type of art (typified by the major part of the art of ancient Egypt) which is (*a*) exclusively religious, and (*b*) conventionally based on earlier forms and traditions

Hieroglyphics are the earliest form of pictured symbolic expressions, and are supposed to have been introduced by the ancient Egyptians They consist of rude depictions of animals, plants, signs, and objects, and in their later examples express, in abridged form, ideas and records from which significant historical information has been gleaned The deciphering of Egyptian hieroglyphics long formed an ardent study, but gradually the key to the riddle was discovered, and most of the ancient records can now be understood Besides the Egyptian there are also Hittite, Minoan and Mayan hieroglyphic scripts. *See* **Rosetta Stone.**

Hindi, the great Aryan vernacular language of Northern India In the Indian Constitution, adopted in 1950, it was laid down that Hindi in the Devanagari script should within 15 years replace English as the official language of the Indian Union.

Hinduism. *See* **J21.**

Hindustani, the *lingua franca* of India, a Sanskritised Hindi vernacular introduced by the British in 1837 to replace the official Persian It is written in Devanagari (Sanskrit) characters The Persianised Hindi vernacular is known as Urdu

Hippogriff, a fabulous animal, like a horse in body, but with the head, wings, and front legs and claws of an eagle The monster frequently appears in the romances of the Middle Ages

Hippopotamus or "river-horse," the largest living

representative of the hog family, widely distributed over Africa, where it lives in herds It is of immense bulk, attaining a length of 12 ft and a weight of 4 tons and stands about 5 ft high Its skin is hairless and about 2 in. thick, and it has a pair of tusks often weighing as much as 6 lb It spends most of its time in the water, and lives entirely on vegetation, both aquatic and terrestrial The pigmy hippopotamus, which occurs in forests and swamps in W Africa, is only half the size

Histology is the study of the structure of plant and animal tissues These mainly consist of groups of cells with similar functions, *e g*, muscle, brain tissue

Hittites, an ancient race (often mentioned in the Old Testament) who inhabited Asia Minor and N. Syria from the third to the first millennium B C. Excavations have revealed that they attained a high level of civilisation round about 1350 B C They were rivals of Egypt, disputing with Pharaoh the mastery of the Middle East

Hobby, a bird of the falcon family, 12-14 in long Local breeding visitor to England and Wales, April-Sept, irregular visitor to Scotland and Ireland. They winter in Africa

Hog, the common name of animals of the Suina family, including the wild boar, pig, and sow The wild boar, *Sus scrofa*, is the common ancestor The skin of the hog is covered with bristles, the snout truncated, and each foot has four hoofed toes Hogs are omnivorous feeders and eat almost anything that is given them.

Hogmanay, the Scottish New Year's Eve festival and a national holiday of the country The custom of demanding Hogmanay bread is still upheld in many parts of Scotland

Hogshead, a cask of varying capacity, also a specific measure In the old English measure a hogshead was 52½ imperial gallons, or 63 old gallons of wine Of beer 54 old gallons make a hogshead

Hollands, Schiedam, or **Schnapps**, a kind of gin made mostly in Holland from rye and malt, with a flavouring of juniper berries

Holly, a hardy evergreen shrub, largely grown in England Its bright dark green prickly curved leaves and clusters of red berries are familiar in all parts of the country, and used as house decoration between Christmas Eve and Twelfth Night, probably a relic from Roman and Teutonic customs Its wood is white and hard, valued for carved work, while its bark yields a gummy substance which is coverted into birdlime

Holy Alliance, an alliance ostensibly for conserving religion, justice and peace in Europe, but used for repressing popular tendencies towards constitutional government Formed by Alexander I, of Russia, Francis I of Austria and Frederick William III of Prussia, at Paris on Sept 26, 1815 Subsequently joined by all the sovereigns of Europe, except the Pope and the King of England It ended after the 1830 revolution in France

Holy Coat of Trèves, a garment preserved in the Cathedral of Trèves and said to have been worn by Christ It was brought from Jerusalem by the Empress Helena in the fourth century

Holy Rood, an annual Roman Catholic festival held on Sept 14 to celebrate the Elevation of the Cross in commemoration of its re-erection in Jerusalem by the Emperor Heraclius in 628 after it had been lost for nearly 300 years and had fallen into the hands of the Persians Also included in the Church of England calendar

Holyrood, the ancient royal palace at Edinburgh, dating from the 15th cent., and inhabited by many Scottish sovereigns, notably Mary Stuart, the rooms occupied by her (including the one in which Rizzio was murdered) being still shown It is now known as Holyrood House and is still used as a royal residence.

Holy Roman Empire, the title which the German Empire received in 962 when Pope John XII crowned Otto I at Rome. It endured until 1806 when Francis II. became Emperor of Austria

Holy Water, water blessed by a priest and kept in small fonts at the entrance to Roman Catholic churches, and used by worshippers going in, and out, or by priests in sprinkling

Holy Week is the week preceding Easter Sunday, and includes the days of the Sufferings of Christ, ending on Good Friday

Honey, the sweet syrup formed by bees from the nectar of flowers, the sucrose in the nectar being converted into a mixture of the simple sugars, glucose and fructose.

Honey-eater, an Australian bird (of which there are many species) provided with a long curved bill and tufted tongue It lives by sucking the "nectar" from the flowers which abound in rural parts of Australia and New Zealand

Hookah, an Oriental pipe for tobacco smoking the smoke being drawn through the water of a goblet (commonly a coconut shell) by means of a long flexible tube

Hoopoe, a remarkably handsome bird with vivid black and white-barred wings and tail and black tipped crest which opens like a fan Ranges over Europe, Asia, and Africa It has bred in England and Wales and occurs in the British Isles in small numbers at all seasons Other species are confined to Africa, Madagascar, and India

Hops, the female "cones" of the hop plant used in brewing, their essential oils give beer an aromatic flavour, and their tannin and resin act as a preservative as well as accounting for the bitter taste desired The hop is a perennial climber belonging to the mulberry family The male and female organs are on separate plants, as only the female flower-heads are commercially useful, female plants predominate in a hop garden, only a very few male plants being grown so that the female flowers can be fertilised

Horizon, the limit of vision, the apparent line where sea and sky, or land and sky meet This is termed the *sensible* or visible horizon An ordinary person at the height of 5 feet can see for 3 miles, at 20 feet 6 miles, at 50 feet 9½ miles, and at 1,000 feet 42 miles The figures are approximate

Horn or **French Horn**, a brass instrument of the trumpet family (*i e*, played by three valves) whose tube is very thin and long (Horn in F 12 ft) In consequence the tube is curled in a complicated manner Owing to the sweet tone it is capable of producing, the Horn sometimes plays as part of the wood-wind

Hornbill, large bird found in Africa and oriental regions, remarkable for its having an immense horned upward-curved helmet, growing over its downward curved beak It inhabits tropical regions, and feeds on fruits When the female has laid her eggs in the hollow of a tree, the male bird stops up the entrance, and keeps her imprisoned until the hatching is completed and the young ones are able to fly There are about 45 species

Hornblende, the commonest member of the amphibole group of minerals, a silicate of calcium, magnesium, iron and aluminium, of a dark green colour It is a constituent of numerous rocks, including diorite, syenite, and hornblende schist

Horned Viper, a curious African genus of *Viperidae* with a small pointed bone over each eyebrow, a venomous species, found in Egypt, is thought by some to be identical with the "adder" mentioned in Genesis xlix 17

Hornet, a general name for many of the bigger wasps It usually nests in hollow trees, and despite its rather fierce some appearance does not sting unless unduly provoked

Horology, the science of time-measurement, including the construction and management of clocks watches, etc Instruments of this kind are not known to have existed before the 12th cent and until the introduction of the pendulum in the 17th cent , clocks were ill-regulated and inaccurate The time-recording mechanisms of the present day include (*a*) the *clock*, which shows the hours and minutes by hands, and strikes the hours, and sometimes quarters, (*b*) the *timepiece*, which is not generally a fixture and shows the time, but does not strike, (*c*) the *watch*, which is a pocket time-keeper, (*d*) the *chronometer*, which indicates the minutest portions of time, (*e*) electric timepieces, mains electric clocks, (*f*) the highly accurate quartz-crystal and atomic clocks used for astronomical purposes *See* **Clocks**

Horse Chestnut, one of the large forest trees, with ample branches, and full foliage, and much

esteemed for parks and ornamental grounds The bark and fruit seeds yield substances of commercial value, but the timber is not worth much The tree came originally from Asia about the 16th cent

Horse Guards, the building in Whitehall which until 1872 was the headquarters of the Commander-in-Chief of the British Army. The archway is still sentinelled by mounted guards

Hospice, a place of refuge and rest for travellers and pilgrims The most famous is that of the St Bernard Pass, where dogs are kept for the succour and help of belated wayfarers

Hospitallers, Knights, were of the order of St John of Jerusalem, at first devoted to the aid of the sick, but afterwards military monks, who became prominent figures in the Crusades of the 12th cent They adopted the Benedictine black habit with the eight-pointed cross worn by the modern St John's Ambulance Brigade In 1309 they took Rhodes, but were expelled by the Ottomans in 1522 In 1530 the emperor Charles V gave them the island of Malta, which, as Knights of Malta, they held until 1798, when they were dislodged by Napoleon The Knights still survive as a sovereign order, with headquarters in Rome *See* **Templars** and **Teutonic Order**

Hottentots, name given to certain African natives by Dutch settlers in the 17th cent They used to occupy the greater part of Cape Colony, and though driven out a number still survive in S W Africa Appear to be related to the Bushmen, though their culture is more advanced In addition to herding, they practise some farming and know how to smelt iron

Hounds are dogs that were originally bred and trained for hunting, such as the greyhound, foxhound, bloodhound, wolfhound, deerhound, beagle, harrier, etc , but now often kept also as domestic dogs The greyhound, deerhound, and wolfhound hunt by sight, the others, with the bloodhound first in order, track by scent

Hour-glass, a glass instrument tapering to the middle to a narrow orifice, through which a sufficient quantity of fine sand gravitates to mark an hour of time When the sand has run through from one end, it can be reversed and made to count the hour in the opposite direction The same kind of glass with smaller supplies of sand will indicate shorter periods, as an egg-glass, which runs its course in three minutes - time to boil an egg by, or to gauge the length of a telephone trunk call

House Flies are world-wide and prolific Their eggs are hatched within 24 hours of being laid, and full maturity is attained in a month They feed mainly on decayed animal and vegetable matter

Howler Monkey, a genus of South American monkey noted for a laryngeal conformation which enables it to emit a loud reverberant noise something between a yell and a howl, as the name suggests

Huanuco-bark, a medicinal bark, brought from the Peruvian town of that name, and derived from the *Cinchona micrantha* tree *See* **Cinchona**

Huguenots, a name applied to the French Protestant communities of the 16th and 17th cent Henry of Navarre, by the Edict of Nantes in 1598, granted them religious freedom, but more than a quarter of a century before—Aug 24, 1572 thousands had been put to death in the massacre of St Bartholomew The revocation of the Edict of Nantes by Louis XIV in 1685 drove thousands into exile in England, Holland, Germany, and America

Humanism. *See* **J21**.

Humble-bee or **Bumble-bee**, the common name of the insects of the genus *Bombus*, of the Hymenoptera order. They live in small communities comprising males, females, and drones, their habitations being underground. They do not have one queen bee only like the hive bee, but several females occupy the same nest, and these alone live through the winter, breeding and forming new colonies in the spring Although this large bee buzzes loudly, it does not sting

Humidity, the state of the atmosphere with respect to the water-vapour it contains "Absolute humidity" is defined as the density of the vapour present, while "relative humidity," more frequently employed, indicates the degree of saturation, *i e* , the ratio of the actual vapour pressure to the saturation vapour pressure at the particular temperature, expressed as a percentage

Humming Birds are so called because of the humming noise made by the vibration of their wings in flying They are of radiant plumage, and are among the smallest birds The smallest bird in the world is the Fairy or Princess Helen's humming bird of Cuba The body is 2 in long and the eggs are ⅓ in long There are from four to five hundred species, and they are confined wholly to North and South America, being most numerous in the tropical latitudes They have long, slender bills and tubular tongues which reach down into flowers to suck up the nectar on which they feed.

Hummum, the original name for what is now called the Turkish Bath in this country One of the first of these baths to be established in London was the Hummums in Covent Garden.

Hundred, the ancient divisional name given to a portion of a county for administration or military purposes It is supposed to imply the territory occupied by a hundred families, or the space of a hundred hides of land, or the capacity of providing 100 soldiers Each hundred had its hundred court, with powers similar to those of a manor court, but this was abolished in 1867 by County Court Act.

Hundred Days, the interval of time between Napoleon Bonaparte's entry into Paris after his escape from Elba and his departure after his abdication, extending from March 20, 1815 to June 28 During this period occurred the battle of Waterloo, June 18

Hundred Years' War, a term applied to the almost incessant contest between England and France, lasting from 1338 to 1453, including such famous battles as Crecy, Poitiers, and Agincourt, and engaging successively Edward III , Henry V , and Henry VI , among English kings

Huns, a fierce Asiatic race which swept over eastern Europe in the 4th cent Under Attila about the middle of the 5th cent they obtained control of a large portion of central and eastern Europe, forcing even Rome to pay tribute Their defeat at Châlons-sur-Marne in 451 and the death of Attila in 453 terminated their empire

Hurdy-Gurdy, an Italian rustic so-called musical stringed instrument of the lute order, the sounds of which are produced by the action of a rosined wheel turned by the left hand, the notes being made by the fingering of the right hand

Hurricane. *See* **Cyclone** *and* **Wind**.

Hydra, an aquatic animal of simple structure, whose body is in the form of a cylindrical tube, with a disc-shaped base by which it attaches itself to any shifting substance Its mouth is surrounded by tentacles by which it catches its food The Hydra has the power of reproducing lost parts *See also* **F22(2)**

Hydrates are compounds containing water of crystallisation

Hydraulic Ram, a form of automatic pump, used to raise water to a height by the action of its own falling velocity

Hydraulics, the science of applied hydrodynamics, or water-machine engineering, ranging from pumps to marine engines

Hydrocarbons are compounds of carbon and hydrogen They include the *paraffins*, which are saturated compounds (*e g* , methane), the ethylene, acetylene and other series which are unsaturated, compounds with ring structures, *e g* , benzene, naphthalene, and anthracene Petroleum is composed almost entirely of hydrocarbons

Hydrochloric Acid, a solution of hydrogen chloride gas in water, and resulting in considerable quantities as a by-product of the soda-ash or salt-cake manufacture Its solution forms the common hydrochloric or muriatic acid of commerce It is present to the extent of nearly half a per cent in the digestive juice secreted by the stomach.

Hydrocyanic Acid, cyanide of hydrogen or prussic acid, very poisonous, and of the odour of bitter almonds It is formed by the action of acids on sodium or potassium cyanide Used to kill wasps (and in the gas chamber in the U S A) It is a very important chemical on account of the reactions of its derivatives in many synthetic fields. Discovered by Scheele in 1782.

Hydrodynamics, the science of fluids in motion

Hydrofluoric Acid is obtained by distillation of fluorspar with sulphuric acid, and is a compound of fluorine and hydrogen. Its action is highly corrosive, a valuable agent in etching on glass, and a rapid decomposer of animal matter.

Hydrogen, Symbol H, the simplest element, atomic number (*q.v.*) of 1, colourless, and the lightest of all substances. Cavendish in 1766 was the first to recognise that it was an element. It is 14·4 times as light as air, and is found in a free state in volcanic regions. It can be obtained by the action of metals on acids, and forms an explosive mixture with air, burning with oxygen to form water. The gas can be liquefied, and the presence of the isotope deuterium was detected by Urey in 1931 in the residue of the evaporated liquid. The third isotope, tritium, is very rare. Commercially it is used to produce the very hot flame of the oxy-hydrogen blowpipe for cutting metals, to fill balloons and airships, to harden certain oils and render them suitable for margarine- and soap-production. *See also* **Deuterium**.

Hydrography, the science of water measurement, as applied to seas, rivers, lakes, currents, rocks, reefs, etc., and embracing the whole art of navigation.

Hydrometer, an instrument for measuring the specific gravity of liquids, especially for ascertaining the strength of spiritous liquors and solutions. It is usually in the form of a glass bulb, to the lower end of which a smaller bulb, containing mercury, is attached, which forces the instrument to sink into the liquid which it is to test. The larger bulb has a scale fixed to it, and the indication on this scale of the sinking point shows the specific gravity. There are many varieties. Twaddell's—a pear-shaped bulb containing mercury. Beaumé's, of similar construction, but applicable to liquids both heavier and lighter than water. Sykes's, largely employed for determining the strength of alcohol; and Nicholson's, used for taking the specific gravities of solids.

Hydropathy, the method of treating disease with water, either by bathing or drinking. Natural springs of special chemical and therapeutic properties, such as sulphur springs, and other mineral sources, have been used since prehistoric times for this purpose. It is probably one of the most ancient methods of cure. Recently the beneficial effects of pure water treatment have been advocated. Hydropathic establishments have been set up in many health resorts.

Hydroponics, the culture of plants without soil. The plants are grown with their roots dipping into a solution of nutritive mineral salts, or they may be rooted in sand which is watered with such a solution.

Hydrostatics, the science of the pressure and equilibrium of liquids that are non-elastic.

Hydrozoa are a class of water animals of the *Coelenterata phylum* to which Hydra (*q.v.*) belongs. In one order of the Hydrozoa, free-swimming colonies showing marked division of labour between the individual units occur; this order includes the Portuguese man-of-war. *See* **F22(2)**.

Hyena, a nocturnal carnivore with powerful jaws. The striped hyenas inhabit N. Africa, India, and S.W. India. The brown hyenas with long shaggy hair are natives of S. Africa. The spotted, or laughing hyena, noted for the peculiar cry from which its name is derived, is also confined to Africa.

Hygrometer, an instrument for measuring the amount of water vapour in the atmosphere. A simple form of hydrometer, known as the wet-and-dry bulb, consists of two vertical thermometers affixed to a frame. One bulb is exposed to the air, and the other is covered with muslin which dips into a water-bath to keep it moist. If the air is saturated, it takes up no moisture from the wet bulb and the two thermometers read the same. If the air is not saturated, evaporation takes place from the wet bulb, latent heat is absorbed from the air and the temperature of the wet bulb is lower than that of the dry bulb. Relative humidity and dew-point of the air can then be derived from suitable tables. Hygrometers depending upon the expansion of human hair and gold-beater's skin and the deposition of dew on a polished surface, when cooled sufficiently, are also in general use. *See* **Humidity**.

Hymenoptera, the order of insects to which bees, wasps, hornets, ants and sawflies belong. They have a well-defined waist, two pairs of membranous wings coupled together, mouth parts modified for biting or sucking; the females possess an ovipositor used for depositing eggs and is sometimes modified for stinging. There are about 70,000 species in this order and many live in highly organised communities. *See also* **Ichneumon Fly**.

Hypocaust, an arched fire vault or chamber through which heat is distributed to rooms above. Used in the baths of ancient Rome.

Hypostyle, an architectural term, designating a colonnade or pillared hall, such as in the ancient Egyptian temple of Karnak.

Hypsometer, an instrument formerly used by mountaineers to find the height above sea-level by indirectly measuring the atmospheric pressure by determining the boiling point of water at the particular height. Based on the fact that as pressure decreases with height so the boiling point is lowered. Superseded by the aneroid barometer.

I

Ibex, wild goats of several species found in the mountain regions of Europe, Asia, and Africa. The male has exceedingly large curved ridged horns. The species that lives in the Alps is called the steinbock or bouquetin.

Ibis, belongs to a family of birds related to the stork. The sacred ibis of ancient Egypt is now extinct in Egypt but is found in the lakes and swamps of the Sudan near the Upper Nile. It has white and black plumage and a long curved beak. Other species are found elsewhere, the Glossy Ibis (black plumage glossed with purple and green) occasionally visiting England.

Ice is frozen water. It is a colourless, crystalline and brittle solid. Being only 92% as dense as water, it floats on the latter; the expansion which occurs as water changes into ice causes the fracture of water-pipes, though the fracture only becomes obvious when the ice melts and leaks out through the crack. The temperature at which ice forms is 0° C., 32° F. Ice can be melted by pressure, and the ease and smoothness with which one is able to skate on ice depend on this phenomenon.

Ice Ages. Periods during which the continents were partly or largely covered by ice-sheets and glaciers. The present-day ice-sheets of Greenland and Antarctica are relics of the latest Ice Age, which began in the Pleistocene. Much of the southern hemisphere experienced an ice age at the end of the Carboniferous Period; ice ages are recorded from isolated localities during the Pre-Cambrian, but there is no evidence that these were simultaneous. *See* **F9(1), 31(1)**.

Icebergs are detached masses of glacier which subside into the sea and float as wind or current may take them. About one ninth of an iceberg is above sea-level. The North Atlantic is the chief home of icebergs, which reach the ocean from the ice-clad plateaux of Greenland. Some of these floating masses of ice are of enormous proportions, and constitute in the spring and early summer seasons a great menace to the safety of ships, as was disastrously shown in the *Titanic* catastrophe of 1912. For some years past these menaces to N. Atlantic shipping have been kept under close observation by vessels specially detailed for this work.

Ice-breaker, a special heavy bow-plated ship for forcing a way through ice and used especially at ports of the Baltic Sea and the Great Lakes region of Canada which freeze during the winter months. The Soviet atomic ice-breaker *Lenin*, the first of its kind in the world, launched in Dec. 1957, is designed to cut a channel through ice of any thickness. Her icebreaking performance will allow the sea-route to the north of Siberia to be kept open throughout the year.

Icelandic Literature, the Old Norse literature, centred about Iceland, which includes numerous works of poetry, mythology, and history of interest and importance. Much of this literature is in the saga form. *See also* **Edda**.

Iceland Moss, a kind of lichen (*Cetraria islandica*) which grows in great quantities in the mountain regions of Iceland and other Northern countries. It possesses certain nutritive qualities and is of some value in medicine.

Iceland Spar, a colourless form of calcite (calcium carbonate), frequently found in association with metallic ores; it has the power to produce strong double refraction of light so that two images are seen of an object viewed through a piece of Iceland spar. It was formerly used in optical apparatus for producing polarised light.

Iceni, an ancient British race who in early times lived in Norfolk and other parts of Eastern England. Their most famous ruler was Queen Boadicea, who led her people against the Romans in A.D. 61.

Ice Plant, also called "dew plant" and "diamond plant." A South African mesembryanthemum commonly grown in British gardens. Introduced in 1690.

Ice Saints, St. Mamertus, St. Pancras and St. Servatius, so called because of the legendary cold on these Saints' Days, namely, May 11–13.

Ichneumon, the Egyptian mongoose, popularly known as "Pharaoh's Rat." It is of great use in checking the multiplication of reptiles. It is frequently domesticated.

Ichneumon Fly, a numerous group of parasitic hymenopterous insects abounding in many lands, and all having the peculiarity of depositing their eggs in the bodies of other insects. It destroys swarms of caterpillars, which become the unwilling hosts of its progeny.

Ichthyology, the natural history of fishes.

Ichthyosaurus was a gigantic marine reptile of the Mesozoic age. The fossils are mostly found in the lias formation. Some were over 30 ft. in length.

Icons. Icons are religious paintings designed for devotional use either by the individual or in church rituals. In size they range from the very small to large ones in two or three panels on church screens dividing the nave from the chancel (these are known as diptych and triptych respectively). The icon style of painting derives from the tomb paintings of Hellenistic and Roman Egypt, where it had become the custom to leave a portrait of the dead over the mummy's face. Icons of the earlier periods are rare, those of the 6th cent. probably having been destroyed and those of the 9th–12th cent. mostly removed to Russia. They were essentially simple with the Virgin and Child, or the Virgin, Christ, and John the Baptist as subject. From the 13th cent. icons were more complex, dealing with New Testament scenes or scenes from the lives of the saints, and by this time schools of painting, each with their own style, were arising in other countries, including Russia, which accepted the Eastern Church. The 16th-cent. icons begin to show Italian influence just as Italian painting was influenced by Byzantine. Most icons were painted on wood, but mosaic was sometimes used, and some icons were of metal.

Ides, in the ancient Roman Calendar, the 15th of March, May, July, October, and the 13th of all other months, always the eighth day after the Nones.

Idiom, an expression characteristic of a country, district, dialect or language, which usually gives strength and force to a phrase or sentence. The idioms of a language are its distinctive marks, and the best writers are the most idiomatic.

Idris, a famous giant belonging to the myths of Wales, commemorated by a chair of rock on the top of the Cader Idris mountain in Merionethshire.

Igneous Rocks are such as have been molten under conditions of great heat at some stage in their history, *e.g.*, granite, basalt. *See* **F8**(2).

Ignis Fatuus *or* **"Will-o'-the-wisp,"** a phosphorescent light which may often be seen on summer and autumn evenings hovering over marshy ground or graveyards. Its nature is hardly understood, though it is generally believed to be the result of the spontaneous combustion of the gases from decaying organic matter. In olden times when marshy grounds were more common than now, this "dancing light" was very frequently visible and was regarded with superstition.

Iguana, large South American lizards, with a long tail, a scaly back and head, a thick fleshy tongue and a prominent dew-lap in the throat. Specimens of the different species average 4–5 ft. in length, and they live mostly in trees, though they are equally at home on land or in the water. The flesh of some species is good eating, as are also the eggs.

Iguanodon, a genus of extinct dinosaurs, whose fossils are found in the Jurassic and Cretaceous rocks. Iguanodons were 15–25 ft. long, and walked on their hind legs, the front legs being small and adapted for grasping the branches of trees on the leaves of which they fed.

Ilex, mentioned by classical authors, is the holm- or holly-oak, which flourishes round the Mediterranean. To botanists Ilex is the genus to which the holly and maté plant belong. *See* **T8**(2).

Iliad, the great epic poem of ancient Greece attributed to Homer (*c.* 700 B.C.). It consists of ancient folk tale and saga, welded into an artistic unity, having as plot the carrying off of Helen by Paris to Troy and the subsequent siege of Troy.

Illuminated MSS. of great value and beauty of decoration exist in most public museums and in many private collections, some of them being of great antiquity, especially those of ancient Egypt executed on papyri. Greek and Latin specimens are also numerous, and the British Museum contains fine examples of all these kinds and also an extensive collection of mediaeval English MSS.

Ilmenite, a mineral widespread in igneous rocks: chemically it is an oxide of iron and titanium. Rich deposits have recently been found in the Allard Lake area of Quebec, the Travancore sands are also a source of ilmenite.

Immortality. *See* **J22.**

Immortelles are wreaths, crosses, or other designs made from what are called everlasting flowers, which are obtained from certain plants of the Composite order, and retain their colours and compactness for a long time. Immortelles are largely used as mementoes for decorating graves, especially in France.

Impeachment, a special arraignment, usually before Parliament or other high tribunal, of a person charged with some offence against the State. The custom in England was for the impeachment to be made in the House of Commons and the trial to be before the House of Lords. The first instance occurred in 1376 when Lord Latimer was impeached. With present parliamentary procedure, impeachment is no longer necessary, since the Cabinet is responsible for the [illegible] actions of its ministers, who, acting as a team, must carry the Commons with them, or resign, when it falls to the Leader of the Opposition to form a new Cabinet. Other famous impeachments were those of the Lord High Chancellor Francis Bacon (1621), Earl of Strafford and Archbishop Laud (1640), Warren Hastings (1788), the last being that of Lord Melville (1805). Under the constitution of the United States public officials may be impeached by the House of Representatives and tried by the Senate. The most famous case was that of President Andrew Johnson.

Imperialism. *See* **J22.**

Impluvium, a basin or tank in the hall or atrium of an ancient Roman house, serving the purpose of receiving the rain that dropped through the open space in the roof.

Impressionism, the name given contemptuously to the first modern movement in painting, being derived from the title of Claude Monet's picture *Impression: soleil levant*, which showed the play of light on water with the observer looking straight into the rising sun. Although intended to be the ultimate form of naturalism the inspiration of the school had been the scientific study of light with an attempt to render the play of light on the surface of objects. Feeling that putting a line around a form was bound to cause it to look unnatural, they used bright colours corresponding to the spectrum and unmixed on the palette, and noted that an object of any given colour casts a shadow tinged with the complementary one (*e.g.*, red-green, yellow-blue). Hence bright sunlight was represented in clear yellows and

orange with violet shadows The first Impressionist exhibition held in Paris in 1874 aroused derision with its paintings by Monet, Renoir, Sisley, Pissaro, Cézanne, and Degas among others Impressionism subsequently led to the entirely artistic and anti-naturalist movement of Post-impressionism Cézanne, who felt that he wanted to produce "something solid and durable, like the art of the museums," was only dubiously impressionist, as were also Degas and Renoir Of course, in the wider sense of the word (*i e*, the recording of an ephemeral impression of a scene), Whistler, Turner, and even Rembrandt used the technique

Impressment, the forced seizure of persons for service on board British war-ships, sanctioned by laws still unrepealed, but not resorted to in this country since the Napoleonic wars

Imprimatur, originally an official licence to print, and an important formula in the early days of printing The term is now used in the wider significance of authority, stamp, or endorsement.

Impromptu, a piece of music for orchestra or solo instrument of informal construction and composed without preparation

Inbreeding, mating of closely related animals and plants Close inbreeding has long been held to be harmful, but this is not necessarily so for if practised with selection, stock can be purged of the undesirable qualities and the race improved

Incas, an Indian people who inhabited ancient Peru, founded a great empire, and reached a high level of civilisation overthrown by the Spaniards in 1533

Incense, an aromatic resinous substance which, under combustion, exhales a pungent odour, and is used, mixed with certain fragrant perfumes, in the celebration of Mass in Roman Catholic churches Olibanum or frankincense is ordinarily the leading ingredient It is not used in the orthodox service of the English Church except by the more pronounced Ritualists

Incisors, the sharp-edged cutting teeth at the front of mammalian jaws Elephant tusks are modified incisors

Income Tax, a tax of so much in the pound sterling of income from whatever source, all persons resident in Great Britain and Northern Ireland, and all persons not resident in, but deriving income from property, trade, or employment in Great Britain and Northern Ireland being liable to assessment. Income is classed under five schedules (*a*) from the ownership of land houses, etc, (*b*) from the occupation or use of land, (*c*) from Government of public stocks, (*d*) from trade, profession, or vocation, remittances from abroad, bank interest, etc, (*e*) from salaries, wages, pensions, emoluments, directors' fees, etc (Schedules (*a*) and (*b*) were to be abolished in 1963)

The income-tax year is from April 6 to the following April 5 Rates of tax on taxable income for the year 1963-64 are as follows on the first £100, 4*s* in the £, on the next £200, 6*s*, and on the balance 7*s* 9*d* in the £ *Taxable* income is found by deducting from *Total* income certain allowances

(1) *Earned Income* allowance of two-ninths to £4,005 and one-ninth to £9,945

(2) *Personal* allowance of £200 to single persons and married women in employment, to married man living with his wife, or if wife though not living with, is wholly maintained by means of a voluntary allowance, £320 If the wife is maintained under a Court Order or under a binding legal agreement the allowance is reduced to £200

(3) *Child* allowance of £115 for each child under 11, £140 over 11, and £165 over 16 if still being educated, provided child does not have income in own right of more than £115 a year.

(4) *Dependent Relative* allowance of £75 for each relative or wife's relative maintained whose own income does not exceed £180 Relief reduced by £1 for every £1 by which relative's own income exceeds £180

(5) *Widow and Widower* allowance of £40 (certain restrictions)

(6) *Daughter's Services*, necessary owing to old age or infirmity, allowance of £40

(7) *Housekeeper* allowance of £75 (certain restrictions)

(8) *Age* allowance of two-ninths of unearned income where taxpayer (or his wife) is over 65 and total income does not exceed £900. Marginal allowances

(9) *Life Insurance* Subject to certain restrictions, an allowance for the premiums paid for life-insurance of tax-payer and his wife, but not on life of his child or any other person, to a maximum of two-fifths on premiums over £25

(10) *National Insurance* flat rate of £22 for adult employees.

Age Exemption: no tax payable by single persons aged 65 or over if income does not exceed £325, £520 for married couples where either is 65 or over Appropriate marginal allowances

Pensions qualify for the earned income relief of two-ninths

Small Income Relief All incomes up to £450 are treated as Earned Income

Surtax is on a sliding scale, increasing from 2*s* in the £ with the size of the income For 1963-64 (payable Jan 1, 1965) surtax on earned income begins, in effect, at £5,000 or more if personal reliefs are due (*See* L110)

Independence Day, commemorates the adoption of the Declaration of Independence on July 4, 1776. July 4 is celebrated as a holiday in the United States

Index. The name given to a list of books, prepared by papal authority, which are declared to be dangerous to faith and morals, and therefore forbidden to Roman Catholics The *Index Expurgatorius* covers books which may be read with offending passages removed Books which may not be read at all by Roman Catholics are in the *Index Librorum Prohibitorum* The first *Index* was issued by Pope Pius IV, in 1559

India Office Library (since 1947 called the **Library of the Commonwealth Relations Office** (Division B)). This is an orientalist library, which specialises in Indian studies It was founded in 1801 by the East India Company, and contains 20,000 manuscripts in European languages and in Sanskrit Persian, modern Indian, and other oriental languages and a quarter-of-a-million printed books, of which three-quarters are in oriental languages There are also collections of drawings, photographs, and other objects of oriental interest It is accessible to *bona fide* students

Indian Ink, a pigment made from lampblack and gum or glue, originally prepared in China and Japan It is dried and marketed in small sticks and used mainly by artists for shading and lettering

Indian Mutiny. This turning-point in the history of modern India occurred in 1857 58 The ostensible cause was the serving out to the native troops of cartridges greased with animal fat, for contact with this was forbidden both by the Hindu and Mohammedan faiths A rebellious feeling, however, had long been developing, and when the Sepoys at Meerut in May 1857 refused to obey the English officers, overpowered and put them to death, the mutiny spread like wildfire The rebels took Delhi and Lucknow, and for many months terrible massacres and atrocities were committed, men, women and children were slain in thousands Order was re-established in the autumn of 1858 when the governing power was transferred from the East India Company to the Crown

Indian Summer is applied to a warm spell of weather occurring in the late autumn.

Indicators, substances which by a marked change in colour are used to indicate the course of a chemical reaction Litmus paper, for instance, is red with acids and blue with alkalis In biological work some radioactive substances are used as tracer elements.

Indigo, the substance obtained from the plant *Indigofera tinctoria*, a native of S Asia. India being the chief producing country The colouring matter is the result of the decomposition and fermentation of a glucoside contained

in the plant. This is afterwards dried and becomes the caked indigo of commerce. Natural indigo has been eclipsed by artificial indigo, a coal-tar dye which came into commercial production at the end of the last century, which is cheaper and more uniform in quality.

Indium, a scarce lead-coloured metal, symbol In, found in zinc blende in Saxony and certain other ores. This element was discovered in 1863 by Reich and Richter. It is an important material in the manufacture of transistors.

Indo-European, a term used to designate the great Aryan family of languages, which embraces Indo-Iranian, Celtic, Greek, Italic, Slavonic, and Germanic. Basque, Magyar, Turkish, and Finnish do not belong to this family.

Indulgence. In the Roman Catholic Church the remission granted by ecclesiastical authority to a repentant sinner of the temporal punishment still due after the guilt of sin has been forgiven by God. The indiscriminate sale of Indulgences by Tetzel and other Papal agents in the 16th cent. was one of the grievances which led to the Reformation (*see* **J38**).

Indulgence, Declaration of, was the proclamation by which James II suspended the penal laws against Roman Catholics and Dissenters. It was issued in 1688, but the clergy as a body refused to obey, and the trial of the Seven Bishops and their acquittal by a jury followed. An invitation was thereupon sent to William of Orange to become King.

Industrialisation is simply a name for industrial development. It is customarily used in particular to designate the course of events in a hitherto underdeveloped country which is seeking to increase its wealth and productivity by the introduction of more advanced techniques and by the establishment of industries previously not carried on within it. The word usually covers not only the development of modern industrial production but also the provision of electric power-stations, irrigation works, and transport and other developments designed to improve production in any field by methods involving large capital investments. The outstanding example in our time of rapid industrialisation has been the Soviet Union, which, unable to get the capital from abroad, has had to carry it through by ruthless restriction of the people's consuming power so as to achieve an unprecedentedly high ratio of investment to total production. Industrialisation has in practice meant a high concentration on the expansion of the basic heavy industries and of power supply, coupled with much slower development of the industries supplying consumers' goods and of agricultural production; but there is no reason why this should always be the case. It may well be that in most underdeveloped countries development can but be devoted largely to the industries making consumers' goods and to measures designed to increase agricultural production and productivity.

Inertia, a term used in mechanics for the property of matter by which it offers resistance to a change in its state of rest or in its state or direction of motion.

Inertial Navigation, an automatic method of dead-reckoning which at present finds its chief application in guided missiles, submarines, and aircraft. Navigation by this means is carried out with reference to inertial space (*i.e.*, space which is stationary with respect to the fixed stars) and not to the surface of the earth as in normal navigation (latitude and longitude). This is done by means of high-accuracy gyroscopes combined with highly sensitive accelerators in an apparatus known as the Ship's Inertial Navigation System. The American nuclear-powered submarine *Nautilus* pioneered the new north-west passage under the polar ice pack by this method of dead-reckoning in Aug. 1958.

Inflorescence, a flowering shoot. Many arrangements of the flowers are possible and there are many kinds of inflorescence, *e.g.*, the spike, catkin, umbel, capitulum (in composites).

Inflation. *See* **G4(2).**

Infra-red Rays *or* **Radiation**. This is the range of rays which come between the visible red rays and the ultra-short Hertzian radiation. The wave-lengths involved range from about 0.00076 millimetre (7,600 Angstrom units) to 0.4 millimetre. Infra-red rays penetrate haze, hence landscapes obscured by haze or cloud can be photographed using plates sensitive to infra-red. Many substances strongly absorb these rays and thereby become hot; this happens in toasting bread. Many industries use infra-red lamps for drying paints and lacquers. Very important to chemists, as a tool in the investigation of the structure of compounds, since various groups of elements absorb infra-red radiation at a characteristic frequency.

Infula, a sacred fillet, of woollen material, worn on the head by priests anciently, and by magistrates and rulers on solemn occasions, also by persons fleeing for protection to sanctuary. The infula later became a pendant to the mitre of bishops.

Ingoldsby Legends, a series of whimsical metrical tales full of droll humour written by the Rev. R. H. Barham, and first published in *Bentley's Miscellany* in 1837.

Ink, a liquid pigment ordinarily made from an infusion of nut-galls, copperas, and gum arabic. Shumac is substituted for nut-galls for inferior inks. An acid is sometimes added to prevent oxidation, and for the blue-black inks a small quantity of solution of indigo serves for colouring. Copying ink contains glycerine or sugar, which keeps the ink moist. Lampblack used to be the leading ingredient in printer's ink but now new methods of manufacturing have been developed. Marking ink is composed of a solution of nitrate of silver, gum, ammonia, and carbonate of soda. For red, blue, and other coloured inks, colouring solutions are used, for example, Prussian blue. The earliest examples of ink writing (on wooden tablets) ever found in Britain were recovered from the well of a Roman villa (3rd cent. A.D.) during excavations in 1954 at Chew Stoke, Somerset.

Ink Sac, a glandular organ found in squids and other cephalopods which contains an inky solution. When roused the animal discharges the contents of the ink sac into the water, to make a cloud through which its enemies cannot see. The pigment, sepia, comes from the ink sac of the cuttlefish.

Inlaying is the introduction of one class of substance into another in some artistic or other design, such as silver let into zinc, copper or lead, and called *bidri*; the insertion of gold and silver into iron or steel, which is *damascening*; the mingling of brass with tortoiseshell, *buhl work*; the inlaying of woods, *marquetry*; of stone, *pietra dura*; and of the arrangement of small pieces of stone, for floors, walls, etc., *mosaic*.

Innocents' Day, a festival day in Roman, Greek, and Anglican Churches in commemoration of the killing of the children of Bethlehem by Herod, Dec. 28.

Inns of Court, the four bodies in London which enjoy the privilege of calling candidates to the bar after they have studied for a certain number of terms and passed certain examinations. The Inns are: the Inner Temple, the Middle Temple, Lincoln's Inn, and Gray's Inn.

Inquisition, a Roman Catholic ecclesiastical court which became a formidable weapon of the Church in the 13th cent. under Pope Innocent III in dealing with charges of heresy. It was effectively set up in the various Catholic countries of the Continent, obtaining its fullest and most sweeping organisation in Spain in the days of Ferdinand and Isabella, when Torquemada was made Grand Inquisitor, and used its powers with terrible severity. *See* **Auto-da-fé**. In the 18th cent. its influence began to wane, and although the Congregation of the Holy Office still exists at Rome, its jurisdiction is limited to the suppression of heretical literature.

Insectivorous Plants, plants which trap insects with special mechanisms. Plant enzymes or bacteria digest the prey, providing the plants with nitrogen usually scarce in the soil in which they grow. The most common British species are the Sun-dew and the Bladderwort.

Insects. This huge class of invertebrate animals (*see* **Arthropoda, (F22)**) includes about 100,000 species. Insects are ubiquitous except in the sea, only a very few species being adapted to marine existence. Characteristic features are: the body is divided into three parts, head,

thorax, and abdomen the head carries a pair of antennae, the thorax three pairs of legs, and usually two pairs of wings The most primitive insects constituting the sub-class *Apterygota* are wingless. The other sub-class, *Pterygota*, is divided into the *Exopterygota* (*Hemimetabola*), which have a simple metamorphosis, *e g*, cockroach, and the *Endopterygota* (*Holometabola*), with a complex metamorphosis, *e g*, butterfly, bee Although many are parasitic on man, animals and plants, innumerable animals and some plants use them as food, and many flowering plants are dependent on a variety of insects for pollination leading to the development of seeds and fruits *See* **F23(1), F28(2), T27(1).**

Insignia, marks or badges of office or honour, such as stars ribbons, crosses, medallions or other designating objects, worn by members of special Orders or holders of prominent offices.

Institut de France was formed in 1795, and after various modifications was in 1832 organised on its present basis Its five academies are --the Académie Française, Académie des Inscriptions et Belles-Lettres, Académie des Sciences, Académie des Beaux-Arts, Académie des Sciences morales et politiques It is restricted to 40 members.

Instruments, Musical. Musical instruments may be classified in a number of ways, but in general they fall into one of the three main classes, String, Wind, and Percussion, according to how the sound is produced **Stringed Instruments** are those which produce the sound by the vibration of a string (*a*) by plucking, as in Harp, Lyre, Psaltery, Zither, Lute, Guitar, Balalaika, Ukelele, Harpsichord, (*b*) by friction (bowed), as in Crwth, Rebec, Viol, Violin, Marine Trumpet, Hurdy-Gurdy, (*c*) by striking (hammered), as in Dulcimer, Pianoforte, Clavichord, (*d*) by wind (blown), as in the Aeolian Harp **Wind Instruments** are those in which the air in the instruments is set in vibration (*a*) by blowing into a tube (flue-voiced), as in Recorder, Pandean Pipe, Flute, Organ, (*b*) by means of reeds (reed-voiced), as in Oboe, Clarinet, Saxophone, Bagpipe, Cor Anglais, Bassoon, Organ reed-stops, (*c*) those in which the sound is produced by the vibration of the player's lips against the mouthpiece (lip-voiced), as in Bugle, Horn, Trumpet, Tuba, Trombone, Saxhorn, Flügelhorn, Cornet In a modern orchestra these are known as the *Brass* instruments of the flute, oboe, and clarinet families as the *Woodwinds* Then there are the **Percussion Instruments**, which include the Drums, Cymbals, Tambourines, Castenets

Insulation, the condition in which an electrified body is prevented from communicating electricity to contiguous bodies by the interposition of a non-conducting material Important insulators are rubber, plastics, some fibres, *e g*, silk, ceramics, oil

Insulin is a hormone which controls the supply of sugar from the blood to muscles The breakdown of sugar provides energy In diabetes there is a lack of insulin, causing a build-up of blood sugar which can be released by the injection of insulin It is secreted by the islet tissue of the pancreas, from which it was isolated in 1922 by Banting and Best Dr. F Sanger of Cambridge University was awarded the 1958 Nobel Prize for his work in determining the chemical structure of insulin. *See* **P39(1). 50(1).**

Intaglio, engraving or carving on a sunken ground, a method frequently adopted in the ornamentation of stones and rings

Intelligence. Intelligence has been variously defined as "the ability to see the relationships between things" and "the ability to profit from experience" The idea of intelligence testing was first devised by the French psychologist Binet at the beginning of this century He was asked by the French government to invent a test which would weed out backward children in state schools, and thus save public money and avoid holding back the work of the class by teaching children who were incapable of learning at a given standard Binet solved the problem by giving a large series of practical questions and finding how many could be solved by the majority of children in a particular age-group. The questions were arranged so that in one group the majority of problems could be solved by most children of ten, in another by most children of twelve, and so on If a child of thirteen could solve correctly only those problems devised for a child of ten, his Mental Age was said to be ten, and his Intelligence Quotient was 10/13 multiplied by 100, or roughly 77% His intelligence, in other words, was only 77% of the normal. More modern intelligence tests have been devised which to some extent discount the influence of learning, since "intelligence" refers to innate ability—the capacity to learn rather than learning itself The following facts have been discovered about intelligence (1) Men and women do not differ in average intelligence (2) Different races do not vary in average intelligence (3) Delinquents are more often of lower intelligence than others. (4) Intelligence is inborn and does not increase after age 14

Interdict, a Roman Catholic ecclesiastical prohibition, directed either against a country, community, or Church, or against persons It is a weapon that is now rarely used, but in former times was often exercised with great power and severity

Interest is the payment made for the use of borrowed money over time The rate of interest is the rate per cent per annum charged for such loans There are many such rates, varying with the plenty or scarcity of borrowable money, with the length of time for which the loans are made, and with the degree of risk, if any, that the loans will not be duly repaid Short-term loans are usually cheaper than long-term the lowest rates are usually for "call money" repayable immediately on demand These are used principally in short-term financial transactions, such as bill discounting Bank loans, though usually made for fairly short terms, command higher rates Long term loans are made chiefly to public authorities, or as bonds or debentures to business concerns The rates obtained vary with the demand and the supply of such accommodation

Interlude, any short stage piece, or brief musical composition for performances between more important pieces In the strict musical sense an interlude is an *instrumental* composition played between the acts

International Date Line, a line along the 180° meridian, marking the difference in time between E and W For the westward-bound traveller crossing the line the date would be put forward one day, for the eastward-bound, back one day To avoid difference of date in adjacent land areas, the line deviates from the 180° meridian where this crosses land

Interval, in music indicates the differences in pitch between two notes This is often expressed numerically Thus the interval between C and the E above it is a major third, that between C and E flat is a minor third, that between C and G is a fifth, that between C and A is a sixth, and so on

Introit, the psalm or hymn in common use in the Anglican Church, which is sung as the clergy enter the church to commence the divine service of Holy Eucharist

Invention of the Cross, a Roman Catholic festival held on May 3, to celebrate the finding of the alleged True Cross at Calvary by the Empress St Helena in 326 Also included in the Church of England calendar *See* **Holy Rood.**

Investiture, the ceremony of conferring honour, office, or possession—the investment of the recipient with badge, token, or public recognition

Iodine, a non-metal element, symbol I, member of the halogen family (*q v*), a substance formerly exclusively obtained from the ribbon-wrack seaweeds These were burnt and the ashes (kelp) extracted with water After concentrating the iodides, these were distilled with manganese dioxide and sulphuric acid to yield iodine vapour which was condensed in stoneware bottles. Nearly all iodine now in use is derived from the iodine salt present in Chili saltpetre (sodium nitrate) Iodine is used in photography, as an antiseptic solution in alcohol or potassium iodide (tincture of iodine), and in medicine. Courtois discovered iodine in 1812

Ions, electrically charged atoms, or groups of atoms. Atoms of the metals lose electrons to become positively charged ions, *e.g.*, the sodium ion (Na^+) has one electron less than the atom. The non-metal ions are negatively charged, *e.g.*, the chloride ion (Cl^-) has one electron more than the atom. Similarly, a group like the sulphate ion (SO_4^{2-}) has more electrons than the constituent atoms. Thus, the hydrogen atom without its electron is a hydrogen ion or *proton* and the helium atom without its two electrons is a helium ion or *alpha-particle*. When an electric force is applied to certain solutions, the ions into which molecules of the dissolved substance are broken up are attracted to the oppositely charged electrodes, their movements constituting an electric current through the solution. In the same way gases, including air, conduct electricity by virtue of free ions (*see* **F12(2)**). Combustion, radioactivity, and ultra-violet and cosmic radiations produce ionisation.

Ionic Order of architecture is one of the five classic orders, its leading characteristics being the volute of its capital, which has on each side distinctive curved or scrolled ends.

Ionosphere, the atmospheric region which lies between about 60 m. and about 300 m. above the surface of the earth. The air in this region is a partial conductor of electricity, a property imparted to it by the action of the sun. The ionosphere is divisible into several layers, each with distinctive properties. The Heaviside layer, named after Oliver Heaviside who postulated its existence on theoretical grounds in 1892, reflects long radio waves. The higher Appleton layer, known after its discoverer, Sir Edward Appleton, reflects short radio waves. *See* **F43(1), 45(2)**.

Ipecacuanha, a flowering plant of the Brazilian forests. Various alkaloids are isolated from ipecacuanha, one is emetine, which is used in medicine to cause vomiting and so remove poisons from the stomach. Another is used as an expectorant in cough mixtures.

Iridium, a white and very hard metal, symbol Ir, discovered by Tennant in 1804. It occurs naturally as an alloy with platinum or osmium; tips for fountain-pen nibs have been made from the former native alloy. The former standard metre was composed of platinum-iridium alloy (*see* **Metre**) as are parts of scientific apparatus and surgical tools that must be non-corrodible.

Iris, the typical genus of the botanical order *Iridaceae*, with tuberous rhizomes and sword-shaped leaves, many of the family having beautiful flowers. About 100 species of Iris are recorded from the northern temperate zone, the most common species wild in Britain being the yellow flag. Orris root, used in perfumery, comes from another iris species.

Iron is a metallic element, symbol Fe (Latin *ferrum*), occurring widely in nature in such ores as hæmatite, loadstone (magnetic iron oxide), spathic ore, and iron pyrites. It is extracted by a process known as smelting, with coke and limestone in a furnace. Its many uses are familiar, the most important being in the manufacture of cast- and wrought-iron products and of steels, which are alloys mainly of iron with added carbon and various metals. Iron rust is formed by the action of oxygen and water, and is a coating of iron oxide. *See* **Smelting**.

Ironclads, ships of war cased in iron or steel plates of sufficient thickness to resist projectiles. They were first introduced (1858) in the French Navy, and in 1860 the first British ironclad, the *Warrior*, was launched.

Iron Curtain. In a speech at Fulton, U.S.A., on March 5, 1946, Sir Winston Churchill used this phrase to describe the dividing line behind which, he said, lie all the capitals of the ancient States of Central and Eastern Europe—Warsaw, Berlin, Prague, Vienna, Budapest, Belgrade, Bucarest, and Sofia. These famous cities and the populations around them, said Sir Winston, lie in the Soviet sphere and are subject "to a very high and increasing measure of control from Moscow."

Ironsides were Cromwell's special troopers, so called because of their solidity and firmness in battle.

Irredentists, a political party organised in Italy about 1878 with the object of incorporating within Italy neighbouring regions. Also a person, group, or party advocating policies for the restoration to their country of territory formerly belonging to it but later lost.

Irrigation, an artificial method of providing water for the growth of plants on lands where the natural supply of water is deficient. The science has made immense progress during the last fifty years, and has been the means of bringing into profitable cultivation vast tracts of territory in India and Western America which had previously been arid wastes. The systems are various and are utilised according to the special conditions of the land to be irrigated, but the success which has attended these experiments has been very gratifying. In fact, irrigated lands are often more productive than lands which receive a fair amount of moisture from the elements, the irrigation supply can be distributed and regulated exactly according to requirements. Irrigation also serves the purpose of supplying *warmth* in winter, *e.g.*, in the English water-meadows, and in the more highly developed Italian *marcite* and winter-meadows, where the water is mostly applied in winter when there is plenty of rain. There are several other functions of irrigation, *e.g.*, washing out of excess salts.

Isinglass, a gelatinous substance manufactured from the swim bladders of certain fish, used to preserve eggs, to keep beer free from sediment, and to make a glue.

Islam. *See* **J23**.

Isobars are the lines drawn on charts linking together points of equal barometric pressure.

Isochasms, lines connecting places at which there is an equal probability of seeing an aurora, taking the average over a number of years, based on the auroral catalogue of Fritz.

Isomers are chemical compounds having the same composition but different structural arrangements, and consequently different physical and chemical properties. For example, ethyl alcohol and methyl ether are isomers, since the molecules of both are built up of two atoms of carbon, six of hydrogen, and one of oxygen, *viz.*, C_2H_6O; ethyl alcohol, C_2H_5OH; and methyl ether, CH_3OCH_3.

Isotherms are lines drawn on charts through points of equal temperature.

Isotopes. When one talks of an element, say, uranium or lead, the name of the element is a generic name for a collection of uranium species and lead species. The different species are called isotopes. For any particular element, the number and arrangement of electrons around the nucleus are the same in all the isotopes so all the isotopes have the same chemical properties. Soddy has described isotopes as "elements, the atoms of which have similar outsides but different insides." For example, in the nucleus of the uranium isotopes, U 235, U 238, and U 239, there are respectively 143, 146, and 147 neutrons, but all have 92 protons. The isotopes have different atomic weights, in this instance respectively 235, 238, and 239. But all have the same chemical properties. Britain is the largest exporter in the world of radioactive isotopes. *See* **F10(2)**.

Ivory, the dentine substance of which the tusks of the elephant, hippopotamus, walrus, etc., are composed. The tusks of the African elephant sometimes weigh as much as 100 lb., and reach a length of 8 or 9 ft.

Ivory Gull, a small, beautifully shaped sea-bird with striking all-white plumage and black legs which breeds on the rocky shores of the Arctic, being found farther north than any other bird; it occasionally wanders south in the winter.

Ivy, the well-known climbing shrub, chiefly evergreen, furnishing a sudorific, the berries having also emetic properties.

J

Jabiru, the Brazilian name for the giant stork of South America.

Jacamar, from *Jacameri*, the Brazilian name for a smallish bird with long, sharply pointed bill and brilliant plumage which inhabits the tropical regions of South America east of the Andes.

These birds are seen sitting motionless on trees, darting off at intervals, like flycatchers, to catch insects on the wing

Jacana, a tropical bird (the water-hen of Brazil and the warmer parts of America) of wide range, beautiful of plumage, with slim body and narrow wings, and long, pointed beak It feeds on seeds and insects, inhabits marshy lands, and is related to the plovers

Jack, a small schooner-rigged vessel, used in the Newfoundland fisheries, a pike, an oscillating lever, a device used in roasting meat

Jackal, *Canis aureus*, a small wild dog related to the wolf and resembling a fox The Common Jackal is found in S E Europe, India, and Ceylon; other species inhabit Africa and Egypt The jackal is a well-known scavenger

Jackdaw, one of the smaller members of the Crow family. This European bird is typically black with grey collar It is easily tamed, makes an amusing pet, and delights in making off with and taking to its nest bright objects, such as silverware

Jacobins, a French revolutionary club or party, formed in 1789, and accustomed to meet at a Jacobin convent, hence the name It became a controlling force in the Revolution, especially in the movement which led to the Terror Robespierre was its chief spokesman

Jacobites, adherents of the Stuart cause after the abdication of James II First James himself, then his son (the Old Pretender), and later his grandson (the Young Pretender) tried to fan the flame of rebellion in Scotland and Ireland, but after the defeat at Culloden in 1746 the cause was lost Also the name of the monophysite heretics of Syria (*see* Section J), so named after their leader Jacobus Baradaeus in the 6th cent. A D

Jade, a green mineral found in China, America, and New Zealand, and used for making vases, bracelets, and other ornamental articles There are many varieties, and there is evidence that the stone was in common use in prehistoric times for weapons and utensils

Jaguar, a South American carnivorous animal resembling the leopard, but much larger and more powerful, the largest of the Felidae

Janeite, a devotee of Jane Austen and her writings

Janissaries, an elite band of Turkish foot soldiers who acted as the Sultan's bodyguard, noted for their turbulence and cruelty They gained great power under the Ottoman Empire. In 1826 the Sultan Mahmud II had them massacred.

January, the first month of the year, named after Janus, the two-faced god of the Romans It was the *Wolf monath* and *Aefter Yule* of the Saxons

Jasmine, a graceful climber belonging to the olive family with odoriferous blossom, originally a Persian plant, but now acclimatised in many varieties in almost all parts of the world Two species of jasmine (the common jasmine and the Spanish jasmine) yield oils used in perfumery

Jasper, a precious stone of the chalcedony variety, opaque, and coloured red, brown, yellow and sometimes green It was greatly esteemed by the ancients, the Bible having numerous allusions to it

Jay, a gaily-coloured bird of the Crow family, of many species—the Blue jay of N America, the Canada jay, sometimes called "whisky jack," the Siberian jay, and the British jay, fawn-coloured with black and whitish crest and bright blue feathers in the wings. It lives in woods and like the magpie, takes the eggs and young of small nesting birds.

Jazz, a rhythmical syncopated music characterised by a strong element of improvisation in the performance, probably originating among the Negro population of the Southern States of the U S A It became popular during the first world war and, in a commercialised form, has held the popular field ever since Modern dance music and popular songs are based on the jazz idiom, which has also had a profound effect upon contemporary music of a more serious kind.

Jean, a stout kind of twilled cotton cloth much worn in olden times, and resembling fustian. Blue *jeans*, adopted by American city youngsters from farmworkers, are now the fashion elsewhere and worn not only as overalls by workmen but by both sexes in leisure time.

Jelly-fish. The jelly-fishes, which have gelatinous, translucent bodies fringed at the margin with delicate tentacles, constitute the coelenterate order *Scyphozoa*. The mouth, with a squarish opening, is seen on the underside, and there are four horseshoe-shaped sex organs

Jerboa, small jumping mammals of the Rodent order. These mice-like animals have long tufted tails and very long hind legs, the front legs not being used for locomotion

Jeremiad, any utterance or writing in which sorrow or complaint is the chief characteristic, so named as recalling the style of the "Lamentations of Jeremiah," in the Old Testament

Jerusalem Chamber, a room in Westminster Abbey deriving its name from the circumstance of its having originally been decorated with a view of Jerusalem Henry IV died in this chamber and the Committee for the Revision of the Bible met there in 1870 and later

Jesuits, members of the Roman Catholic teaching order founded by Ignatius Loyola in 1534 A long and vigorous course of study is prescribed before they are admitted into the privileges of full membership They are required to take the vows of voluntary poverty, perfect chastity, perfect obedience, and complete submission to the Pope The Society played an important part in politics

Jet, a deep black fossil substance admitting of a high polish and much used for jewellery, ornaments, and trimming It is a form of lignite the most important British deposit being found near Whitby, where jet manufacture has been an established industry for a long period.

Jet Engine, an aeroplane engine which derives its thrust from the high velocity of the gases it ejects The essential units in a jet engine are a rotary compressor and a gas turbine, the latter driving the compressor The first reliable, high-performance jet propulsion engine for aircraft was invented by Air Commodore Sir Frank Whittle

Jet Stream, a meteorological term coined in 1946 to describe the relatively narrow belt of strong winds (100–200 m p h) at levels in the atmosphere from 3 to 7 miles These winds are important in forecasting weather, and can be a valuable aid to aircraft. From the ground, where there may be little wind, the jet stream can sometimes be seen as high cirrus cloud moving across the sky at high speed.

Jewish Calendar is supposed to date from the Creation, which according to their reckoning occurred on Oct 7, 3761 B C

Jew's Harp. The name is believed to be a corruption of "jaws harp" This instrument consists of a metal frame with a central tongue of spring steel The frame is pressed against the teeth, and the tongue of the harp is twanged with the finger, the mouth acting as a resonating chamber By altering the shape of the mouth the resonant frequency and therefore the note can be varied

Jimson Weed, corruption of Jamestown Weed, a synonym for the Thorn Apple of the Nightshade family

Jockey Club, the governing body that, although possessing no legal status, frames rules and laws by which horse-racing and turf matters generally are regulated The club-house is at Newmarket.

John Bull, the typical figure of an Englishman, bluff, big, and burly Arbuthnot's *History of John Bull* is supposed to have originated the character

John Dory, a well-known sea-fish of which there are six species It is of a golden-yellow colour (*jaune dorée*), has a high dorsal fin with long filaments projecting from the spines, and is much valued as a table fish. It is sometimes found in British waters, but the Mediterranean is its chief habitat

John o' Groat's House, W of Duncansby Head, Caithness, popularly named as the northernmost point of Scotland According to legend the house, which has now disappeared, was built in octagonal form by a Dutchman Jan de Groot who came to live there in the 16th cent. The site is marked and an inn was erected near it in 1876

Jongleurs were minstrels and jesters who wandered from town to town singing songs, playing

musical instruments, dancing, and giving entertainments in mediæval France and Norman England. Jongleurs were low-born in contrast to the Troubadours, who were often of the nobility

Joule, a unit of energy equal to 10^7 ergs, this is about ¾ of a foot-pound. Named after the British scientist, J. P Joule (1818-89) *See* **F16** (2).

Jousts were military tiltings in the nature of tournaments, where the contestants strove against each other on horseback with blunted lances It was the sport of nobles in feudal times

Judaism. *See* **J24.**

Jugendstil, the German equivalent of Art Nouveau (*q v*) The name was derived from the magazine **Jugend** (youth) first published in Munich in 1896

Julian Calendar, named after Julius Cæsar, who in 46 B C, finding the Roman year 90 days in advance of the real time, was the first to adopt the calculation of time by the solar year, the average length being fixed at 365¼ days There was still an overplus of a few minutes every year, and this was rectified by the Gregorian Calendar, introduced in Italy in 1582 and adopted in England in 1752, from which date what is called the "New Style" begins

Julus, a genus of millipedes with cylindrical bodies and two pairs of legs to each segment, the latter being 40 to 50 in number In South America specimens 5 or 6 in long are frequent, but those found in England are small

July, the seventh month of the year, named after Julius Caesar It was the *Maed monath* (Mead-month) of the Saxons

July Revolution, the French revolution of 1830 whereby Charles X was deposed and Louis Philippe made king The latter was deposed by the revolution of 1848

Junco, the name given to a genus of snowbirds, confined to the American continent

June, the sixth month of the year, containing 30 days and deriving its name from Juno It was the *Sear* (Dry) *monath* of the Saxons

Jungle-Fowl, birds related to the peacocks and peacock-pheasants At least four species are known from the jungles of India, Ceylon, and Java The domestic chicken has been derived from the Red Jungle-Fowl (*Gallus gallus*)

Junkers, name of the ruling class of Prussia, military in spirit, who were the party of reaction and defenders of the landed interests Supported Bismarck prior to the Franco-Prussian war and helped bring Hitler to power

Jupiter, the largest planet It is believed to have a rocky core surrounded by ice layers thousands of miles thick There is an outer atmosphere containing ammonia and methane, both presumably in the liquid or solid state owing to the very low temperatures of the outer layers (−120° C) In 1610 Galileo made history by discovering the four major satellites of Jupiter, these are visible with good field-glasses There are eight others For distance of Jupiter, etc, *see* **F7.** Also the supreme mythical deity of the Romans, identified with the Greek Zeus (**H38**)

Jurassic Formation, a series of rocks (the evidences of which are most marked in the Jura Mountains) coming between the Cretaceous and Triassic groups and including the Oolite and the Lias It is a formation rich in fauna, abounding in echinoids, lamellibranchs, ammonites, and belemnites large reptiles, marine and land, are common, as are the plants called cyads In Britain the Jurassic outcrop extends from the Dorset coast to the Yorkshire moors *See* **F30**

Jury, a body of private citizens chosen and sworn to hear and pass verdict upon evidence brought forward at a trial, inquest, or inquiry The origin of the English jury is obscure, but it is thought to have been introduced by the Normans. The jurors are the judges of fact upon the evidence laid before them, and unless all 12 agree the case must be retried with a fresh jury

Jute, the name given to the fibre of a plant grown largely in Pakistan in the Ganges delta and used for the manufacture of coarse cloths, cordage, and packs. Calcutta is the biggest jute-manufacturing centre of the world, as Dundee was in the 19th cent.

Jutes, a Low German race who in the 5th cent. invaded the south-eastern part of England, establishing themselves in Kent and making Canterbury their capital.

K

Kaffirs, Bantu-speaking negro tribes of South Africa, whose occupations are cattle-raising, farming, and hunting

Kagu, native name for a curious bird related to the sun-bittern and the only member of the Rhinochetidae family, found inhabiting New Caledonia when that island was colonised by the French

Kakapo, the Maori name for the New Zealand owl-parrot, a peculiar and interesting species, possessing wings but not able to use them for flight, of brown mottled plumage, nocturnal in its habits, and nesting in burrows The bird, once abundant, is rapidly becoming extinct.

Kalmuks, a branch of the Tartar or Mongol race who in the 17th cent migrated to Europe. Many of them returned to China in 1771 The descendants of the last of these nomads to enter S.E. Russia are now organised as the Kalmyk Autonomous Soviet Socialist Republic

Kangaroo, pouched (marsupial) mammals of Australia and adjacent islands. There are over 20 species, the smaller ones being known as "wallabies" Kangaroos leap in a succession of springy bounds 10–20 ft long, the forefeet not touching the ground They can reach a height of over 6 ft and a weight of 200 lb. First seen by white men when Capt Cook's expedition visited Australia in 1770. Related genera include the tree kangaroos, rat kangaroos, and the Tasmanian Jerboa kangaroo

Kaolin *or* **Kaolinite**, a fine clay much used in the manufacture of high-class pottery It results from the decomposition of felspar, and is found in China, Japan, Devon, Cornwall, at Limoges in France, and in certain parts of the United States

Katydid, large long-horned insects of the grasshopper family, common throughout the United States east of the Rockies Their name comes from the sound these insects make

Kauri Pine, a large coniferous tree yielding a fine copal resin which ranges from Malay to New Zealand The New Zealand Kauri, *Agathis australis*, is found only in N Island Some of the best Kauri gum comes from fossilised pines and is dug out of the soil far from any living trees

Kava, a refreshing drink made from the pounded root of the pepper plant (*Piper methysticum*) and the national drink of Tonga

Keep, the central tower or chief stronghold of an ancient castle, sometimes called the donjon

Kelpie, a water-sprite of Scottish fairy-lore, whose appearance assumed various forms, and foreboded drowning to the person who saw it In Australia the Kelpie is a valuable sheepdog

Kentish Rag, a fossiliferous clayey limestone of Cretaceous age found in Kent Used in building.

Keratin, a hard protein material of which horns, nails, claws, hoofs, and reptiles' scales are made

Kermes, a crimson dyestuff, less brilliant than cochineal, but more lasting It is made from the bodies of the females of a small oak-inhabiting insect (*Coccus*) found in immense numbers on the coasts of the Mediterranean

Kerosene. *See* **Paraffin.**

Kestrel, the most common British falcon, well known for its habit of hovering for minutes at a time with vibrating wings and then swooping down to attack mice and insects The male has spotted chestnut-brown back, greyish head and tail, which has a broad black band near tip

Ketones. A class of organic compounds, related to aldehydes, of general formula R_2CO (where R is an organic radical) The simpler ketones, especially acetone, are widely used as solvents for lacquers, synthetic rubber, and polymers, such as cellulose acetate and perspex More complex ketones occur in nature, and some are used in the perfumery industry, muscone (from the musk deer (*q v*)) is an example.

Kew Gardens, officially known as the Royal Botanic Gardens, are among the most celebrated gardens in the world. They were started in 1759 by Princess Augusta of Saxe-Gotha, widow of Frederick, Prince of Wales, and mother of George III They remained private

property until 1841, when control passed to the Commissioners of Woods and Forests. They now cover 300 acres and are administered by the Min. of Agriculture, Fisheries, and Food. Since 1841 the gardens have been open to the public, and form one of the most attractive resorts near London.

Key, a musical term indicating the central dominating note that gives the melodic order in which the tones of a tune or composition are arranged. It is the starting-point, and different starting-points demand different scales. The natural key of C, for instance, requires no flats or sharps, all other keys require the use of sharps or flats to bring the notes of their scales into proper relation.

Keys, House of, is the Manx representative assembly. *See* **Tynwald.**

Keystone, the stone which occupies the centre and highest point of an arch and is usually the last to be inserted.

Khaki, a clay-coloured cloth adopted for uniforms in the British Army in the time of the war with the Boers, and used in the first and second world wars. First used by Indian regiments.

Kilderkin, once a common liquid measure in England, representing 18 gallons.

Kilogram, a unit of mass equal to 2·2 lb. One kilogram equals 1,000 grams.

Kilowatt. *See* **N13(2).**

Kinetic Energy, the energy (*q.v.*) possessed by a particle or body in virtue of its motion. If the motion is destroyed, *e.g.*, by the impact of the body with an obstacle, the kinetic energy vanishes, being turned into some other form of energy such as heat and sound. If the body has mass m and speed v its kinetic energy (leaving out corrections due to relativity) is $\frac{1}{2}mv^2$.

Kinetic Sculpture, a development of equipoised sculpture (*i.e.*, sculpture independent of gravity in the sense of resting on a base either horizontally, vertically, or obliquely) intended to appear as "a weightless poising of volumes, relationships, and interpenetrations." Since in the literal sense this is impossible, the Constructivists (Pevsner, Gabo, and Moholy-Nagy) used glass and invisible wire as supports, giving the impression that their creations were in fact independent of gravity. However, the American, Alexander Calder, has made constructions of balls and wire which he calls "mobiles," and in this form they are now known to everyone as they delicately dangle and rotate suspended from the ceiling.

King Crab, remarkable arthropods now classified separately from both Arachnids and Crustacea which they resemble, inhabiting the sea coasts of America, Japan, India, and Malay Peninsula, carrying a shield-shaped shell, and having a long pointed spine projecting from the posterior. The body comprises three separate sections articulated together. These crabs—in America known commonly as the horseshoe crab because of their shape—are from 18 in. to 2 ft. in length. Fossil king-crabs are found as far back as the Silurian. There are about six living species.

Kingfisher, a well-known family of brilliant-plumaged birds, found in all continents, comprising some 250 species and sub-species. The British kingfisher, *Alcedo atthis*, haunts the rivers and streams, and is one of the most beautiful of native birds, having iridescent blue-green, white, and rich chestnut in its plumage and bright-red feet. All kingfishers have long, dagger-shaped bills. In the Malayan region, New Guinea, the Moluccas, and Australia the varieties are very numerous. The quaint *Laughing Jackass* of Australia is among the largest of the kingfisher family. The European kingfisher is the bird of the Greek legend of the Halcyon.

King-of-Arms, the name of the chief officials of the Heralds' College. There are several in England—the principal being those of the Garter, Norroy, Clarenceux. *See* **Heralds' College.**

Kiosk, a word of Russian or Turkish origin meaning a small open pavilion of light construction much used in Eastern countries as a place of shade and rest. Similar structures are common in the streets of Paris as news and advertisement stands, and in London as telephone offices.

Kirimon (*Kiri no go Mon*) and **Kikumon** (*Kiku no go Mon*), the two Japanese imperial crests, the first a design of leaves, stems, and flowers of the Paulownia plant, and the other representing the sixteen-petalled chrysanthemum.

Kirk, the Church of Scotland. Kirk-Session is a "court" of the Presbyterian churches, consisting of the ministers and elders.

Kismet, a word signifying fate, destiny, or doom, frequently employed (or its equivalent) in most Oriental countries, and also in considerable use in European literature and speech.

Kite, name of several birds of prey, widely distributed, related to the hawks and eagles, graceful in flight, and distinguished by their long wings and deeply forked tails. The red kite, light chestnut brown, once the most familiar bird of prey in Britain, seen scavenging the streets of London, is now the rarest, and found only in Wales. The Egyptian kite and the pariah kite of India, notorious for their daring thefts, are closely related to the black kite, a smaller European species, with less forked tail and blackish-brown plumage.

Kittiwake, a beautiful white and pearl-grey gull with black legs, dark eyes, and greenish-yellow bill. Its range is wide, and includes the British Isles, where it is a local resident. The flight of this only truly oceanic gull, which excepting in the breeding-season, is generally found offshore, is graceful, swift, and buoyant. A triangular black patch, noticeable on the ends of the wings when open, is characteristic of the species, as is the call kitti-wake, from which the bird derives its name. It nests in colonies on the ledges of caves and steep cliffs.

Kiwi, flightless, stoutly-built birds of New Zealand now very rare and carefully protected by the Government. They are little larger than a domestic hen, and lay astonishingly large eggs for their size. Incubation and care of chicks fall to the male bird. They have rudimentary wings concealed by the plumage, and the feathers are hair-like. They are nocturnal [illegible].

Knighthood is a degree of honour or title common in Europe since the Middle Ages, and was at first exclusively a military order. In Great Britain the four main orders of knighthood are those of the Garter, the Bath, the Thistle, and St. Patrick, in addition to which there are several other orders, such as the Order of St. Michael and St. George, the Star of India, etc. There are also Knights Bachelors such as are not associated with any special order. The title is not hereditary, and therefore ranks below that of a baronet, though both are entitled to the prefix "Sir."

Knot, a nautical measure of speed (1 sea mile per hour), and formerly measured by a log-line, divided by knots at equal distances $\frac{1}{120}$ of a geographical mile. The number of knots travelled by the ship in half a minute corresponded to the number of sea miles it travelled per hour. A sea mile is equal to about $1\frac{1}{7}$ of a statute mile. Also, a grey and white wading bird, usually a winter visitor to Britain found in flocks on the coast.

Knout, formerly a Russian instrument of punishment, consisting of a whip of many thongs, used upon Russian criminals since the 15th cent. A hundred and twenty strokes were considered equivalent to a sentence of death, half that number sufficing to kill in many instances. Tsar Nicholas I., however, changed the form of the knout, and made it a much milder instrument.

Koala, the Australian arboreal marsupial mammal that looks like a toy teddy-bear, with ashy-grey fur, bushy ears, and rudimentary tail. It feeds on the leaves and shoots of certain eucalyptus trees, and is not more than 2 ft. in length.

Kohl, a powder prepared from antimony or burnt almond shells, and in common use by the women of the East for darkening the eyelids.

Koto, a musical instrument in general use in Japan consisting of a series of 13 silken strings stretched across a curved wooden surface, and played with the fingers. Each string is 5 ft. long, and has a separate bridge so fixed as to give the vibration necessary for the note it has to produce. It is a sort of horizontal harp, and in the hands of an expert player is capable of giving forth excellent music.

Kremlin, the citadel or walled city within a Russian city which during the Middle Ages served as an administrative and religious centre and offered protection. That of Moscow, now

the headquarters of the Russian government, contains the cathedral where the Tsars were crowned, an imperial palace, and the bell-tower of Ivan the Great. Its walls which are topped with towers were built in the 15th cent.

Krypton, one of the rare gases, symbol Kr, occurring in the air to the extent of 1 part in 20 million. It was discovered in 1898 by Ramsay and Travers. It is used in gas filled electric lamps.

Kussier, a Turkish musical instrument consisting of five strings stretched over a sort of kettle-drum.

Kusti, the sacred cord or girdle of the Parsees, consisting of 72 threads—the number of the chapters of the Izashne—and two branches, each branch containing six knots, together standing for the 12 months of the year.

Kutch, the packet of vellum leaves in which gold is placed for the first beating, the gold-beaters' skin packet into which the leaf is placed for the second beating is known as the "shoder."

Kyrie Eleison ("Lord, have mercy"), the name of a common form of prayer in the Anglican, Roman Catholic, and Greek Churches, also applied to the English Church responses after the recital of the commandments.

Kyrle Society, named after Pope's "Man of Ross," John Kyrle, founded by Miss Miranda and Miss Octavia Hill in 1875, and having for its object, the decoration of workmen's clubs, hospitals, etc. and the promotion among the poor of a taste for literature, music, and outdoor recreation.

L

L.S.D., from the Latin libra (a pound), solidus (a shilling), and denarius (a penny), introduced by the Lombard merchants.

Labarum, the standard of Constantine the Great, adopted after his conversion to Christianity, marked with his seal, and represented upon the coinage.

La Belle Sauvage, a site on the north side of Ludgate Hill, famous for the inn that stood there from the 15th cent. to the early 19th. The site was blitzed during the second world war.

Labourers, English Statute of, was passed 1350–51, with the object of compelling labourers to accept a certain rate of wages and not leave their employers' service, the Plague having rendered labourers so scarce that they were in great demand and had been insisting on higher pay. These enactments were bitterly opposed and led to the "Peasants' Revolt," headed by Wat Tyler.

Labradorite, a felspar rich in calcium and of a pearly lustre on cleavage, found in masses in igneous rocks, the best samples of which come from Labrador.

Labyrinth, or Maze, a combination of roads and passages so constructed as to render it difficult for anyone ignorant of the clue to trace the way to the central part. The Egyptian labyrinth near Lake Moeris had 3,000 rooms, half of them subterranean and the remainder above ground. The labyrinth in Crete, according to Greek myth, was built by Daedalus to house the Minotaur. There was one at Lemnos, renowned for its stalactite columns, and another at Clusium constructed by Porsenna, King of Etruria, about 520 B.C. The labyrinth in which Fair Rosamond was concealed was at Woodstock. Hampton Court maze dates from the 16th cent.

Labyrinthodonts, gigantic fossil amphibians which get their name from the curious labyrinthine structure of their teeth, probably an evolutionary link between fishes and reptiles. They occur in the Carboniferous, Permian, and Triassic formations, and remains have been found in Britain and other parts of Europe. Their heads were several feet long, and their footprints, by which they were discovered, closely resemble the prints of the human hand.

Lac, a resinous matter deposited on the branches of a number of tropical trees by the females of the lac insect, the exudation including eggs and a viscous covering. At the gathering time, the twigs are broken off and dried in the sun, when the insects die, and the lac that remains is termed *stick-lac*. From this, by the removal of extraneous accretions and dissolving, *seed-lac* is produced. *Shell-lac* is seed-lac after it has been melted and otherwise prepared, and this is the best known of the lacs, being used in printing and the manufacture of varnishes and sealing-wax, and for other commercial purposes.

Lace, a delicate fabric of linen, silk, or cotton threads, made by hand or machinery, and worked in various ornamental designs. The kinds of lace are many, deriving their distinctive names either from the method employed in production or from the place where any special variety was originally made. The best-known makes are pillow or bobbin-lace, woven and plaited by hand, needle-point lace, worked by the needle over a traced design, and machine lace, which practically dates from Heathcote's invention of the early part of the 19th cent. Some of the most famed laces are the following: *Alençon*, a needle-point lace; *Brussels*, a very fine kind, with needle-point sprigs and flowers, *Chantilly*, a silk variety with flowers and openwork, *Cluny*, a netlace with darned stitch, *Honiton*, a delicate kind with dainty sprigs and figures, *Mechlin*, generally made in one piece and very varied in design, and *Valenciennes*, or bobbin lace, of great durability, the pattern and ground of which are made at the same time, being one of the best and most costly of laces, now manufactured mainly in Belgium. Nottingham is famous for its lace.

Lace-Wings, insects with frail, transparent, and much-veined wings whose grubs eat large numbers of insect pests such as aphids. The eggs are borne at the ends of threads attached to plants.

Lachesis, a genus of venomous snakes of the rattle-snake family confined to tropical countries, and including the "deadly bushmaster" of Surinam, and several Crotalidae pit-vipers of Guiana and Brazil.

Lacquer, a varnish made from shellac and certain colouring matters, and utilised for imparting lustre to various surfaces of metal or wood. In China and Japan the production of lacquer ware of a decorative character has long been an important industry, bringing into use gold, coral, vermilion, sprinkled, and other lacquers, with pleasing effect.

Lacrimoso, a musical term denoting a mournful method of playing, sadly, with feeling.

Ladybird, the common name of a large family of beetles—the *Coccinellidae*. The insect is usually of a red or yellow colour with small black or coloured spots. Ladybirds are of good service to the gardener because their larvae feed on aphids. There are about 2,000 species.

Lady-Day, the day of the festival of the Annunciation of the Virgin Mary, Mar. 25. One of the four English quarter days.

Lagoon, a stretch of shallow water opening out upon the sea. Venice is built on lagoons.

Lake Dwelling, the name given to certain prehistoric habitations which were thought to have stood on platforms over lakes, like villages in certain Pacific islands. Recent excavations at the Lake of Burgaschi in Switzerland show that the prehistoric Swiss pile dwellings probably stood on the shores of lakes, not on platforms over the water.

Lakes are bodies of water collected in depressions of the earth's surface. The most notable lakes are the Great Lake series of North America, including Superior, Michigan, Huron, Erie, and Ontario, all discharging into the St. Lawrence River. Africa has an enormous area of lakes, including the Albert Nyanza and the Victoria Nyanza, forming the sources of the White Nile, Lakes Tanganyika, Nyassa, Tchad, etc. Smaller lakes are numerous in other countries—Switzerland, Germany, Italy, England, Ireland, Scotland, all having their lake regions, where the scenery is invariably beautiful and romantic.

Lake School, the name given, at first in ridicule, to a distinguished trio of poets—Wordsworth, Coleridge, and Southey—who made their homes in the English Lake District.

Lamellibranchs (Pelecypods), the class of aquatic, bi-valve molluscs to which the oysters, cockles, mussels, clams, and scallops belong. In these animals the body, which is compressed laterally, is enclosed in two hinged shells held together by muscular action. The gills are thin plates, hence the name "lamellibranch."

Lamellicornia, a sub-order of beetles, distinguishable because the antennae, made up of a number of plates, appear club-shaped The Lamellicorn beetles are herbivores and number several thousand species, the best-known being the stag-beetles, cockchafers, and scarabs

Lamination, stratification on a very fine scale, as in shales

Lammas Day is one of the oldest of the Church festivals probably derived from the loaf-mass (hlafmaesse) of the Anglo-Saxons. It occurs on August 1. In the olden times it was the day when loaves were given in place of first-fruit offerings

Lammergeyer, the bearded vulture of alpine regions, resembling an eagle in appearance It has a white head with black tufts at base of the bill, and its general plumage is dark brown, nearly black It is found in the remote mountain ranges from Southern Spain to China, and is becoming scarce

Lampblack, a carboniferous pigment obtained from flame-smoke, and now produced in specially constructed furnaces in which bodies rich in carbon, such as tar, resin, petroleum, etc , are burned The smoke or soot resulting is collected from the sides of the furnace, and forms lampblack It finds use in making printer's ink, black paint, etc Being a very pure form of carbon, it is also utilised in the manufacture of dynamo brushes and arc-lamp carbons.

Lamprey. Eel-like fish having no scales, bones, paired fins, or jaws They attach themselves by their mouths to fish whose blood they suck Together with the hagfishes, the lampreys are placed in a special class—the Cyclostomes. There are three British lampreys

Lancelet. *See* **Amphioxus.**

"Lancet," the name of a noted English medical journal, established in 1823 by Dr Wakley

Land Crab, a family of crabs (*Gecarcinidae*) which live mainly on land though migrating to the sea to deposit their eggs

Land League, an association formed in 1879, with Parnell as president, for compelling a reduction in the rents of land, and a reconstruction of the land laws in Ireland, and in case of non-compliance refusing to pay rent For a time this League exercised great political influence and was an important aid to the Home Rule agitation

Landrail, popularly known as the Corncrake, is a regular summer visitor to Britain, and is well known by its harsh and piercing note, so familiar in cornlands in the night time

Landslip, a sudden downward sliding under gravity of large masses of rock, soil, etc , often set off by earthquake shock or saturation of a particular stratum with water Many serious landslides have occurred from time to time In 1618, an earthfall happened at Plurs, on Lake Como, involving the destruction of many buildings and the loss of numerous lives In 1806 a portion of Rossberg mountain in Switzerland slipped from its position, and falling into the valley below buried many villages and hamlets and over 800 people A chalk cliff from 100 to 150 ft high and three-quarters of a mile long fell at Lyme Regis, in Dorsetshire, in 1839, doing great damage Over 200 people were killed by a landslip in Naini Tal, in India, in 1880, and at Quebec, in 1889, a rocky eminence called Cape Diamond gave way, many buildings being destroyed and lives lost. Notable landslips in recent times have occurred at Amalfi (Italy) in 1924, and at Murchiston (New Zealand) in 1929

Langue d'oc and Langue d'oïl, the two principal mediæval French dialects, *oc* and *oïl* being their respective words for the affirmative particle (modern French *oui*) *Langue d'oc*, spoken south of the Loire, was the language of the troubadours. Provençal, one of its dialects had a literary revival in the 19th cent under the influence of the poet Frédéric Mistral *Langue d'oïl* was spoken in northern France, and it was the dialect of the Paris region which developed into modern French

Lantern Fly, bugs belonging to the family *Fulgoridae* in which the head is drawn out to form a lantern-like structure In no instance is the "lantern" luminous, though naturalists used to think it was

"Lantern of England." Bath Abbey possesses so many windows that it is called sometimes the "Lantern of England." Among numerous interesting monuments Bath Abbey contains that of Malthus, author of *Essay on Population*.

Lanthanum, a metal belonging to the rare earth group of metals, discovered by Mosander in 1839.

Lapidary, a cutter of, or dealer in, precious stones, also used in adjective form in regard to the working, engraving, or setting of stones.

Lapis Lazuli, an azure-blue mineral, being a silicate of aluminium and sodium. The pigment ultramarine is made by grinding it, though artificial ultramarine has largely superseded it. The mineral (also called *lazurite*) has been used as a gemstone since ancient times

Lapwing *or* **Green Plover**, familiar British bird on moors and marshlands with iridescent greenish-black plumage, white underparts, and black crest Often called "peewit" from its cry

Larboard is the old nautical term indicating the left-hand side of a ship, and changed by Admiralty order to "port" in 1844 Starboard is the right-hand side

Larch, a familiar coniferous tree in the mountain regions of northern Europe, and though not native to Britain, the Common Larch is successfully cultivated in various parts of the kingdom It is one of the best of all turpentine-yielding trees, and the bark is valued for tanning The larch is an unusual conifer in being deciduous

Larid, a bird of the *Laridae* or gull family

Lark, a family of song birds (*Alaudidae*) of many species, some of which—notably the skylark—are famed for their habit of soaring into the air, singing all the while They build their nests on the ground in the open country and, except for the black lark of Russia, have streaked brown plumage The skylark and woodlark are the best known British species, while the crested lark and shore lark are among the occasional visitors Africa has the greatest number of larks, America has only one species, the horned lark

Larkspur, the common name of the genus *Delphinium*, a favourite flower introduced into British gardens from Switzerland in 1573 The common larkspur is *D consolida*

Larva, the undeveloped form of any animal which, before maturity, undergoes metamorphosis, usually different from the adult in structure and habits

Latent Heat is the quantity of heat required to convert 1 gram of a substance from one form into another For example, when a solid changes into a liquid or a liquid into a gas, the addition of heat to bring about the change produces no rise in temperature, the energy being absorbed in the form of latent heat An equal amount is released when the process is reversed The latent heat of fusion of ice is about 79·6 calories per gram and that of the vaporisation of water about 539 calories per gram

Lateran Councils were the religious conventions held in the Lateran basilica at Rome for deciding important questions of Church doctrine The most brilliant was that of 1215, which pronounced in favour of a Crusade. *See* **Oecumenical Councils.**

Laterite, a residual deposit formed in the tropics by weathering and decomposition of igneous rocks It consists mainly of hydrated ferric and aluminium oxides and is difficult to cultivate.

Latin America. The Spanish-speaking, Portuguese-speaking, and French-speaking countries of N America, S America, Central America, and the W. Indies

Latitude of a point on the earth's surface is its angular distance from the equator, measured on the surface of the earth in degrees, minutes, and seconds. Thus the equator is 0° Lat and the poles 90° Lat (N or S) First determined by Hipparchus of Nicaea about 160 B C.

Laughing Gas. *See* **Nitrous oxide**

Launce *or* **Sand Eel**, a family of eel-like sea fishes found in large numbers on the coasts of North America and Europe There are two species common to British waters These fishes are of a bright silvery hue, and live much in the sand underneath the water. They are prized as bait

Laurentian Shield refers to the Pre-Cambrian

rocks in the region of the Upper Lakes of Canada, nearly 2 million sq m in extent. Of enormous importance to Canada on account of the mineral wealth, forests yielding valuable timber and wood-pulp, and water-power

Lava, the molten rock which is erupted from a volcanic vent or fissure Also the same material which has cooled and solidified

Lawn, very fine sun-bleached linen, in olden time called "cloth of Rhenus"

Lead, a soft malleable metal, symbol Pb (Latin *plumbum*), occurring in numerous ores, which are easily smelted It is found in its native form in small quantities in Sweden Lead is largely used in plumbing on account of its pliability, and as an alloy element it combines in the formation of type metal, stereo metal, shot metal, pewter, and many other compounds Oxides of lead are used in some types of glass and in the manufacture of paints (red lead) Lead mining is carried on in several of the northern counties of England and in Wales The world output of lead ore before 1939 averaged 1,800,000 tons per annum, of which about one-fourth was raised within the British Empire, Australia being the chief British lead-producing region

Leaf Insect, a group of insects related to the locusts, grasshoppers and stick insects which in colour and form closely resemble leaves

Leaf Miners, insect larvae which tunnel between the upper and lower skins of leaves Most leaf miners are caterpillars of tiny moths, some sawfly larvae have the same habit

Leagues, or combinations of kings, countries, communities, have been frequent since the kings of Canaan united against the Israelites Among the most famous leagues may be mentioned the Holy or Catholic League, which prevented the accession of Henry IV of France until he became a Roman Catholic, and the League of Augsburg against Louis XIV of France in 1686

League of Nations, was founded on Jan 10, 1920 with the object of promoting international peace and security The original members were the signatories to the Peace Treaties at Versailles, and membership grew to fifty-three as new nations and ex-enemy States were admitted Two notable absentees were the United States and Soviet Russia, the latter not being represented until 1934 Germany was a member from 1926 to 1933 The League had an Assembly which met at Geneva every year and a Council which met five or six times a year The Permanent Court of International Justice sits at The Hague The final Assembly of the League was held at Geneva between April 8 and 18, 1946 Its place has been taken by the United Nations The International Labour Organisation, set up by the League of Nations met on April 20, 1944, at Philadelphia and resumed its old quarters at Geneva under the new organisation in 1946

Leap Year *or* **Bissextile**, was fixed by Julius Cæsar, 45 B C, the addition of one day in every four years bringing the measure of the calendar year even with the astronomical year with three minutes per year over The Gregorian Calendar corrected this by dropping leap year at the centuries not divisible by 400 For instance, 1700, 1800, and 1900 were not leap years

Leather was made in ancient Egypt, Greece, and Rome, and has through succeeding centuries played an important part in the service of man It consists of the dressed hides or skins of animals after the process of tanning has been gone through Untanned skins are known as pelts Leather is classed either according to the skins from which it is made or the system of preparation employed. The best-known kinds are morocco, kid, Russian, chamois, Cordovan, grained, patent, russet, tan, calf, Hungarian

Lebensraum, a German slogan for "living space"

Leech, an aquatic blood-sucking worm, mostly found in fresh-water ponds Each end of the body is provided with a sucker, but that at the head end has jaws and teeth The medicinal leech has three jaws. The leech attaches itself with avidity to animal bodies and sucks until glutted. Its saliva contains an anti-coagulant.

Leeward, a nautical term, meaning the sheltered side of a vessel—that is, the opposite side to that from which the wind is blowing

Legion, a body of Roman troops, varying in numbers at different periods. A legion was divided into 10 cohorts, and every cohort into three maniples Three legions composed the Roman army of occupation in Britain

Legion of Honour, the French order for distinguished services, military or civil, was instituted by Napoleon I in 1802, and confirmed and modified under later rules There are five grades—Grands Croix, Grands Officiers, Commandeurs, Officiers and Chevaliers

Legume, the fruit typical of the pea, bean family, or *Leguminosae*

Leitmotif, a musical theme intended to represent a particular idea and introduced whenever the composer wishes that idea to be held in mind Wagner made use of the leitmotif to such an extent that his enemies said that each of his characters presented a visiting card

Lemming, small light-brown rodents with dark spots, abounding in Scandinavian countries and in Siberia, about 5 in long, with a short stump of a tail The migrations of the lemming are famous, probably caused by overbreeding when food is plentiful So insistent is the urge to keep moving that these animals will march on into the sea in their thousands and be drowned

Lemur, the most primitive member of the Primate order of mammals (to which man, apes, and monkeys also belong) They are noted for having strong pliant toes enabling them to use their feet as hands, and also well-developed thumbs on the hands They have long squirrel-like tails, fox-shaped heads, and large staring eyes, and are distributed over the tropical parts of the Old World, being most abundant in Madagascar

Lend-Lease, an arrangement made by the U S A in March 1941 to provide goods, services, and capital facilities to nations whose fighting contributed to her own defence The principal beneficiaries were Great Britain and Soviet Russia There was to be payment or repayment in kind, property, or other benefits to the U S A, but when the time of settlement came goods already consumed were written off the account and the recipient countries were asked to make some payment for what remained in existence By the end of the war practically all the Allies were giving each other Mutual Aid, as it was called, making available their own resources for the use of others in the task of defeating the common enemy It is estimated that Lend-Lease aid given by the U S A, amounted to over £12,000 million and Mutual Aid given by Great Britain to over £2 000 million

Lenses, pieces of transparent material designed to focus an image of an illuminated object Usually of glass, but plastic lenses are common, and quartz, etc are used for special purposes The surfaces of the simplest lenses are parts of spheres Lenses which are thickest, or thinnest, at the centre are called convex and concave respectively Lenses of complex shape are often used in microscopes, etc Electron lenses are arrangements of electric or magnetic fields which focus beams of electrons, *e g*, on to television screens

Lent, the forty days' period of fasting that precedes Easter

Leo, one of the twelve signs of the Zodiac, bounded on the west by Cancer, and on the east by the Virgin The constellation consists of seventy-five stars, of which Regulus (a double star) is the brightest The Leonids, the best-known of meteor showers, radiate from a point in this constellation

Lepidodendron, a fossil plant of gigantic height (nearly 100 ft) bearing a cone-like fruit, frequently met with in the coal strata *See* **F28(1)**.

Lepidoptera, the order of insects with scaly wings and bodies, to which the 90,000 butterflies and moths gelong

Lepidosiren, a genus of S American lung-fishes In times of drought these fish burrow in the mud, and breathe by means of the air bladder which functions as a lung

Lepus, the constellation of the Hare, situated

under the Orion group, and one of the constellations with which the ancients were familiar

Lernaea, or *Lernaeocera*, a parasitic crustacean, a "fish louse," with two hosts first, a flat fish, and later a cod, haddock or whiting

Lettres de Cachet, sealed letters which the kings of France issued to their agents to secure the imprisonment of distrusted or disliked persons without trial Abolished in 1789

Levée, a State reception held by the Sovereign or his representative and attended by men only

Lever, a rigid bar of metal or wood used for raising heavy bodies, and worked by means of a support called the fulcrum placed underneath the lever

Lewis, a contrivance for stone-lifting, the principle of which was known to the ancient Romans, it consists of two dovetail tenons of iron or other metal, expanded by an intervening key in a dovetail-shaped mortice in the stone, and shackled by a ringed bolt to the hoisting chain

Leyden Jar, the earliest form of electrical condenser Its invention is usually credited to Muschenbroeck of Leyden (1745) It consisted of a jar coated inside and out with tinfoil for about two-thirds of its height and having its inner coating connected with the top by a brass knob and chain The jar was charged by connecting it to an electrostatic machine

Lias, a geological term referring to the lower section of the Jurassic group, and mainly comprising shales and limestones

Liberalism. *See* **J25.**

Libra, the Scales, one of the twelve Signs of the Zodiac, lying east of the Scorpion,

Libraries, before the invention of printing, were few, and collected together at enormous cost At Nineveh remains of libraries, consisting of tablets of baked clay, have been discovered There were two libraries at Alexandria containing a vast collection of rolls or volumes, founded by Ptolemy I Soter (367 283 B C) and established by Ptolemy II Philadelphus (309 246 B C). Among the great libraries of later times may be mentioned the Vatican Library at Rome, moved to its present premises in 1588, the Royal Library in Paris which later became the Bibliothèque Nationale, The Astor Library, New York, and in England, the Bodleian Library, Oxford, and the British Museum Library at Bloomsbury Since 1850 public libraries have been established in all the chief cities and towns of the kingdom The first lending library was opened in Edinburgh in 1726 In most villages there is a "county library centre" to which collections of books are sent by the County Library In Great Britain there are 24,000 centres of this kind in village clubs, halls, shops, schools, and even homes. In some counties there is a library van or the bibliobus, as it has been called by a French writer This travelling library tours on a pre-arranged time-table so that everyone knows exactly when it will arrive Four of the best special libraries in the world are open to the public in London They are

1 The Library of the National History Museum (for zoology, geology, and related subjects)

2 The Library of the Science Museum (all branches of science and technology, except medicine)

3 The Patent Office Library

4. The Library of the Victoria and Albert Museum which is the national art library containing volumes and photographs on all aspects of fine, applied, and decorative art

Full details of the large number of specialist libraries in London (including that of the British Library of Political and Economic Science, one of the best collections in the world on this subject, at the London School of Economics) will be found in *The Student's Guide to the Libraries of London*, by R A Rye, published by the University of London Press and *The Libraries of Greater London*, by L M Harrod, published by G Bell. *See also* **British Museum, India Office Library.**

Libration, an astronomical term referring to an apparent irregularity in the moon's course, which may be libration in longitude or latitude, or diurnal, and due to a variety of causes

Libretto, the word-book of an opera or oratorio. Usually the composer and the librettist collaborate in the writing of an opera, but several composers (*e g*, Wagner) wrote their own libretti Boito, librettist to Verdi for *Otello* and *Falstaff*, himself composed two operas, *Mefistofele* and *Nerone*

Licence is a permission given to do some act, which, without such permission, it would be unlawful to do It usually refers to permits issued on payment of excise duty Licences are required for keeping carriages, dogs, for operating a television or wireless set, for driving a motor vehicle, for shooting game, for setting up as a bookmaker, for hawking and peddling, for selling beer, ale, wines and spirits, tobacco, etc

Lichens. In every lichen, two plants are associated, one being an alga and the other a fungus The fungus derives its food from the alga, probably the alga gains too from the association, being protected against desiccation by the fungus (an example of symbiosis) Lichens are the first plants to colonise bare rocks

Lieder, the plural form of the German word *Lied* meaning song It is applied particularly to poems set to music by the German romantic composers, Schubert, Schumann, Brahms, and Hugo Wolf

Life-Boat was invented by three men, Lionel Lukin who converted a coble into a boat for saving life in 1785, William Wouldhave, who discovered how to make a boat right herself if she capsized, and Henry Greathead, who built a life boat, partly from Wouldhave's model, in 1789 This boat was stationed at South Shields, which was the first permanent life boat station to be established. It was not until 1851 that the first life-boat able to self-right was built, and a motor was first installed in a life-boat in 1904 Modern motor life-boats have engines of from twin-18 h p to twin-80 h p, with a speed of nearly 10 knots All coastal life-boats in this country are maintained by the Royal National Lifeboat Institution founded by Sir William Hillary in 1824

Light, a particular kind of electromagnetic disturbance capable of travelling through space, and some kinds of matter, and of affecting our eyes to cause vision Its finite speed was first demonstrated by O Römer, using observations of the eclipses of Jupiter's satellites in 1675 In 1860 Maxwell showed that light waves are electromagnetic Since Einstein's theory of relativity (1905) it has been generally realised that the speed of light is a fundamental natural constant Visible light with wavelengths between about 4 and 6×10^{-5} cm is only a small part of the electromagnetic spectrum Subtle modern methods give the speed as 2 997930 10^{10} cm per sec (about 186,000 miles per sec) *See also* **Optical Masers, F53 5.**

Light Year A measure of astronomical distance, equal to the distance light travels in the course of a year A light year is thus 5 88 million million miles *See also* **F3(2)**

Lighthouses, to warn ships of dangerous places and indicate coasts, points, harbours, etc, have existed since the building of the Pharos, a tower of white marble 600 ft high, built by Ptolemy II Philadelphus at Alexandria about 280 B C In early lighthouses the lights were simple fires The most famous and one of the earliest British lighthouses is the Eddystone (which see) The introduction of parabolic mirrors was a great improvement, providing a reflecting medium which intensified the light beam in the required direction Further improvements were made by Fresnel, Stevenson, and others A new Dungeness lighthouse is planned which will be revolutionary in design and the first in Britain to be fully automatic in operation It will be powered by a small but extremely powerful lamp, and electronic equipment will control all the operations from switching on the main beam at nightfall to detecting presence of fog and sounding fog signals The lighthouses of England and Wales, the Channel Islands, and Gibraltar are under the control of Trinity House; Commissioners of Northern Lighthouses control those of Scotland, and the Commissioners of Irish Lights control the coasts of Ireland Particulars of lights in all parts of the world are published for the guidance

of navigation in the *Admiralty Lists of Lights*, compiled annually by the British Admiralty.

Lightning, the flash of a discharge of electricity between two clouds, or between a cloud and the earth, when the strength of the electric fields becomes so great as to break down the resistance of the intervening air With "forked" lightning the actual path, often branched, is visible, while with "sheet" lightning the flash is hidden by the clouds which themselves are illuminated. "Ball" lightning or fireballs is the name given to the luminous balls which have been seen floating in the air during a thunderstorm. The Boys camera has provided much information regarding the sequence of events in a lightning discharge It is found that a flash consists of a number of separate strokes, usually four or five, and that the discharge of electricity to earth begins with a faintly luminous "leader" moving downwards and branching at intervals As the ground is approached a much brighter luminosity travels back along the conducting channels, lighting up the several branches The multiple strokes which follow in fractions of a second have the same "return" nature and are rarely branched. Lightning flashes to earth damage structures, cause loss of life and endanger overhead power systems, often interrupting electricity supply Such storms generally affect radio transmissions and present hazards to aircraft Thunder-clouds may develop energy far exceeding the capacity of our largest power generating stations

Lightning Conductor, a metal rod, the upper part of which is of copper with a conical point, the lower portion being iron, which extends into the earth Its effect is to gather to itself the surrounding electricity and discharge it into the earth, thus preventing its falling upon the protected building In ships, lightning conductors are fixed to the masts and carried down through the ship's keel-sheathing Benjamin Franklin was the first to realise the possibilities of lightning protection and, in 1752, carried out his famous experiment of drawing electricity from thunder-clouds, with the aid of a sharp-pointed conductor fixed to a kite

Lignin, a substance found in the cell walls of plants, making them strong and rigid It forms 25–30 per cent of the wood in trees

Lignite *or* **Brown Coal**, an intermediate substance between peat and coal, it is known as brown coal The best-known deposits in Britain are the Bovey Tracey Beds in Devon

Lillibulero, an old marching song composed by Purcell With words by Wharton, it is said to have "sung James II out of three kingdoms" During the second world war it was used by the B B C as a station identification signal preceding news bulletins

Lily Family (**Liliaceae**), one of the largest families of flowering plants, with 200 genera and 2,500 species It includes the true lilies (*Lilium*) tulips and hyacinths Useful vegetables belonging to the family are the onion and asparagus Most members are herbaceous plants, shrubs or small trees occur in the genera *Aloe* (Yucca) and *Dracaena* (Dragon-tree)

Lime, an alkaline earth obtained from kiln-heated limestone, and used in making mortars and cements, valuable in agriculture in treatment of acid and clay soils

Limes, trees of the genus *Tilia*, including some 30 species spread over north temperate regions. The word is a corruption of "linden" Limes native to Britain are the small-leaved *T cordata* and the broad-leaved *T platyphyllos* The hybrid *T vulgaris* was introduced into Britain from the Continent during the 17th cent and is frequently seen in streets and parks Lime-wood was used by Grinling Gibbons for his fruit, flower, and bird decorations.

Limestone is carbonate of calcium It is found in every geological formation, and is often highly fossiliferous Marble is limestone that will polish after cutting

Limpet, a marine mollusc with a single-valved shell, generally found sticking close to sea-washed rocks

Linen, a textile fabric manufactured from flax fibre, known to the ancient Egyptians, and first manufactured in England under Henry III, by Flemish weavers. The chief seat of the manufacture is Ulster, with Belfast as the centre. Dunfermline (famous for its damasks) and Manchester are also large linen-producing towns.

Ling, a sea-fish common on the coasts of Britain, and abounding in more northern waters. It averages from 3 to 4 ft in length, and is a voracious feeder, living chiefly on small fish Ling is also the name applied to *Calluna vulgaris*, the plant which most people called "heather"

Linseed, the seed of the flax plant, containing, apart from its fibrous substance, certain oily and nitrogenous matter of considerable commercial value. This yields linseed oil, and some of the residue is used to make cattle food.

Lion, the most impressive of the Cat tribe (Felidae) of the order Carnivora It is chiefly found in Africa, being comparatively rare in Asia Its large square head, its flowing mane (in the males only), and its tufted tail distinguish it From tip to tip it can reach a length of 10 ft , a weight of 500 lb.

Lion and Unicorn, the supporting figures of the royal arms of Great Britain, date from the union of Scotland with England at the accession of James I (James VI of Scotland), the lion representing England and the unicorn Scotland

Liqueurs are essences combined with alcoholic liquid, and are of many kinds, named according to their flavourings or place of production, and include Maraschino, Chartreuse, Curacoa, Benedictine, Noyau, Kümmel, etc

Liquid, the name given to matter in such state that it takes its shape from the containing vessel The volume it occupies is independent of the container, however *See* **F17**(1).

Litanies were first used in church processions in the 5th cent The first English litany was commanded to be recited in the Reformed churches by Henry VIII, in 1544

Lithium, a soft metallic element, symbol Li, similar to sodium It is very reactive and is stored under paraffin oil. It is the lightest metal element

Lithography, the art of drawing on stone and printing therefrom, was discovered by Alois Senefelder about 1796, and was introduced into England a few years later Many improvements in the art have been made in recent years, especially in chromo-lithography and photo-lithography

Litmus, a special kind of colouring matter produced from certain lichens The resulting colour is violet, is turned red by acids and blue by alkalis

Litre, a metric measure both for liquids and dry articles *See* **N12**.

Liturgy, the name given to the Church ritual, though strictly applying only to the portion used in the celebration of the Eucharist or Lord's Supper The present English liturgy dates from 1662, when it received the approval of Parliament

Liverworts (**Hepatics**), a class of simple green plants related to the mosses There is no differentiation into stem and leaves Liverworts are most common in damp situations, such as the banks of ditches *See* **F27**(2)

Lizard, the name given to a diversified order of reptiles, of which there are about 1,600 species. Included among the lizards are the geckos, chameleons, glass snakes, skinks, and blind worms

Llama, mammals related to the camels, from which they differ in small size, absence of humps, and more woolly coat. The domestic llama of S America is used as a beast of burden, also providing wool, meat, and milk. *See also* **Alpaca, Guanaco.**

Loadstone *or* **Lodestone**, an oxide of iron, found chiefly in Sweden and Norway. Its scientific name is magnetite It has the power of attracting pieces of iron and served as the first magnets used in compasses One of the class of non-metallic magnetic materials nowadays known as "ferrites"

Lobby Correspondents are political correspondents of newspapers who do not report the actual proceedings of Parliament—this is done by Parliamentary Correspondents—but interpret political news and events.

Lobsters are marine crustacean animals existing in large numbers in the northern seas of Europe

and America, and in fair proportion on some parts of the British coasts, especially in the neighbourhood of the Channel Islands.

Locarno, Treaty of, 1925, whereby Germany, France, and Belgium undertook to maintain their present frontiers and to abstain from the use of force against each other. Hitler broke the pact by re-occupying the Rhineland, the demilitarisation of which had been recognised by Germany

Locust, insects of the grasshopper family, but much more powerful. They are inhabitants of hot countries, and often make their appearance in untold millions, like clouds, devastating all the vegetation that comes within their course The locust-tree (*Ceratonia siliqua*) is supposed to have furnished food to St. John the Baptist in the wilderness, and its "beans" have accordingly been styled "St. John's Bread"

Loess, a deposit of silt or marl laid down by wind action. The biggest loess deposits are in Asia, the source of the dust of which they are composed probably being the deserts of Central Asia

Log, a line used for reckoning the speed at which a ship is travelling It was first used in the 16th cent. The line is divided into spaces of 50 ft marked off by knots and measured by a half-minute sand glass, bearing the same proportion to an hour as 50 ft bear to a mile

Logarithms, a system of calculation invented by John Napier in 1614, and developed by Henry Briggs a few years later Thus if a number is expressed as the power of another number, *i.e.*, if $a = b^n$, then n is said to be the logarithm of a to base b, written $\log_b a$. Common logs are to base 10 and Napierian to base 2 7182818 . . ., expressed as e Their use represents a great saving of time *See* **N31–4.**

Logical Positivism. *See* **J25.**

Lombards, a German people, originating on the Elbe, who settled in Italy in the 6th cent., occupying northern and central regions, and establishing a kingdom with Pavia as capital They were conquered by Charlemagne in 774, but left their name to the region of Lombardy Lombard Street, London, takes its name from the Lombard merchants and bankers who came to settle there in the 12th cent

London Clay, geological stratum which occupies much of the London Basin and part of the Hampshire Basin It represents the lower stratum of the Eocene Outside the metropolis, brickfields utilise the clay for brickmaking Water held above this impervious stratum is tapped by a number of artesian wells in London The tunnels of the Capital's underground railways run through the London Clay

London University comprises nearly one-third of the academic activity of the United Kingdom, and is recognised as one of the great universities of the world Originated in the foundation of a non-sectarian college in Gower Street in 1828 Among the chief colleges are. University, Kings, Imperial College of Science and Technology, London School of Economics, School of Oriental and African Studies, Queen Mary, Birkbeck, and the 4 women's colleges, Royal Holloway, Bedford, Westfield, and Queen Elizabeth College. London University was the first to throw open all degrees to women (1878).

Long Distance Routes. The National Parks and Access to the Countryside Act 1949 provided for the establishment in England and Wales of Long Distance Routes for walkers and where possible for horse riders The first routes chosen were the Pennine Way (a magnificent hill walk of 250 miles from Edale in Derbyshire along the Pennines over the Cheviots to the Scottish border), the Cornwall and Pembrokeshire coasts, and Offa's Dyke which runs some 168 miles along the marches of Wales Surveys are also being made of a way from Beachy Head to Salisbury, the Pilgrim's Way, and a walk over the Chiltern and Berkshire Ridges, the Marlborough Downs and so to Seaton. *See also* **R5(2)** and **National Parks.**

Longitude of a point on the earth's surface is the angle which the meridian through the poles and that point makes with some standard meridian. The meridian through Greenwich is usually accepted as the standard meridian and the longitude is measured east or west of that line. As the earth revolves through 360° in 24 hrs, 15° longitude represent 1 hour's difference in apparent time.

Long Parliament (1640–60), marked the end of Charles I's 11-year attempt to govern without parliament It carried through what has come to be called "the English Revolution" and was the parliament of the civil war (1642–49)

Lord, a title of honour held by such as are peers of the realm, and bestowed on persons who have achieved distinction or inherited by descent. It is also borne by Bishops, on spiritual and ecclesiastical grounds, and is accorded as a courtesy to the eldest sons of dukes, marquises, and earls, to the younger sons of dukes and marquises, and to Judges of the High Court in England and Scotland

Lord Lieutenant is the Queen's representative in the county, and his office is now largely ceremonial. On his recommendation the magistrates or Justices of the Peace are appointed by the Lord Chancellor The office was created by Henry VIII. in 1549 to take over the military duties of the sheriff

Lords, House of, the Upper House of the British Parliament composed of Lords Spiritual and Lords Temporal The former consist of the Archbishops and twenty-four English Bishops and the latter of Peers The full membership is about 800 The right of the Lords to veto Bills passed by the Commons is restricted by the Parliament Acts of 1911 and 1949 The Lord High Chancellor presides over the House of Lords *See* **C24(1), 25.**

Louse, parasitic insect found on the skin of birds and mammals The bird or biting lice make up one order (*Mallophaga*), the true or sucking lice belong to another order, called *Anoplura* Two species of lice parasitise man, and one of these, the body louse, is a carrier of typhus

Louvre, one of the old royal palaces of Paris, was built in its present form partly by Francis I, and added to by later monarchs, Louis XIV completing the edifice Napoleon I. turned it into a museum and enriched it with the plunder of many foreign art galleries The great extension to the Louvre building begun by Napoleon I. was completed under Napoleon III in 1857 Much injury was done to the building during the Commune of 1871 Amongst other famous treasures it houses the Venus de Milo and Leonardo da Vinci's masterpiece, *La Gioconda*

Lovebird, a vivid little bird native to Africa, resembling a parrakeet but with a short, wide tail and short body

Luddites, a combination of workmen formed in 1811, in a period of great distress, with the object of destroying the new textile machinery then being largely adopted, which they regarded as the cause of their troubles. Their first outbreak was at Nottingham, and was stated to have been started by a young apprentice named Ned Ludd Afterwards, serious Luddite riots occurred in various parts of the country, especially in the West Riding of Yorkshire, where many people were killed, mills were destroyed, and numbers of rioters were tried and executed Charlotte Brontë used the period in her novel, *Shirley*

Lunar Month. *See* **Month.**

Lung Fishes *or* **Dipnoi** *See* **Dipnoi**

Luniks, the name of the Soviet moon rockets *Lunik I*, launched 2 Jan. 1959, with payload of 800 lb. and max velocity of 25,500 m p h, entered a solar orbit between Earth and Mars to become the first man-made planet *Lunik II*, launched 2 Sept, 1959, with payload of 860 lb, and max velocity of 25,500 m p h, landed on the moon. *Lunik III*, launched 6 Oct 1959, with payload of 613 lb and max. velocity of 24,500 m p h, circumnavigated the moon and took a photograph of its hidden side which it televised back to Earth *See also* **F47(1).**

Lute, a stringed instrument of the guitar type of unknown antiquity. Its name is Arabian. Lute music was very popular in England in the 17th cent. There has been a revival in this cent

Lutecium, element of the rare-earth metal group discovered in 1907 by Urbain

Lutheranism. *See* **J25.**

Lynx, cats of sturdy build, with tufted ears and spotted fur, inhabiting many parts of the world,

including Northern and Central Europe They commit serious ravages among sheep and goats and are very fierce.

Lyon King of Arms, the President of the Scottish Lyon Court, and head of the heraldic organisation for Scotland.

Lyre, an upright stringed instrument rather like a miniature harp It was the universal musical instrument of classical Greece and Rome

Lyre-Bird, a remarkable family of Australian birds, the males of which possess a beautiful lyre-shaped tail The bird is not more than 15 in long, but its tail, displayed during its remarkable courtship dance, is 23 in in length There are two species: the Superb and Albert's Lyrebird

M

Macaque. A family of monkeys which include the Barbary ape (specimens of which live on Gibraltar), the Rhesus macaque (the organ grinder's monkey and the one used for experimental work in the investigation of disease), the Bonnet monkey of southern India and Ceylon, the Crab-eating, and the Pig-tailed monkeys of south-eastern Asia

Macaw, a genus of large parrots with brilliant scarlet and sky-blue plumage, with interminglings of green. Native to South and Central America.

Mace, originally a weapon of offence, now an ensign of authority borne before officers of state and other dignitaries At the present day, among others, there are maces for the Speaker of the House of Commons, the Lord Mayor of London, and other mayors The mace-bearer is the functionary who on ceremonial occasions carries the symbol of authority before judges and civic or state officials

Mach Number. Unit of flight speed The ratio of speed of flight to speed of sound under same conditions of pressure and density Speed of sound at sea-level is 762 m p h , so flight speed of 381 m p h is equivalent to a Mach Number of ½ At supersonic speeds the Mach Number is greater than 1, subsonic speeds, less than 1.

Machinæ Organa, defined in the 10th book of the famous treatise of Vitruvius, *de Architectura*, as "contrivances for the concentration and application of force," and known by the names of instruments, engines, and machines

Mackerel, a familiar sea-fish existing in large numbers in the northern waters of both hemispheres In May and June immense shoals are to be found round the British coasts

Madder, one of the most important of dye-stuffs, largely used in producing Turkey-red dye, but now superseded by synthetic alizarin. Natural madder is the root of the *Rubia tinctorum*

Madrier, a term in military engineering denoting a beam laid in a ditch to support a wall, or in a mine to hold up the sides or roof , also an armoured plank affording protection against hostile fire, or fitted to receive the mouth of a petard in attacks upon obstacles.

Madrigal, a style of unaccompanied composition for three or more voices Developed in the Netherlands, it reached perfection in 13th-cent Italy Brought to England during the Renaissance it achieved great popularity and many English composers became famous for their madrigals

Maelstrom, a great whirlpool The most famous is that off the coast of Norway, between the islands of Moskenës and Mosken, of the Lofoten group, the power of which has been much exaggerated

Mafia, a secret Sicilian society formed for purposes of vengeance, private and public, prominent about 1860, and again after the second world war. Signor Dolci (*see* **B26**) is working to end Mafia exploitation, intimidation, and violence in Sicily

Magenta, a blue-red aniline dye discovered in 1859 by Sir W H Perkin, and named after the great battle of that year between the French and Austrians.

Magic. *See* **J26.**

Magistrates *or* **Justices of the Peace** preside over courts of petty sessions, and are appointed by the Lord Chancellor on the recommendation of the Lord Lieutenant of the County There are some 25,000 magistrates in Britain, of whom about 1,000 are women They are unpaid. Mayors during their time of office are J P's *ex officio* In certain big towns a barrister known as a stipendary magistrate is appointed to act as full-time salaried magistrate There are 28 stipendaries in London known as Metropolitan Police Magistrates

Magma, molten rock material rich in volatile constituents prior to its eruption at the surface On eruption and loss of volatiles it becomes lava

Magna Carta was sealed by King John at Runnymede on June 15, 1215, in obedience to the insistent demands of the barons, and has been confirmed many times by later monarchs It was not a revolutionary document It laid down what the barons took to be the recognised and fundamental principles for the government of the realm and bound king and barons alike to maintain them Its main provisions were that no man should be punished without fair trial, that ancient liberties generally should be preserved and that no demands should be made by an overlord to his vassal (other than those recognised) without the sanction of the great council of the realm

Magnesium, a metallic element, symbol Mg, first isolated in 1808 by Sir Humphry Davy, who prepared it by electrolysing the chloride. Its chief ores are magnesite and dolomite. Industrially it is obtained by electrolysis Many important light alloys contain magnesium The metal burns with a very bright light, and for this reason it is used in photographers' flash bulbs and also in firework manufacture.

Magnetic Poles are at a considerable distance, of the order of 1,000 miles, from the geographical poles, and are not antipodal to one another. The poles do not remain fixed, and the North pole wanders more than the South. The position of the North magnetic pole is in the region of lat 74° N., long 100° W., considerably north of Amundsen's observations of 1904 The South magnetic pole is not far from lat 70° S , long 150° E

Magnetic Storms, large irregular disturbances superimposed upon the normal magnetic field of the earth They may occur at any time, but are most frequent during equinoctial months and in years of sunspot maxima World-wide in extent, magnetic storms are most pronounced in the polar regions, being due apparently to intense electric currents located in the upper atmosphere near to the zones of greatest auroral frequency. One theory attributes the high ionisation of these belts to solar radiation Magnetic storms cause radio fade-outs and interfere with telegraphic communication *See* **F43(1)**

Magnetism, originally the name given to the quality of attraction for iron possessed by lodestone (*q v*) Now known to be a phenomenon inseparably connected with electricity **(F18)** Strong magnetic attraction is possessed by a comparatively small class of substances; iron, nickel, and cobalt are the most common elements, but there are several less well known, *e g* , gadolinium Many alloys have valuable magnetic properties which make possible numberless technical devices New magnetic substances are always being developed (*see* **Ferrite**). The earth acts like a huge magnet with its axis inclined at about 10° to the axis of rotation the magnetic poles being on the Boothia Peninsula (North Canada) and South Victoria Land (Antarctica). The magnetic field at the surface consists of the regular field of a magnetised sphere with an irregular field superimposed upon it. Variation in the magnetic forces occurs from place to place and from time to time, and maps showing the distribution over the globe of points of the same declination (*i e* , the angle which the magnetic meridian makes with the geographical one) are of the utmost importance in navigation In the south-east of the British Isles, at present, a magnetic needle points 9° and in the north-west 14° west of true north. Little is known regarding the origin of the main (regular) field of the earth, but it is believed that the irregularities are due to the presence of intense electric currents in the upper atmospheres and local magnetisation of rock strata

Magnetohydro-dynamics. A current-carrying wire

always experiences a force if it is in a magnetic field. This is the well-known electrodynamic force, and electric motors work because of it. If the current is carried in a fluid, *e.g.*, a liquid metal or a plasma, these forces cause bodily movements of the fluid, which are in general very difficult to calculate. The forces are then called *magnetohydro-dynamic forces*. Now magnetic fields are themselves produced by electric currents, so a current flowing in a fluid produces a magnetic field, which then reacts on the fluid itself by means of the magnetohydrodynamic forces. In the Harwell machine Zeta, used in studying the technical problems of thermonuclear reactions, this effect acts so as to constrict the electric discharge on to the axis of the tube and thus keeps it away from the walls. This action is assisted by an extra magnetic field produced by a separate current flowing in metallic conductors outside the tube. Thus the hot plasma is contained by magneto-hydro-dynamic forces and not at all by the material tube wall. In practical devices of the future magnetic forces may have to sustain plasma pressures of 60 atmospheres—a pressure for which a thick steel wall would normally be used! *See also* **Plasma Physics.**

Magnificat, the hymn of the Virgin Mary, given in Luke 1, 46 beginning in the Vulgate with the words "Magnificat anima mea Dominum" ("My soul doth magnify the Lord"), and used in the services of all Christian Churches.

Magnitude in astronomy is a measure of the apparent brightness of a star, which is inversely proportional to the square of its distance. A low number indicates a bright star, and a high one a faint star. The *absolute magnitude* is a measure of *real* brightness, *i.e.*, the brightness a star would have at a standard distance away of 32·6 light years. The distance can be calculated if the apparent and absolute magnitudes are known.

Magnolia, species of the family *Magnoliaceae* comprising many beautiful trees, and shrubs with large and fragrant flowers, and chiefly native to North America and Asia. Introduced in 1688.

Magpie, a well-known bird of the crow family, of glossy black and white plumage, famed for its mischievous propensities.

Magyars, the Hungarian race who came to eastern Europe from S.W. Asia and settled in Hungary in the 10th cent. Their language belongs to the Finno-Ugrian group.

Mahdi, an Arab leader of great influence, invested with powers akin to those of a Messiah in the Mohammedan mind. The title was taken by Mohammed Ahmed, who overran the Egyptian Sudan, and in 1885 captured Khartoum.

Mahogany, a fine hard wood susceptible of a very high polish, and distinguished for the beauty of its colour and markings. The tree which produces this wood (*Swietenia mahogani*) is a native of the West Indies and tropical America. Mahogany is said to have been first brought to England by Raleigh in 1595.

Maidenhair Tree *or* **Ginkgo.** This tree takes its name from the shape of its leaves, which resemble those of the maidenhair fern. Widely cultivated in China and Japan. It is the only survivor of an order of gymnosperms which flourished in Mesozoic times. Botanically interesting because the male gametes are motile. *See also* **F28(1).**

Major Scale. *See* **Diatonic Scale.**

Malacostraca, the sub-class of the Crustacea to which the lobsters, crayfish, shrimps, belong.

Malmaison, château at Rueil-Malmaison, a western suburb of Paris. It derives it name from having been inhabited in the 11th cent. by the Norman brigand Odon, and afterwards, according to the tradition, by evil spirits, exorcised by the monks of St. Denis. It was the residence of Napoleon and of the Empress Josephine after her divorce. She died there in 1814 as the result of a chill caught while showing the Russian Emperor round the grounds. In 1900 it was given to the nation.

Malmsey, a strong, sweet wine originally made in Greece, but now also in Spain, Madeira, and the Azores; known also as Malvoisie.

Maltose, a sugar formed in cereal grains during germination. It is produced by hydrolysis of starch, and further hydrolysis converts the maltose into glucose.

Mamluks, commonly known as Mamelukes, were originally—in the 13th cent.—a bodyguard of Turkish and Circassian slaves in the service of the Sultan of Egypt, and attained such influence that in 1250 they were strong enough to appoint one of their own body to the throne of Egypt. After that a succession of Mamluk Sultans reigned down to 1517. Then the Turks annexed Egypt, and the Mamluks were taken into the service of the Beys. They again came to the front after Napoleon's conquest of Egypt, and for a time resumed governmental sway, but in 1811 they were decoyed into the citadel of Cairo and massacred by order of Mehemet Ali.

Mammalia. *See* **F23(2).**

Mammoth, extinct elephants of gigantic size. In 1799 the first perfectly preserved specimen was found in Siberia in a block of ice. It was in prehistoric times an inhabitant of Britain and other parts of Europe, as well as of Asia and America.

Mammoth Cave of Kentucky, about 10 miles long, is one of a series of spacious caverns formed in the limestone rock formation, and is from 40 to 300 ft. wide and at one point 300 ft. high. Stalactites and stalagmites abound.

Manatee, an aquatic mammal of the sea cow (Sirenia) order of mammals, averaging when full grown from 10 to 12 ft. in length, with shovel-shaped tail, and four limbs and nails which almost give the appearance of arms and hands. In spite of their ungainly aspect, these creatures are believed to have given rise to the legend of mermaids.

Manchus, the original nomadic race inhabiting northern Manchuria who invaded China early in the 17th cent. A Manchu dynasty occupied the imperial throne of China from 1644 to 1911.

Mandarin, the name given to a powerful Chinese official, civil or military under the old regime, whose rank was shown by the wearing of a button on the cap. In Chinese the name is Kwan.

Mandible, the lower jaw in human anatomy. The two parts of a bird's beak are known as the upper and lower mandible. The term is also used for biting jaws in arthropods.

Mandoline, an Italian fretted guitar, so called from its almond conformation.

Manganese, a metallic element, symbol Mn, discovered by Scheele in 1774. It is silver-white, not very hard (it forms a hard alloy with carbon), brittle, and tarnishes when exposed to air. Its chief ore is pyrolusite (manganese dioxide). Steels containing manganese are very tough, and used for making machine parts.

Manikin, a dwarf or pigmy, an artificial figure employed in anatomical demonstrations, made sometimes of papier-mâché.

Maniple, eucharistic vestment worn over left arm.

Manna, a tree of the ash genus, *Fraxinus ornus*, growing in the South of Europe and in the East and exuding a sweet substance which is gathered, boiled, and eaten.

Manometer, instrument used to measure gas pressure. Usually a U-tube containing water or mercury, one end open to the atmosphere, the other to the gas whose pressure is to be measured. More sensitive for small pressures than the Bourdon gauge.

Manors were estates originally granted in Anglo-Saxon times as rewards for knightly service, and included the privilege of a special court with jurisdiction, criminal and civil, within the manorial territory. *See* **Court-Leet.**

Mansion House, the official residence of the Lord Mayor of London, stands opposite to the Bank of England, and was erected in 1739–53 from the designs of George Dance.

Mantis. Large insects belonging to the same order as the locusts and grasshoppers. The manner in which the forelegs are held, as though in supplicance, has gained for these insects the common name of "praying mantis." They are distributed throughout the warmer countries of the world.

Manuals, the keyboards of an organ which are operated by the hands as apart from the pedals which are worked by the feet. In a large organ there may be four manuals, each controlling a group of stops. These groups are

called great organ, swell organ, choir organ, solo organ.

Manx, the original Celtic inhabitants of the Isle of Man, where a Celtic dialect still lingers

Maoris, the race found in New Zealand at the time of its discovery by Europeans. The Maoris are believed to have migrated from Polynesia about 1350. They number 165,000 (1961), and being very intelligent people have adapted themselves with considerable success to the conditions of civilised life. Until 1870 they were frequently in arms against the Government, but since then have settled down with the Whites as equal citizens.

Maple, trees native to the northern hemisphere. There are over 100 species. The sycamore is the best-known species growing in Britain. The sugar maple abounds in Canada and the eastern parts of the United States. The sugar is tapped by boring holes in the tree in Feb and Mar., and the juice that escapes is collected and evaporated. The maple-leaf is the Canadian national emblem

Maquis, name of the dense scrub in Mediterranean France and Corsica, providing good cover for bandits and outlaws. The French resistance movement adopted the name Maquis during the German Occupation, 1940–45

Marabouts, Mohammedan hermits or monks, especially amongst the Moors and Berbers of N.W. Africa. They live in monasteries or attached to mosques and are held in great veneration by the Berbers

Marble is limestone in its hardest and most crystalline form. There are many varieties—33 were used in the building of the Paris Opera House—but white is the purest and rarest. White marble was used by the ancient Greeks for their temples and statues. Among the famous marbles of Italy are the Carrara and Siena marbles, which were used by Renaissance sculptors. Devonshire and Derbyshire yield some beautiful marbles and Connemara furnishes a serpentine-marble

Marcasite, crystalline white iron pyrites (iron disulphide) often used for ornaments and costume jewellery

March, the third month of the year, and the first of the old Roman Calendar. It was named after the god Mars, and was the *Hlyd* (storm) *monath* of the Anglo-Saxons

Mardi Gras, the last day of the Carnival in France, Shrove Tuesday

Mares' Tails, term popularly applied to high (cirrus) cloud when it appears in tufts or feather-like plumes

Marionettes are puppets moved by strings. They originated in the *Fantoccini* of the 15th cent. which had such a vogue in Italy and elsewhere on the Continent. The English *Punch and Judy* is a version of Punchinello. Puppet shows were known in the earliest civilisations

Marl, a rock composed partly of clay and partly of carbonate of lime

Marlinspike, a pointed iron tool used by sailors to splice wire. The instrument used when rope splicing is called a fid

Marmoset, small monkeys confined to the New World. Very squirrel-like in appearance, with long bushy tails, and thick woolly fur, they are pretty little animals and the smallest of all monkeys. There are claws, not nails, on their digits, the big toe excepted

Marprelate Tracts, seditious pamphlets written with great maliciousness by a group of Elizabethan puritans about 1586, and intended to discredit the episcopacy, caused a great sensation in their time, and led to the execution of their supposed author, John Penry

Marquess *or* **Marquis**, the title next in precedence to that of duke. The first English marquess was Rovery de Vere, Earl of Oxford, who had the honour conferred upon him by Richard II in 1385

Marquetry, a kind of inlaying in which thin layers of coloured woods are wrought into a design, and mainly used in ornamental floors

Mars, the fourth nearest planet to the sun, being 141,500,000 miles distant. Its diameter is 4,215 miles as against the earth's 7,920. There has been much speculation about certain dark lines which some observers have seen on the surface of Mars: photographs give no support to the theory of an artificially constructed network of canals, but it is possible they represent areas covered by some simple form of vegetation of the lichenous type. The temperature of the planet's surface would allow living organisms as we know them to exist, but the quantity of oxygen in the atmosphere would be almost certainly too little to support animal life.

Marseillaise, the French national hymn, written and composed by Rouget de L'Isle, a French engineer officer, who was inspired to write it in 1792 to encourage the Strasburg conscripts. It immediately became popular, and received its name from the fact that it was sung by the Marseillaise troops while marching into Paris

Marshalsea Prison, a once well-known house of detention in Southwark. It stood near St George's Church, and was originally a prison for royal servants convicted of offences, but from 1842 to 1849 was a debtors' prison. It was abolished in 1849. Dickens described it in *Little Dorrit*

Marsh Gas. *See* **Methane.**

Marsh Tortoise, an amphibious animal of the order *Chelonia*, spread over many countries and inhabiting ponds and small rivers. There are 42 species, and they are all carnivorous

Marston Moor, near York, was the scene of the famous battle between Prince Rupert and Cromwell on July 2, 1644. Cromwell's victory was the turning-point in the Civil War

Marsupials. Except for the opossums of America, all marsupials occur in Australasia. Well-known marsupials are the kangaroos, wallabies, and wombats. *See* **F23(2)**

Martello Towers, circular forts erected on the coasts of England early in the 19th cent. as defences against the threatened Napoleonic invasion. So called from the circular fort at Mortella (Corsica), which resisted an English fleet in 1794

Marten, carnivorous animals of the weasel family, one species of which was once common in Britain, but now seldom met with. Many valuable furs come from martens, *e.g.*, the sable of N. Asia and the marten of N. America

Martial Law is a term loosely employed to indicate the suspension of the administration of normal civil law and its replacement by military authority when this is rendered desirable by such circumstances as war or rebellion

Martin, a well-known bird-visitor to Britain. It belongs to the swallow family, and the two species that spend their summers here are the house-martin, which makes its nest of mud under the eaves of houses, and the sand martin, which builds in sandy banks

Martingale, a long strap or thong of leather, one end of which is fastened to the girth of a horse, between the fore legs, and the other to the bit, or to a thin mouthpiece of its own

Martinmas *or* **St. Martin's Day**, falls on Nov. 11, and is one of the Scottish quarter days. St Martin was a popular Saint with our ancestors, and Martinmas was a busy time for the mediæval housewife. It was the date when "Martlemas Beef" was dried in the chimney, and enough bacon and mutton cured to last until the spring, because, owing the the scarcity of winter fodder, fresh meat could seldom be obtained. This diet of dried meat without vegetables caused scurvy, King's evil, leprosy, and other maladies. Originally the goose belonged to Martinmas, not to Michaelmas, the legend being that when Martin was elected Bishop of Tours he hid himself, but was betrayed by the cackling of geese. He died in the 4th cent. The spell of fine weather sometimes occurring at Martinmas is called St. Martin's Summer.

Martyrs. People who suffer death in testimony to their faith. Stephen was the first Christian martyr in 39. The first English martyr was St. Alban, 286, and in Tudor times many eminent churchmen went to the stake at West Smithfield, in London, and at Oxford, where now exists the "Martyrs' Memorial". There is a Martyrs' Memorial Church in St. John St., Clerkenwell, near the scene of the Smithfield fires

Marxism. *See* **J27.**

Masers, Optical. *See* **F53–5.**

Mason and Dixon's Line is the boundary line separating the old slave states of America from

the free state of Pennsylvania. It was drawn by two English surveyors, Charles Mason and Jeremiah Dixon, between 1763 and 1767

Masques were light dramatic compositions set to music and performed on special occasions One of the best-known examples is Milton's "Comus," which was given at Ludlow Castle in 1634

Mass, the service in the Roman Catholic Church in which are enacted and enshrined Christ's words and actions at the Last Supper It is high or low, *i e*, performed with full choral service, or merely by the rehearsal of prayers without singing. Mass was first celebrated in Latin in the 4th cent, and was introduced into England in the 7th cent.

Mass Spectrograph, an instrument for separating isotopes It works by sorting electrified particles according to their masses, the particles stream through a magnetic and possibly an electric field, and the lightest particles undergo the greatest deflection

Massorah, a collection of criticisms on the Hebrew text of the Scriptures, and rules for its correct interpretation

Mast, a long round piece of timber or tubular steel or iron, standing upright in a vessel, and supporting the yards, sails, and rigging in general. The earliest ships had only one mast, carrying a simple sail The number increased until there were 4 or 5, or even more Above the lower mast of a sailing-ship comes the topmast, and above that, the topgallantmast and royalmast The position of each mast is indicated by a prefix, as foremast, foretopmast, foretopgallantmast, foreroyalmast, mainmast, maintopmast, etc. The foremast is in the fore of the ship, the mainmast in the centre, and the mizzen nearest the stern. In large vessels nowadays the mast does not extend to the keel, as it formerly did, but is usually stopped at the second deck

Master of the Revels was an important Court official upon whom devolved the arrangement of Court festivities. The office is at least as old as the time of Edward III. By 1737 it seems to have died

Master of the Rolls, one of the English judges, formerly a judge of Chancery, but since 1881 a judge of the Court of Appeal only In addition he has charge of the rolls or records of Chancery and ranks next to the Lord Chancellor and Lord Chief Justice

Mastodon, an extinct order of quadruped closely resembling the elephant in structure, but much larger.

Mathematics is the language of physics, and uses symbols for expressing measurements, theories, and laws. Mathematical formulae summarise and condense in exquisite simplicity the results of vast numbers of observations and experiments.

Matins, the first of the canonical hours or services of the day in the Roman Catholic Church and Morning Prayer in the Anglican Church The daily service in the Roman breviary (*q v*) consists of eight offices or "hours," fixed by canon, for prayer and devotion Formerly Matins was recited or sung at midnight, Lauds at sunrise, Prime at 6 a m, Terce at 9 a m, Sext at midday, Nones at 3 p m, Vespers at sunset, and Compline before retiring for the night. Lauds are now commonly joined to Matins

Mau-Mau, a secret, anti-European, terrorist movement which agitated the Kikuyu tribe of Kenya during the years 1953–57 Mau-mau was a symptom of native insecurity and discontent, emergency powers were lifted in Nov. 1959, and large-scale reforms are in progress.

Maundy Thursday, the day before Good Friday, commemorates the Last Supper. "Maundy" derives from Christ's command (mandatum) to his disciples on that day to love one another. It was the custom in the monasteries for the monks to wash the feet of the poor on this day, and for many centuries the sovereigns of England, through their almoners, have distributed money, food, and clothing to "as many old men and as many old women as the Sovereign is years of age." The Royal Maundy ceremony is still observed, special silver money granted by the Royal Almonry is coined for the occasion and the distribution takes place in Westminster Abbey. *See* **U.K. Coinage, N9.**

Mausoleum, a special place of sepulture, generally for the reception of the remains of members of a royal or other family of distinction The name is derived from the tomb of King Mausolus at Halicarnassus, erected about 350 B C, and forming one of the seven wonders of the world

Mauve, a colouring matter produced from lichens by Dr Stenhouse in 1848, but in 1856 obtained from aniline by William Perkin (1838-1907), who gave it the name Mauveen. This was the first synthetic organic dyestuff ever to be produced, which led to the building up of the great synthetic dyestuffs industry

May, the fifth month of the year, but the third of the ancient Roman calendar. Supposed to be named after Maia, the mother of Mercury, to whom sacrifices were offered on the first day of this month. In England in former days May Day was made the occasion of many festivities, including the crowning of the May Queen, dancing round the Maypole, etc.

"Mayflower," the name of the ship which in 1620 conveyed the Pilgrim Fathers, 101 in number, from England to America *See* **Pilgrim Fathers.**

May Fly. *See* **Ephemoptera.**

Mayor. *See* **C21(1).**

Mazarin Bible, an edition of the Latin Vulgate, acknowledged as the masterpiece of the Gutenberg press (1456) It was the first book completely printed from movable types It is called the Mazarin Bible because the first copy to capture the attention of scholars was found in the library of Cardinal Mazarin, in Paris Sometimes called the Gutenberg or the 42-line Bible (

Mazurka, a Polish dance in 3-beat time Chopin wrote many Mazurkas as concert-pieces for the pianoforte.

Meal-Worm is the larva of a beetle—*Tenebrio molitor*—and is found in corn mills, granaries, and bakeries, where it does considerable damage. It is largely used for feeding birds

Mean. In mathematics generally understood to be the arithmetic mean, *i.e.*, the average The geometric mean between two quantities is the square root of their product.

Medals, as decorations for military service, were first issued in this country by Charles I, who ordered medals for gallantry to be distributed to certain soldiers in 1643 Medals were also issued to officers and men who were victorious against the Dutch fleet in 1653 After Lord Howe's victory in 1794 a naval medal was instituted Medals were also struck for the victory of Waterloo, and since that time special medals have been issued in connection with all our wars The Victoria Cross, a special reward for personal gallantry in the Navy, Army, and Air Force, was instituted in 1856 The George Cross for gallantry instituted in 1940 ranks next to the Victoria Cross. The Military Cross was instituted in 1914

Medlar, a tree of which the fruit is about 1 in. in diameter and hard fleshed when gathered, but after being stored for a few weeks it softens. It has a peculiar flavour Its large white flowers give it a decorative appearance

Meerschaum, a white or yellow-white earthy mineral, found in beds in Asia Minor, Greece, and other places, is a silicate of magnesium allied with water Its chief use is in making pipe-bowls, though in Spain it is used for building purposes

Megalith, a prehistoric monument, consisting of a large single stone or a group of such stones, in a circle as at Stonehenge or in burial chambers as at New Grange, Ireland Megalithic monuments have been constructed by different peoples in different parts of the world since the third millennium B C.

Meiosis, a process of plant or animal cell division, in which the number of chromosomes is halved, only one member of each pair of chromosomes appearing in each gamete or sex-cell. The gametes in man each contain 23 chromosomes.

Melody, a succession of single notes forming a pattern around which the rest of the composition (harmony, counterpoint) is woven. The theme (of a fugue, for instance) is a short melody.

Mendelian Law. The first statistical rules of inheritance, determining the ratio of variation of characteristics in the offspring of differing individuals, and the classification of characters

discontinuously inherited, were first formulated by the Austrian monk Gregor Mendel The results of his most important experiments in the crossing of peas were published in 1866, and showed that when two races are crossed, the resultant hybrids will exhibit the dominant features of one parent, but the offspring of the second generation will show those of both grandparents *See* **F32.**

Mendicant Friars, certain religious orders which spread over Europe in the 13th cent., and comprised the Franciscans, Dominicans, Augustines, and Carmelites Originally they depended entirely on alms.

Mercator's Projection, a method of indicating meridians and parallels of latitudes on maps, introduced by Mercator in the 16th cent., and still universally used in navigator's charts

Mercury, one of the smaller planets and the nearest to the sun, being 36 million miles distant It has no satellite. *See* **F7.**

Mercury *or* **Quicksilver,** symbol Hg (Latin *hydrargyrum*) is one of the oldest-known metals, whose chief ore is the sulphide, cinnabar, found in certain parts of Spain, China Japan, Mexico, and South America It is liquid at ordinary temperature and is used in the construction of barometers and thermometers Alloys of mercury are called amalgams. It is also of great value in medicine. The metal is used in the mercury-vapour (or "sunlight") lamp, since the vapour gives a bright yellow-white glow in an electric discharge

Meridian, an imaginary circle extending through the North and South Poles and any given place When the sun is at its midday height at any place it is "on the meridian", hence the terms ante-meridian (a m) and post-meridian (p m)

Merino Sheep were imported into England from Spain in 1788 and had great influence in improving native breeds, especially in regard to the quality of the wool.

Merit, Order of, founded by King Edward VII in 1902 as a special distinction for eminent men and women without conferring a knighthood upon them The Order has twenty-four British companions in addition to foreign honorary members limited in number, as the choice of members is, by the Sovereign's pleasure Lord Kelvin was the founder companion The only honorary members still alive are General Eisenhower (1945) and Dr Schweitzer (1955) Florence Nightingale is the only woman to have received this coveted decoration

Merovingians, the name given to the family that ruled over France from about 500 to 750 Clovis was first of the line and Chilperic the last

Mesons (from Greek *meso* = middle), a family of unstable particles of mass between that of an electron and that of a proton. Some are positive, some negative, some neutral No stable meson is known, the longest-lived particle having a lifetime of only two-millionths of a second The first of these particles was discovered in cosmic radiation in 1937 and called the mu-meson or *muon* In 1947 a heavier type was discovered called the pi-meson or *pion*, which behaved like the meson predicted on theoretical grounds by Yukawa in 1935 The pion is connected with the theory of nuclear forces. *See also* **F13, 14.**

Mesozoic. The geological era which includes the Triassic, Jurassic, and Cretaceous rocks. It began about 225 million years ago and lasted about 150 million *See* **F30**

Metabolism, the physiological processes of an organism as a result of which energy is released and growth takes place Digestion of food is an example of a metabolic process

Metalloid, an element which has properties intermediate between those of a metal and a non-metal Arsenic is a metalloid.

Metamorphic Rocks are such geological deposits as have undergone alterations of structure and mineral reorganisation. The most active agents in producing these metamorphic changes are heat, water, and pressure. *See* **F8**(2)

Metamorphosis, period of development from egg to adult, during which the animals have different forms, as found, *e.g.*, in the life histories of frog and butterfly.

Meteorites. The word meteor originally signified any natural phenomenon, but in modern usage meteors are small bodies coming from interplanetary space which become luminous by friction on entering the earth's atmosphere Popularly called "shooting stars." Larger meteors are known as fireballs. Some of these reach the ground. The object which has been a meteor in flight then becomes a meteorite In some meteorites iron is the predominating element, others are like rock. The iron meteorites are more common amongst those which have been preserved, but falls of rock-like meteorites occur more frequently. At l'Aigle in France in 1803 from 2000 to 3000 meteorite stones fell, this fall is famous because it convinced scientists that meteorites really came from outside our atmosphere. (The largest meteorite stone actually known to have fallen to earth is one which descended in Emmott County, Iowa, in 1870, weighing 437 pounds) A meteorite weighing no less than 36½ tons found in Greenland is now in New York On June 30, 1908, an enormous meteor fell in Siberia in a sparsely-inhabited region A hot blast destroyed all trees within a radius of about 5–10 miles, the explosion waves being recorded by barographs as far distant as London, Washington, and Batavia For the next few nights there was in Europe in the northern sky brilliant illumination due to sunlight falling on clouds of dust at a great height in the atmosphere Whether this dust had accompanied the meteor in its journey through space like the tail of a comet or whether the dust had come from Siberia is unknown When the place where the meteor fell was visited in 1927 some 200 craters were found, but no considerable meteorite has been recovered. Meteorites are possibly debris from the disintegration of a body in the solar system Present studies of the composition and age of meteorites will throw light on this *See also* **F48**(2).

Meteorology, the science of the atmosphere considered as a heat engine Deals with weather, climate, optical phenomena, atmospheric electricity, physical processes such as radiation and precipitation, the dynamics and structure of cyclones, anticyclones, etc. Wide application to problems of aviation, agriculture, commerce and shipping Meteorological observing stations are in operation all over the world, and on the simultaneous or synoptic reports of their instrument readings and estimates of pressure, temperature, humidity, speed and direction of wind, rain, character and amount of cloud, visibility, etc, forecasts, gale, snow and frost warnings are based Instruments carried by earth satellites are giving new information about the dynamical and physical processes of the atmosphere, *e g*, winds, cloud cover, water vapour, variations in the radiation from the sun Such meteorological observations on a world-wide basis are of the greatest importance in weather forecasting. *See* **Weather Forecasting, F51–3.**

Methane. The simplest hydrocarbon, compounded of one carbon atom and four hydrogen atoms This gas occurs over marshes and swamps, where it is liberated in the decay of vegetable matter. It is the main constituent of natural gas, and also occurs in coal-mines, where it is called "fire-damp" because of the explosive character of its mixture with air Formerly this natural gas was removed from the coal seams and ran to waste, now in many countries (including Britain) it is being used for commercial purposes

Methodism. *See* **J27.**

Methylated Spirit, a mixture of 90 parts by volume ethyl alcohol, 9½ parts wood naphtha (methyl alcohol), ½ part crude pyridine, together with small amounts of petroleum oil and methyl violet dye. Industrial methylated spirit consists of a mixture of 95 parts by volume ethyl alcohol and 5 parts wood naphtha. It is used as a solvent and a fuel

Metre. *See* **English Verse, M2.**

Metre, unit of length in the metric system = 39 37 in The wavelength of the orange-red light of krypton 86 has recently been adopted as the basis of the international unit of length

Metric System, the system of weights and measures based on the gram and the metre, smaller and

larger units being decimals and multiples of the primary units respectively A decimal currency was adopted in France in 1795 and the metric system of weights and measures in 1799 (In that year the quadrant of the earth was surveyed and the standard metre adopted) Nevertheless the change was accepted slowly, and as late as 1837 the French Government had to pass a law forbidding the use of the old measures Since then the metric system has been adopted in most of the continental countries and is used universally in scientific work Although there have been many attempts to get the system adopted in Britain, it was not until 1961 that the government accepted in principle a changeover to decimal coinage *See* **N11.**

Mezzotint, an engraving from copper or steel produced by instruments which burnish and scrape away portions of the surface, and yield an impression effectually graded in light and shade

Mica. The mica of commerce is a nearly transparent mineral, which has great heat-resisting power, and can be split into thin plates The most important micas are muscovite (potassium mica), the commoner variety, phlogopite (magnesium mica), and biotite, the magnesium and iron mica

Michael, St., and George, St, an order of knighthood originally founded for the Ionian Isles and Malta in 1818, and reorganised in 1869, so as to admit Crown servants connected with the Colonies The Earl of Derby, Earl Russell, and Earl Grey were the first of the new knights

Michaelmas Day, the festival day of St Michael and All Angels, Sept 29th, one of the English quarter days

Microbe, a term proposed by Sédillot in 1878 to denote any microscopic organism, vegetable or animal, or found on the borderland between the two great natural kingdoms The term is commonly used, but not by scientists

Micrometer, an instrument for measuring minute distances, usually attached to the eye-pieces of a microscope or telescope, and consisting of two very fine hairs or wires stretched across the field of view, one fixed, the other movable. It was invented by William Gascoigne in the 17th cent and improved by later inventors Sir Joseph Whitworth made one in 1858 to measure the millionth part of an inch

Microphone, device for converting the acoustic energy of sound waves into waves of electrical energy, used in sound amplifying systems Developed independently by Edison (1877) and Hughes (1878)

Microscope, invented about 1590 by Janssen, and improved by Galileo, Fontana, and others, is an instrument which by a lens system magnifies minute objects Microscopes are simple, compound, and binocular The more powerful instruments have a magnifying capacity of as much as 10,000 diameters *See also* **Electron Microscope.**

Middle Ages (*c* A D 400-1500), usually considered to be the period between the decline and fall of the Western Roman Empire and the fall of Constantinople to the Turks (*see* **A4-7**) The period covers (*a*) an earlier part ending with the 12th cent. (sometimes called the Dark Ages) when science was dead, when theology was the main preoccupation, and when the language of the learned West was Latin, and (*b*) a later age of Arabian influence when alchemy and astrology (at that time indistinguishable from astronomy) were central interests, technology was advancing, and Greek learning was transmitted by Arab scholars. Characteristic features of the mediaeval scene were monasticism (**J29**), the Crusades (*q v*), Gothic art (*q v*), feudalism (**J17**), and the supremacy of Islam in the field of learning The period came to an end with the ushering in of the Renaissance (**J38**).

Midrash, name given to the homiletical interpretation of some of the Hebrew Scriptures in which allegory and legendary illustration were freely used Compiled by Jewish rabbis from *c* A.D. 200.

Millenary Petition was presented to James I. in 1603, on behalf of nearly 1,000 Puritan Ministers against certain of the rites and ceremonies of the Church of England. The Hampton Court Conference was the outcome of this petition.

Millennium, a period of a thousand years. The term is specifically used of the period of a thousand years during which, according to Rev xx. 1–5, Christ will reign in person on earth. The Millenarians are a sect that interprets the " Millennium " as beginning with the commencement of the 6001st year from the Creation, which, according to Archbishop Ussher (1581–1650), was in 4004 B C

Millipede. Arthropods allied to the centipedes, from which they differ in having two pairs of legs to each body segment (except the first three) instead of one pair Worm-like in shape but with a pair of antennæ on the head, they are vegetarians and can do much harm to garden plants. *See* **T28**(1)

Millstone-Grit, a series of grits and sandstones of deltaic origin underlying the coal measures of the Carboniferous system and attaining in England a thickness in parts of 5,000 ft. It is from this rock that millstones have been made from time immemorial

Mimicry, protective similarity of an animal to another animal or to inanimate objects Examples of the former are the hover flies, which mimic wasps and bees, of the latter, leaf insects, stick insects, and caterpillars that look like dead twigs.

Mind and Matter. *See* **J28, F40(2).**

Minim, a musical term denoting a note equal to two crochets, or half the value of the semibreve, also pharmaceutical term for $\frac{1}{480}$th part of a fluid ounce

Mink. Semi-aquatic mammals closely related to polecats There is one American species and one European. The fur, which varies light to dark brown, is soft and thick, and is among the most valuable of commercial furs

Minnesingers were minstrel poets of Germany who, during the 12th and 13th cent , composed and sang verses of heroism and love They were of knightly rank, the counterpart of the French troubadours.

Minnow, a small fresh-water fish of the carp family, abounding in all the waters of Europe, it has a mottled back and silvery belly, and forms a popular bait for trout

Minor Scale. *See* **Diatonic Scale.**

Minstrels were originally specially appointed instrumentalists and singers—pipers, harpers, and gleemen—engaged by barons and manorial lords to amuse their tenants Later, minstrels assumed nomadic habits, made their way into the houses of the great, and were generally welcome By Elizabeth's time, however, they were too numerous, and were classed as " rogues and vagabonds," along with actors

Minuet, a composition in 3-beat time and in the rhythm of the minuet dance A movement of a sonata or symphony may be in minuet form

Miracle Plays, which were very popular in England in the 15th cent , were usually religious in character, representing some of the dramatic incidents of the Bible Staging of plays was one of the many activities of the Guilds of these days

Mirage, an optical illusion often observed in desert regions when the objects on the surface of the earth often some distance away appear as if reflected in a surface of water Mirage is due to the unequal heating of the different parts of the atmosphere, which bends the light rays, and so produces distorted images.

Mishna, the first part of the Talmud, setting forth the " Oral Law " of the Jews.

Missal, the name of the mass-book of the Roman Church compiled 492–96 by Pope Gelasius I , and revised by Gregory I , 590–604 The present Roman Missal was sanctioned by the Council of Trent 1545–63 In the Anglican Communion the Book of Common Prayer superseded the Missal in 1549

Mistle-thrush receives its name from its partiality to the mistletoe-berry. Larger than the song-thrush, with spotted breast rather than speckled

Mistletoe, a parasitic evergreen with white berries used as a decoration at Christmas-time The familiar mistletoe of Europe is the *Viscum album*, which grows on the boughs of lime, willow, apple, poplar, maple, ash, hawthorn, but seldom on oak-trees It was sacred to the Druids, and in Norse mythology it was a mistletoe dart that killed the god Baldur.

Mistral, a cold, dry, northerly wind peculiar to the French coast of the Mediterranean.

Mites, minute animals related to spiders, but without the well-marked division of the body exhibited by the latter. Some are parasites, *e g.*, the scab mite and mange mite. The garden pest called the "red spider" is really a mite.

Mitre, the twofold pointed head-dress of bishops and certain abbots of the Western Church and occasionally of other ecclesiastics.

Moa, the name for several species of ostrich-like extinct birds related to the New Zealand kiwi. The largest species, *Dinornis maximus*, stood 8 ft 7 in high. They died out about 500–700 years ago.

Moabite Stone, a stone of the 9th cent. B.C. containing the earliest known inscription in Phoenician characters, and discovered in the highlands of Moab in 1868. It is now in the Louvre, Paris. It records the campaign between Moab and Israel, a differing account of which is given in the Old Testament.

Moderator, a material used to slow down neutrons in an atomic pile. Examples of moderators are pure graphite and heavy water. *See* **Nuclear Reactors.**

Mohole Project, an experiment which is being carried out near Guadalupe Island off the Mexican coast by an American led team of geophysicists to bore through the earth's crust to take samples of the mantle rocks beneath. The drill is expected to reach a depth of some 6–7 miles below sea-level. Russian geophysicists are also engaged in a similar experiment, but are boring not through the sea bed, as the Americans are doing, but through land rocks where the digging will have to be much deeper and higher temperatures are likely to be met with. The boundary between the earth's crustal and mantle rocks is known as the Mohorovičić Discontinuity, or, more simply, as the Moho. *See* **F8(1)**.

Molasses, sugar-cane juice in its uncrystallised form after boiling. The crystallised part is the raw sugar. Used to make rum.

Mole, a small burrowing animal with long, sensitive nose, about the size of a small rat, with short legs and forefeet armed with strong claws for digging in the earth. Their subterranean dwellings are of curiously ingenious construction, and they do not often leave them except to make raids on mice, frogs, snails, etc. The earth worm, however, is the mole's chief item of food. Not to be confused with the vole which has a blunt nose.

Molecule. *See* **F12(2)**.

Mollusca. *See* **F23(1)**.

Molybdenum, symbol Mo, a fairly hard white metal with properties resembling those of chromium. Its commonest ore is the sulphide, molybdenite. The chief use of the metal is in the manufacture of alloy steels.

Monasticism. *See* **J29.**

Monazite, a cerium mineral containing some thorium. Occurs as grains, often as sand ("monazite sands"), derived from granites. Deposits occur in India (Travancore), Russia, Norway, Madagascar, S. Africa, Brazil, U.S.A.

Monday, the second day of the week, called by the Anglo-Saxons *Monandaeg*, because the first hour of this day was supposed to be ruled by the moon.

Mongols, a yellow race of central Asia, largely nomadic. In the 13th cent., they conquered large portions of Asia, including China, Persia, and India. They founded the Mogul dynasty in India in 1525, and ruled up to the end of the 18th cent., when their empire came under British control.

Mongoose, species of mammals related to the civets, feeding on vermin and reptiles. These animals, which have long tails and short legs, occur in Africa and Asia (especially India). The biggest mongoose is the Egyptian ichneumon, and this has been introduced into the W. Indies because of its ability to kill large poisonous snakes.

Monitor, a family of lizards most resembling dragons. There are about 30 species widely distributed over the tropical parts of Asia, Australia, and Africa.

Monocotyledons. *See* **F29(1)**. Most monocotyledons are herbs, many are cultivated for their beautiful flowers, *e g.*, lilies, tulip, daffodil, iris, orchids, and cannas. A few are tree-like, *e g.*, bananas, pineapples, bamboo, and palms.

Monolith, a column or shaft comprising a single stone. "Cleopatra's Needle," now on the Thames Embankment in London, is an example.

Monotremata. *See* **F23(2)**.

Monroe Doctrine, a principle of American policy declining any European intervention in political affairs of the American continent, outlined by President Monroe in 1823. At the same time interference was disclaimed with existing European colonies in the Western Hemisphere. The American Civil War hampered the application of the doctrine for some time, but afterwards the United States firmly insisted on it. The Doctrine is not international law, but a national policy of the U.S.A.

Monsoons, regular persistent winds which blow at certain seasons in middle latitudes, mainly in South and East Asia. Their occurrence is related to the great changes of pressure which take place between summer and winter over the land mass. In India the south-west monsoon (June–Oct.) is moisture-laden from its long passage over the sea and in the higher regions, especially, there is heavy rainfall. Sudden reversal of the wind results in the cold north-east monsoon (Oct.–March) which is dry on account of the shelter afforded by the mountain ranges to the north. Frequently the term "monsoon" is applied to denote the associated rainfall without reference to the actual winds.

Monstrance, an ornamental transparent receptacle in which the Sacred Host is carried in procession or exposed for adoration.

Month, the 12th part of the calendar year. A lunar month is the interval of new moon to new moon or full moon to full moon, mean length, 29 days, 12 hours, 44 minutes, 2.87 seconds. A sidereal month represents the time of the moon's revolution from a given star back to the same again, 27 days, 7 hours, 43 minutes, 11.5 seconds. In English law, since 1926, a month, unless otherwise expressed, means a calendar month.

Monument of London, erected in 1671–77 by Wren in commemoration of the Great Fire, is 200 ft. high and cost £14,500. The original inscription upon it ascribed the fire to "the treachery and malice of the popish faction," which stood down to 1831, when the words were erased as objectionable. The black marble staircase consists of 345 steps.

Moon, the earth's satellite, 2,160 miles in diameter and 238,857 miles distant from the earth. Its surface is believed to be covered by a layer of solid porous material, but we shall know for certain when scientific instruments have been landed on the moon to make direct tests. For the first time in history a space flight from the earth to the moon was made on 13 Sept. 1959 by the Soviet space rocket *Lunik II*, which hit the moon after 36 hours' journey. *Lunik II*'s instruments confirmed that the moon has no external magnetism and no radiation belt around it. *Lunik III* photographed the back of the moon. *See also* **Luniks** *and* **F46(2)**.

Moorhen, a widely distributed bird of the rail family, a common resident in the British Isles. The adult is blackish with white under tail-coverts, a white line on the flanks, and a yellow-tipped bill. The frontal shield and the base of the bill are vermilion. It bobs its head, flirts its tail, and dives well. The nest is usually placed close to the water's edge or on an overhanging branch. In feeding the young the parents are sometimes helped by their off-spring of a previous brood of the season. In N. America the bird is known as the Florida Gallinule.

Moors, the name given to the Moslems who live in N.W. Africa and to those who once lived in Spain. In 711 Moorish Arabs invaded Spain and spread beyond the Pyrenees into France, where they were driven back by the end of the century. Spain, however, remained virtually under Moorish domination until the 11th cent., and during that period was the most civilised and prosperous part of Western Europe. In the arts and sciences the impact of Moorish culture was profound and lasting. Examples of

the brilliant splendour of Moorish architecture are still to be seen in Toledo, Córdoba, Seville, and Granada. During the long struggle for the Christian reconquest thousands were killed and expelled, and in 1492 Granada, their last remaining kingdom, was forced to surrender. They were virtually exterminated by the Inquisition, and the last were expelled in 1609.

Moose, the largest members of the deer family. The N. American Moose stands 5½–6½ ft high, and has huge palmate antlers. There is another New World species, occurring in Alaska. The European species is known as the elk.

Morris Dance, an old English country dance of the reel order.

Morse Alphabet, a system of dots and dashes, intended to be used in combination with the indicator in telegraphy, but usually read by sound, the receiving operator writing down the words in the system as transmitted. This system of signals was invented by the American inventor and artist Samuel Finley Breese Morse (1791–1872) of Charlestown, Massachusetts.

Mosaic, art of arranging small pieces of coloured glass, marble, or other materials in such a fashion as to produce a decorative pattern. Some of the best examples of Byzantine mosaics are to be seen at Ravenna, Rome, Venice, and Sicily.

Mosque, a Mohammedan church, the greatest being that of Santa Sophia at Istanbul, now converted into a museum of Byzantine art.

Mosquito, small two-winged flies with long legs and and slender body. Their larvae are aquatic. The females of some species are blood-suckers, and thus come to transmit the blood parasites which cause malaria and yellow fever, for example. *See* **D.D.T.** *and* **Gammexane.**

Mosses. Most mosses live in moist habitats, but there are some species that can withstand desiccation and are adapted to live on rocks and tree-trunks. *See* **F27(2)**

Motet, an unaccompanied anthem of the Catholic and Lutheran Churches. Many fine motets which were settings of sacred writings or paraphrases and which were written mostly in the 15th cent. still survive.

Moths, of the insect order, *Lepidoptera*, differing from butterflies which have clubbed antennae, in having feathery, sometimes thin, pointed antennae, rarely clubbed. Most are nocturnal, and the pupae are usually brown and enclosed in a cocoon unlike those of the butterfly, which are usually naked. *See also* **Lepidoptera**

Motion, Laws of. According to Newton: (1) A body continues in its state of rest or uniform motion in a straight line except in so far as it is compelled by external forces to change that state. (2) Rate of change of momentum is proportional to the applied force, and takes place in the direction in which the force acts. (3) To every action there is an equal and opposite reaction. These laws are the basis of almost all engineering and everyday mechanics. Corrections to them have been made by relativity and the quantum theory. *See* **F13, 14.**

Movement, one of the contrasting pieces which together make up a Sonata, Symphony, or Concerto. A typical sonata has three movements, while a typical symphony has four.

Mule, a hybrid between horse and ass. Also the name of the spinning machine invented by Crompton in 1779 which combined the principle of Hargreaves' spinning jenny with the machine invented by Arkwright.

Mullions, the vertical bars dividing the lights in a window, forming a highly decorative feature in the Tudor period of English Gothic architecture. The cross-beam or horizontal bar of wood or stone in a mullioned window is styled a transom. *See* **Windows.**

Munich Agreement. In Sept. 1938 Mr. Neville Chamberlain and M. Daladier, British and French Premiers, reached agreement with Hitler at Munich for the dismemberment of Czechoslovakia, primarily for the benefit of Germany. Czechoslovakia itself was not consulted, nor Russia who with Britain and France had jointly pledged themselves to uphold the independence of Czechoslovakia. Hitler had been threatening that country for some time, but every concession had been met by further demands. After three visits to Germany, during which Hitler raised his demands, the British and French statesmen gave way. Mr. Chamberlain declared on return that he had secured "Peace in our Time." The Agreement was the subject of much controversy. Hitler seized Czechoslovakia in March 1939.

Musk Deer, a small deer of the Himalayas, standing about 20 in. high. It is grey in colour, slightly brindled, and carries a small pouch in the abdominal region, containing what is commercially known as musk, an article which is of great value in the manufacture of various perfumes. The active constituent of musk, muscone, is now made synthetically. The species was becoming rare on account of its slaughter for its musk.

Mutton Bird, an Australasian name of controversial origin for a shearwater or petrel, *e.g.*, the Short-tailed and Sooty Shearwaters and the Great-winged, Kermadec, and White-headed Petrels. The young are taken by hand from their burrows for human food.

Myrrh, a resinous substance obtained from a tree of the natural order *Amyridaceae*, growing plentifully in Abyssinia and Arabia. Its use for embalming, medical, and aromatic purposes may be traced back to the most remote times.

Mysteries, Greek, secret mystic ceremonies of the ancient Greeks, religious drama accompanied by dancing, the most well known being the Eleusinian and Orphic ceremonies.

Mystery Plays were the mediaeval religious dramas performed by the priests at great ecclesiastic festivals, particularly in France and Bavaria, staging the Nativity, Passion, and Resurrection.

N

Nadir, one of the two poles of the horizon, the other being the zenith. The nadir is the pole vertically below the observer's feet.

Nahum, one of the books of the Minor Prophets of the Old Testament. It is a prophecy of doom on the approaching sack of Nineveh which fell in 612 B.C. to the Medes and Babylonians.

Naiad, a water-nymph of classic mythology, beautiful and mystic, celebrated by Virgil, Ovid, Homer, and other ancient writers.

Nantes, Edict of, was a decree promulgated by Henry IV. of France in 1598, giving full freedom of worship to the Protestants of the country. It was the revocation of this edict in 1685 by Louis XIV. that drove hundreds of thousands of French Huguenots to this country.

Naphtha, a liquid combustible believed to have been one of the ingredients of "Greek fire." Naphtha is a light, highly inflammable oil obtained by distilling petroleum, shale oil, or coal tar. The petroleum naphtha consists of a mixture of paraffins, that from shale contains olefines as well as paraffins. Coal-tar naphtha contains xylol.

Naphthalene is an aromatic hydrocarbon; it is obtained from coal tar, and its derivatives are much used in the manufacture of colours for dyers and printers. "Moth balls" are made of naphthalene.

Narcotic, a medical dictionary definition is that a narcotic is a drug that produces stupor, complete insensibility, or sleep. In terms of drug addiction, a narcotic has been defined as altering and distorting the user's perception of himself and of the external world, being taken primarily for that purpose. *See* **P22–23.**

Nardus, a genus of coarse grasses, growing on bleak upland heaths and hill slopes. *Nardus stricta*, known as "mat-weed," is a British species.

Narghile, an oriental tobacco pipe so constructed that the smoke passes through water and up a long flexible tube before reaching the lips of the smoker.

Narrative Art, a type of art popular during the late 19th cent. based on the principle "every picture tells a story"—*e.g.*, such paintings as the little Royalist boy surrounded by his anxious family and confronted across a table by the Roundheads bearing the title: "When did you last see your father?" The term, although often applied derisively, suitably describes many works of considerable artistic merit. *e.g.*, Hogarth's *Marriage à la Mode*, his series of eight engravings entitled *A Rake's*

Progress, the Bayeux Tapestry, and many Babylonian and Egyptian friezes

Naseby, Battle of, was fought on June 14, 1645, between the Royalists under the command of Prince Rupert and the King, and the Parliamentarians under Fairfax and Cromwell. It resulted in a complete defeat for Charles.

National Anthem, a musical composition with words, officially adopted for ceremonial use as an expression of patriotism and loyalty to a national cause The national anthem of the United Kingdom is "God Save the Queen" which has been in use since about the middle of the 18th cent. There is some doubt about its origin It has been variously attributed to Dr John Bull, Henry Carey, and James Oswald

National Assembly, the name taken by the body responsible for the opening stages of the French Revolution and subsequently by other sovereign bodies in France and elsewhere

National Covenant, an oath and declaration subscribed to by the Scottish Presbyterians in 1638 to maintain their religion against Charles I.'s episcopalianising designs

National Gallery, established in 1824 at Pall Mall, London, with the Angerstein Collection of 38 pictures, purchased for £60,000 as a nucleus The existing building which was opened in 1838 has been enlarged several times. The National Gallery at Millbank, known as the Tate Gallery, was given to the nation by Sir Henry Tate in 1897

Nationalisation is the taking over by the State of the ownership and operation of an industry or service—*e g*, coal-mining, railway transport, gas, and electricity Where this is done without revolution, compensation is usually paid to the previous owners at what is regarded as a fair market price, the compensation is sometimes paid in cash, but more often in fixed-interest-bearing bonds issued either by the State or by the administration of the nationalised service, which is usually a publicly appointed Board or Corporation acting, with greater or lesser autonomy, under the direction of a Minister responsible to Parliament In some cases the State becomes a partner with private investors in the ownership of a particular enterprise, *e g*, oil companies, such as the former Anglo-Iranian and some recent French examples Nationalisation is usually brought about by a separate Act of Parliament relating to each industry or service taken over These Acts, in Great Britain, include provision for joint consultation at all levels between the administering boards or commissions and the workers employed and their Trade Unions When, as in the Soviet Union, nationalisation occurs as an outcome of social revolution no compensation is paid to the dispossessed owners

Nationality, British. *See* **D7 (1).**

National Parks. Under the National Parks Act 1949 a National Parks Commission was set up to create National Parks in England and Wales Twelve areas had been recommended in the Hobhouse Report, and of these several have already been designated. The areas named in the Report were the Lake District, Snowdonia, the Peak District, Dartmoor, the N Yorkshire Moors, the Pembrokeshire Coast, Exmoor, the Yorkshire Dales, the South Downs, the Roman Wall, the Broads, and the Brecon Beacons and Black Mountains It is not intended to change the character of these territories but to control their development so as to harmonise with the two dominant principles (*a*) that the characteristic beauty of the landscape within the Park area shall be preserved and (*b*) that the visiting public shall have ample access and facilities for recreation and enjoyment. *See* **R8** *and also* **Long Distance Routes.**

National Physical Laboratory, situated at Teddington, is one of the world's largest and best-equipped laboratories. It was first established in 1900, and functions as a central bureau of physical standards and as a research laboratory of industrial physics. In 1918 it became part of the Department of Scientific and Industrial Research and has the following Divisions. Aerodynamics, Applied Physics, Basic Physics, Control Mechanisms and Electronics, Electricity, Light, Mathematics, Metallurgy, Ship and Standards.

National Portrait Gallery, established in 1856, and now located in a building in St. Martin's Lane adjoining the National Gallery. Contains portraits of eminent people in history, literature, art etc, and a valuable collection of medals and autographs.

National Trust, founded in 1895. "A non-profit-making organisation incorporated by Act of Parliament for the purposes of promoting the permanent preservation of lands and buildings of historic interest or natural beauty for the benefit and access of the people" As a consequence of gifts of public-spirited individuals the Trust now owns many acres of magnificent scenery and property, including mediaeval castles, bird sanctuaries, ancient monuments, birthplaces and homes of famous men, and classic examples of domestic architecture, preserved for the enjoyment of present and future generations Since 1946 lands and houses of interest to the nation may be given to the National Trust in lieu of death duties. *See also* **R8(2).**

Nativity. There are three Nativity-Festivals in the Christian Churches, the Nativity of Christ on Dec 25, the Virgin Mary on Sept 8, and John the Baptist on June 24.

Natterjack, a curious warty, prominent-eyed, brown toad (*Bufo calamita*), having a bright yellow line down the middle of its back It utters a muttering sort of croak, hence its name.

Natural Law. *See* **J32.**

Naturalisation, the grant of British nationality to an alien Before an application can be made to the Secretary of State for the grant of a certificate an alien must have qualified by 5 years' residence in the U.K. or service under the Crown, during the 8 years immediately passed

"Nautical Almanac," published under the authority of the Admiralty, is always issued four years in advance, and contains information specially prepared for the use of navigators and astronomers. It first appeared in 1767

Nautilus, a term now applied only to the pearly-shelled nautilus, the sole surviving example of the four-gilled section of the *Cephalopoda*. Its fossil relatives are called Ammonites. The spiral shell is divided into a number of compartments, the animal living in the last and largest chamber There are three or four species, all living in tropical seas The Paper Nautilus is not related to the Pearly Nautilus, belonging to the same order as the octopus

"Nautilus," the name of the American nuclear-powered submarine which made the first voyage under the North Pole in Aug. 1958, having navigated a new north-west passage without stars, compass, radio, or radar but using a piece of equipment known as an "inertial navigator" *See* **Inertial Navigation.**

Nave is the body or main open portion of a cathedral or church, and extends from the chief entrance to the choir, or chancel, and is usually flanked by aisles. A nave, in mechanics, indicates the "hub" or central part of a wheel.

Neandertal, the name of the valley lying between Düsseldorf and Wuppertal, where in a limestone cave a now famous skull of a very early species of prehistoric man was discovered in 1856 Fossils of Neandertal man have been found over a wide area, and from archaeological evidence he began to disappear from Europe during the last Ice Age, about 40,000 B.C *See also* **F34(2).**

Necromancy, "the black art," was in olden times much believed in, and supposed to be an occult power by which its practitioners could converse with the spirits of the dead and learn the future

Negroes are the dark-skinned, woolly-headed races, natives of tropical Africa, or descendants of such natives There are many different racial types, but the most typical Negroes are found in W Africa—the Ashanti of Ghana, and the Yoruba of Nigeria. There are the Pygmies living in the forests north and south of the equator, the Bushmen of the Kalahari Desert, the Hottentots of South Africa, who however have largely lost their identity, the Bantu peoples, and many others. Their culture is rich in folk-lore, and they have a great gift for music and dancing. About 25 million people of Negro descent are in N. and S. America, the European slave trade having taken them there from their homes in W Africa

Negus, the name given to any mixture of wine and water, and said to have been named after Colonel Francis Negus about 1714. The sovereign of Abyssinia is styled the Negus.

Nekton, term used to differentiate actively swimming aquatic organisms (*e.g.*, fishes) from the "drifters" or plankton.

Nelson Column, in Trafalgar Square, London, designed by Mr. William Railton, was chosen from among a number of designs—temples, obelisks and various sculptural groups—sent in as a result of a competition held in 1839. The erection of the column was begun in 1840. Twenty-six years later the lions designed by Landseer were set up at the foot of the completed column. The statue of Nelson himself was made by E. H. Bailey and the bronze reliefs at the base executed by Carew, Woodington, Ternouth, and Watson, representing the Battles of the Nile, St. Vincent, Copenhagen, and Trafalgar. Height 170 ft., executed in Portland stone instead of granite, as originally planned, at a cost of £46,000.

Nematodes, the roundworms or threadworms. Some parasitise man and domestic animals.

Néné or Hawaiian Goose. At the Severn Wildfowl Trust at Slimbridge Mr. Peter Scott has saved this bird from extinction.

Neo-Classical School of Art, a French school of painting and sculpture belonging to the late 18th and early 19th cent. and founded by Jacques David, the Academician, republican, and later admirer of Bonaparte. His classicism probably arose from his republican sympathies, which caused him to paint such works as the *Oath of the Horatii* (Louvre) drawing analogies between revolutionary France and Rome. Because of these views he revolted against the romantic and sensual art of Watteau and Greuze and equally against the realism of Chardin. Among his many famous pupils was Ingres, who later assumed leadership of the school.

Neodymium, an element belonging to the rare earth metal group. Discovered by Welsbach in 1885.

Neo-Impressionism, a development of Impressionism (*q.v.*) by Seurat and Signac during the 1880s who devised the method of painting known as *pointillism* (the application of pure colours in minute touches to form a composite whole, based on a knowledge of the laws of colour and optics). One of the best-known examples of this technique is Seurat's *Sunday Afternoon on the Grand Jatte*.

Neon, inert gas present in air to the extent of about 1 part in 65,000. The crimson glow produced when an electric discharge passes through the gas is familiar in advertising signs.

Neoprene, generic name for a class of synthetic rubbers made from acetylene.

Nepotism, the bestowal of patronage by reason of relationship rather than of merit. It had its origin in the custom of certain Popes to enrich their families out of the offices of the Church.

Neptune. Apart from Pluto this is the most distant of the planets, estimated to be about 2,793 million miles from the sun, and taking about 165 years to revolve around it. Discovered by the German astronomer Galle on Sept. 23, 1846, after its existence had been predicted by Leverrier and Adams.

Neptunium, element 93, one of the four new elements discovered during the progress of the atomic bomb project in the second world war. Neptunium is formed when a neutron enters a nucleus of Uranium 238, and it decays radioactively to yield plutonium.

Neuroptera, an order of insects which includes lacewings, alder-flies, ant-lion flies, etc.

Neutrino, a neutral particle which carries energy and spin and although possessing little or no mass plays an important part in the interaction of other fundamental particles. The discovery that there are in fact two distinct neutrinos, each with its counterpart, was discovered in 1962 as a result of an experiment made with the 30,000 million-electron-volt proton accelerator at Brookhaven. *See* **F13, 14.**

Neutron, a neutral particle present in all atomic nuclei except the hydrogen nucleus which is a single proton. In the development of nuclear science and technology the neutron has played a most important role and neutrons produce the radioisotopes now widely used in medicine, agriculture, and industry. Neutrons and protons are termed nucleons. *See* **F10, 14.**

New Deal. The measures taken by President Roosevelt in U.S.A. in 1933 to overcome the great economic crisis which broke out at the end of 1929 and to restore the social security threatened by it. The measures were drawn up by a group of experts called a Brains Trust and they provided for recovery by a programme of public works, including large-scale construction of houses and large-scale assistance to farmers. Loans were granted and authorities formed to stimulate activities which reduced the workless from 17 millions to between 7 and 10 millions. Unemployment relief was regulated and enlarged; and social insurance (which for decades had been a subject of dispute, being held to be contrary to American principles of self-help) was introduced. Many of the changes have become a permanent part of American legislation though some laws were repealed by the U.S. Supreme Court as being unconstitutional.

Newgate Prison, now pulled down and replaced by the Central Criminal Court, opened in 1907, was situated near the point where once stood one of the old London city gates. There is a record of a prison upon this spot in the 13th cent. Later a new one was built by the executors of Richard Whittington, but this was destroyed by the Great Fire in 1666. Still another new prison on this site was erected between 1778 and 1780. In the Gordon Riots of the latter year it was destroyed by fire and re-erected. It was not used as a prison after 1880.

News Letters were an early form of newspaper, popular in the time of Charles II. They consisted of items of news and gossip collected at the various coffee-houses and other places of public resort. They often included blank pages on which readers wrote their private letters.

Newspapers. The first news-books to be published at regular intervals in Britain appeared in 1662 with news of what was going on abroad translated from German and Italian news-sheets. Licence to print was obtained from the Star Chamber, which until its abolition in 1641 allowed only the printing of foreign news. With the lifting of the ban on domestic news the Press became free. In the reign of Queen Anne English newspapers employed writers of great intellectual power and versatility. Despite the newspaper tax introduced in 1712, the number of newspapers published in London in 1776 had increased to 53, though the standard of writing was below that of earlier times. The development of the Press was greatly assisted in the 19th cent. by the abolition of the "taxes on knowledge," by the introduction of the cheap postal system, and by improvements in printing, distribution, collection of news, and advertising. The *London Gazette*, founded in 1665 (and still appearing twice weekly as the official organ of the Government), is the oldest newspaper living. *The Times*, known throughout the world, began as the *London Universal Register* in 1785, and adopted its present title in 1788. The *Manchester Guardian* (renamed *Guardian* in 1959), once a provincial but now a national newspaper with a world-wide reputation, began as a weekly in 1821, and became a daily in 1855. The *Scotsman*, founded as a weekly in 1817 and established as a daily in 1855, and the *Glasgow Herald*, which began as the *Glasgow Advertiser* in 1783, are the leading Scottish newspapers. The London Press, which is national, publishes 11 daily, 2 evening, and 9 Sunday newspapers.

Newt, amphibians of lizard shape and mottled markings. There are three British species, the largest being the Great-Crested Newt (*Triturus cristatus*), which attains a length of 6 in.

Newton's Rings. Concentric circular rings, due to the phenomenon of interference, which are seen around the point of contact of a slightly convex lens with a flat plate of glass.

New Towns. The new towns in Britain established under the provisions of the New Towns Act, 1946, are at Basildon, Bracknell, Crawley, Harlow, Hatfield, Hemel Hempstead, Stevenage, Welwyn Garden City, Corby, Newton Aycliffe

and Peterlee in England, at Cwmbran in Wales, and at East Kilbride, Glenrothes and Cumbernauld in Scotland Three further new towns—Skelmersdale, Dawley and Livingston—were designated in 1962 and in 1963 approval was given for the development of Runcorn and Redditch as new towns. *See* **K191.**

New Year's Day, Jan 1. The first New Year's festival of which we have record is that constituted by Numa 713 B C, and dedicated to Janus

Nibelungenlied, the German epic of the 12th cent comprising numerous mythical poems or sagas of which several English translations exist These poems have been utilised with great effect as foundations for Wagner's famous series of operas comprised under the general title *Ring des Nibelungen*

Nicene Creed, a summary of the principles of Christian faith, first issued in 325 by the Council of Nicaea (summoned by the emperor Constantine the Great) for the purpose of thwarting the Arian heresy and asserting the godhead of Christ Date of Easter fixed at Council of Nicaea

Nickel, silver-coloured metal, symbol Ni, fairly soft though harder than iron Chief source of the metal is the nickel sulphide in iron-copper pyrites deposits in Ontario Chief uses are in electroplating, in coins, as an element in alloy steels A novel method of making pure nickel (by treating the metal with carbon monoxide and heating the resulting liquid, nickel carbonyl) was developed in 1890 by Mond This discovery led to many technical advances in industrial chemistry, one of which is the production of catalysts for a variety of processes

Nicol Prism, a device for producing plane-polarised light It consists of two pieces of Iceland spar cut and cemented together in a special way

Nicolo, a large brass reed instrument, common in the 17th cent but now superseded by the bassoon

Niello Work was in considerable vogue in the Middle Ages, and is said to have suggested the idea of engraving upon copper It was produced by rubbing a mixture of silver, lead, copper, sulphur, and borax into engravings on silver, and some highly decorative results were obtained

Night-heron, a stocky, short-legged heron of black and white plumage, red eyes, and yellowish legs, crepuscular except in breeding season, and an occasional visitor to Britain

Nightingale, a familiar singing bird which visits the southern counties of England every summer, and is sometimes found as far north as Yorkshire It is a shy, brown bird, not often seen, but the song of the male, usually heard in the late evening or at early morn, is of remarkable sweetness and variety After its wooing period is over its song ceases

Night-jar, nocturnal, insectivorous bird, owl-like in appearance, with mottled brown plumage of "dead leaf" pattern, and a churring song It is a common breeding visitor to the British Isles, Apr to Sept, and lays its eggs on bare ground

Nimbus, a circlet of light depicted round the heads of saints or divine personages in ancient art, also name of dense dark "rainy" cloud

Niobium is a metal element, symbol Nb, related to vanadium. Technical development has been slow because of its rare occurrence, although niobium is now used in ferrous alloys to increase resistance to corrosion and produce steel which can be used at high temperatures

Nitre *or* **Saltpetre,** is now mostly manufactured by the double decomposition of sodium nitrate and potassium chloride Its chief use is the manufacture of gunpowder and fireworks It has been manufactured in England since 1625

Nitrogen, a non-combustible gaseous element, symbol N, devoid of taste or smell, and constituting nearly four-fifths of the atmospheric air Nitrogen compounds are essential to plants and animals, and are used in fertilisers

Nitro-Glycerine, an explosive yellow fluid produced by mixing small quantities of glycerine with a combination of one part of nitric acid and two parts of sulphuric acid By itself it is a dangerously explosive substance to handle In 1867, Nobel produced dynamite, a safe explosive made by absorbing nitro-glycerine in kieselguhr.

Nitrous Oxide, a compound of nitrogen and oxygen possessing mild anaesthetic power It was the first of the inhalation anaesthetics to be used. It was termed "laughing gas" on account of its exhilarating effect. It is still used in dentistry and for minor operations.

Nocturne, a short piece of music, romantic in character, generally for the pianoforte The nocturne was invented by John Field, from whom Chopin borrowed the idea After this the nocturne became popular all over Europe, being known in Italy as "notturno" and in Germany as "nacht-musik"

Nones were dates of the Roman calendar which fell on the 5th of each month, excepting Mar, May, July, and Oct, when they fell on the 7th

Nonet, a musical composition for nine voices or instruments

Non-jurors were the clergy who refused in 1689 to take the oath of allegiance to William III and his successors, contending that James II had been unjustly deposed.

Non Nobis Domine! ("Not unto us, O Lord!"), a musical canon, sung as a grace at public feasts (traditionally attributed to Byrd)

Norman Architecture is English Romanesque (*q v*), which flourished from the time of the Norman Conquest and was gradually superseded through a transition period (*c* 1175–1200) by the introduction of the pointed arch characteristic of the Early English (first Gothic style) Typical of Norman churches are the round arches, thick walls, massive cylindrical columns, with throughout the basic pattern of the square and the circle Some churches (*e g*, the Temple church in London or the chapel at Ludlow Castle) are wholly circular Roofs in the early days were flat and towers, usually placed at the "crossing," were square but occasionally round, the spires of all these towers have perished, but it seems likely that they were squat and pyramidal

North-East Passage, from the North Atlantic to Bering Strait has been rapidly developed by the U S S R in recent years as a northern sea route to render accessible vast areas of northern Siberia Attempts to find a north-east passage were made by Englishmen and Dutchmen in the 16th cent but they were always defeated by the ice, for the sea is completely frozen for some 3,000 miles for 9 months of the year A Swede succeeded in sailing from Europe to Japan via the Arctic in the late 19th cent *See also* **Arctic Exploration.**

North-West Passage, from the Atlantic to the Pacific through the Arctic Seas, has been the dream of navigators for centuries Attempts to find it were made in the 16th and early 17th cent by John and Sebastian Cabot, Frobisher, Gilbert, Davis, Hudson, and Baffin Two centuries later Ross, Parry, Franklin, and others made the attempt, but it was not until 1903–5 that Amundsen, discoverer of the South Pole, made the complete voyage The American nuclear-powered submarine, *Nautilus*, opened up a new short sea route between the Atlantic and the Pacific when she made her epic voyage under the North Pole in Aug 1958

Notre Dame, the famous Paris cathedral, was founded in 1163, and is one of the finest specimens of Gothic architecture in Europe The best descriptions of the buildings are to be found in Victor Hugo's "Hunchback of Notre Dame"

November, the 9th month of the year originally, but from *c* 700 B C, when Numa added Jan, and Feb, it became the 11th month

Nuclear Energy. Atomic nuclei consist of protons and neutrons joined in various proportions (**F10**). The heaviest naturally occurring nucleus contains 238 particles (92 protons, 146 neutrons) and is uranium 238 (U^{238}), the lightest is hydrogen, which consists of 1 proton Neutrons and protons attract one another by very strong forces which are not at all well understood, they are called *nuclear forces* Consequently it requires energy to be supplied if a nucleus is to be pulled apart into its constituent particles The energy is required to overcome the attractions of the nuclear forces Conversely, when the particles rush together to form a nucleus, energy is released in the form of heat or radiation. The energy released when protons and neutrons coalesce to form a nucleus is called

Binding Energy The binding energy of a nucleus divided by the number of particles involved is called the binding energy per particle, which we will call B It is very difficult to overestimate the importance of B to the human race B varies from nucleus to nucleus, and the exact form of its variation is only roughly understood at the present time But the most significant thing is that B is greatest for elements of medium atomic weight and lowest at the heavy (uranium) and light (hydrogen) ends of the periodic table This means that if middleweight nuclei can be formed either from heavy ones or from light ones, B increases and *energy is released in either case*

Nuclear Fission. *See* **F12(1).**

Nuclear Fusion. If light nuclei are hurled at high speeds into intimate contact they sometimes coalesce and release binding energy (*see* **Nuclear Energy**) This has been studied in laboratories where powerful and energy-consuming machines accelerate small numbers of particles for purely experimental purposes. If useful amounts of energy are to be gained these fusion reactions will have to occur on a bigger scale in an apparatus from which the resulting heat can be extracted in a controlled way The one "useful" fusion device so far made is the thermonuclear bomb ("H-bomb") Thermonuclear is the important word If a suitable gas can be raised to a very high temperature the nuclei are stripped of their electrons and all particles move with very high speeds The gas is then called a plasma High enough temperatures will make speeds great enough for fusion reactions to occur and nuclear energy to be released This is a thermonuclear reaction For example, in deuterium gas, at temperatures over a million degrees Centigrade, the deuterium nuclei (*i e*, heavy hydrogen nuclei consisting of 1 proton joined to 1 neutron) interact to produce helium nuclei To obtain a net gain in energy from this process, the temperature must be raised to about 300 million degrees C and maintained long enough, otherwise the energy released is less than that required to heat the fuel and to make up for heat losses Many attempts to study the staggering technical problems are being made In the Harwell machine Zeta the deuterium gas was contained in a metal tube shaped like a tyre 3 metres across The temperature was raised by passing a huge electric current (about 200,000 amps) through the gas for a few thousandths of a second Temperatures up to 5 million degrees have been produced, and new apparatus is stepping this up Neutrons have been detected, but the original view that these were evidence of true thermonuclear reactions has not survived later studies *See also* **Plasma Physics.**

Nuclear Power Stations. Of the eight British nuclear power stations (at Berkeley, Bradwell, Dungeness, Hunterston, Hinkley Point, Sizewell, Trawsfynydd and Oldbury), Berkeley and Bradwell began producing electricity for the national grid in 1962 All should be in operation by 1966 Sites for further stations are being investigated

Nuclear Reactors are pieces of apparatus designed to permit nuclear chain reactions to occur under controlled conditions (Uncontrolled chain reactions are dangerous, *e g*, atomic bombs) The success of a reactor depends on the neutrons reaching the U^{235} nuclei to produce more fissions and not being wasted in irrelevant processes or simply escaping through the wall of the apparatus (neutrons are quite difficult to contain) The neutrons leaving the scene of fission are rapidly moving, and they stand more chance of causing another fission if they are slowed down. Consequently a material other than the uranium has to be present to facilitate this, and it is called a moderator A useful moderator is pure graphite Thus a reactor may consist of alternate blocks of uranium and graphite. If the reactor is too small so many neutrons escape that there are not enough to keep the chain reaction going The reactor must therefore be greater than a certain *critical size* In order to intensify or damp down the chain reaction, it is arranged for pieces of neutron-absorbing material, such as cadmium, to be inserted or withdrawn as required While the chain reaction is proceeding countless numbers of fissions are occurring, each one liberating energy which turns into heat. The temperature therefore increases, and to prevent a catastrophic rise, cooling has to be provided. The reactor therefore has cooling pipes through which a fluid coolant is pumped. The coolant carries the heat away and, in a reactor designed to produce electrical power, the heat is taken to steam-raising boilers and the high-pressure steam is led to turbines which drive the electric generators. What has been briefly described is the type of reactor first used for serious power production at Calder Hall This is a graphite-moderated, gas-cooled reactor using as fuel natural uranium (*i e*, fissile U^{235} greatly diluted with U^{238}) It is also possible to make reactors work without slowing the neutrons with a moderator, these are called *fast reactors* Britain, the U S A. and the U S S R. have the fast reactors under observation or construction That at Dounreay in Scotland was the first in the world to produce electricity on a commercial scale (1962) It is a fast-breeder reactor using liquid metal (sodium-potassium alloys) as coolant It is expected that reactors of the Dounreay type will become an integral part of the electrical power grid by the late 1970s The Americans have had spectacular successes with their nuclear-powered submarines, proving that it is quite practicable to use reactors in propulsion plant. The Russian ice breaker, *Lenin*, has three reactors for motive power A merchant ship of 21,000 tons made her maiden voyage in Aug 1962 and its 20,000-h.p turbine is driven by steam from a nuclear heater This ship, the American n s *Savannah*, is the first nuclear cargo ship, and it raised and solved many new problems of marine engineering Nuclear-propelled ships, and for that matter, nuclear power-stations, are not necessarily economic propositions The *Savannah* certainly is not and the British nuclear electricity production, with several stations in operation or under construction, will be hard put to it to compete successfully with conventional methods *so long as coal and oil are plentiful* It is in the more remote future that nuclear power will become indispensable, and in this context *nuclear fusion* (*q v*) is important

Nucleic Acids. Living matter is built up of cells each of which has a nucleus surrounded by cytoplasm Cell nuclei are composed chiefly of substances called nucleoproteins, which consist of a protein attached to a nucleic acid (this original name is still used, although nucleic acids are found in the cytoplasm as well as the nucleus) Nucleic acids are complex organic structures made up of chains of compounds called nucleotides (**F20 (2).** Nucleotide molecules have a sugar group attached to a nitrogenous base and a phosphate group Only two sugar groups are found in the nucleotides, ribose, giving rise to ribonucleic acids (R N A.s, found mainly in the cytoplasm) and deoxyribose, which forms deoxyribonucleic acids (D.N A s, found mainly in cell nuclei) Seven different nitrogenous bases have been isolated, so that a number of different nucleotides are possible A repeating, regular pattern of nucleotides is linked by the phosphate groups, forming nucleic acids The functions of nucleic acids are of fundamental importance They are concerned in the process of transmission of inherited qualities in reproduction and in building up body proteins Lord Todd of Cambridge University was awarded the 1957 Nobel Prize in Chemistry for his work on the structures of nucleic acids, the 1962 Nobel Prize in Medicine (*see* **L126**) was awarded for the discovery of the molecular structure of D N A *See* **F20 (2).**

Nuncio, a permanent official representative of the Holy See at a foreign court Nuncios were permanently established during the 16th cent

Nuremberg Trial. On Nov 21, 1945, an International Military Tribunal, consisting of one American, one British, one Russian, and one French member, began the trial of twenty-four Nazi leaders There were four counts the conspiracy of Nazism, wars of aggression; war crimes; and crimes against humanity. Twelve were condemned to hanging of whom

ten were hanged on Oct 16, 1946. Goering committed suicide; Bormann has never been found. Papen, Schacht, and Fritsche were acquitted. The rest received varying terms of imprisonment.

Nuthatch, name of a number of tree-creeping birds, plump, with short tail, bluish-grey plumage, and black stripe under eye. Nest in holes and wedge nuts in bark of trees, hammering them to get a kernel. There are three European species, one, *Sitta europaea*, resident in England.

Nutmeg, the kernel of the stone of a tropical fruit, used as a spice and is highly aromatic.

Nylon, a generic term for any long-chain synthetic polymeric amide which has recurring amide groups as an integral part of the main polymer chain, and which is capable of being formed into a filament in which the structural elements are orientated in the direction of the axis. The first nylon of commercial interest was made in 1935, and the world's first nylon factory—in the United States—began production in 1940.

O

Oak, a tree of the genus *Quercus*, including some 300 species distributed over the northern hemisphere and into the tropics. Two species are native to Britain, where the oak is the commonest tree (1 in 3)- *Q petraea*, more common in the west and north on shallower, lighter soils, and *Q robur*, more common in the south on deeper, heavier soils. Oak timber is much prized for its strength and durability, and from the time of the Spanish Armada to Nelson's day was in great demand for naval construction. It has always been used for building, flooring, furniture, and cabinet work. The oak is attacked by many insects, the round nut-like oak galls, or oak-apples, being produced by the sting of certain minute gall wasps.

"Oaks," the name of a famous race for three-year-old fillies run at Epsom two days after the "Derby."

Oakum, loose hemp and untwisted ropes, in the preparation of which prison labour used to be used in England.

Obbligato, originally, as the name suggests, a part which must be played (= obligatory). Now, by a curious misuse of the word, a part which need not be played, *e g*, a "violin obbligato"—additional to the pianoforte accompaniment and may be omitted if desired.

Obelisk, a tapering monolithic column, square at the base and pyramidal at the top, regarded by the ancient Egyptians as a sacred stone and usually found at the entrance to the sun temples. Many were transported from Egypt and set up at various times there is one in the Place de la Concorde in Paris, and one on the Thames Embankment in London—Cleopatra's Needle—originally erected at Heliopolis, centre of the sun-cult, by Tuthmosis III about 1500 B C.

Obi, the Japanese name for a coloured sash commonly worn by Japanese women, and tied with a large bow at the back of the waist.

Oblation, a gift offered in worship, referring especially to the bread and wine offered to God in the Eucharist.

Oboe, (old spelling: hautbois). A reed wood-wind instrument rather similar to the clarinet in appearance, but having a double reed. The tone of the oboe is more thin and penetrating than that of the clarinet. The tenor oboe is called the Cor Anglais, while the bass oboe is the Bassoon. There is also a "double-bass" oboe called the contra-bassoon.

Observatories existed in ancient Babylon and Egypt. They were erected on tombs and temples. The most famous observatory of Egypt was that of Alexandria, erected by Ptolemy Soter, 300 B C. It was not until the 16th cent, however, that an observatory adequately equipped for astronomical investigations was built. This was at Cassel. Tycho Brahe's observatory at Uranienburg was erected in 1576. The Royal Observatory at Greenwich was completed in 1675. Mount Wilson Observatory in California has had a 100-in. reflector telescope working since 1917 but Mount Palomar Observatory, also in California, has a 200-in reflector—the largest in the world, completed in 1949—which can reveal remote galaxies out to a limiting distance of 2,000 million light years. It is known as the *Hale* telescope in memory of Dr George Ellery Hale, the founder of the Mount Wilson Observatory. A 98-in telescope, the *Isaac Newton*, is being installed at the new Royal Greenwich Observatory at Herstmonceux Castle. A number of observatories are devoted to meteorological and geophysical work, the most important in the British Isles being those at Eskdalemuir (Dumfries), Kew, Lerwick, and Valencia (Eire). *See also* **Astronomy** *and* **Telescopes.**

Obsidian, a form of volcanic rock of vitreous structure, and usually a silicate of aluminium, lime, magnesium, etc. Produced when acid lavas are rapidly congealed, it is usually black and fractures like pitch.

Ocarina, a simple kind of musical instrument usually made of terra-cotta. The whistle mouthpiece is at right angles to the bulbous body, in which are a number of finger-holes. The tone resembles that of a mellow flageolet.

Occam's Razor. *See* **J32.**

Occultation, in astronomy, refers to the concealment of a celestial body by the passing before it of some other heavenly body. The most frequent occultation is the eclipse of a star or planet by the moon.

Ocean comprises the great body of water which covers five-eighths of the surface of the earth, and has an average depth of 2 miles. The principal oceans are the Pacific, Atlantic, Indian, and Arctic. *See* **F9.**

Ocean Currents are well-defined streams running over certain portions of the ocean and caused mainly by wind friction, slope of the sea surface and differences in density of the water, all movements being influenced by the deflective forces due to the earth's rotation. The climatic importance of the great ocean currents is that they constitute one of the means whereby heat is transferred from lower to higher latitudes.

Ocelot, the most common wild cat of S America. It is about 4 ft in length, including tail, and of a grey or tawny colour and spotted. Closely related to the Leopard cats.

Octane Number, the index of the knock-rating of petrol. It is based on the arbitrary scale in which iso-octane (which does not cause "knocking") has a value of 100, and normal heptane (which is prone to "knocking") has a value of 0. A good fuel for modern cars must have an octane number greater than 80.

Octarch, the kings of the English heptarchy, Hengist (455) being the first, and Egbert (800) the last.

Octave, an interval of an eighth (*see* **Interval**). The interval between one note and the same note pitched higher. A pure note is an air vibration of fixed frequency. Middle C is thus 256 vibrations per second. The note an octave above middle C is exactly twice this frequency, *i e*, 512 vibrations per second.

Octet, a musical composition for eight voices or instruments.

October, the 10th month, but the 8th in the old Roman calendar. It was held sacred to Mars.

Octopus, a genus of marine molluscs with eight tentacles that bear suckers.

Odyssey, Homer's famous epic poem setting forth the incidents of the wanderings of Odysseus on his way back to Ithaca after the Siege of Troy. *See* **H34.**

Oecumenical Council, a general council of the Christian Church summoned when important questions of Church doctrine and policy are to be decided. The early councils were predominantly Greek and convoked by the emperor. Those summoned by the pope when they meet at the Lateran Palace in Rome are called Lateran Councils, others have met at Constance, Florence, Trent, and the Vatican. Their decisions are not binding on the rest of Christendom. Only 21 Oecumenical Councils have been held in the history of Christendom. The first was held at Nicaea in 325 when the mystery of the Trinity was defined. The 21st (known as the 2nd Vatican Council) opened in Oct 1962 in St Peter's, Rome, on Dec 8 it went into recess until Sept 8, 1963.

Oeil-de-boeuf, meaning bull's eye, is the name of a small octagonal vestibule lighted by a small round window in the palace of Versailles. The

term is used in architecture for a small round or oval window in friezes, roofs, or domes of buildings.

Ohm's Law, was propounded by Dr G S. Ohm in 1827 and now usually expressed in the equation: voltage = current (in amps) × resistance (in ohms). The *ohm* is the practical unit of electrical resistance *See also* **N12 (2).**

Olbers' Comet was discovered in 1815 by Olbers the German astronomer. Olbers also discovered the asteroids Pallas and Vesta (1802–07)

Old Red Sandstone, the continental rocks formed during the Devonian. *See* **F30.**

Olefines, a series of hydrocarbons, in which the hydrogen atoms are double the number of those of carbon. The first member of the series is ethylene.

Oleic Acid, an important fatty acid present in lard and olive- and cotton-seed oils Used in soap-making Olein is the ester formed by the reaction of oleic acid and glycerine.

Oléron Laws or Judgments, were a code of maritime laws, introduced into England in the reign of Richard I in the 12th cent Oléron is an island off the west coast of France, opposite the mouth of the Charente

Olive. This small tree, whose fruit yields olive oil, is a native of the eastern Mediterranean countries, but has been introduced into cultivation elsewhere Its oil is used for cooking, in packing sardines, and in soap making, the green unripe fruit is pickled for table olives.

Olympiads were periods of four years which elapsed between each celebration of the Olympic games, instituted in honour of Zeus by the Greeks, and held at Olympus in the Peloponnesus These festivals included competitions in literature, art, drama, rhetoric, music, and gymnastics, and they were continued, with intervals, from 776 B C to A D 394 Athletic revivals have taken place at Athens 1896, Paris 1900, St Louis 1904, London 1908, Stockholm 1912, Antwerp 1920, Paris 1924, Amsterdam 1928, Los Angeles 1932, Berlin 1936, London 1948, Helsinki 1952, Melbourne 1956, Rome 1960, and it is planned to hold the 1964 Olympic Games in Tokyo *See* **U36** for 1960 Results

Onyx or **Sardonyx,** a variety of chalcedony built up of different-coloured layers, which are parallel and straight (not curved as in agate).

Oolite, a geological term for the Jurassic oolitic limestones existing through a long stretch of country extending from Yorkshire to Dorsetshire It abounds in fossils of molluscs and reptiles The term "oolite" derives from the fact that these rocks are made of egg-shaped particles of calcium carbonate

Opal, a mineral consisting of hydrous silica, occurring in numerous varieties and colours Precious opal displays a beautiful internal opalescence, the result of the interference of light waves on the surfaces of layers differing in their water-content Opal miners are called gougers Chief source, the Andamooka and Coober Pedy fields of South Australia

Opera derives, like drama, from the religious plays of mediaeval times These plays were always accompanied by music, but, whereas drama has relegated music to the entr'acte, opera has developed it to the point of being the most important feature of the performance. The first true opera was produced at Florence in 1597. It was written by Rinuccini and composed mainly by Peri and called *La Dafne* Rinuccini and Peri followed this in 1600 with *Euridice*—the earliest opera of which we have a complete record The first opera house was opened in Venice by Cavalli in 1637 Cardinal Mazarin tried to introduce Italian opera into France, bringing in Cavalli in 1660, but the experiment was a failure Native French opera began in 1672 under the patronage of Louis XIV with Lulli's *Les Fêtes de l'Amour et de Bacchus.* In England musical plays were being performed at this time, but the first real opera was Purcell's *Dido and Aeneas* written in 1680 At this time Scarlatti was writing operas in Naples and shaping the Italian opera into the form in which we know it to-day Handel produced nearly forty operas in thirty years, his first being *Rinaldo* at the Haymarket, London, in 1711. The comic opera seems to have originated in Naples. The first English comic opera, the *Beggar's Opera* by Gay, was given in London in 1727. Mozart, after producing his magnificent *Idomeneo* at the age of 25, wrote a succession of comic operas *Seraglio* (1782), *Figaro* (1786), *Don Giovanni* (1788), *Così fan tutte* (1790) These laid the foundations for all future comic opera. *The Magic Flute* (1791) was the first of what might be called "opera for the people" Beethoven made a single excursion into opera *Fidelio* (1805). Rossini is best known for *The Barber of Seville* (1816), a comic opera, although his reputation was made with a serious opera *Tancredi* (1813) The operas of Bellini are rarely performed outside Italy, but these had considerable influence on the work of Chopin and Liszt Bellini's successor Donizetti is best known for his comic operas *Don Pasquale* and *L'Elisir d'Amore* This period in French opera is best represented by Auber's *Fra Diavolo* German opera, slow to take root, developed at this time through Weber and Meyerbeer to Wagner, whose first important opera, *Rienzi*, was performed in 1842. The complete *Ring* was first given at Bayreuth in 1876 and Wagner's last opera, *Parsifal*, in 1882 The most successful exponent of comic opera at this time was Offenbach, although Strauss in Vienna and Sullivan in England enjoyed considerable local success Italian opera underwent a revival with the advent of Verdi Of his earlier operas, *Rigoletto* (1851), *Il Trovatore* (1853) and *La Traviata* (1853) alone have retained their popularity *Aida* (1871) is a more mature work, while *Otello* (1887), and *Falstaff* (1839), for which Boito wrote the libretti, are works of high merit Several French operas of this period retain their popularity Gounod's *Faust* (1859), Bizet's *Carmen* (1875), Massenet's *Manon* (1884), Saint-Saëns *Samson et Dalila* (1877) In 1890 Mascagni achieved startling success with *Cavalleria Rusticana* This was followed almost immediately by Leoncavallo's *I Pagliacci* and the two are now inseparable Of the operas produced in the 20th cent, the most popular have been Puccini's *La Bohème* (1896), *Tosca* (1900), *Madame Butterfly* (1904), Richard Strauss's *Der Rosenkavalier* (1911) and Debussy's *Pelléas et Mélisande* (1902)

Ophicleide, a brass instrument invented in the 19th cent Mendelssohn and Berlioz wrote scores for the ophicleide, but the instrument has fallen out of general use

Opium was known to the ancients, and used by them as a medicine It is obtained from the poppy (*papaver somniferum*), the unripe "head" or seed capsule of that flower yielding a juice which when dried becomes the opium of commerce The poppy is cultivated in India, Persia, Turkey, Macedonia, and China for the sake of this juice, which yields various alkaloids, such as morphine, narcotine, codeine, etc In Europe the drug is mainly used medicinally *See also* **P23(1)**

Opossum, marsupial mammals found in the more southerly of the United States, South America, and Australasia. They are arboreal except for the water-oppossum, which eats fish

Optics, the branch of physics which investigates the nature and properties of light and the phenomena of colour Burning lenses were known to the ancient Greeks and Ptolomy wrote a treatise on optics A D 150 Lenses as visual aids were known in ancient China but eyeglasses were not in use until the 13th cent. Spectacles were in more general use after the invention of printing in the 15th cent. The camera obscura was invented in the 16th cent. and the telescope and microscope at the beginning of the 17th cent.

Opus, a single work of serious music Most serious composers list their works in this way; *e g.*, Opus 1, Opus 2, etc If several pieces are included in a single opus they are listed as follows: Opus 1, No. 1.

Oracles were in ancient times supposed to be words spoken by the gods, and it was the custom on important occasions to consult them about the future. The Greeks had the Oracles of Zeus at Dodona, and Apollo at Delphi, while the Romans consulted the Oracles of Mars, Fortune, and others.

Orange, a fruit growing in most sub-tropical

climates and in universal demand. It is grown on an evergreen tree that attains a height of about 20 ft. at maturity.

Orang-utan, one of the largest of the anthropoid apes, found only in Borneo and Sumatra. When full-grown it stands over 4 ft. in height and weighs about 150 lb

Oratorio, a sacred work for solo voices, chorus, and orchestra The word applies to a special composition and not to a musical setting for a normal part of the church service.

Orchestra, a group of instruments and instrumentalists whose playing is under the direction of a conductor The composition of a typical symphony orchestra is as follows STRINGS 1st Violin (16), 2nd Violin (16), Viola (12), Violoncello (12), Double Bass (8). WOOD-WIND Flute (3-4), Piccolo (1), Oboe (3), Cor Anglais (1), Bass Oboe (1), Clarinet (3), Bass Clarinet (1), Bassoon (3), Contra-bassoon (1) BRASS Horn (6), Trumpet (5), Trombone (3-4), Tuba (2). PERCUSSION: Timpani (3-6), Side Drum (1), Bass Drum (1), Cymbals (1), Harp (2)

Ordeals, or Trials by Ordeal, were known in England in the time of the Saxons, and existed down to 1218, when they were abolished The ordeals were usually of fire, water, or poison The accused would be set to handle red-hot iron, be cast into water, or made to partake of poison, and unless he could withstand these tests he was condemned as guilty

Orders, Holy, in the Roman Catholic Church are of seven kinds, extending from door-keepers, exorcists, readers, and acolytes, in the minor class, to deacons, priests, and bishops of major rank, while in the Anglican Churches there are only three—deacons, priests, and bishops

Orders in Council are issued by the sovereign on the advice of a few selected members of the Privy Council They must not seriously alter the law of the land Another class of Orders in Council are issued by authority of an Act of Parliament for the carrying out of its provisions

Ordination, the ceremony of installing ministers or clergymen in clerical offices, has existed from the earliest times In the Anglican and Roman Catholic Churches the rites of Ordination are performed by bishops, among Nonconformists the power of ordination rests with the governing bodies of the different Churches

Ordnance Office was an old Government department entrusted with the supply of weapons and materials of war from the time of the archers to the days of guns and explosives After the Crimean campaign, when the administration of the Ordnance Board was shown to be very defective, the office was abolished, and its duties vested in the War Minister

Ordnance Survey, an authorised survey of Great Britain entrusted to a special body of Royal Engineers and civilian experts, by whom maps and charts are from time to time produced, showing the full details of the geographical, geological, and industrial condition of the country The scale adopted for counties is 6 in. to 1 mile, and 1 in to 1 mile for the general map of the kingdom The Ordnance Survey Department now comes under the Ministry of Agriculture, Fisheries and Food.

Organ is a musical wind instrument of ancient origin whose tones are produced by the vibrations of air in pipes of varying length Basically, an organ consists of a number of pipes grouped in rows or ranks according to their special tone-character. The air is fed by bellows or, in modern organs, by a rotary fan, electrically driven Each rank is controlled by a slider, and the knob that controls the slider is called a stop The organist pulls out the stops to give the tones he wants, the other pipes being kept out of action by the slider When a particular note on the keyboard is depressed the player may hear, by pulling out the appropriate stop, not only the normal pitch but the note in several octaves A stop of which the notes are of normal pitch is called an 8-foot stop, a 16-foot stop would give an octave lower, a 4-foot stop an octave higher, and a 2 foot stop two octaves higher. The hand keyboard is called a manual, and the foot keyboard the pedal board. The basic tone of an organ is its diapason tone, and is normally of 8-foot length and pitch Most large organs have four manual keyboards and one pedal board The most important manual is the great organ which comprises the majority of basic stops The next in importance is the swell organ, so called because the pipes are enclosed in a box fitted with movable shutters operated by a swell-pedal The effect provides a controlled crescendo or diminuendo The tone of a typical English swell has a reedy character The third manual controls the choir organ—a collection of stops suitable for vocal accompaniment The fourth manual controls the solo organ—a group of stops which, singly or in combination, may provide a solo melody which the remainder of the organ accompanies. The pedal keyboard controls most of the bass stops. In some very large organs there is a fifth manual controlling the echo organ. This is a small group of stops usually set high in the roof of the building to give the effect of distant music Most church organs have two or three manuals Modern cinema organs may have some normal stops but rely chiefly on a number of effects unknown to the straight organ.

Orguinette, a musical instrument composed of reeds which are played upon by a bellows. A strip of paper passes over the holes of the reeds, moved by a crank, and the paper is cut into holes to represent the required sounds As the rollers turn the bellows the melody is "ground out"

Oriel Window is a window projected from the front of a building, rectangular, triangular, or pentagonal The ordinary bay window and bow window are varieties of Oriel. When an Oriel window does not reach to the ground it usually rests upon moulded sills supported by corbels

Oriflamme, the name of the original banner of the abbey of St Denis, and adopted by Louis VI as his standard It remained the national emblem of France for three centuries The flag was of red silk, the outer edge being cut in the form of flames

Original Sin, according to Christian doctrine the corruption that is born with us, as a result of Adam's fall

Orioles, brilliantly coloured birds, members of the passerine family *Oriolidae*, found in the tropical regions of Asia, Africa, and Australia The golden oriole, perhaps the most beautiful of them all, with brilliant yellow plumage, black wings and tail, winters in Africa, visits England, and is known to have nested here

Orion, a famous constellation of the heavens, comprising nearly a hundred stars, all visible to the naked eye It contains three stars of the second magnitude in a line, and these are called "Orion's Belt"

Ormer, a shellfish (*Haliotis tuberculata*) which occurs in the Channel Islands and on parts of the French coast It is considered a great delicacy

Ornithology, the scientific study of birds

Ornithorhynchus. *See* **Duck-bill**

Orogeny, large-scale earth movements, including faulting and folding and sometimes igneous activity, which produce a linear belt of mountains, *e g*, the Alpine orogeny in Europe which produced the Alps

Orphism. *See* **J33, H117-128.**

Orphrey, the name of an ornamental border of gold and silver embroidered on ecclesiastical vestments

Orrery, an instrument used in the 18th and early 19th cent which showed the motions of the planets round the sun and the satellites round their primaries The first orrery made was named after Charles Boyle, Earl of Orrery

Orthodox Eastern Church. *See* **J33.**

Orthoptera. The large order of insects including grasshoppers, crickets, locusts, mantises, stick insects, cockroaches, etc. These insects have biting mouth parts, and wings, if present, are in two pairs, the front pair being hardened to protect the membranous hind wings which are folded under the front ones when at rest

Osborne House, near Cowes, in the Isle of Wight Queen Victoria's favourite winter-residence, and where she died It was given to the nation by Edward VII, and is now a convalescent home.

Osier, a species of willow growing in damp soils and yielding branches utilised in basket-making.

Osmium, a very hard, bluish-white metal, symbol Os, of the platinum group and one of the heaviest of known metals. It is obtained from certain sands of South America, California, Australia, and Russia. The alloy of osmium and iridium (osmiridium) provides long-wearing tips for gold fountain-pen nibs

Osmosis, The process by which absorption of liquids through semi-permeable membranes takes place A solution exerts osmotic pressure (O P.) or suction in proportion to concentration but also depending on kind of dissolved substance The roots of the higher plants are covered with fine root-hairs, within the cell-walls of which the sap is normally of a higher concentration than the dissolved matter in the surrounding soil The root-hairs, therefore, draw into themselves these weaker salt-solutions (The explanation of water and salt exchanges is complicated by the selective ability of some cells (*e g* , roots) to accept or reject particular dissolved substances along with the water. The absorption of salts by a plant is selective, each plant selecting through the semi-permeable membranes of its root-hairs those substances which are most suited to itself)

Osprey (*Pandion haliaëtus*), a large and magnificent bird of prey, dark brown above and nearly white below. The head is whitish with a dark band from eye to nape. To the British Isles it is a rare passage migrant In 1959, thanks to the energy and vigilance of the Royal Society for the Protection of Birds, a pair nested in a Scots pine in Inverness-shire and reared three young. In 1960 two more flew from the same eyrie and three more in 1961 The food consists almost entirely of fish, which the bird seizes with its talons The so-called osprey plumes do not come from this bird but from the egret

Ostrich, the largest living bird, related to the rhea, emu, and extinct moa, now found only on the sandy plains of Africa and parts of S.W. Asia The male has beautiful white plumes on wings and tail The wings are useless in flight, but the birds have a fleetness of foot exceeding that of the swiftest horse An ostrich's egg weighs 3·lb

Otary, any seal which has external ears (as opposed to the *true seals* which lack them) The eared seals make up the family *Otariidae*, which includes the Sea-Lion and the Fur-seal of the N. Pacific.

Otter, an aquatic carnivorous mammal widely distributed over Europe, and at one time very common in England and Wales Otter hunting, indeed, is still a country sport in some districts, and a breed of dogs called otter-hounds is kept for the purpose. The otter averages about 2 ft in length, exclusive of tail, has web-feet, and is a very expert swimmer.

Ounce, a carnivorous member of the cat family, spotted like a leopard and having a long bushy tail. It is only found at high altitudes on the Himalayas, and is often called the "snow leopard"

Outcrop. Where a bed of rock appears at the surface of the ground, there is an outcrop of the particular rock Outcrop coal is surface coal, the mining of such coal is called open-cast mining

Overture, introductory piece to an opera or oratorio, often including the main themes to be elaborated later. Many so-called overtures have been composed as separate concert pieces.

Oviparous, a zoological term referring to animals which lay eggs to be hatched outside the body of the parent

Ovipositor, the organ by means of which female insects lay their eggs

Owls, nocturnal birds of prey, distributed over the greater part of the world. Their forward-looking eyes, embedded in rings of feathers, give them a characteristic "owl-like" appearance, and their plumage, usually a mottled blend of browns and greys, is so soft that their flight is almost noiseless Owls live on small mammals, reptiles, birds, insects, and fish, and are very valuable birds to the farmer. British owls include the barn owl (screech owl), short-eared owl, long-eared owl, tawny owl, little owl

Ox, the popular name of the mammals included in the genus *Bos* They are hollow-horned ruminants and hoofed quadrupeds, and include the various classes of domestic cattle as well as the different wild species. The adult male is called a bull, the female a cow, and the young a calf. The best-known breeds of domesticated cattle are the Durham or Shorthorn, the Angus, the Jersey, Ayrshire, Suffolk, and Hereford.

Oxalic Acid, an organic acid obtained from numerous plants, such as sorrel and rhubarb, and produced artificially for commercial purposes from sawdust, treated with caustic potash or caustic soda. It combines with metals to form oxalates, used in the manufacture of ink.

Oxford Clay, a geological formation consisting of a bed of blue clay hundreds of feet thick, and forming the lower portion of the Upper Jurassic. It makes good bricks

Oxford University. The early history of the university is obscure. There was a school at Oxford as early as 1115 and it is known that Robert Pullen, a theologian from Paris, lectured there in 1133. Allusions to Oxford as the most celebrated centre of learning in England occurred in a work of Gerald of Wales in 1184–5 The earliest colleges to be founded were University College (1249), Balliol (about 1263), Merton (1264) In 1571 the university was reorganised and granted a Charter of Incorporation by an Act of Elizabeth Other colleges, halls, and societies with their dates of foundation are· All Souls (1438), Brasenose (1509), Christ Church (1546), Corpus Christi (1517), Exeter (1314), Hertford (1874), Jesus (1571), Keble (1868), Lincoln (1427), Magdalen (1458), New College (1379), Oriel (1326), Pembroke (1624), Queen's (1340), St Edmund Hall (1270), St John's (1555), Trinity (1554), Wadham (1612), Worcester (1714), St Peter's Hall (1929), St Antony's College (1950), St Catherine's Society (1868), Campion Hall, St Benet's Hall, Mansfield College (1886), Regent's Park College, Greyfriars, Nuffield College (1937), and Linacre House (1962) The women's colleges are:- Lady Margaret Hall (1878), Somerville (1879), St Hugh's (1886), St Hilda's (1893), St Anne's (1952) Women were not admitted to degrees (though allowed to sit for examination) till 1920.

Oxygen is the most abundant of all terrestrial elements, symbol O In combination, this gaseous element forms about 46% of the earth's crust, one-fifth of the atmosphere, eight-ninths by weight of all water Joseph Priestley in 1774 was the first to separate it from red oxide of mercury. It is colourless, tasteless, and odourless, and forms the chief life-supporting element of animal and vegetable life.

Oyster, a bivalve mollusc, of the genus Ostrea, having very numerous species and abounding in nearly all seas. The shell is rough and irregular Oysters are exceedingly prolific, spawning in May and June. In England and Scotland deep-sea oysters are not allowed to be sold between June 15 and Aug. 4, and other kinds between May 14 and Aug. 4 In Ireland, no oysters may be taken between May 1 and Sept 1, except in certain waters The Whitstable oyster beds have existed since pre-Roman times. "clocks" are dead oysters

Oystercatcher, a wading bird with black-and-white plumage and long, orange bill, inhabiting estuaries and sea-shores Feeds on mussels, shell fish, etc., but not oysters.

Ozone, a modified form of oxygen, containing three atoms of oxygen per molecule instead of two. It is prepared by passing oxygen through a silent electric discharge. When present in air to the extent of 1 part in 4 million parts of air it kills bacteria, and has been used for this purpose in ventilating systems, *e g* , that of underground railways It is present in extremely small quantities in the lower atmosphere but is comparatively plentiful at heights of about 20 miles. The belief widely held that seaside air is particularly rich in ozone is untrue. As ozone absorbs ultra-violet light of certain wavelengths spectroscopic methods, involving the analysis of sunlight, are chiefly used in ozone determinations. *See also* **F43**(1)

P

Paca, a genus of large rodents found in Central and South America, and resembling the guinea-pig. It is of nocturnal habits, has a streaked and spotted fur, and lives on fruits and plants.

Pacific Ocean. The first European to recognise the Pacific as distinct from the Atlantic was the Spanish explorer, Vasco Nuñez de Balboa, who discovered its eastern shore from a peak in Panama in 1513 The first European to sail upon it was Magellan, who entered it by the strait that bears his name in 1520. Sir Francis Drake was the first Englishman to sail upon it in 1577 The world's greatest ocean depth (6,297 fathoms or just over 7 miles) was established by a British survey ship in 1962 in the Mindanao trench in the Philippine Sea

Pagan, a person who does not worship God; a heathen. The word is derived from the Latin *paganus* (a countryman or uncultivated person) In the Middle Ages the term was used largely to describe Mohammedans (Moors, Saracens, etc)

Pagoda, the name given in China, India, and other Asiatic countries to a high pyramidal tower, usually, but not necessarily, connected with a temple

Palaeontology, the science which is devoted to the investigation of fossils animal (palaeozoology) and plants (palaeobotany) By studying the markings and fossils of living things in the stratified rocks, palaeontologists have been able to establish with astonishing accuracy a record of the evolution of life through geological time The geologist at the same time with the evidence of the fossils has been able to work out the order and the age of the rocks *See also* **F29–31.**

Palaeotherium, a genus of extinct tapir-like animals of large size, discovered in the Paris basin and elsewhere, of the Upper Eocene Age

Palatinate, a term formerly applied to two German electorates or provinces, the Upper and Lower Palatinates. They are now provinces of Bavaria

Pale, the name given to the part of Ireland colonised by the English and comprising portions of the counties of Louth, Dublin, Meath, and Kildare The Anglo-Saxon rulers were styled " Lords of the Pale "

Palimpsests are ancient MSS or parchments which have been partly effaced and used for fresh writings Many valuable MSS. were thus lost, but sometimes the second writing has been washed out, enabling the original writings to be deciphered Among such restorations are a dialogue of Cicero's, a portion of a book of Livy, etc

Palladium, a scarce metallic element, symbol Pd, similar to platinum, with which it is usually found It is an expensive metal, with desirable properties as a catalyst in reactions involving hydrogen, since it has a remarkable capacity for absorbing this gas, for example, coal gas and air will inflame in the presence of palladium at room temperature It forms a silver-white alloy with gold, and this is used in some kinds of jewellery It is used in expensive watches to make non-magnetic springs

Pallium, a vestmental ornamentation of white wool presented by the Pope to archbishops on their appointment, and the sign of Papal confirmation

Palm, a large straight-trunked plant or tree common to tropical countries, and usually fruit-yielding, such as dates, coconuts, etc Many commodities useful to man are obtained from plants of the Palm family (*Palmaceae*)

Palm Sunday, the Sunday before Easter, upon which occasion it is customary to carry palms to the churches in some countries, in commemoration of Christ's entry into Jerusalem for the Feast of the Passover, when the people went forth to greet Him with palm branches

Panama Canal. In 1904 the United States signed a treaty with Panama (which had previously seceded from Colombia) by which rights of sovereignty over a strip of land ten miles in width, extending across the isthmus, were ceded to the U S The canal connects the Atlantic and Pacific Oceans, is just over fifty miles long (with sea approaches), and the width of channel varies from 300 to 1,000 ft at bottom. Transit from sea to sea occupies about eight hours. The depth varies from 41 to 85 ft. It is constructed above sea-level, with locks It has been available for commercial shipping since Aug. 3, 1914

Panda, *or* **Cat-Bear,** is related to the Raccoon, Dogs and the Bear. There are two kinds, the Red or True Panda, resembling a large domestic cat, which lives in the eastern Himalayas and S W. China, and the Giant Panda, which is more like a bear in appearance and inhabits the mountains of western China. Both frequent the dense bamboo forests of these regions

Pangolin, the scientific name of the " scaly anteater," a member of the armadillo family, found in Africa and Southern Asia It has an extensive tongue, covered with glutinous matter, which it uses in catching ants, its chief food When once caught on the tongue, the insects cannot escape When attacked the pangolin rolls itself into a ball, and its scales assume the form of sharp spikes *See* **Anteater**

Pantagruel, the leading character in one of the satires of Rabelais

Pantheon, the famous temple in Rome, originally consecrated to the gods, built by Agrippa in 27 B C and rebuilt in the 2nd cent by Hadrian Its splendid dome and portico make it one of the most interesting architectural monuments of ancient days Since the 7th cent, it has been used as a Christian church

Panther, another name for the leopard, *Panthera pardus*, related to the lion, carnivorous, active climber, found in India, and other parts of Asia, also in Africa

Papal Infallibility. *See* **J33.**

Paper has been known in one form or another from very early times The papyrus reeds of the Nile swamps served the ancient Egyptians for sheets upon which to inscribe their records The Chinese and Japanese, centuries later, were using something more akin to modern paper in substance, an Asiatic paper-mulberry, yielding a smooth fibrous material, being utilised. With the spread of learning in Western Europe the necessity of a readier medium made itself felt and paper began to be manufactured from pulped rags and other substances. The first known English paper-mill was Sele mill near Stevenage, built about 1490, which produced the paper for an edition of Chaucer in 1948 Other mills were set up under Elizabeth, using linen and cotton as raw material Other papermaking staples were later introduced, such as surat, esparto grass, and wood-pulp. The chief raw material in the world paper industry is wood-pulp, the main exporters being the timber-growing countries of Canada, Sweden, and Finland Canada is the world's chief producer of newsprint and supplies a large proportion of U S requirements

Papier mâché means pulped-paper and is a composition of paper pulp and other substances, to which, when moulded into form, coatings of japan, with gilt and coloured inlayings, are added. Elegant and decorative objects are made of papier-mâché A ceramic papier-mâché is very durable

Papyrus, the earliest known paper made in Egypt at a very remote period from a large species of reed, *Cyperus papyrus* This plant is to be found all over tropical Africa, especially in the " sudd " region of the White Nile

Parachute, the umbrella-shaped safety device used in emergency by the crew and passengers of aircraft The first parachute descent was made in 1797 by André Garnerin from a balloon *See also* **Parachute Jumping, U24.**

Paraclete (the Holy Ghost, or Comforter), the name used in the English translations of St John's Gospel, and adopted by Abelard to designate the convent in Champagne founded by him, and of which Héloïse became the abbess.

Paradise, a Persian word used by the translators of the Old Testament to designate the Garden of Eden, and since meaning any place of happiness

Paraffin, a mixture of hydrocarbons of higher boiling point than petrol. Paraffin was first obtained by distillation of coal, the process being discovered about 1830 About 1848, Mr James Young procured it from mineral oil, and Irish peat also yielded it. The main source of paraffin supply to-day is crude petroleum. It is largely used in the manufacture of candles, for waterproofing, and numerous other purposes.

Parakeets, various small parrots of vivid plumage native to Australia, Polynesia, Asia, and Africa.

One of the loveliest of the parakeets is the budgerigar of Australia. *See* **Z21, 23.**

Parallax, the change in direction of a body caused by a change in position of the observer. If the parallax is measured (in degrees of angle) and the distance between the two observation points is known the distance of the observed body can be calculated. The distance of heavenly bodies has been found this way. The first stellar distances were so obtained in 1838 by Henderson, Struve, and Bessel. Stellar distances are so great that even when the two observations are made at opposite points of the earth's orbit round the sun the parallax is always less than 1 0″ of arc *See* **Aberration.**

Parchment, made chiefly from the skins of animals, usually of goats and sheep, was employed in olden times before printing was invented and superseded papyrus as writing material. Vegetable parchment, invented by W E Gaine in 1853, though not equal in strength and durability to skin parchment, is about five times stronger than ordinary paper Vellum is parchment made from the skins of young calves or lambs.

Paris University, of which the Sorbonne forms a part was founded in 1256 and is one of the greatest educational institutions of Europe

Parliament, is the name given to the supreme legislature of the United Kingdom It consists of the Queen, the Lords spiritual and temporal, and the Commons. It meets in two houses the House of Lords (the Upper or Second Chamber) and the House of Commons It derives from the Anglo-Saxon *Witans* (*see* **Witan**). The Statute of Westminster (1275) first uses " parlement " of the Great Council in England, which comes from the French word meaning discourse *See* **Outline of Central Government, Section C,** *also* **D5**

Parliamentary Correspondents sit in the Press Gallery of the House of Commons and describe its proceedings for newspapers either by impressions or a summary of the debate

Parquetry, the name of a style of flooring consisting of small rectangular wooden blocks laid down according to geometrical pattern

Parrot, the popular name of a widely distributed family of tropical birds, including the African grey parrot, the green parrot of South America —both familiar cage pets in this country—and the various parakeets, cockatoos, macaws, lories, etc Many of these birds possess a remarkable gift of imitating sound, especially that of the human voice

Parsec, unit of distance used by astronomers for expressing distances between stars, equivalent to about three and a quarter light-years

Parthenogenesis. The development of animals from unfertilised eggs. The drones of the honey bee are parthenogenetic, and the phenomenon is also common among aphids

Parthenon, the famous Temple of Athena on the Acropolis at Athens, was built under the rule of Pericles between 447 B C and 432 B.C. It was made wholly of marble without mortar The famous sculptured friezes, known as the Elgin Marbles, are now in the British Museum.

Partridge, a well-known British game bird the shooting of which forms a considerable attraction to sportsmen in the season, which opens on Sept 1. Two species are common in Britain

Passeriformes, the order of perching birds which includes about half the known species.

Passport is an official document issued to a person by his own government, certifying to his citizenship and permitting him to travel abroad. Passports to British subjects are granted by the Foreign Office, authorise bearer to leave the country and guarantee him the state's protection. Fee £1 10*s* Valid for 5 years Renewable for a further period of 5 years for a fee of £1. A simplified form of travel document (British Visitors' Passport) was introduced in 1961 for British subjects wishing to pay short visits to certain foreign countries for a fee of 7*s*. 6*d*., valid for 12 months.

Paten, the dish used for holding the consecrated bread in the Eucharistic service.

Patricians, the aristocracy of ancient Rome

Paul's Cathedral, St., is the third cathedral church to be built on the site. It was preceded by a Norman building which was practically destroyed by the Great Fire in 1666. This followed a Saxon church which was burnt in 1086. The present building was designed by Sir Christopher Wren. The foundation stone was laid in 1675 and the structure was completed in 1710. It cost a little under £748,000. Its central feature is the dome, crowned by its cupola and lantern with the golden ball and cross It escaped serious damage during the air raids of the second world war, but many of the surrounding buildings were laid waste

***pC* Value,** introduced by Dr. C. L Whittles in 1935 as a measure of salinity of aqueous solutions (soil extract, irrigation water, etc.), defined as the negative logarithm of specific electrical conductivity in reciprocal ohms Alone or joined with *pH* (below) is useful as an index of osmotic pressure (*see* **Osmosis**) and related hindrance to plant growth resulting from excess of fertiliser or soil salts If manuring is balanced, growth is best about *pC* 3 3

Peacock, a bird of large size and beautiful plumage, its characteristic feature being a tail of brilliant " eyed " feathers, which it can erect and spread out, the males possessing resplendent feathering to a much greater extent than the females It is related to the pheasant, one species is found wild in the forests of India, and another inhabits Burma and the Malayan regions, in Africa there is the Congo Peacock.

Pean, a term in heraldry indicating one of the furs borne in coat armour, the ground of which is black, with ermine spots of gold.

Peanut, Ground Nut *or* **Monkey Nut.** A member of the pea family native to S America, but now cultivated in many parts of the world After pollination, the flower stalk bends down and buries the pod containing the peas (" nuts ") in the ground The oil from these " nuts " can be used for margarine manufacture

Pearl is produced by certain shelled molluscs, chiefly the oyster The inner surface of the shells of the pearl oyster yield " mother-of-pearl," and distinct pearls are believed to be morbid secretions, caused by some external irritation. Many fine pearls are found in the actual body of the oyster The Persian Gulf, Ceylon, the north-west coast of Western Australia, many Pacific islands, and the Gulf of Mexico are among the most productive pearl-fishing grounds In ancient times Britain was renowned for its pearl fisheries, the pearls being obtained from a species of fresh-water mussel. Western Australia has produced a 40-grain pearl, the finest the world has seen. The largest pearl ever found was the " Beresford-Hope Pearl," which weighed 1,800 grains, over six times as much as the oyster that produced it

Peat, decayed vegetable matter found mostly in marshy positions, and common in Ireland and Scotland Peat is coal in its first stage of development; burnt for fuel in many cottage homes

Peccary, a pig-like animal native to the Americas There are two species the collared peccary and the white-lipped peccary, the latter being a vicious and dangerous animal

Pelican, a genus of bird with long depressed bill pouched underneath so that it can hold a number of fish in reserve for future consumption It has immense wings and webbed feet

Pemmican, venison or other meat, sliced, dried, pounded and made into cakes, used by explorers and others when out of reach of fresh meat.

Penguin, a genus of flightless, fish-eating sea-birds of the southern hemisphere They are stout-bodied, short-necked, and of small, moderate, or large size. The Emperor and King Penguins make no nest but protect and incubate the single egg by carrying it in the down feathers between the feet and the body. Other species brood in the usual way and may lay as many as three eggs Penguins use their flippers for swimming under water All 16 species are bluish-grey or blackish above and white below They are very sociable and breed in colonies.

Penicillin. An antibiotic drug produced by the mould *Penicillium notatum*, and discovered by Sir Alexander Fleming in 1928. It is one of the most effective chemotherapeutic agents known The mould produces a number of penicillins, all of which are effective antibiotics. *See* **P4(2), 9(1).**

Peninsular War lasted from 1808 to 1814. Fought

in Spain and Portugal (the Iberian peninsula) by the British, Spanish, and Portuguese forces, chiefly under Wellington, against the French. The latter were defeated.

Pentagon, government office in Washington (the largest in the world), housing many thousands of military and civilian workers in the War Department of the United States (Army, Navy, and Air Force).

Pentateuch, the first five books of the Old Testament—Genesis, Exodus, Leviticus, Numbers, and Deuteronomy.

Pentatonic Scale, the scale of five notes prevalent in Chinese, Japanese, Javanese, and some Negro music. Music based on the pentatonic scale is almost incomprehensible to an ear accustomed to the diatonic scale.

"Pepys Diary," by Samuel Pepys, was first published in 1825. The original MS is deposited at Magdalene College, Cambridge. The "Diary" gives a picture of the social life of the period between Jan 1, 1660, and May 31, 1669.

Perch, a well-known family of fresh-water fish, with dark striped sides. The common perch of British rivers and lakes falls an easy prey to the angler because of its voracity.

Percussion Instruments, a collective term covering the instruments of an orchestra that give forth sound when struck, *e g*, timpani, drums, cymbals, tambourine, triangle, glockenspiel. In some modern orchestral works the pianoforte is used as a percussion instrument instead of in its usual role as a solo instrument.

Perfumes are essences or odours obtained from floral and other substances. The chief flower perfumes are those obtained from rose, jasmine, orange flower, violet, and acacia. Heliotrope perfume is largely obtained from vanilla and almonds. Among the aromatic herbs which yield attractive perfumes are the rosemary, thyme, geranium, lavender, etc, while orange peel, citron peel, musk, sandalwood, patchouli, and other vegetable products are largely drawn upon. In recent times chemistry has been called into play in aid of the perfumer, and many of the popular perfumes of to-day are chemically prepared in simulation of the scents of the flowers or other natural substances the names of which they bear. *See* **Musk Deer.**

Periclase, a mineral form of magnesium oxide.

Perigee. The moon or the sun is said to be in perigee when it is at its least distance from the earth. The opposite of apogee (which see).

Perihelion. That point in a planet's orbit when it is nearest to the sun. The opposite of aphelion.

Peripatus, an animal which stands as a link between the annelid worms and the arthropods. Wormlike with short unjointed legs it breathes by a system of air tubes like those in insects. Certain other points of internal structure point to a relationship with annelid worms. There are some fifty species, the best known being the S African *Peripatus capensis*.

Perjury, the offence of giving false evidence. The ancient Romans threw the perjurer from the Tarpeian Rock, and after the Empire was Christianised, those who swore falsely upon the Gospel had their tongues cut out. The usual punishment in England from the 16th to the 19th cent. was the pillory, fine, and imprisonment.

Permian Formation, a group of rocks lying between the Trias and the Carboniferous strata. It has three subdivisions, Upper, Middle and Lower Permian. *See* **F30**.

Per Procurationem signature means that the subject of the correspondence has been put into the writer's care by his principal for him to use his personal judgment in the matter, and that he is authorised to sign on behalf of his principal. Normally contracted to *per pro* or *p p*.

Peruke, the name given to the wigs worn by men in the latter half of the 18th cent. The custom of wearing wigs was gradually superseded by powdering the natural hair. Wigs are still worn by the Speaker of the House of Commons, judges, and barristers.

Petrel, the name given to a member of a large, widely-distributed family of sea-birds of great diversity of size and colouring and distinguished by tube-like external nostrils. They usually skim low over the waves, and some, for this reason, are known as shearwaters. The storm petrel or Mother Carey's chicken occasionally patters along the surface, and is often called Little Peter—a reference to St. Peter walking on the water. Except when breeding, petrels are always at sea. They mostly nest in holes and crevices on islands and lay one egg, which is invariably white. The storm petrel, Leach's petrel, Manx shearwater, and the fulmar petrel are resident in the British Isles. *See also* **Mutton Bird.**

Petroleum, a mineral oil composed of a very complex mixture of hydrocarbons, occurring naturally in the earth and recovered from wells drilled often to several thousands of feet. Rarely the oil is under high pressure due to natural gas (*q v*) and may reach the surface as a gusher. More commonly the oil has to be pumped to the surface. The composition of the crude oil varies according to source and may be divided roughly into two types: paraffinous and naphthenic. The crude oil is subjected to fractional distillation which separates out the various grades of petroleum with their different boiling points. "Cracking" converts, by heating under pressure, oils of high boiling point into more volatile oils suitable for petrol engines. A great industry has grown up around petroleum, and the by-products, which used to be regarded as waste, form the basis of the modern synthetic-chemical industry (rubber, plastics, etc). Chief sources are U S A., Middle East, Caribbean, U S S R, and Eastern Europe. (*See* **K192–3**.) The oil is carried in pipe-lines sometimes for hundreds of miles from oilfield to port.

Pewter, alloy of tin and lead formerly much used for making household utensils and ornaments.

***pH* Value.** Introduced in 1909 by the Danish chemist Sørensen to indicate hydrogen-ion concentration on the basis of electrical conductivity and a view of ionisation since discarded, is now taken as a logarithmic scale of acidity or alkalinity of aqueous solutions: acidity 0–7, neutrality at 7 0, alkalinity 7–14. The *pH* of blood is about 7 6 (faintly alkaline).

Phalanger, pouched marsupial mammals. They are arboreal and superficially resemble squirrels. There are two genera of flying phalangers or flying squirrels, which have a remarkable membrane along each side of the body enabling the animals to glide through the air. The members of the phalanger family are confined to the Australasian and oriental regions.

Phalangid, a member, of the arachnid family Phalangida: popularly known as "harvesters".

Phalanx, a name applied by the ancient Greeks to a body of troops drawn up in close array, with overlapping shields, and eight, ten, or more rows deep. The Macedonians stood sixteen deep. A Greek phalanx consisted of 8,000 men.

Pharmacopoeia, an official publication containing information on the recognised drugs used in medicine. Each country has its own pharmacopoeia. The British Pharmacopoeia (B P.) is published under the direction of the General Medical Council. The Pharmaceutical Society issues the British Pharmaceutical Codex (B P.C), there is also an International Pharmacopœia (2 vols) which is issued by the World Health Organisation.

Pharos, the name of the first lighthouse, built by Ptolemy II about 280 B C., on the Isle of Pharos, at the entrance to the harbour of Alexandria. It was 600 ft. high, and one of the "seven wonders".

Pheasant, game birds related to the partridges, quails, peacocks, chickens, and turkeys, distinguished by their brilliant plumage and long tapering tail. First found by the Greeks in Georgia where the River Phasis flows through to the Black Sea.

Philippics, the orations delivered by Demosthenes, 352–341 B C, against Philip of Macedon—remarkable for their acrimonious invective. The word was also used for Cicero's speeches against Antony. In modern use, any impassioned invective.

Philosopher's Stone. *See* **Alchemy, J2.**

Phoenix, a fabled bird of Egyptian mythology.

Phosphorus is a non-metal element, symbol P. Most familiar as a waxy, yellow solid which is spontaneously inflammable in air. It has

chemical similarities to arsenic, like which it is very poisonous. It was discovered by Brandt in urine in 1669 It is found in most animal and vegetable tissues. It is an essential element of all plants and of the bones of animals. In combination with various metals it forms different phosphates, which are largely utilised as manures. The chief commercial use of phosphorus is in the preparation of matches.

Photoelectric Cell, a device which gives a useful electrical response to light falling on it There are several kinds depending on the different effects which light may have on a suitably chosen solid (usually a semiconductor), viz., the emission of electrons from the surface (" photoemissive cell "); change in electrical resistance (" photoconducting cell "), generation of electric current from a specially designed sensitive structure (" barrier layer " or " photovoltaic cell ", " solar battery ") Different cells respond differently to lights of various wavelength and must be chosen for each application. *See also* **Solar Battery.**

Photogrammetry, the science of measurement from photographs taken from an aircraft. Aerial photography has many uses and is of great value to military intelligence and for map-making

Photosynthesis *See* **F29 (1).**

Phrenology. *See* **J34.**

Phylloxera, a genus of plant-lice related to the aphids, which attacks the grape vine Many vineyards of France, in common with the rest of Europe, were replanted with native vines grafted on immune stocks from California in 1879 after being ravaged by the insect (which came from America) Curiously enough, the remedy also came from America, the vine stocks there being immune to *phylloxera*

Piano-Accordion, a small, portable reed-organ whose melody is played by the right hand on a short piano-type keyboard The left hand operates up to 120 stud-like bass keys, each of which produces a standard chord. The instrument is slung from a strap across the shoulders and wind for the reeds is provided by a central bellows operated by the movement of the left arm The piano-accordion is an Italian development of the older accordion or concertina

Pianoforte. Fundamentally a mechanical dulcimer whose hammers are operated from a keyboard, just as the harpsichord is a mechanical harp whose strings are plucked by quills operated from a keyboard. Historically, however, the pianoforte followed the harpsichord, on which it was regarded as an improvement. The name itself (piano-forte = soft-loud) was chosen to point out that the new instrument gave a much wider control of volume than did the harpsichord The pianoforte first appeared in the 18th cent. and its invention is generally attributed to an Italian, Cristofori, who produced an instrument called the " piano e forte " in 1711 England first saw the pianoforte in the 1760s Probably the most famous makers of pianofortes are Pleyel (France) and Blüthner and Bechstein (Germany). Good English pianos have been made by Broadwood, Collard, etc

Piccolo, a small flute with a high, piercing note When required, the piccolo is usually played by one of the flautists in an orchestra.

Picts, inhabitants of Scotland in pre-Roman times, are held by some historians to be a branch of the old Celtic race, by others to have been of Scythian origin They occupied the Lowland portion of Scotland, and were subdued by the Scots in the 9th cent Kenneth II, becoming king of the whole of Scotland

Pike, a familiar fresh-water fish abundant in the temperate regions of both hemispheres. It forms good sport for the angler in rivers and lakes, and sometimes attains a weight of from 20 to 30 lb. It is extremely voracious, is covered with small scales, and has a ferocious-looking head

Pilchard, a fish of the herring family, but with smaller scales and more rounded body. It appears off the Cornish coasts in vast shoals every summer.

Pilgrimage, the undertaking of a journey to a distant place or shrine to satisfy a religious vow or secure spiritual benefit, was resorted to in early Christian times The first recorded pilgrimage is that of the Empress Helena to Jerusalem in 326. In the Middle Ages pilgrimages became common, and were undertaken by monarchs and people of rank in all Christian countries. Moslems have been making pilgrimages to Mecca since the death of the Prophet, such duty being enjoined by the Koran Among the great centres of Christian pilgrimages are Jerusalem, Rome, the tomb of Becket at Canterbury, and the holy places of Lourdes and La Salette in France

Pilgrim Fathers, the 101 English Puritans, who, after living some years in exile in Holland, to escape persecution in their own country, set sail for America in the *Mayflower*, Sept. 6, 1620, landing at Plymouth, Mass , Dec. 4. They founded the settlement of Plymouth, and are regarded as the pioneers of American colonisation although 13 years earlier a small Virginian colony had been established.

"Pilgrim's Progress," Bunyan's famous allegory, written in Bedford gaol. The first part was issued in 1678 It is the greatest work of its kind. *See* **M12 (1).**

Pillory, a wooden instrument of punishment in use in England until 1837. It consisted of a pair of movable boards with holes through which the culprit's head and hands were put, and was usually erected on a scaffold. While a person was undergoing this punishment the mob generally pelted him with stones and rubbish, sometimes to his serious injury. People convicted of forgery, perjury, or libel were often condemned to the pillory, but from 1816 to 1837 the only offence for which it could be inflicted was perjury.

Pine, a conifer of the genus *Pinus*, which flourishes all over the northern hemisphere and includes 80–90 species, which afford valuable timber and yield turpentine and tar The Scots Pine, *Pinus silvestris*, with its blue-green, short needles, set in pairs, and its rosy-orange branches, is native to Britain, as it is to the whole of Europe It provides the red and yellow deal in everyday use

Pipa, a species of toad inhabiting Guiana, and not found elsewhere. It is of considerable size, and is remarkable for the fact that the female carries its eggs on its back until they are hatched, herself depositing them in that position. Generally known as the " Surinam toad."

Pitcairn Islanders were originally the mutineers of the *Bounty*. They took possession of the island in 1790, and it was not until 1814 that their whereabouts was ascertained, accidentally, by a passing ship The mutineers, under their leader, Adams, had settled down to a communal existence, married Tahitian women, and increased so in numbers that in the course of years they were too many for the island to support, and in 1856 they were removed by the British Government to Norfolk Island A small number returned to Pitcairn

Pitchblende *or* **Uraninite**, a relatively scarce mineral. It is nearly all uranium oxide, but lead, thorium, etc., are also present Pitchblende from Joachimstal in Czechoslovakia was the material in which radium was discovered by the Curies Pitchblende also occurs in Saxony, Rumania, Norway, Cornwall, the Congo, and at Great Bear Lake in Canada.

Plague. *See* **Black Death.**

Plainsong, a style of musical composition sung in unison (all voices singing the same tune without harmony), familiar in the Western Church from very early times and still performed, principally in the Roman Catholic Church Though restrained and contemplative in spirit, it is capable of expressing deep emotion

Planets, the name give to such celestial bodies as revolve round the sun in elliptical orbits The name was first used by the Greeks to indicate their difference from the fixed stars There are nine planets, Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus, Neptune, Pluto *See* **F7.**

Plankton, a word which first came into biological use in 1886 to describe the usually microscopic plants and animals floating, swimming, and drifting in the surface waters of the sea. To be distinguished from *nekton* (swimming animals

like fishes and squids) and *benthos* (plants and animals living on the sea bottom, like fixed algae, sponges, oysters, crabs, etc.). Of great economic importance, providing food for fish and whales.

Plantagenets, the kings who reigned in England between 1154 and 1485 and included the Houses of Lancaster and York. More correctly they are styled Angevins, from Anjou, of which Geoffrey, father of Henry II, was Count, and whose badge was a sprig of broom (*planta genista*).

Plasma Physics is the physics of wholly ionised gases, *i.e.*, gases in which the atoms initially present have lost practically the whole of the electrons that usually surround their nuclei, so that the gas consists of a mixture of two components, positively charged ions and negatively charged electrons. The problems to be solved in the controlled release of the energy of fusion reactions are problems in plasma physics. A new professorship of Theoretical Plasma Physics was established at Oxford in 1962 and research is carried out at the Culham Laboratory of the U.K.A.E.A. *See also* **Nuclear Fusion.**

Plastics, a broad term covering those substances which become plastic when subjected to increased temperatures or pressures. The Plastics Industry is based on synthetic organic examples of this group. There are two classes of plastics: the *thermoplastic*, which become plastic every time they are heated (*e.g.* cellulosic plastics) and *thermosetting*, which undergo chemical change when heated, so that once set they cannot be rendered plastic again (*e.g.* Bakelite). Plastics are usually made up of very long-chained molecules, *e.g.*, polyethylene.

Platinum, a metal element, symbol Pt. It is a scarce white metal generally allied with iridium, osmium, ruthenium, and palladium. It can only be melted in an oxyhydrogen or electric furnace, but can be rolled out into a film-like sheet, or drawn out to the finest wire; being resistant to acids it is termed a noble metal.

Platyheminthes *or* **Flat-worms.** *See* **F22(2).**

Plebeians were the ordinary citizens of Rome as distinct from the patricians. There was a long struggle between the two orders for political equality.

Pleiades, famous cluster of stars in the constellation of Taurus. Of the seven principal stars in the group, one is rather faint, and many myths have sprung up about this "lost pleiad".

Pleistocene the geological period that succeeded the Pliocene. It is supposed to have begun more than half a million years ago. During the Pleistocene, also known as the *Great Ice Age*, there were four cold periods, when the ice sheets covered northern Europe and N. America, separated by warm periods when the glaciers drew back into the mountains. *See* **F30, 31.**

Pliocene, the geological period preceding the Pleistocene, and the last major division of the Tertiary strata. It began about fifteen million years ago. *See* **F30.**

Plough Monday, the first Monday after the Epiphany, when in olden times the rustic population returned to work after the Christmas festivities.

Plover, wading birds, widely distributed over marshy places of Europe. Several species occur in Britain, including the Golden-plover, which breeds on the moors of Devon, Somerset, Wales, N.E. Yorkshire, and Scotland, and the Ringed plover, Kentish plover, and Dotterel.

Pluto, the last planet to be discovered: existence established by C. W. Tombaugh at the Flagstaff Observatory in Arizona in Jan. 1930 from reckonings made by P. Lowell in 1914. It is the most distant of all the known planets; diameter about 3,650 miles. Mean distance from the sun estimated at 3,671 million miles.

Plutonium, a chemical element, symbol Pu, capable of nuclear fission in the same way as Uranium 235. Not until after it had been synthesised in atomic piles during the second world war was it shown to occur in infinitesimally small traces in nature. Its synthesis in the atomic pile depends on the capture by Uranium 238 nuclei of neutrons, immediate product of this reaction is the element neptunium, but this undergoes rapid radioactive disintegration to plutonium.

Poet Laureate is the poet attached to the royal household, an office officially established in 1668, though its origins go back to the early Middle Ages, when minstrels were employed at the courts of English kings. Chaucer, Skelton, and Spenser, though not court poets, were all unofficial poets laureate. Ben Jonson has been described as the first "official laureate," but the office was not officially recognised until 1688, when Dryden was formally granted the office. It is customary for the poet laureate to write verse in celebration of events of national importance. John Masefield succeeded Robert Bridges as poet laureate in 1930.

Pogrom. Russian word meaning "destruction." First used to describe the Tsarist attacks on the Jews in 1881 in Russia. In 1938 Hitler ordered a general pogrom in Germany: all synagogues were destroyed and nearly all Jewish shops and homes, Jewish hospitals and children's homes suffered. During the subsequent war Jews of central Europe were systematically exterminated in cold blood by the Nazis.

Poitiers, Battle of, was fought on Sept. 19, 1356, during the Hundred Years' War, when Edward the Black Prince gained a complete victory over John, King of France, who was taken prisoner and brought to London.

Pole-Cat, an animal of a dark-brown colour, about 18 in. in length, exclusive of tail, the ears and face-markings are white or light brown. It is carnivorous and belongs to the weasel family. Like the skunk, it emits an offensive odour.

Pole-Star is of the second magnitude, and the last in the tail of the Little Bear constellation. Being near the North pole of the heavens—never more than about one degree from due north—it always remains visible in the Northern hemisphere, hence its use as a guide to seamen.

Police, a regular force established for the preservation of law and order and the prevention and detection of crime. The powers they have vary from country to country and with the type of government, the more civilised and democratic the state, the less police intervention. England, compared with countries abroad, was slow to develop a police force, and it was not until 1829 that Sir Robert Peel's Metropolitan Police Act established a regular force for the metropolis, later legislation establishing county and borough forces maintained by local police authorities throughout England and Wales. Up to that time police duties were discharged by individual constables and watchmen appointed by local areas in England and Wales. The existing organisation of police forces is complicated. There are at present 158 separate police forces in Great Britain: 125 in England and Wales, and 33 in Scotland. Those in England and Wales are.—

1. County forces, under a Joint Standing Committee (half the members from the county council and half Justices of the Peace).
2. Borough forces, under Watch Committees, elected by the borough councils.
3. Combined forces covering more than one county or borough, under a body representing the constituent areas.
4. The Metropolitan Police Force, covering a 15-miles radius from Charing Cross, under the control of the Home Secretary.
5. The City of London force, under a committee of the Common Council.

Pollution of the atmosphere is due chiefly to the incomplete combustion of fuels, especially coal, large particles of soot being deposited fairly quickly close to their place of origin and smaller particles (including smoke) remaining suspended in the air for a long time. Corrosion of exposed objects and damage to buildings result from the production of sulphuric acid. The introduction of more efficient furnaces, the washing of flue gases and the introduction of smokeless zones have assisted in the abatement of smoke and other forms of pollution. Estimation of polluting substances is carried out systematically in Great Britain by the Department of Scientific and Industrial Research, the dust and matter brought down with the rain being collected in large deposit gauges, automatic filters provide continuous records of the variation of the floating solid impurities; and apparatus is employed to measure the concentration of sulphur dioxide

Nuclear tests add to the load of pollution in the atmosphere (*see* **Fall-out**). "Smog" (smoke-laden fog) which reduces visibility to zero and affects the respiratory organs, is liable to occur when the air near the earth is cooled below the dew-point temperature by radiation on a still, cloudless night when an accumulation of smoke over a large city cuts off daylight and produces gloom, and absence of wind or vertical currents prevents the lower layers of the air from getting away. Such conditions are associated with the smoke-laden atmosphere of large industrial towns during a winter anticyclone.

Polonaise *or* **Polacca**, a musical composition in the style of a traditional Polish dance. Chopin is the best-known composer of Polonaises.

Polonium, a radioactive element, symbol Po, discovered by Madame Curie in 1898, and named after her native land of Poland.

Poltergeist. *See* **J35.**

Polymerisation is the linking together of small molecules to make a large long-chain molecule. The general name for polymers of ethylene is Polythene, a wax-like plastic solid which because of its special qualities is being used in a variety of ways today.

Polytheism. *See* **God and Man, J18.**

Pomander, name of a small ball or box containing perfumes and spices, formerly carried suspended from the neck or girdle as a protection against infection so it was believed.

Pomology, the science of fruit-growing.

Pontifex, the title assigned in ancient Rome to members of the college of pontifices. "Pontifex maximus" was the official head of Roman religion. It was as "pontifex maximus" that Julius Caesar revised the calendar in 46 B.C., and when after the rise of Christianity the popes took over the title the revision of the calendar fell to them.

Poodle, a well-known variety of domestic dog having a thick curly coat which it is the custom to cut close on the lower part of the body.

Pope, The, the head of the Roman Catholic Church, recognised by that Church as the lawful successor of St. Peter. He is elected by the body of Cardinals. Since 1870, when the King of Italy deposed the holder from temporal power, no pope had left the Vatican between appointment and death until 1929, when peace was made between the Church and State in Italy and compensation was paid to the Holy See for the loss of temporal power. Cardinal Roncalli, Patriarch of Venice, was elected Pope John XXIII in 1958 following the death of Pope Pius XII. The Pope was visited by the Archbishop of Canterbury in Dec. 1960, the first such meeting since before the Reformation. *See also* **Papal Infallibility, J33.**

Porcelain. There are three kinds of pottery, earthenware, stoneware, and porcelain, the marks shown (**N18, 19**) are restricted to those used on porcelain, a word thought to be derived from the Italian *porcelana*, indicating the texture of a piglet. The majority of porcelain made on the continent was of "hard-paste," or true porcelain, similar to that discovered by the Chinese as early as the T'ang Dynasty (A.D. 618–907). It was composed of kaolin (china-clay) and petuntse (china-stone) which when fired at a high temperature formed an extremely hard and translucent material. The recipe of "hard-paste" porcelain remained a secret of the Chinese until 1708, when it was rediscovered in Europe by Johann Bottger of the Meissen factory (popularly known as Dresden). Aided by runaway Meissen workmen factories were soon established at Vienna, Venice and later in many other parts of Germany. During the middle of the 18th cent. Plymouth and Bristol were the only English factories to make this type of porcelain, elsewhere both in England and France, the material used was known as "soft-paste" or artificial porcelain which was made by blending varying ingredients together with the materials of glass. By the 19th cent. hard-paste porcelain was used throughout practically the whole of the continent, but in England a hybrid-paste containing bone-ash was introduced and is still the material used to-day.

Porcupine, a rodent whose back is covered with long, sharp, black and white spikes, which form a powerful means of defence. There are two families of porcupines; one is confined to the Old World and the other contains the American porcupines.

Porphyry, a form of crystalline rock of many varieties that in ancient Egypt was quarried and used for the decorative portions of buildings and vessels. The term is applied generally to the eruptive rocks in which large well-formed crystals of one mineral are set in a matrix of other minerals.

Porpoise, a highly intelligent marine mammal of the dolphin and whale family, and a common inhabitant of northern seas. Porpoises travel in shoals, their progression being marked by constant leapings and plungings. Their average length is from 4 to 5 ft. There are several species, nearly all being confined to northern oceans.

Port, a special kind of red Portuguese wine, taking its name from Oporto. It was little known in England until the Methuen Treaty of 1703, when it was permitted to be imported at a low duty.

Portcullis, a strong, movable timber or iron grating let into the wall of the gateway to a feudal castle, and capable of being lowered or raised at will. It formed an effective protection against attack in the days before firearms.

Portland Cement is a mixture of about 20 parts of clay with 80 parts of chalk, specially prepared in kilns, and forming a substance which, after admixture with water, will set hard and solid.

Portland Vase, one of the most renowned specimens of Greek Art, long in the possession of the Portland family. In 1810 it was loaned to the British Museum. Here it was shattered in 1845 by a stone from a maniac's hand, but has been skilfully restored. It is said to have been found in the 17th cent. in an ancient tomb near Rome. It was purchased from the Barberini family in 1770 by Sir Wm. Hamilton, subsequently sold to the Duchess of Portland. The vase, which is actually a two-handled urn, stands about 10 ins. high, is of transparent dark blue glass, ornamented with figures in relief in white enamel. It was purchased by the British Museum in 1945.

Portreeve in olden times was an official appointed to superintend a port or harbour, and before the name of mayor was used the chief magistrate of London was styled the Portreeve.

Positivism. *See* **J35.**

Positron, the "positive electron," an atomic particle having the same mass but an electric charge equal but opposite to that of an electron. It was discovered in 1932. *See also* **F13(1), 14.**

Post-Impressionism, a term introduced by Roger Fry to describe the exhibition of paintings sponsored by himself in London (1910–11) officially entitled "Manet and the Post-Impressionists." The exhibition included paintings by Manet, Cézanne, Gauguin, Van Gogh, Seurat, Signac, works by Matisse, Rouault, and the *Fauves* (*q.v.*), and sculpture by Maillol. In a second exhibition, held in 1912, Picasso and the Cubists were also represented. The term therefore refers to the movement in modern art which reacted against the transient naturalism of the Impressionists by concerning itself primarily with colour, form, and solidity. Most artists today would include Cézanne, Van Gogh, and Gauguin as the main Post-Impressionists and maintain that it prepared the way for Fauvism, Cubism, and Expressionism.

Potassium, a metal, symbol K (German *Kalium*). It is similar to sodium, like which it reacts violently with water. It was discovered by Sir Humphry Davy in 1807, and now generally obtained by the electrolysis of fused potassium hydroxide or chloride/fluoride mixture. Its principal minerals are carnallite and kainite, and it is relatively common in rocks, accounting for about 2½% of the earth's crust. An essential element for healthy plant growth; the ashes of plants are relatively rich in potassium.

Potsdam Agreement was signed by Truman, Stalin, and Attlee in Aug., 1945. By this Agreement a Council of Foreign Ministers was established, representing the five principal Powers, China, France, Soviet Russia, the United Kingdom, and United States of America, with the task of drawing up the peace treaties for submission to the United Nations. It laid down, *inter alia*,

that German militarism and Hitlerism should be destroyed, that industrial power should be so reduced that Germany would never again be in a position to wage aggressive war, that surplus equipment should be destroyed or transferred to replace wrecked plant in allied territories; that Germany should be treated as an economic whole, and that local self-government should be restored on democratic lines as rapidly as was consistent with military security *See* **C39**(2).

Prado Gallery, the great public picture collection of Madrid, containing a superb collection of paintings by Velasquez, Murillo, Raphael, Titian, Dürer, Van Dyck, Rubens, Holbein, etc

Pragmatism. *See* **J35.**

Prairie Dogs are common rodents in Western America and very like the marmot in general structure They live in communities in burrows.

Prawns, crustaceans related to lobsters, shrimps, and cray fishes

Prebendary, a clergyman who receives a prebend or stipend because of his special connection with a cathedral or cathedral church

Prefect, chief magistrates in ancient Rome The title is now applied to the chiefs of administration of the departments of France

Prelude, a piece of music intended to precede another piece, *e g*, Prelude and Fugue The name has been used by many composers (*e g*, J S Bach, Chopin) to describe short compositions for which no following piece was written

Pre-Raphaelite Brotherhood was the name given to their school of thought by three British artists, Dante Gabriel Rossetti, J E Millais, and W Holman Hunt, who in 1848 revolted against the academic art of their time and advocated a return to the style of the Italian painters prior to Raphael—the simple naturalism of the Primitives, such as Botticelli, Fra Angelico and Fillipo Lippi Thus they avoided the use of heavy shadows and painted on a white ground in bright colours a technique which aroused the ire of those used to the dark and murky canvases of the contemporary romantic artists Although they held these principles in common the three members of the " P R B ", as it was popularly called, were really quite different in other respects Thus Rossetti (who for some reason is always thought of as the typical Pre-Raphaelite) produced works of a highly romanticised mediaevalism which, apart from certain aspects of technique, bear not the slightest resemblance to the sentimental naturalism of Millais or the much more dramatic realism of Holman Hunt (*e g*, in *The Scapegoat*) The Brotherhood was later joined by a number of lesser artists, but its works are not commonly accepted with enthusiasm to-day when the general feeling is that they are sentimental and religiose rather than the product of deeply-felt emotions Ruskin in his writings defended their work but the movement came to an end in 1853.

Presbyterianism. *See* **J35.**

Press-Gang, a body of sailors employed to impress men into naval service, frequently resorted to in England, especially during the war with France in the early 19th cent. Press gangs were not used after that

Primate. *See* **F24(1).**

Primitive Art. The word "primitive" has a number of different meanings (1) the art of prehistoric communities (*e g*, the famous animal cave-drawings of the Aurignacians, *c* 25,000 B C, at Altamira in Spain), (2) the art of modern primitive communities (*e g*, Bushman rock-paintings), (3) child art, (4) peasant art which springs from a spontaneous desire to impart beauty to objects of daily use and shows a tendency towards abstraction. Peasant art has many features in common the world over, the woodcarving of the Norsemen being almost indistinguishable from that of the Maoris; (5) the modern school of primitive painting in which naïveté of presentation is either the aim of a highly sophisticated mind (*e g*, the self-taught French painter Le Douanier Rousseau (d. 1910)), or arises naturally from a simple one (the American " grandma " Moses (d 1961) who began to paint in her seventies).

Printing by movable types was first used in Europe in 1454 by Johann Gutenberg, a citizen of Mainz. The invention is also claimed for Laurens Koster of Haarlem It was introduced into England by Caxton, who set up a printing press in Westminster in 1476 Gothic characters were first used, being superseded by Roman letters in 1518. In 1798 Earl Stanhope replaced the wood printing press by one of iron. In 1814 Friedrich Koenig applied the principle of steam power to the press Mr John Walter, of *The Times* newspaper, was the first to use the steam press which printed 1,100 sheets per hour Improvements were introduced by Applegath and Cowper in 1828 and great strides were made in 1858 when the Hoe machine, which turned out 20,000 impressions an hour, was put on the market. Then came the Walter press in 1866 which printed on continuous rolls of paper from curved stereotyped plates. Modern Hoe machines can print a 48-page paper at 28,000 copies an hour (max speed 50,000). The Monotype machine casts single letters and the Linotype whole lines

The Privy Council is the Queen's own Council, consisting of over 300 distinguished men drawn from all walks of life Its function is to give private advice to the Queen From it have sprung many organs of the constitution For example, the Judiciary or courts of justice have grown from the Queen's Council sitting as a Court of Justice, and today the Judicial Committee of the Privy Council is a body of distinguished lawyers acting as a Court of Appeal from courts of the Commonwealth Many of our Government Departments have grown from Committees of the Privy Council

Productivity. Physical productivity is the output of products during a time unit, *e g*, so many products per man hour, or day, or year Total productivity is the sum of all the units of product created during the given time Labour productivity is the part of the total that is attributed to labour as a factor of production Productivity of capital is the element attributed to capital as a factor Productivity of land is the element attributed to the natural powers of the soil, as distinct from what is contributed by the application to it of capital or labour The term productivity is also used to refer not to the quantity of output, but to its money value There have been many attempts to compare the productivities of different economies—*e g*, Great Britain and the United States or advanced and underdeveloped countries *See* **G37.**

Proteins are the main chemical substances of living matter they are a part of every living cell and are found in all animals and plants Proteins have many functions, and occur in structural matter such as bones, tendons, skin, hair, and hoof, and in some vitamins and hormones Lean meat, fish, and eggs are almost entirely proteins. Their composition varies with the source, but all proteins are basically constructed of carbon, hydrogen, oxygen, and nitrogen, and some contain sulphur, phosphorus (nucleoproteins), and iron (haemoglobin) Proteins are built up of very long chains of amino-acids connected by amide linkages (the synthetic polymers such as " nylon " and casein plastics (from milk) are built up of the same linkages) Enzymes, which bring about chemical reactions in living cells, are proteins having specific properties *See* **F21, 55(2).**

Proton, a basic constituent of the atomic nucleus, positively charged, having a mass about 1836 times that of the electron It is a positive hydrogen ion *See* **F10(2), 14.**

Protoplasm. *See* **F20(1).**

Provost, a Scottish official similar in rank to an English mayor The Provosts of Edinburgh, Glasgow, Aberdeen, Perth, and Dundee are styled Lords Provost. The title of provost is also given to the heads of various English colleges

Prud'hommes (Prudent Men), **Councils of**, were French trade tribunals, of masters and workmen, formed to decide on disputes. Originally a mediaeval institution, they were revived by Napoleon in 1806, and were carried on by the Third Republic

Psalms, Book of, for many years attributed to David, but present-day scholars are of opinion that the psalms were written by a series of

authors at different times and for different purposes, and that few, if any, were written by David The Holy Scriptures contain 150.

Psychic Research. *See* **J36.**

Psychology. *See* **Section J under appropriate headings.**

Ptarmigan, birds of the grouse family, one species of which occurs in Britain, inhabiting the Scottish Highlands. In the winter assumes a white plumage.

Ptomaines, amino acids produced during the putrefaction of proteins of animal origin. Not a cause of food poisoning, as was once generally supposed, which is almost invariably due to certain specific bacteria

Publicans, under the Roman Empire, were people who farmed the public taxes. It is this class of officials that is alluded to in the " publicans and sinners " phrase in the New Testament.

Public Corporations A method of operating large-scale industries transferred from private to public operation. Thus the Port of London Authority is an independent corporation governed by users of the port and representatives of municipal interests and labour. The Forestry Commission, the Electricity Authorities, the British Railways Board, the National Coal Board, the Gas Council, and the B B C follow a varied pattern.

Public Schools. The Public Schools Act of 1864 named nine " public " schools. Eton, Harrow, Rugby, Winchester, Westminster, Shrewsbury, Charterhouse, St. Paul's, and Merchant Taylors. Today the term embraces many more, and can be applied to all those schools which are financed by bodies other than the State and whose headmasters belong to the Headmasters' Conference as distinct from the Headmasters' Association There are about 200 such schools in Britain, including among others· Bedford Grammar School (founded 1552), King Edward's School, Birmingham (1552); Brighton College (1845), Charterhouse School, Godalming (1611); Cheltenham College (1841); Christ's Hospital, West Horsham (1552), City of London School (1442); Clifton College, Bristol (1862); Dulwich College (1619); Eton College (1440); Felsted School (1564); Haileybury College (1862), Harrow School (1571); Malvern College (1865); Manchester Grammar School (1515); Marlborough College (1843); Merchant Taylors' School (1561); Mill Hill School (1807); Oundle (1556); Radley (1847); Repton School, Derbyshire (1557); Rugby School (1567); St Paul's School (1509), Sherborne School (1550); Shrewsbury School (1552); Stonyhurst College (1594); Tonbridge School (1553); Uppingham School (1584); Wellington College (1859), Westminster School (1339), Winchester College (1387); and Warwick (1545) Public schools for girls include. Christ's Hospital, Hertford (1552), Cheltenham Ladies College (founded by Miss Beale in 1853), North London Collegiate School (founded by Miss Buss in 1850), Roedean (1885), Wycombe Abbey (1896).

Puma, a carnivorous mammal of the cat family found in the New World from Canada to Patagonia.

Pyramids of Egypt, on the west bank of the Nile, are vast stone or brick-built structures with inner chambers and subterranean entrances, built by the Pharaohs as royal tombs and dating from about 3000 B.C. The most celebrated are at Giza built during the 4th dynasty. The largest, originally 481 ft. high, is called the Great Pyramid, one of the seven wonders of the world, built by the Pharaoh Khufu, better known as Cheops, and there he was buried, 300,000 men, according to Herodotus, being employed for 20 years upon it. Chephren, successor of Cheops, erected the second pyramid, and the third was built by Mycerinus, a son of Cheops The pyramid at Meidum built by King Snefru, founder of the 4th dynasty, is the most imposing of all.

Pyrite, the brassy-yellow crystalline form of iron disulphide It can often be seen in coal, known as " fool's gold ".

Pythons, large snakes, non-poisonous, and destroying their prey by crushing it. Some species average 30 ft. in length, and prey upon deer and other small mammals. Found in Asia, Africa, and Australia. They lay eggs.

Q

Quadrant, an astronomical instrument for measuring altitudes, superseded for navigational purposes in modern times by the sextant. It consists of a graduated arc of 90° with a movable radius for measuring angles on it.

Quadrille, adapted from an old French country dance, became fashionable throughout Europe in the early part of the 19th cent, but seldom danced now.

Quai d'Orsay. An embankment in Paris where the French Foreign Office is situated.

Quail, an edible bird of the partridge family, of which only one species, the Common Quail, is found in England. It is not more than 8 in. long. It is found in most of the warmer regions of the world In England and Wales the Quail is covered by the Wild Bird Protection Acts

Quair, an old name for a pamphlet or little book

Quantum Theory. *See* **F13**(2)

Quartering, in heraldry, is the disposition of various escutcheons or coats of arms in their proper " quarters " of the family shield, in such order as indicates the alliances with other families

" Quarterly Review," the great Tory quarterly was started in 1809, in opposition to the *Edinburgh Review*, the Whig organ, est. in 1802

Quartermaster, a military officer charged with the provisioning and superintendence of soldiers in camp or barracks, and holding the equivalent rank to a lieutenant. The Quartermaster-General is an officer who presides over the provisioning department of the whole army A Quartermaster in the Navy is a petty officer responsible to the Officer of the Watch; at sea for the correct steering of the ship and in harbour for the running of the ship's routine.

Quartet, a musical composition for four voices or instruments If for stringed instruments (*e g*, first and second violin, viola, violoncello) it is called a string quartet. If for three strings and another instrument it is called by the name of the fourth instrument, *e.g*, piano quartet The name is often misapplied to the musicians instead of to the music Thus a four-piece string orchestra will be called a string quartet. This misuse is also found with quintet, sextet, etc

Quarto, a sheet of paper folded twice to make four leaves, or eight pages, usually abbreviated to " 4to "

Quartz is a common and usually colourless mineral, occurring both crystallised and massive. In the first form it is in hexagonal prisms, terminating in pyramids When pure its specific gravity is 2 66. It is one of the constituents of granite, gneiss, etc Among the quartz varieties are *rock crystal* (colourless), *smoky quartz* (yellow or brown), *amethyst* (purple), *rose quartz* (pink), and *milky quartz* (white). Quartz veins in metamorphic rocks may yield rich deposits of gold. Mining for gold in the rock is termed quartz-mining.

Quaternary Deposits *or* **Post-Tertiary,** are the latest stratified rocks of the earth's crust, and include the Pleistocene (" Great Ice Age ") and recent systems

Quaver, a note of music, equal to one-eighth of a semibreve and one-fourth of a minim

Queen Anne's Bounty, established by Queen Anne in 1704 for the augmentation of the maintenance of the poor clergy. Since April 1, 1948, Queen Anne's Bounty and the Ecclesiastical Commissioners ceased to exist and became embodied in the Church Commissioners for England.

Queen's (or King's) Speech is the speech prepared by the Government in consultation with the Queen and delivered by Her Majesty in person or by her deputy, at the opening or closing of a Parliamentary session.

Quicksilver. *See* **Mercury.**

Quince, a well-known hardy orchard tree of the pear family, bearing fragrant, yellow, pear-shaped fruit, largely used for preserves. A mucilage is made from the seeds, which also possess medicinal virtues.

Quinine, a vegetable alkaloid obtained from the bark of several trees of the *Cinchona* genus. It is colourless and extremely bitter. The drug, sulphate of quinine, is one of the most valuable medicines, forming a powerful tonic. It is anti-

periodic, antipyretic, and antineuralgic. In cases of malaria it is the most efficacious remedy of natural origin known.

Quintal metrique, a French weight of 100 kilogrammes, or 220 lb. avoirdupois.

Quintet, a musical composition for five voices or instruments. If all five instruments are strings the piece is a string quintet. A clarinet quintet, for example, is a piece scored for "four strings" and a clarinet.

Quirinal, one of the seven hills of Rome.

Quisling, term which came into use during the second world war to denote traitor, collaborator, or fifth-columnist After Vidkun Quisling, who became head of the puppet government after the German invasion of Norway in 1940.

Quorum, the number of members of any body or company necessary to be present at any meeting or commission before business can be transacted Forty form a quorum in the House of Commons.

Quo Warranto ("By what authority") a form of writ which has existed in England since 1278, and is a direction to the proper authorities to inquire into the circumstances under which any office or franchise is held.

R

Rabbi, a Jewish term applied to specially ordained officials who pronounce upon questions of legal form and ritual, and also generally accorded to any Jewish scholar of eminence.

Rabbit. *See* **Z17.**

Raccoon, plantigrade carnivorous mammals common to the American continent. There are several species. The common Raccoon (*Procyon lotor*) is about 2 ft. long, with a bushy ringed tail and sharp snout Its skin is valuable.

Race. In the old text-books anthropologists were much concerned with the differences between the various races of Man they described the Black Man (Negro), the Yellow Man (Mongol), the Red Man (American Indian), the Brown Man (Indian), and the White Man (European) Those who study Man from this point of view further subdivide each group into others. Thus White Man may be divided into Nordic, Alpine, and Mediterranean, Black Man into Hamitic, Bushman, and so on Each of these groups tends to have physical traits which its members hold in common, although, of course, there are no *pure* racial types. All existing races have been fairly thoroughly mixed. What, in view of recent experience, is really important, is that races or even nations do not have psychological traits—at least not *innate* traits Anthropology dismisses all theories of a superior race as unscientific there is not the slightest evidence that one race differs in any way from another in its psychological potentialities. Jews, Irish, Scots, Italians do differ (so do the inhabitants of Edinburgh and London): but their differences are due to their situation and not to anything inborn. *See* **F35(2).**

Raceme, an inflorescence in which the main stem bears stalked flowers, *e g* , lupin, foxglove. The youngest flowers are at the tip of this axis.

Radar. The basic principle of radar is very similar to that of sight. We switch on a light in the dark, and we *see* an object because the light waves are reflected from it and return to our eye, which is able to detect them. Similarly, the radar station *sees* an object because the invisible radio waves sent out from the transmitter are reflected from it and return to the receiver, which is able to detect them.

The utilisation of radio waves for the detection of reflecting surfaces began with the classical experiment of Dr. (now Sir) Edward Appleton in 1925, which he conducted in order to demonstrate the existence of the Heaviside layer in the upper atmosphere. During the course of the last war developments took place which tremendously improved the methods and instruments used. As in the case of so many of the inventions primarily developed for the purpose of waging war, many useful applications have been found for radar in times of peace, and, in particular, it has proved of great service as an aid to aerial and marine navigation. For an account of radar astronomy see **F48–50.**

Radiation, energy emitted in the form of a beam of rays or waves, *e g* , acoustic (sound) radiation from a loudspeaker, radiant heat from a fire, β-radiation from a radioactive substance The radiation of electromagnetic waves from a body depends on its temperature, the amount of energy radiated per second being proportional to the fourth power of the absolute temperature The hotter the body, the shorter the wavelengths of the radiation, thus the colour of a glowing body depends on its temperature Of paramount importance to us is radiation from the sun Amongst other radiations, the sun sends ultra-violet, visible, and infra-red (heat) waves. The principal gases of the atmosphere are transparent to practically all of the solar and sky radiation and also that which the earth re-transmits to space Carbon dioxide and water vapour, however, strongly absorb certain types, the latter, as clouds, playing an important rôle in regulating the temperature of the globe The cooling of the ground on a clear night is a result of the outgoing long-wave radiation exceeding that coming down from the sky, at sunrise cooling ceases as the incoming radiation becomes sufficient to compensate for the loss of heat

Radiation, Cosmic. *See* **F3(2).**

Radioactivity. *See* **F11.**

Radiosonde, a weather station in miniature carried aloft by a free balloon to heights normally in the neighbourhood of 10 miles Signals representative of values of atmospheric pressure, temperature and humidity are transmitted simultaneously by radio to receiving apparatus on the ground The position of the balloon at any instant can be determined by radar, enabling the speed and direction of the upper winds to be deduced.

Radium, a radioactive metal, symbol Ra, discovered by Marie and Pierre Curie in 1898. Atomic weight 226 The Radium Institute, founded and equipped by Lord Iveagh and Sir Ernest Cassel, was opened in 1911 for the treatment of patients and research into the effect of radium on the human system Radiotherapy (use of X-rays from radium) is used in the treatment of cancer *See* **P22(1).**

Radon, a radioactive gaseous element, symbol Rn, formed by radioactive decay of radium. Its discovery completed the series of elements known as the inert (or rare) gases.

Rail, a well-known genus of the *Rallidae* family, including the Water Rail, the Moorhen, Corncrake, and Coot, resident in the British Isles.

Rain. When moist air rises into lower temperatures and becomes saturated, condensation takes place on the numerous hygroscopic particles present in the atmosphere If the temperature is above freezing a cloud of small droplets is formed, and as the air continues to rise they grow in size until the weight is great enough to make them fall to the earth as rain The formation of large raindrops has been attributed to coagulation of smaller drops of different sizes, while another mechanism depends upon the presence in the cloud of ice crystals as well as water drops In temperate latitudes snowflakes falling from the freezing level melt in the warmer air below, producing large raindrops which grow in their flight through the lower part of the cloud.

Rainbow, a beautiful colour effect visible to an observer with back to the sun and facing a rain shower, caused by the refraction and reflection of sunlight in minute water-droplets in the air From high in the air it would be possible to see a rainbow as a complete circle, but from the ground the most that can be seen is a semicircle when the sun is just on the horizon, the higher the sun is, the smaller the arc of the rainbow When conditions are suitable two bows are seen, the secondary with the colours of the spectrum reversed. The colours of the rainbow are seven: red, orange, yellow, green, blue, indigo, and violet—the colours of the spectrum. *See also* **Aurora.**

Raingauge, an instrument consisting of a deep metal funnel whose stem dips into a graduated glass jar from which the depth of the rain water collected can be read. Continuous records of rainfall are provided by self-registering instruments.

Rambouillet, a royal French château (14th cent., rebuilt 18th cent.), near Paris, and the official summer residence of the President of the French Republic. Also the name of the famous literary salon of the Marquise de Rambouillet (1588–1665).

Rampant, in heraldry, is a term applied to the figure of an animal with forelegs elevated, the dexter uppermost. When the animal is shown side-faced it is *rampant displayed*, when full-face, *rampant guardant*; when looking back, *rampant reguardant*; and when in sitting position *rampant sejant*.

Rape, a cruciferous plant yielding coleseed or rape-seed, extensively grown in all parts of Europe and India. Rape oil or colza is made from the seeds, and the leaves and refuse are used for sheep-food. Rape oil is a yellow, thick oil, of considerable commercial importance as a lubricant and for other purposes. It was at one time much used as an illuminant.

Rare Gases (also called **Inert Gases**). These are a group of elements which are chemically inert, comprising helium, neon, argon, krypton, xenon, and radon. Cavendish in 1785 noticed that there was in air some gas which was not oxygen, nitrogen, or carbon dioxide, but it was not until 1894 that the first of the rare gases was found by Rayleigh and Ramsay. This they called argon (inert). After the discovery of helium in 1895 Kayser, Rayleigh and Travers soon isolated the other gases except radon, which was later detected as a radioactive decay product of radium. Some of these inert gases are used to fill electric-light bulbs, and helium is used in balloons, since it is very light.

Rat, a well-known order of rodent embracing many species. The *brown rat* appeared in Europe early in the 18th cent., coming from the East and entering by way of Russia, now it is widespread and met with in Britain and all parts of the Continent. The *black rat*, which was the common rat before the arrival of the brown species, is a smaller animal and now comparatively scarce. There are numerous other kinds, all of them gross feeders, and existing in such numbers in many places as to constitute a pest. *See* **Z13.**

Rationalism. *See* **J37.**

Rattlesnake, venomous snakes which obtain their name from the possession of a rattle in the end of their tail, consisting of horny pieces so arranged that when vibrated they make a rattling sound. They are only found in N. and S. America.

Raven, a black-plumaged bird of the crow family, with raucous voice and massive bill. Occurs in many parts of Europe, Asia, and America. Ravens are easily domesticated and form interesting pets. Dickens had one which he described in *Barnaby Rudge*.

Ray, fish with a very flat body and broad and fleshy pectoral fins, related to the sharks. There are about 140 species. In Britain they are generally called *skate*.

Razorbill, a sea-bird of the auk family, having a high, furrowed bill and black-and-white plumage. It inhabits rocky cliffs during the breeding season, and at other times is mostly out on the open sea.

Realism is a vague term. For its use in philosophy *see* **J38(1).** As a movement in art it can be said to have started with Gustave Courbet in the mid-19th cent. in his revolt against the classicism of Ingres and the romanticism of Delacroix. He was a man of strong radical views, and like Zola, Balzac, and Flaubert in literature, turned to the actuality of everyday life, recording it with frankness and vigour. Some young English painters, notably Bratby, of the "kitchen sink" school, practise what some describe as social realism. In another sense, realism is an attitude concerned with interpreting the essential nature of the subject, revealing truths hidden by the accidentials of ordinary visual appearance. Thus form becomes more significant than content. Beginning with Cézanne and Van Gogh this trend passes on to Cubist and Abstract painting.

Recitative, a style of singing only slightly removed from ordinary speaking, used in the narrative portions of operas and oratorios. In older operas "recitativo secco" (dry recitative) was used, the voice being accompanied by the harpsichord alone. After Scarlatti the orchestra was used to give a more dramatic touch to the recitative, while Verdi introduced a type of recitative that was half-way to an aria.

Record Office, in Chancery Lane, London, the place where the Public Records of England are now preserved, including Domesday Book, the various Rolls of Charters, and important historical documents from a remote period.

Recusants, people who refused to attend the Anglican Church or to acknowledge the ecclesiastical supremacy of the Crown in the 16th and 17th cent.

Redbrick, a term used to denote a university of modern foundation whose buildings are conceived as being built of red brick in contrast to the stone of the ancient universities.

Red Crag, the name given to a strata of gravel or sand, containing certain fossil mollusc deposits, found on the Suffolk and Norfolk coasts.

Red Cross. *See* **Geneva Convention.**

Rede Lecture, at Cambridge University, was instituted and endowed in 1524 by Sir Robert Rede, Chief Justice of Common Pleas. These lectures were superseded by an annual oration, which is usually given by an eminent scientist.

Red-Letter Day, a Church festival day indicated in the Prayer Book by red letters, now a popular term for any day of special significance.

Redoubt, a term applied to enclosed fortified work, especially to a small area temporarily fortified as a place of retreat for a defending force.

Redstart, a small bird of the Thrush family of handsome plumage and striking song. Two species visit Great Britain, the Common Redstart, with bright chestnut rump and tail, white forehead, and black cheeks, favours wooded country, and the Black Redstart, with black breast and throat, chestnut tail and white wing bars, prefers rocky ground or bombed buildings, and has recently begun to breed in S. England.

Redwing, a bird of the Thrush family which finds its way to this country for the winter. Resembles the song thrush, but distinguished by smaller size, buffish-white eye-stripe, chestnut flanks and underwings. It has bred in Scotland and on Fair Isle.

Redwood *or* **Sequoia.** This genus of coniferous tree comprises two species of Redwoods occurring in N.W. America. Specimens of one species, the Giant Redwood, reach a height of over 300 ft and a thickness of 36 ft. The age of the largest, the General Sherman tree, is put at 3,500 years.

Reed, the sound-producing agent (of thin cane or metal) of many musical instruments. Reeds are described as *free* or *beating*, and the latter as single or *double*, i.e., two reeds placed together which vibrate when wind is forced between. Reed instruments include clarinet, harmonium, bassoon, oboe, bagpipe, mouth organ.

Referendum and Initiative, two methods by which the wishes of electors may be expressed with regard to proposed legislation. It is developed to the highest extent in Switzerland. In a referendum some specific matter is referred to the electors. The Initiative is the means by which electors can compel their representatives to consider a specific issue. After consideration by the legislature it must then be submitted to the electorate for approval (i.e., a referendum). Gen. de Gaulle has made use of the referendum in seeking the consent of the French nation for his policies. In a democracy a referendum should be preceded by a programme of education and public debate.

Reformation. *See* **J38, 25.**

Reform Bills. The principal Bills have been passed for the reform of the Parliamentary franchise. The first was the great Reform Bill of 1832, introduced by Lord John Russell and enacted under the Whig administration of Lord Grey. In addition to a sweeping redistribution of seats, this Act greatly extended the franchise but still left many people without the right to vote. The second Bill, passed in 1867, further redistributed the seats and gave the vote to workers in towns. A third Bill, passed in 1884 under a Gladstone ministry, removed the distinction between borough and county franchises, enfranchised agricultural workers, and thus gave the vote to all men over 21. Women had to wait until 1918 to get the vote at

the age of 30. The Representation of the People (Equal Franchise) Act, 1928, gave them the right to be registered as Parliamentary electors at the age of 21, thus making England into a true democracy *See also* **C10(1)**.

Refraction. ● The change of direction which light rays and other rays undergo when passing from one medium to another The phenomenon is due to the fact that in different media light (and other forms of radiation) has different speeds

Refractory, a substance capable of standing high temperatures and therefore useful for making furnaces and allied apparatus. Some insulating refractories are fire-clay, alumina, porcelain, carborundum, graphite, and silica Some refractory metals are platinum, molybdenum, tungsten, tantalum, and the alloys nichrome, chromel, alumel

Reindeer, a genus of deer horned in both sexes, occurring only in northerly regions It has an average height of 4 ft. 6 in, is very fleet of foot, and the Laplanders utilise it for draught purposes and for food

Relativity. The laws of relativity have been substantially proved and have revolutionised our ideas as to the nature of space, time, matter, and energy and forced us to think along new lines In 1949 a new theory by Einstein was announced which sets forth in a series of equations the laws governing both gravitation and electromagnetism, which is said to bridge the gap that separates the universe of the stars and galaxies and the universe of the atom At present the one is explained by relativity, and the other rests on the quantum theory *See* **F14.**

Relief in sculpture is of three kinds—high relief (*alto-relievo*), in which the figures stand out to the extent of one-half of their natural proportions, low-relief (*basso-relievo*) when the figures project but slightly; and middle-relief (*mezzo-relievo*), when the projection is intermediate

Renaissance. *See* **J38.**

Reptilia, the class of vertebrate animals including tortoises, lizards, snakes, crocodiles *See* **F23(2)**

Republican Party of the United States was born by the fusion in 1854 of the group who called themselves National Republicans, having split from the Democrats over tariffs in 1825, and the northern Democrats, both of them being opposed to slavery It came to power on Abraham Lincoln becoming President in 1861 and remained in power (with the exception of four Administrations) until 1912 On coming to power in 1920 the Republicans withheld the U S ratification of the Treaty of Versailles, which had been negotiated by Woodrow Wilson It was defeated in 1932 largely as a result of the economic depression Once isolationist in foreign policy, the Party now advocates an active policy, especially in Asia Until the election of Gen. Eisenhower as President in 1952, the Republican Party had not held power for 20 years The symbol of the party is an elephant

Requiem Properly a mass for the dead, the term is extended to cover musical settings by Palestrina, Mozart, Verdi, and others

Reredos, the ornamental screen at the back of the altar or communion table It is often of a highly decorative character and is an architectural feature in many churches in Spain. Other examples are to be found in the following cathedrals in England. Southwark, St Albans, Winchester, Durham, and Liverpool In All Souls College, Oxford, one is to be seen actually attached to the wall.

Resins, natural resins are vegetable compounds largely employed in the industrial arts They comprise india-rubber, amber, mastic, copal, etc. "Synthetic resins" is a term sometimes used as a synonym for "plastics"

Rest, a musical term denoting silence or cessation from playing for the period represented by the character of the rest, *e g*, minim, semibreve, quaver

Retina, the layer of the eye which is sensitive to light

Reuter, an international news agency, organised since 1941 as a trust and owned by the newspapers of Britain, Australia, and New Zealand, founded by Baron J de Reuter in 1819

Rhapsody, an instrumental composition, not in symphonic form, which suggests that it was composed to express some powerful emotion or ecstasy. Liszt's "Hungarian Rhapsodies" are based on old folk tunes, while it is believed that Gershwin's "Rhapsody in Blue" is intended to express the mood of America at the time it was written.

Rhea, a large flightless bird, the "ostrich" of S America, distinguished from the ostrich proper by smaller size, longer beak, larger wings, no tail and 3 toes instead of 2. There are 2 species

Rhinoceros, a large hoofed quadruped, of which there are nine existing species native to the river and marsh regions of Africa, India, Borneo, and Java. It is remarkable for its thick hide and upturned snout, from which springs a long horn The white rhinoceros, which is scarce, is the biggest species, attaining a length of 10–12 ft and a height of from 5 to 6 ft

Rhodium, a metallic element, symbol Rh, discovered by Wollaston in 1804 It is found in platinum ores in small amounts, generally less than 2 per cent. With platinum it gives a very hard and durable alloy. It is also used, instead of silver, in putting the reflecting layer on a mirror.

Rialto, a famous bridge that crosses the Grand Canal at Venice, and dates from 1591.

Ribbon Fish *or* **Oarfish,** a deep-sea fish, deriving its name from its ribbon-like shape Though many feet in length, it is only an inch or two thick The ribbon fish is rarely met with because of its habitat, and most of what is known about it has been learnt from specimens occasionally cast ashore during storms

Riboflavin. Vitamin B_2, it is essential in the diet of man and many animals, its absence causes stunted growth and loss of energy It is a nitrogenous base attached to a sugar group, found in milk, yeast, liver, and eggs, and it occurs in some enzymes and nucleic acids

Rice, a grain-yielding grass, of which thousands of strains are known today, extensively cultivated in China, India, and certain parts of America, and forming the main food of the peoples of China, Japan, India, and the Malayan regions Some 95 per cent of the world's rice is produced and consumed in the Orient. The grain with the husk is known as "paddy" Arrack, an alcoholic liquor, is made from fermented rice seeds.

"Rights of Man," the title of the declaration of the French National Assembly in 1789, proclaiming that all men have equal rights. Also the title of a famous book by Tom Paine, justifying the Revolution.

Rime, a crystalline deposit of ice formed on objects exposed to wet fog at the same time as frost

Rinderpest *or* **Cattle Plague,** is a highly contagious disease affecting cattle, sheep, and other ruminants In Europe the disease has been eradicated, but it was formerly very widespread and caused great loss of life amongst cattle. The disease is caused by a filtrable virus, and is attended by fever and congestion of the mucous membranes

Ring Dove *or* **Wood Pigeon,** a blue-grey bird, distinguished from other pigeons by larger size (16 in), white wing-bar, glossy green-and-purple neck, and white half-collar. It is very common in Britain

Rituale, the book of rites used in the Roman Catholic Church for the administration of certain sacraments and other church ceremonies Like the Roman breviary, it dates in its present form from the Council of Trent

R.N.A. (Ribonucleic Acids). *See* **Nucleic Acids.**

Roach, a well-known small fresh-water fish of the carp family.

Roaring Forties, name applied to the prevailing westerly winds over the oceans in the temperate latitudes of the Southern Hemisphere.

Robin (or Redbreast). A small bird with olive-brown upper parts and orange-red forehead, throat, and breast, both sexes alike The young are speckled, lacking the red breast Its wide European distribution includes the British Isles, where it is the national bird It also occurs in N Africa and W Asia The nest is placed in a great variety of situations including holes in banks, trees, and walls; in sheds, amongst ivy, and sometimes in old tins. Nesting-boxes are readily adopted, but care should be taken to ensure that the entrance-hole is small enough to exclude starlings. Robins are pugnacious and defend their territories with

vigour. Their attractive appearance, trustful disposition, engaging ways, and sweet song make them extremely popular. The name robin is also applied to a number of very different birds, one of which, the American Robin, occasionally wanders to Europe

Rock Dove, the grey pigeon *Columba livia* of Europe and Asia, ancestor of the domestic pigeons as Darwin was the first to show

Rockets for use in war were invented by Sir William Congreve early in the 19th cent., and proved very destructive in siege operations They were used over 2,000 years ago by the Chinese Rockets were used as weapons by aircraft, infantry, etc and the Germans devised the huge V2, carrying a ton of explosive, which was used near the end of the war to bombard London. Rockets are propelled by the burning of fuel (*e.g*, oxygen or nitric acid), the exhaust, being ejected at high velocity, thrusts the rocket forward Instruments are carried to high altitudes by rockets to measure atmospheric pressure, density, temperature, and wind velocities and to study the properties of the ionosphere A Soviet space rocket carrying scientific instruments hit the moon in Sept 1959. British high-altitude rockets are *Black Knight and Skylark*. *Blue Streak* (a rocket 75 ft long, 10 ft. diameter, and weighing 50 tons), which was abandoned by the British as a military weapon, is now being used in the European Space Research Programme. *See also* **F44.**

Rockoons, rockets raised to firing position in the upper atmosphere by large plastic balloons During the International Geophysical Year rockoons were fired from the Arctic, Antarctic, and Equator to study geomagnetism and the aurora.

Rococo, an architectural style which was, in effect, the final stage of **Baroque** (*q v*) The name first came into use about 1830 to describe the period 1720–70 and means "shell-shaped" (French *Rocaille*), since the shell was a favourite motif in Rococo ornamentation About the beginning of the early 18th cent the heavy older type of Baroque began to show even less restraint than had characterised it in the past; it became still less utilitarian, and showed a kind of playful lighthearted vitality which manifested itself in a wealth of ornamental invention Baroque was flamboyant and robust, Rococo frivolous. In architecture Rococo is naturally found in those areas where the Baroque had flourished, *i e*, Munich, Prague, Vienna, and Dresden. In painting, the best expressions of Rococo are to be seen in the works of the French painters Watteau (d 1721), Boucher (d. 1770), a favourite of Mme de Pompadour, and famous as a decorator of boudoirs, and Fragonard (d. 1806) (As in the case of Baroque, it was typical of Rococo that the sculpture, painting, and the decorative arts of a building all expressed the same spirit)

Roe, popular name given to organs in fish which produce eggs and sperms. "Hard roe" is that of the female and consists of eggs; that of the male is the soft roe or milt.

Roebuck, a deer that was formerly common in the forests and parks of Britain, but is now only found at large in the northern parts of Scotland.

Roller, a tropical Old World bird of the *Coraciidae* family, related to the hoopoe, kingfisher and bee-eater, of strikingly brilliant blue, chestnut, greenish-blue plumage There are fifteen species, one of which breeds in the far north and visits the British Isles on its migrations to and from its winter quarters in Africa.

Romanesque Architecture, prevailed throughout Europe from the mid-10th to the 13th cent, and implies an art which developed from that of the Romans Notable in Romanesque style were the rounded arch and masonry vaulting Romanesque led to the graceful and more complex Gothic (*q v*). The Italians never regarded Gothic highly and Romanesque churches, generally based on the basilican plan (oblong with double colonnades and a semi-circular apse at the end), continued to be built there until the beginning of the 15th cent. Some of the best examples can be seen at Pisa (11th cent), Florence (San Miniato, 1013), Lucca (12th cent), and Milan (the 12th cent. San Ambrogio, most famous of all). In Germany Romanesque architecture flourished longer than in France or England; the most famous churches are in the valley of the Rhine, at Cologne (completely destroyed during the second world war), Mainz and Speyer In France Romanesque churches are found in Burgundy, Provence and Normandy For English Romanesque *see* **Norman Architecture.**

Roman Roads, highways constructed by the Romans. They were of great durability. The best known British roads were Ermine Street (London, Lincoln, York), Fosse Way (Lincoln through Leicester, Cirencester, Bath, Exeter), Watling Street (London to Shropshire)

Romanticism, a term for a movement in the arts—whether in music, painting, sculpture or literature—which seeks to give expression to the artist's feelings about his subject rather than to be concerned with form or reality The romantic view is that art is nature seen through a temperament. the realist view is that art is a slice of life Just as Descartes (1596–1650) was the herald of the Age of Reason, so Jean Jacques Rousseau (1712–78) was the herald of the Age of Romance, the first to give it full expression His influence cannot be overemphasised (*See* **J14**). In painting Delacroix (1798–1863) is the romantic artist par excellence with his uncontrolled expression of the passions and love of the exotic. In literature the Romantic movement reached its finest form in the works of Goethe, Schiller, and Heine, in the poetry of Byron, Keats, Wordsworth, Shelley and Blake, and in the writings of Victor Hugo. Since Romanticism is partly a matter of temperament in the artist just as Classicism is, it may be found at all times and places, although whether or not it becomes predominent depends on contemporary taste Cubism, for example, with its attention to form is classical, whereas Surrealism with its attention to content is romantic

Roman Walls were built as frontier barriers under the Emperors Hadrian (76–138) and Antoninus Pius (86–161) Hadrian's works, linking Wallsend-on-Tyne with Bowness-on-Solway, comprised a twenty-foot stone wall, ditches, turrets, "milecastles," fortresses, and a double earthen mound, or "Vallum." Impressive ruins are still visible at Chesters and Housesteads Antoninus Pius, Hadrian's successor, made a further advance, but the turf wall which he built between Forth and Clyde was soon abandoned Septimius Severus (146–211) restored Hadrian's wall after the assassination of Commodus and the subsequent civil wars. It was finally abandoned between 380 and 390

Rondo, a piece of music in which a principal theme is repeated several times with other themes in between In the typical Rondo of Beethoven (*e g*, third movement of Sonata Pathétique) the order is 1, 2, 1 — 3 — 1, 2, 1

Rood Screen, an ornamental partition, separating the choir from the nave in a church, and supporting a crucifix or rood

Rook, a member of the crow family, abounding in most parts of the British Isles and found in Europe, Asia, and N Africa It has been introduced into New Zealand. Rooks usually nest in colonies in tall trees. They are highly intelligent birds, and their ways have long been the subject of much careful study.

Rosary, a circular chain of beads, used by Catholics when reciting a particular form of sustained prayer. Each bead represents an entire prayer, and the combined prayers constitute the Rosary.

Roses, Wars of the (1455–85), between the rival houses of York and Lancaster, for the possession of the English crown, began in the reign of Henry VI, and ended with the death of Richard III on Bosworth Field. The emblem or badge of the Lancastrians was the red rose and of the Yorkists the white rose All rivalry between the Roses ended by the marriage of Henry VII, the Lancastrian, with the Princess Elizabeth, daughter of Edward IV, the Yorkist.

Rosetta Stone, discovered in 1799 by the French at Rosetta in Egypt, and deposited in the British Museum. It is a piece of black basalt about 3 ft. long, and contains a decree of the Egyptian priests of Ptolemy V. Epiphanes (205–181 B C)

in (1) hieroglyphics, (2) demotic, and (3) Greek characters. It was by means of the three different inscriptions on the same stone that hieroglyphic writing was first able to be deciphered.

Rotten Row, a corruption of *route de roi* (king's drive), the famous riding resort in Hyde Park

Rouge et Noir, a well-known gambling card game played on a table divided into two sections and marked with two black and two red lozenges. Any number of players can take part, and the money is staked on the red or black spaces The cards are dealt out, first to Noir, until the pips aggregate more than 30, then in like manner to the Rouge, and the packet coming nearest to 31 wins the stakes

Roulette, a gambling game played on a table carrying a revolving wheel divided into 37 compartments. Each compartment bears a number, 0 (zero) and 1 to 36. The numbers are mixed and do not follow any particular order. Of these 37 numbers 18 are black and 18 are red, whereas zero is green. The players stake their money on any compartment, colour, or combination of numbers they please The wheel is whirled round and a ball is set rolling in the opposite direction, dropping finally into one of the compartments, thus deciding the winning number and colour.

Round, a musical composition in several parts, taken up by each participator at a different point from the other, and effecting a harmonious combination throughout. A Catch is similar in form, but usually allied to humorous words

Roundhead. In the reign of Charles I, and later, a Puritan or member of the Parliamentary party who wore his hair cut short. It was originally a term of derision applied by the Royalists, who usually wore ringlets

Round Towers, high circular towers with conical roof and massive masonry walls, built during the early Middle Ages (c 10th cent) It is believed that they served as refugees and lookouts These buildings are numerous in Ireland, and three remain in Scotland, including that at Brechin which is attached to the church

Royal Academy of Arts was founded in London in 1768, under the patronage of George III. The early exhibitions of the Academy were held first in Pall Mall, and after in Somerset House, where the exhibitions continued to be held until 1836, when the National Gallery being built, the Academy moved its quarters to that building In 1869 the present Royal Academy at Burlington House was opened The Academy numbers 58 R A s and about 30 A R.A s List of presidents Sir Joshua Reynolds (1768), Benjamin West (1792), James Wyatt (1805), B. West (1806), Sir Thomas Lawrence (1820), Sir M. A. Shee (1830), Sir C. Eastlake (1850), Sir F. Grant (1866), Lord Leighton (1878), Sir J. E. Millais (1896), Sir E. J. Poynter (1896), Sir Aston Webb (1919), Sir F Dicksee (1924), Sir William Llewellyn (1928), Sir E Lutyens (1938), Sir A J Munnings (1944), Sir Gerald F Kelly (1949), Sir A. E Richardson (1954) and Sir Charles Wheeler (1957). The Academy holds an exhibition of pictures, statuary, and architectural designs every summer, to which non-members can, subject to selection, send their work

Royal Hospital, Chelsea, built by Wren, was opened in 1694 as an institution for invalid soldiers.

Royal Institution, established 1799, and incorporated by Royal Charter in 1800 for " the promotion, extension, and diffusion of Science and of Useful Knowledge." It was in the building of the Institution that Faraday conducted his experiments. It supports four professors: natural philosophy, astronomy, chemistry, and physiology. Famous also for its Christmas lectures designed for a juvenile audience

Royal Society was founded by Royal Charter in 1660, Viscount Brouncker being the first president. Its *Philosophical Transactions* date from 1665. The meetings are held in Burlington House. Among the presidents have been Sir Christopher Wren, Pepys, Sir Isaac Newton, Sir Joseph Banks, Sir Humphry Davy, Prof. T. H. Huxley, Lord Rayleigh, Sir Archibald Geikie, Sir J. J. Thomson, O M , Prof. Sir C. S. Sherrington, O.M., G.B E., Lord Rutherford, O.M., Sir William Henry Bragg, O M., Sir Henry Dale, O.M., Sir Robert Robinson, O.M., Lord Adrian, O M., Sir Cyril Hinshelwood, O.M., and Sir Harold Florey.

Rubber, produced from the juice of certain trees and shrubs of tropical countries, is in such extensive demand now for tyres and other purposes that rubber plantations have been established in almost every part of the world where rubber can be grown, particularly in Malaya and Indonesia. The best kinds come from the Amazon valley. Great advances were made in the production of synthetic rubber during the second world war

Rubicon, a small river falling into the Adriatic, and forming one of the Italian boundaries, the crossing of which anciently involved decisive action and constituted a declaration of war Thus the phrase " crossing the Rubicon ", denoting an act from which there is no withdrawal

Rubidium, a metallic element, symbol Rb, most closely resembling potassium. It is silver-white and very soft, and was discovered in 1861 by Bunsen and Kirchoff, using the spectroscope It is rare, occurring in small amounts in the mica called lepidolite and in potash salts of the Strassfurt deposits in Germany.

Rubrics are instructions in regard to the ceremonies of the Church, appearing in red in the Prayer Book

Ruby is a deep red variety of Corundum (aluminium oxide), one of the most valued of precious stones Burma yields some of the finest, and rubies of inferior colour are found in Siam, Ceylon, South Africa, and Brazil

Rudd, a fresh-water fish of wide distribution, plentiful in the rivers of Britain, and found in most other parts of Europe, also in Asia Minor It is of a reddish-gold colour, with a greenish-blue beard.

Ruff, a bird related to the common sandpiper, at one time very common in the Fen districts. The males have a ruff of feathers round the neck in the breeding season. The female is the Reeve

Ruffe *or* **Pope,** a small fresh-water fish common in most parts of central Europe, and similar in appearance to the ordinary perch It is found in British rivers

" Rule, Britannia ! " the national sea-song of England, was written by James Thomson (1700–48), the author of the " Seasons," and set to music by Dr Arne about 1740 The poet's words were " Britannia, rule the waves! " but it is usually rendered " Britannia rules the waves "

Rum, an ardent spirit distilled from molasses, and containing from 40 to 50 per cent. of alcohol. It is chiefly manufactured in the West Indies, and derives its special flavour from a volatile oil.

Ruminants, animals that chew the cud, being provided with a compartmented stomach, enabling them to swallow food, and later to bring it back to the mouth for mastication; *e g*, sheep, goats, oxen, etc While in the rumen, or storage compartment, some digestion of food, especially cellulose, takes place by bacterial action

Runcible spoon, a kind of fork used for pickles having three broad prongs The word was used by Edward Lear about 1870 as a nonsense word and may be derived from *Rouncival* meaning large or huge from the bones said to have been dug up at *Roncesvalles* where Roland fell Rouncival peas are the large peas called " marrowfats "

Runes, certain characters of an alphabet found in inscriptions in the Germanic languages, discovered cut upon stone monuments and implements found in many parts of Europe, including England. The runic alphabet originally had 24 letters. Scholars agree that some of the runes derive from Greek and others from Latin.

Rural Dean, an ecclesiastical officer whose chief duty is to assist the Bishop in the duties of his diocese

Ruskin College, the first residential college for working people, founded at Oxford in 1899 by Mr Walter Vrooman, an American

Rusts, parasitic fungi, some common species of which have reddish spores which in a mass have a rusty appearance A well-known species is the Wheat Rust (*Puccinia graminis*), which has an alternative host in the barberry

Ruthenium, a greyish-white metallic element, symbol Ru, discovered by Claus in 1845. It is

harder and more brittle than platinum, in whose ores it occurs.

Rutile, mineral titanium dioxide It is found in many igneous rocks, and in gneisses and schists. Its commonest colour is reddish-brown.

S

Sabaoth, a Hebrew word, meaning an army or host, and applied sometimes to the Supreme Being, *e g.*, " the Lord of Hosts " (Rom. ix. 29).

Sabbath, the Bible name for the seventh day of the week, designated as the day of rest in the fourth commandment. It corresponds with Saturday in the modern calendar. The Christian " Sunday " is the first day of the week It is nowhere in Scripture called the Sabbath, though this name is sometimes erroneously applied to it.

Sabbatical Year was instituted by the Jews in ancient times for the purpose of giving the soil a rest from cultivation. This was every seventh year.

Sable, a furred mammal of the weasel family mainly inhabiting Siberia It is bright brown in colour, and has a long, bushy tail. American sable is a marten.

Saccharin, a white crystalline solid manufactured from toluene, 550 times as sweet as cane sugar. It is used as a sweetening agent, as a substitute for sugar when sugar is forbidden, as in certain diseases, or when there is a shortage It has no value as a food.

Sack, the white dry wines of Spain and Madeira, canary being the most popular.

Safety Lamp, as used in coal mines, was invented by Sir Humphry Davy in 1816. The flame is enclosed in a cage of fine-meshed wire which allows air to enter and promote burning, but conducts away the heat generated in combustion so that no product of combustion escapes at a temperature high enough to ignite explosive gases in the mine

Sagittarius *or* **" the Archer,"** one of the celestial constellations situated between Cygnus and Aquila. Sagittarius is another of the zodiacal constellations of 69 stars, which ancient astronomers worked into the representation of an archer. It lies between Scorpio and Capricornus

Sainfoin, a widely cultivated forage plant, especially adapted for sheep It is of strong, leafy growth and bears bright red flowers It belongs to the same family of flowering plants as peas and beans.

St. Elmo's Fire, a glowing brush-like discharge of electricity which takes place from sharp-pointed objects on mountains or the masts of ships exposed to the intense electric fields of thunder-clouds.

Salamanders are amphibia superficially resembling lizards, from which they differ in having a moist skin and no scales

Salic Law was probably instituted in France in the 5th cent. for the purpose of excluding females from inheriting the Crown. The Bourbons introduced the same law into Spain, but this was abolished by decree in 1830 to enable Isabella II. to succeed

Salicylic Acid can be obtained from the flowers of the meadow-sweet, and from oil of wintergreen, but is now usually prepared by the action of carbon dioxide on sodium phenate under pressure The acid is then prepared from the sodium salicylate. It is used as an antiseptic and has been used as a food preservative. Aspirin is a derivative of salicylic acid

Salmon, a familiar fish notable for its habit of ascending rivers from the sea in the autumn and there depositing its spawn, not returning to the sea until the early spring. The salmon fishing season varies from place to place.

Saltpetre. *See* **Nitre.**

Salvarsan, the organic arsenical compound arsphenamine, which Ehrlich discovered was able to kill inside the human body the spirochaete germ that causes syphilis Also known as " 606 " It has been superseded by neosalvarsan.

Salvation Army. *See* **J39.**

Sanctuaries were places where offenders against the law were free from arrest, and previous to 1697, when sanctuaries were suppressed, several parts of London were treated as sanctuaries. The chief of these refuge localities was in Whitefriars. There were others in the Minories, Mitre Court, the Savoy, Westminster, and the Mint Other sanctuaries were at Beverley and at St Burian's in Cornwall.

Sanderling, small wading bird of sandpiper family, breeds in tundra regions of far north, and is seen on sandy beaches of Britain as a winter visitor Conspicuous white wing stripe and, like Curlew, Sandpiper, Knot, Dunlin, and other members of sandpiper family, has marked change of plumage between winter and summer.

Sandpiper, small- to medium-sized wading birds of several species whose migratory powers are so great that they are found in most parts of the world. They include the Common Sandpiper, a bird about 7 in long, greenish-brown head and back, white under-parts, beak long and slender Other species met with in Britain are the Green, Purple, Wood, and Curlew-Sandpipers

Sans-culottes (French = without knee breeches), a term applied by the French aristocrats to the revolutionary leaders during the French Revolution who wore long trousers instead of knee breeches.

Sanskrit is the language of ancient India, spoken by the Brahmins, and existing in early Oriental literature. It was the language of literature and government and is now confined to temples and places of learning. Its relationship to the modern Indian languages is rather like that of Latin and Greek to modern European languages

Saponin. The term is a generic one applied to a range of organic compounds which produce frothy, soapy solutions Saponins are extracted from the soapwort root, horse chestnut seeds, etc. Saponin is the basis of the " foam " used for fire fighting; it can be used like soap to make insecticides and fungicides adhere to the leaves of plants Also used as detergents

Sapphic Verse, a form of verse said to have been invented by Sappho, the lyric poetess of Lesbos, who flourished about 600 B C

Sapphire, a valuable deep blue variety of Corundum (aluminium oxide) found mostly in India, Ceylon, and Northern Italy. Synthetic sapphire is often used for gramophone styli

Saprophytes. A term applied to plants which feed on dead organic matter Many fungi are saprophytes

Saracen, the name given in classic times to the Arab tribes of Syria and adjacent territories In the Middle Ages the current designation among the Christians for their Muslim enemies

Sarcophagus, the name given to a stone coffin, such as was used by the ancient Egyptians, Greeks, and Romans, for receiving the remains of their famous dead These sarcophagi were often decorated with rich carvings and sculptures

Sardonyx. *See* **Onyx.**

Sarrusophone, bears the same relation to the Oboe as the Saxophone does to the Clarinet (*i e.*, it has a metal tube and a double-reed mouthpiece). The Contrabass Sarrusophone is sometimes used instead of the Double Bassoon.

Sassanides were a dynasty of Persian rulers descended from Artaxerxes from 226 to 652

Satellites are small planets revolving round the larger ones The moon is the earth's only satellite. Jupiter has twelve, Saturn, nine, Uranus, five; Mars, two, and Neptune, two A number of artificial earth satellites have been launched by America and Russia since Oct. 1957. *See* **F44.**

Satin-Bird, one of the bower birds of Australia, the male is silky blue back and the female greyish green *See* **Bower bird.**

Satinwood, the timber of a tree plentiful in India and Ceylon, and valued for cabinet work It is of fine grain and very hard Varieties also exist in the West Indies, Florida, and Tasmania.

Satrap, the name given in ancient times to a Persian Governor of a Province.

Saturday, the seventh day of the week (the Jewish Sabbath), derived its name from Saturn, or, as some hold, is called after the Saxon idol, Saterne, which was worshipped on this day.

Saturn, a planet, the sixth from the sun, from which it is distant about 886 millions of miles, and around which it makes a revolution in about twenty-nine and a half years. It is about 71,500 miles in mean diameter, or nine times as large as the earth, and rotates on its axis in ten

and a quarter hours. It is surrounded by a series of rings composed of myriads of tiny satellites. It has nine small satellites. *See* **F7**.

Saturnalia, festivals held in ancient Rome in honour of the god Saturnus. They were made the scene of the most boisterous festivities, and were continued for several days at the end of December.

Sawfish, a large marine ray found in tropical America and Guinea, whose snout often attains the length of several feet, and is provided with saw-like teeth. This "saw" is swung from side to side among a shoal of fish which form the food of this ray.

Sawfly. These insects are considered to be the most primitive members of the order (*Hymenoptera*) to which the bees and wasps belong. In appearance they resemble somewhat the latter but there is no waist separating thorax and abdomen. The ovipositor is never used as a sting, usually it is saw-like so that the female can use it to make incisions into tissues of plants where the eggs are laid. The larvae look like caterpillars of butterflies and moths. One of the commonest species occurs on gooseberry bushes.

Saxhorns, large brass instruments on the cornet model invented by Sax. They are much used in military and other brass bands. The Tuba is the Bass Saxhorn in E flat or F. The Euphonium is the Bass Saxhorn in B Flat. The Contrabass Saxhorn in B flat (*i.e.*, one octave lower than the Euphonium) is called the Bombardon, but this term may be applied to the E flat Tuba.

Saxons, a Teutonic race originally inhabiting what is now Holstein. By the 7th cent. they had, with the Angles and Jutes, conquered and colonised most of England.

Saxophone, a musical instrument best described as a metal clarinet with a wide, curved tube. It is rarely used in serious music but is an important component of dance bands and the like. It is also used in military bands.

Scale (Musical), the series of notes on which a musical composition is built. Most European music is constructed upon the Major and Minor Diatonic Scales (*q.v.*).

Scald, the name of the Norse poets, who were similar to the bards of Wales. They had to celebrate the achievements of their warriors and leaders.

Scallop, marine bivalve molluscs of the genus *Pecten*, which is widely distributed. The scalloped edge to the shell results from a pattern of radiating grooves. Related to the oyster.

Scandium, a metal element, symbol Sc. It was discovered in 1879 by Nilson, and occurs in small quantities in certain rarer minerals such as wolframite.

Scapular, a vestment hanging from the shoulder to the knees, worn by members of certain Roman Catholic orders. The name is also given to two small pieces of cloth worn over the shoulders by lay members of the Church in honour of the Virgin.

Scarabaeidae, a family of beetles (Scarabs) widely distributed through Africa and Asia and the inner parts of Europe. It is to this genus that the "Sacred Beetle" of the Egyptians belongs, and numerous representations of it are found on ancient monuments.

Sceptre, the staff or rod constituting the symbol of supreme authority. Tarquin, the elder, was the first Roman to assume the sceptre in 468 B.C. The French kings of the 5th cent. made a golden rod their sceptre.

Scherzo. The word signifies a *joke*. It is used to describe a piece of music in light or jocular vein. Beethoven used the Scherzo as a middle movement in a number of Symphonies and Sonatas, since when it has tended to displace the more formal minuet.

Schism, an ecclesiastical term for division in a church. The Great Schism was the separation of the Greek Church from the Latin, finally established in 1054. The Western Schism was the division in the Roman Catholic Church from 1378 to 1417, when there were two lines of popes, one at Rome and one at Avignon, which arose over the election of Urban VI and Clement VII to the papacy and was more a matter of persons and politics than a question of faith.

Schist, the geological name of certain metamorphic rocks composed for the most part of minerals with thin plate-like crystals (*e.g.*, mica) so that the layers of a schist are closely parallel. Quartz occurs in schists, and where it preponderates the term "quartz schist" is applied.

Schoolmen, the great scholastic philosophers of the Middle Ages who devoted themselves to the study and exposition of questions of religious inquiry, and attempted to reconcile the teaching of the Church with that of Aristotle. The chief Schoolmen were Archbishop Anselm, Albertus Magnus, Thomas Aquinas, Peter Lombard, Duns Scotus. *See also* **J39**(2).

Scorpion. The scorpions constitute an order of the arthropods. Distinctive features are the pair of powerful claws at the head and a "sting" at the tail, which curves over the back in attack or defence so that it points forwards. The poison injected by the sting is potent, causing instant death in spiders, centipedes, etc., and acute discomfort to humans. The idea that a cornered scorpion can sting itself to death is a myth, scorpions are immune to their own poison.

Scorpion Fly. The scorpion fly, of which there are less than 500 species, constitute a separate order of insects, the *Mecoptera*. They have 2 pairs of membranous wings, and gain their popular name because in some species the end of the abdomen is turned up, though it does not function as a sting.

Scree *or* **Talus,** the mass of loose, angular rock fragments which accumulate towards the bottom of hill-sides and mountain-sides. These fragments have been detached by weathering processes, in particular frost action.

Scyphozoa. *See* **Jelly Fish.**

Scythians, nomadic conquerors and skilled horsemen of ancient times (9th–3rd cent. B.C.) who inhabited much of Southern Europe and Asiatic Russia.

Sea Anemones *or* **Actiniaria,** an order of marine animals of the coelenterate class *Anthozoa*. They form a large and varied group of about 1,100 species and occur in many beautiful colours, flower-like in form.

Sea Butterfly, marine molluscs which propel themselves by two "wings," or side expansions of the foot. They constitute the order called *Pteropoda*.

Sea Cow. *See* **Manatee.**

Sea Cucumbers *or* **Holothurians.** These animals constitute the class of echinoderms called *Holothuroidea*. They are elongated and worm-like, with a ring of about twenty tentacles round the mouth. There are about 500 species.

Sea Eagle, a genus of flesh-eating birds related to the true eagles, kites, and other birds of prey. Examples are the Bald Eagle, emblem of the U.S.A., White-tailed Eagle (Grey Sea Eagle), and Steller's Sea Eagle of the Pacific coast of Asia. Last known in Britain in 1911.

Sea Elephant *or* **Elephant Seal,** a curious genus of seal, the males of which possess a proboscis a foot or more in length that suggests an elephant's trunk. They are found on the coast of California and in certain parts of the Southern Ocean, their blubber has a commercial value.

Sea Gravimeter, a new instrument to determine the density of the earth's crust beneath the oceans of the world. Designed by Dr. A. Graf of Munich and Dr. J. Lamar Worzel of Columbia University, it can detect changes of one-millionth of the value of gravity at the earth's surface and is being used in the oceanographical research programme of the I.G.Y.

Sea Hare, a genus of molluscs (*Aplysia*), so-called because of resemblance to a crouching hare. The shell is thin curved plate largely sunk in the animal's body. They have four tentacles, occur in Britain in the laminaria or ribbon-wrack zone, and discharge a purple fluid when molested.

Sea Horse, a sea-fish (*Hippocampus*), very numerous in the tropics and comprising some twenty species. Their bodies are ringed and they have prehensile tails. Their heads are horse-shaped, and they swim in a vertical position.

Sea Lily. A class of echinoderms, the sea lilies may be roughly described as "stalked star-

fishes" There are about 400 living species, and several thousand extinct species are known. Otherwise called Crinoids

Sea Mouse, a genus of marine worms called *Aphrodite*, oval in shape, 8 or 9 in long, iridescent, covered with fine bristles.

Sea Squirts *or* **Tunicates.** These animals are placed in the sub-phylum called *Urochorda*, found growing in rounded, jelly-like masses on rocks near low-water level They get their name through the water jets they discharge.

Sea Urchin, species forming the class *Echinoidae* The body is globular and covered with spines which may be used for both defence and locomotion The main organs of locomotion are, however, the tube feet, as in starfishes Much has been learnt of recent years by marine biologists from experiments with the purple sea-urchin *Arbacia*

Seasons comprise the four natural divisions of the year, and are due to the inclinations of the earth's axis to the plane of the ecliptic *See* Equinox, *also* **N20.**

Secondary Sexual Characters. Characters of animals which are distinctive of sex, but have no direct connection with the reproductive process Examples are the mane of the lion and the antlers of some deer

Secretary Bird, so called because of the quill-like plumes about its ears, is a bird of prey related to the eagles and vultures, common in Africa, and of considerable service as an exterminator of snakes It is a large bird about 4 ft in height

Sedimentary Rocks. *See* **F8(2)**

Seismology, the branch of geophysics devoted to the study of earthquakes and other earth movements. The instruments used for the registration of earth tremors are termed seismographs and consist in principle of a pendulum system, the supporting framework following the ground movement and the bob remaining at rest, thus setting up a relative movement between two parts In order to record the displacements completely, at one station, three seismographs are necessary to show the two horizontal and the vertical components of the motion Apart from detection and study of waves from earthquakes, sensitive seismographs are now widely used in geophysical prospecting, particularly in the search for possible oilfields

Selenium, a non-metallic element, symbol Se, related to sulphur it is a dark red colour, and solid, found associated with sulphur, iron, pyrites, etc , though only in small quantities It is a semiconductor (**F18**) and its special electrical properties have led to its use in photo-electric cells and rectifiers Selenium is widely used in the chemical industry as a catalyst (*q v*) in producing aromatic hydrocarbons from less useful hydrocarbons. Also used in making some types of glass

Semi-Conductors. Many of the functions of thermionic valves are nowadays being performed by various types of semi-conductors, the increasing use of which promises to effect big changes in the design of radio receivers and other radio equipment It is interesting to note that the crystal detector, which was in use for many years before the advent of the valve detector, was itself a particular example of the use of a semi-conducting device During recent years the properties of certain crystalline materials have been more closely investigated, and as a result crystal diodes have been produced which possess several advantages over valves But, more important, it was soon found that crystals, if built up or arranged in a suitable manner, could provide amplification, and thus could be used as amplifiers or as oscillators, in many instances in the place of valves The crystal material used is principally germanium into which an impurity has been introduced, or sometimes silicon similarly treated *See* **Transistors.**

Semitic Languages are divided into two main sections, one including the Assyrian, Aramaic, Hebrew, and Phoenician groups, the other embracing the Arabic and the Ethiopian

Semitone, the smallest interval in music—half a tone in the diatonic scale

Senate, the higher governing Assembly of a Legislature. The word, applied primarily to the Roman council, is also used to denote the upper chamber in the legislatures of France, the United States, and other countries. In certain universities the governing body is also called the Senate.

Sensitive Plant. A species of Mimosa (*Mimosa pudica*), whose leaves are extremely sensitive to touch, shaking, and burning

Sepia, the "ink" of the cuttlefish *See* **Ink Sac.**

September, the ninth month of the year, and the seventh of the old Roman calendar, hence the name, from Septimus The designation was several times changed by the Emperors, but none of the new names survived for long

Septet, a musical composition for seven voices or instruments

Septuagesima Sunday, the third Sunday before Lent

Septuagint, the Greek translation of the Old Testament There are many differences between the Septuagint and the Hebrew original, and therefore it is of great value for textual criticism

Serfs, the name given to the slaves formerly existing in Russia, who answered to the condition of the feudal "villeins" of England They were attached to the soil and were transferred with it in all sales or leases Serfdom existed in Prussia until 1807 and in Russia until 1861

Serpentine, a mineral chemically a hydrous silicate of magnesium Green serpentine is used as an ornament stone Fibrous serpentine is called asbestos

Serval, a small carnivorous animal of the lynx order, with black spots on a tawny ground It is numerous in Africa preys upon the smaller animals of the deer family, and is sometimes styled the "Tiger Cat"

Servitor. *See* **Sizar.**

Settlement, Act of, passed in 1701, assigned the Crown to the House of Hanover in case of Anne's death without children The decision represented the determination of the squires and the Anglican Church never again to trust themselves to a Roman Catholic king

Seven Champions of Christendom, as set forth in mediaeval literature, were St George of England, St Andrew of Scotland St Patrick of Ireland, St David of Wales, St James of Spain, St Denis of France, and St Anthony of Italy

Seven Churches of Asia, referred to in the Revelation of St John, were those of Ephesus, founded by St Paul in 57, Smyrna, Pergamos Thyatira, Sardis, Philadelphia (Lydia), and Laodicea (Phrygia), all in W Asia Minor

Seven Wonders of the World were 1 the Pyramids of Egypt; 2, the tomb of Mausolus, King of Caria (hence the word mausoleum), 3, the Temple of Diana at Ephesus, 4, the Walls and Hanging Gardens of Babylon, 5, the Colossus at Rhodes, 6, the Ivory and Gold Statue of Jupiter Olympus, and 7, the Pharos, or Watch Tower, built at Alexandria by Ptolemy Philadelphus, King of Egypt

Seven Years' War was waged by Frederick the Great and England against Austria France, and Russia, from 1756 to 1763 It resulted in the secession of Silesia to Prussia of Canada to England, and in the strengthening of our Indian Empire

Sexagesima Sunday is the 2nd Sunday before Lent.

Sextant, an instrument which has superseded the quadrant as a measurer of angles between distant objects It is of special importance in navigation and surveying, and contains 60 degrees described on a graduated arc A small telescope is attached and there are also a couple of mirrors which reflect the distant objects so as to enable them to be accurately observed The invention is attributed to John Hadley, and to Thomas Godfrey independently, about 1730

Sextet, a musical composition for six voices or instruments

Shad, a marine fish belonging to the same genus as the herring It is found along the Atlantic Coast of the U S A , and ascends rivers to spawn

Shagreen, shark's skin; also a leather of peculiar grain made from skins of wild asses, camels, horses, etc , and mostly manufactured in Astrakhan and Asia Minor

Shake, a musical embellishment produced by the rapid alternation of two notes.

Shalloon, a kind of cloth manufactured from wool and worsted, and used chiefly for women's dresses and coat linings. It gets its name from

the fact that it was originally made at Chalons

Shamrock, the three-leaved clover-like plant native to Ireland and its national emblem

Shark, a large and powerful ocean fish, comprising many species, very widely distributed, but most numerous in tropical seas They have formidable teeth and are the most carnivorous of all fishes They usually attain a large size, the whale-shark being often of a length of 50 ft Commercially the shark yields shagreen from its skin, the fins are made into gelatine, and an oil is obtained from the liver

Sharp. *See* **Flat**.

Sheep, a well-known family of ruminants of great utility as wool-producers, and for food From the earliest times sheep have been a source of wealth to England So much were they valued in the 15th and 16th cent, that their exportation was frequently prohibited The chief English varieties are the Leicester, Cotswold, Southdown, and Cheviot breeds Of the foreign breeds the most valued are the Merino sheep of Spain, which yield a fine long wool Australia, U S S R, Argentina, India, U S A, New Zealand, and S Africa are the chief wool-producing countries in the world

Shelduck, a handsome genus of surface-feeding ducks, one of which, the common shelduck, is an inhabitant of this country It is a beautiful white-and-chestnut plumaged bird with dark-green head and neck and red bill Another species, the ruddy sheldrake, appears in Britain only occasionally

Shellac This resin is the secretion of the lac insect (*Coccus lacca*), which occurs in forests of Assam and Siam It is used for making varnish and in the manufacture of gramophone records *See also* **Lac.**

Sherardizing Process for coating steel or iron parts with zinc to prevent corrosion, this is done by heating the parts in a closed rotating drum containing zinc dust

Shilling has been an English coin from Saxon times, but is was not of the value of 12 pence until after the Conquest The present style of shilling dates from the time of Henry VII

Ships have existed from prehistoric times There is mention of one that sailed from Egypt to Greece in 1485 B C, and in 786 B C the Tyrians built a double-decked vessel No double-decked ship was known in England, however before the *Royal Harry* was built by Henry VII and it was not until the 17th cent that ship-building was carried on in this country as a prominent industry

Ship-worm. *See* **Teredo.**

Shoddy, the name given to a kind of cloth mainly composed of woollen or worsted rags, torn up and re-fabricated by powerful machinery It was first made at Batley in Yorkshire about 1813, and became a very important industry employing many thousands of people at Batley and the neighbouring town of Dewsbury

Shot, the name given to solid projectiles fired from guns In the time of Henry V stone shot was used, later leaden shot, then iron shot, and finally steel shot, introduced by Sir Joseph Whitworth

Shrike, a large and varied family of birds of hawk-like behaviour found in all continents except S America The Red-backed Shrike, which winters in Africa, is a breeding visitor to England and Wales It is commonly called the "Butcher Bird" from the way it impales its prey (small birds and insects) on thorn-twigs The other species on the British list are the Great Grey Shrike, the Lesser Grey Shrike, the Woodchat Shrike, and the Masked Shrike

Shrove Tuesday, the day before the first day of Lent, receiving its name from the old custom of shriving, or making confession, on that day. In England the day has always been associated with the making of pancakes

Sicilian Vespers, the term applied to the terrible massacre of French people in Sicily in 1282 The French under Charles of Anjou were then in occupation of the island, and had been guilty of many cruelties It began at Palermo on Easter Monday at the hour of vespers and resulted in the expulsion of the French king and the introduction of Spanish rule.

Silence, Tower of, or *dakhma*, a tower about 25 ft high, built by the Parsees for their dead. The corpse is taken inside by professional corpse-bearers and left to be consumed by vultures. Parsees do not burn or bury their dead, and the *dakhma* is to protect the living and the elements from defilement

Silhouette, a form of black profile portrait, invented by Etienne de Silhouette in 1759, and formed by an outline cutting made with scissors or other sharp instrument from cloth, paper, or other flat substance

Silicon, an important non-metallic element, symbol Si, it is related to carbon Next to oxygen, it is the most abundant constituent of the earth's crust (27% by weight) It occurs in many rocks, and its oxide occurs in many forms (*e g*, quartz, sand, flint, agate, chalcedony, opal, etc) Coming into use as a semi-conductor material for making transistors and similar devices

Silicones are synthetic organic derivatives of silicon which because of their high resistance to heat and moisture have special uses, *e g.*, lubricants, heat-resistant resins and lacquers, and water-repellent finishes Silicones are compounds in which the molecules consist of chains of atoms of silicon and oxygen alternately Silicones were developed in the United States from discoveries first made by Prof F S Kipping at Nottingham University Manufacture began in Britain in 1950, and in the form of fluids, resins, rubbers, and greases they find wide use in industry The largest plant in Europe is in Glamorgan

Silk, the name given to a soft glossy fabric manufactured from the fine thread produced by the silkworm It was known to, and highly prized by, the ancients, being at one time paid for, weight for weight, with gold The manufacture of silk was carried on in Sicily in the 12th cent, later spreading to Italy, Spain, and the south of France It was not manufactured in England before 1604, but when certain French refugees established themselves at Spitalfields in 1688, the industry was developed and became of importance In the 18th cent the Lombes of Derby achieved great success in this industry. Japan, China, Italy, Korea, and the Soviet Union are the chief silk-producing countries

Silkworm, the larva of a species of moth, *Bombyx mori* It is native to China, and has been cultivated with success in India, Persia, Turkey, and Italy The silkworm of commerce feeds on mulberry leaves and produces a cocoon of silk varying in colour from white to orange The cocoon is the silken habitation constructed by the worm for its entrance upon the pupal condition, and to obtain the silk the pupa is killed by immersion in hot-water

Sill, a sheet-like mass of igneous rock which has been intruded parallel with the stratification of the country rock, cf a dyke

Silurian This geological period is one of the major subdivisions of the Palaeozoic era. Its beginning is estimated at 440 million years ago, and the period lasted about 40 million years. Maximum thickness of the Silurian strata in Britain measures 15,000 ft *See* **F30.**

Silver, a white precious metal, symbol Ag (Latin *argentum*), found in a free state, also in certain combinations, and in a variety of ores The chief silver-producing regions are the Andes and Cordilleras Peru, Bolivia, and Mexico have yielded vast supplies of the metal since the 16th century, and Colorado and Nevada in the United States have also been very prolific in silver yield In England standard silver (that used for coinage) formerly contained 92½ per cent the silver and 7½ per cent alloy, but when the price rose to 89½*d* per oz and the coins became worth more than face value, the Coinage Act of 1920 was passed, reducing the fineness to half To provide silver bullion for industry and for a fund towards the redemption of our silver debt to America, it was decided in 1946 to replace the United Kingdom silver coinage by one made of cupro-nickel (75 per cent copper, 25 per cent nickel) Maundy money, however, is of the original silver standard Silver chloride and bromide are light-sensitive compounds and are used in photography

Silverfish, a primitive wingless insect (*Lepisma*) found commonly in old papers and under floor coverings

Simony, the offence of trading in church offices, has been contrary to English law since the time of Edward VI Elizabeth also promulgated laws against simony In 1879 a Royal Commission reported on the law and existing practice as to the sale, exchange, and resignation of benefices The position is now controlled by the Benefices Act 1898, the Amendment Measure 1923, and the Benefices Rules 1926

Sinn Fein (*Irish* = ourselves alone), an Irish nationalistic movement founded in 1905 which developed into a mass republican party and triumphed in the establishment of the Irish Free State A small extremist group has survived which represents politically the outlawed I R A

Sins, The Seven Deadly or Capital Sins are pride, avarice, lust, anger, gluttony, envy, sloth

Sirius, the dog-star, so called because of its situation in the mouth of the Dog (Canis Major) it is the brightest of all the fixed stars, and is also one of the nearest to us

Sirocco, a warm, southerly, often dust-laden, wind blowing across Mediterranean lands from the Sahara, in advance of an eastward-moving depression over the Mediterranean

Siskin, a small bird of the finch family, common in Northern regions, nesting in Britain The common Siskin has a yellow-green colour and is a lively, swift-flying bird with a stout bill

Sistine Chapel, the chapel of the Pope in the Vatican, renowned for its frescos by Michelangelo

Six Articles, The Statute of the, was passed in 1539 for compelling adhesion to the chief doctrines of Roman Catholic faith, transubstantiation, communion in one kind only for the laity, vows of chastity, celibacy of the clergy, private masses, and auricular confession those who refused to subscribe to the Articles were treated as heretics The Act was repealed in 1547

Sizar, a student of Cambridge or Dublin University to whom concessions in regard to college bills are made after having passed a certain examination He formerly waited on the table, similar students at Oxford are called servitors

Skate, a genus of sea-fishes related to the Rays

Skink. The skinks constitute a large family of lizards with large smooth scales, under each of which is a bony plate The largest species, found in Australia, is about 2 ft long Some skinks have adopted a burrowing habit and degeneration of the limbs is associated with this. The Common Skink is a small species about 5 in long, living in the deserts of N Africa

Skua, falcon-like marine birds related to the gulls, found throughout the world Known as "Robber Birds" because they steal not only the young and eggs of other birds (including penguins) but also their food, which they force them to disgorge in mid-air The Arctic Skua breeds as far south as Scotland The Great Skua breeds in both Antarctica and Arctica Other species are the Pomarine, the Long-tailed, and McCormick's Skua

Skunk, a North American mammal of the weasel family, with short legs and long bushy tail All fifteen species are black and white, some being striped and the rest spotted It secretes and ejects at will a foul-smelling fluid Anything tainted with this fluid retains the odour for days

Sky. The blue colour of the sky on a summer's day is the result of the scattering of light waves by particles of dust and vapour in the earth's atmosphere Blue light having almost the smallest wavelength in the visible spectrum (0 00004 cm) is scattered laterally about 10 times as much as the red (0 00007 cm).

Skyscraper; owing to lack of ground space, increasing cost of land, and growth of modern cities, buildings are being made higher than broader, hence the name The structures are constructed of a steel framework usually clothed in concrete or reinforced concrete. Among the highest examples are the Soviet Palace, Moscow (1,365 ft), the Empire State Building of New York (1,250 ft), and the Crane Building of Chicago (1,022 ft)

Slate, fine-grained clayey rocks which have undergone metamorphism. They cleave easily. and it is this property of cleavage which makes them a valuable source of roofing material. Welsh slates are among the best, there being important quarries at Penrhyn, Llanberis, and Ffestiniog

Slavery. In its earlier forms, as in the times of ancient Greece and Rome, in the feudal ages, when vassalage and villeinage existed, and in the serfdom of Russia and other northern nations, slavery was attended by many inhumanities and evils, but perhaps in the negro slavery system which prevailed in the British colonies for upwards of 200 years and in certain parts of the United States up to 1865, it attained its highest point of cruelty Since 1833 no slavery has existed in the British possessions, though to the world's shame it is still prevalent in parts of Arabia, and, in the form of forced labour, in parts of Africa and elsewhere

Slide Rule, an instrument which in its simplest form consists of two logarithmic scales sliding alongside each other By its use multiplication, division, extraction of roots, etc , are speedily carried out

Sloth, a curious family of mammals, only found in Central and South America. They dwell almost entirely in the trees, proceeding from branch to branch with their bodies hanging downwards, their weight being supported by their large hook-like claws They eat foliage

Slow-Worm, a species of lizard found in Britain which lacks legs Silver with longitudinal brown stripes, it lives almost entirely on slugs

Smelting. The process of heating an ore with a reducing agent to convert ore into metal, and with a flux to convert rocky impurities into a slag that will float on top of the molten metal Slag and metal can then be tapped separately An example is iron smelting, the reducing agent is coke, and limestone is added as the flux, the smelting is carried out in a blast furnace

Snake The snakes constitute the important reptilian order *Ophidia* Snakes have a scaly cylindrical limbless body, lidless eyes, forked tongue, and the upper and lower jaws joined by an elastic ligament Their locomotion is accomplished by means of the excessive mobility of their numerous ribs All snakes have teeth used for seizing prey, and the poisonous varieties are furnished with poison fangs in the upper jaw These fangs are hollow modified teeth and the venom passes into them from a special gland situated behind the angle of the mouth Some 2,500 species of Snakes are known, divided into 13 families

Snipe, a wading bird, long-legged, with long, slender, straight bill, brown plumage, and zigzag flight The Common Snipe breeds locally throughout Britain, the Great Snipe and small Jack Snipe are occasional visitors The close season is Feb 1 to Aug 11

Snort (*Ger* Schnorchel), a tubular device of modern invention used in submarines It contains two pipes for the intake of air and outlet of gases, and can be maintained above the level of the surface of the water When a submarine is submerging with snort at the surface it is said to be *snorting*

Snow. When water vapour condenses at high levels at a temperature below freezing, a cloud of ice particles is formed If these frozen droplets are small, they fall slowly and gradually assume a feathery crystalline structure, reaching the earth as snowflakes if the temperature remains below freezing

Socialism. *See* J40.

Sociology is the study of society, but the science is so vast that sociologists differ in what they consider to be its subject-matter One of the leading sociologists, however, Professor Ginsberg of London, lists the problems of the worker in this field as follows (1) the investigation of the quantity of the population and its quality, the study of the various types of social structure and classification of social groups and institutions, (2) social control—the study of law, morals, religion, convention, and fashion—the regulating agencies of society, (3) social processes—study of the various types of interaction between individuals and groups—co-operation, conflict, etc , (4) social pathology—the study of social maladjustment and disturbances Sociology, like psychology, has been for long considered a field for arm-chair philosophy, most of the great philosophers from Plato and Aristotle onwards to Marx and Engels have pro-

duced theories on the nature of society, but such theories often tell more about the individual who composed them and his political prejudices than about facts. Recently, however, there are signs that sociology is becoming a science in its own right.

Soda, carbonate of sodium, is now mainly obtained by certain processes of manufacture from common salt. It was formerly obtained from the ashes of plants. Bicarbonate of sodium is the primary product in the Solvay or Ammonia-soda method for commercial manufacture of soda, it is also formed when carbon dioxide is passed into strong soda solution. The bicarbonate is used in medicine and in the preparation of baking powder.

Sodium, a metallic element, symbol Na (Latin *Natrium*), first obtained by Sir Humphry Davy in 1807 from caustic soda by means of the electric battery. Its chloride is *common salt*, the deposits of salt (*e.g.*, in Cheshire and at Stassfurt) have come into existence through the drying up of inland seas. Salt occurs in sea-water to the extent of about 3 per cent., the Dead Sea contains about 22 per cent. The blood of animals is maintained at a level of about 0·6% sodium chloride. That there is sodium in the sun's atmosphere was confirmed in 1859 by Kirchhoff from his spectroscopic observations.

Soil, the superficial covering of land areas composed mainly of disintegrated rock material and the remains of dead plants and animals (humus) and containing in varying amounts trace elements and other nutriments essential for plant growth.

Solar Battery, one of the innumerable devices made possible by the development of semi-conducting materials, notably germanium and silicon. This device creates an electric current from light falling on it. The current can be put to use or stored in storage batteries. The energy of the current is derived from the sunlight, and the solar battery is thus an *energy-converting* apparatus. Solar batteries have provided power for the instruments in satellites. In London in 1960 a car (developed in the U.S.A.) was demonstrated running on the power from sunlight and solar batteries.

Solstice, an astronomical term indicating the point at which the sun is most distant from the equator. *See* **N20**.

Sonata. Properly the instrumental equivalent of a Cantata, *i.e.*, an extended piece for a solo instrument, *e.g.*, pianoforte or violin with pianoforte accompaniment. A typical sonata (*e.g.*, Beethoven's Pathetique, Op. 13) consists of three movements. Each movement (*see* **Movement**) consists of two or more subjects interwoven in a characteristic way. The first movement is longer than the others. A solemn introduction leads to an agitated first subject which is connected by a bridge to the second subject. This is followed by a small coda. This first part comprises the Exposition. There follows a short Development of themes found in the Exposition, this leading to a recapitulation of the first and second subjects, the latter with a change of key. The movement ends with a Coda consisting of themes from the Introduction and first subject. This treatment is typical of sonata form. The second movement is in complete contrast and is one of the loveliest slow movements ever written. Its form is that of a simplified Rondo: 1, 2, 1-3-1, Coda. The third movement is again in contrast. It is rapid but has not the tragic character of the first movement. The form is that of a full Rondo.

Soundings at sea, to determine depth at any point, have been taken in all seas, and with considerable accuracy. A deep reading was that of the *Challenger* expedition in 1873, near St. Thomas's in the North Atlantic, when 3,875 fathoms were sounded. In 1851 H.M.S. *Challenger* recorded the then maximum ocean depth in the Marianas Trench (W. Pacific) by echo-sounding as between 5,882 and 5,940 fathoms. Another deep was located in the S. Pacific in 1952–53 of 5,814 fathoms in the Tonga Trench, 180 miles S. of Tonga Tabu. Since then even greater depths have been recorded, in the Marianas Trench and the Mindanao Deep. *See* **Pacific Ocean.**

Southern Cross, popular name of *Crux*, a constellation of the Southern hemisphere, consisting of four bright stars in the form of a Latin cross. It has been called the pole-star of the south and is indispensable to seafarers.

South Sea Bubble, a project entered upon in 1711 as a financial speculation by what was called the South Sea Company. Harley, Earl of Oxford, who was then in power, conceived the idea of utilising this project for getting together a sufficient sum to pay off the National Debt, then standing at about £51,300,000. The company contracted to redeem the whole debt in 26 years on condition that they were granted a monopoly of the South Sea trade. The idea fascinated the public, fabulous profits being dreamt of, and there was an immense demand for shares, which ran up in value from £100 to £1,000. All classes joined in the gamble, but by the wise policy of Sir Robert Walpole the fraud was exposed in 1720, when the whole scheme collapsed and thousands of people were ruined.

Soya Bean. This is the bean of a leguminous plant (*Glycine soja*) found in Asia. The bean meal, which is rich in protein and oil, is familiar in Britain as "soya flour."

Space Flight. The Soviet Union was the first country to launch a man into space and bring him safely back to earth. This epoch-making event took place on April 12, 1961, when Yuri Alexeyevich Gagarin, an officer in the Soviet Air Force, girdled the earth in a spaceship weighing about 4½ tons. It was launched by rocket in an elliptical orbit with greatest height 187 miles and least 109 miles. The inclination of the orbit to the equator was 65 deg. 4 min. and the period of revolution was 89 min. 6 sec. Since then, the Russians Titov, Nikolayev and Popovich, and the Americans Glenn, Carpenter and Schirra have brought the number of human space travellers to seven (up to March 1963). *See also* **C15(1).**

Space Research. *See* **F43–48.**

Spanish Civil War, 1936 to 1939. The war commenced by a revolt by the Fascist General Franco against the Republic which had succeeded the Monarchy in 1931. Germany and Italy aided the rebels who besieged Madrid for over 2 years. An International Brigade was formed to help the Republic, but the Spanish Government was faced by the greater part of the Army, and very effective assistance from Italy and Germany. Those powers seized the opportunity to have a curtain-raiser to the world conflict which they intended to precipitate. After a total loss of a million men the Fascists overpowered the Republic.

Sparrow, name given to finch-like birds found in most parts of the world, of which the House Sparrow *Passer domesticus*, is the most familiar of British birds. Also native to Britain is the rural Tree Sparrow, distinguished from the male House Sparrow by its chestnut crown. Other European species are the Italian, Spanish and Rock Sparrows.

Specific Gravity, defined as the ratio of the mass of a particular volume of a substance to the mass of an equal volume of water at 4° C. *See* **Hydrometer.**

Spectroscope, an instrument for spectrum analysis or observation. It consists in its simplest form of a tube through which the light, in whose spectrum the observer is interested, is conveyed to a collimating lens, which focuses it on to a prism, and a telescope through which to view the spectrum. The first flame spectrometer was constructed by Kirchhoff in 1859. High-precision spectroscopy is a very important technique in physics, chemistry, and astronomy, and is facilitated by numerous elaborate instruments. *See* **F13(1).**

Spectrum. When light is refracted by a prism the rays of different wave-length are refracted slightly differently. Thus white light is broken down to give its spectrum colours, ranging from red (longest wave-length) to violet (shortest wave-length). This phenomenon was discovered by Newton in 1672. Outside the wave-length range of visible light are other electromagnetic waves ranging from very long radio waves to very short γ-rays (*see* **F13**). This extended series of radiations is called *the electromagnetic spectrum.*

Spelling Reform. The complaint is often made about the English language that, more than any other, there is a tendency to incongruity between spelling and pronunciation (*e g*, "ough" is pronounced quite differently in such words as plough, cough, through, though, lough, bough, tough). In addition, the same word is indicated by different spellings (*e g*, too, two; see, sea, fair, fare) Or some letters are not pronounced at all as in myrrh or psalm No doubt this incongruity causes difficulty both to children and even more so, to foreigners trying to learn the language, and for this reason it has been proposed that spelling should be phonetic Various systems have been suggested from the simple phonetic spellings which, partly deliberately, partly out of ignorance, arose in America during the last two centuries or so (*e.g*, plow for plough, sox for socks, thru for through, labor for labour), to the more complex and most recent method, which adds new letters to the alphabet. If there is something to be said for spelling reform there is also much against it (unfortunately the subject is one of those apparently innocuous ones which some people make into what amounts to a personal religion) (1) There are constant changes in pronunciation during the course of time (*e g*, it used to be thought correct in poetry to pronounce "wind" as "wynd") and, of course, there are also local differences in the way words are pronounced (*e g*, that (particularly irritating to the Scot who tends to give the full value to sounds) of the cultured southern Englishman leaving out the letter "r" where it does appear and putting it in where it does not) This would result—even by B B C standards—in "rather" being spelt "ratha" or "rathah," whilst "India" would be spelt "Indiar," and "law," "lor" (2) Phonetic spelling would necessitate the complete revisal of all previous literature without which many would find it incomprehensible (3) Although this may simply be a matter of habit, one obtains pleasure not only from the sound of words but from their appearance on the printed page, this particularly applies to verse (4) Spelling reform would, in the long run, deprive us of useful information about the derivation of words

Spermatozoa, microscopic cells about $\frac{1}{500}$ in long which are the reproductive cells in male animals, and possess the power of fertilising the female ovum. In shape they resemble a tadpole, their mobility deriving from the long tail each spermatozoon has

Sphinx, in Greek mythology, a winged creature with a woman's head and a lion's body The sphinx of Egyptian religion, which probably originated in Mesopotamia, represented a king in divine form. The Great Sphinx at Giza, probably built in the reign of Chephren (c 2900 B C) is in the form of a lion with the head of a pharaoh

Spiders belonging to the *Arachnid* class Unlike insects, they have two divisions of the body, eight legs, no antennae, no wings, and usually four to eight simple eyes, never compound Most species spin webs composed of a viscid fluid

Spinet, a sort of boudoir harpsichord popular in the 17th cent The name derives from that of its inventor, Spinetti

Spiritualism. *See* **J41**.

Spirituals, negro melodies with religious inspiration and which are still spontaneously created, but have also passed into art-music Paul Robeson, the American Negro, is the best-known singer of spirituals to-day

Sponge, a marine organism consisting of a colony of cells organised in a more primitive way than most multi-cellular organisms without a nervous system. While the sponge lives a current of water circulates through the main apertures It is the dead skeleton of this mass that forms the sponge of commerce *See* **F22**(2).

Spoonbill, a long-legged, marsh bird, closely related to the ibis and stork, remarkable for its snow-white plumage and broad, flat, spoon-shaped bill. The European species has not bred in England since the beginning of the 17th cent., but is still a regular summer visitor from Holland, where it nests in colonies in reed-beds and islets.

Sputniks, the name of the Russian earth satellites first launched during the period of the International Geophysical Year. *Sputnik I*, launched 4 Oct 1957, became the first man-made earth satellite *Sputnik II*, launched a month later, carried a dog as passenger. *Sputnik III*, launched in May 1958, and weighing well over 2 tons, became the first fully-equipped laboratory to operate in the heavens The sputniks represent a highly significant landmark in the history of scientific research The father of space travel with rockets was a Russian—Konstantin Eduardovich Tsiolkovsky—the centenary of whose birth practically coincided with the launching of the first earth satellite. *See also* **F44–48**.

Squirting Cucumber, *Ecballium elaterium*, so named from the fact that when ripe it breaks from the stalk and ejects its seeds and juice from the hole made by the breakage

Stainless Steel. The development of stainless steel for cutlery manufacture etc, began with the discovery of Harry Brearsley in 1912 that steel containing 12 per cent. of chromium is rust-proof

Stalactites are deposits of calcium carbonate formed on the roofs and sides of limestone caves, and in tunnels, under bridges, and other places where the carbonic acid of rain-water percolates through and partly dissolves the limestone, resulting in the growth of icicle-like forms that often assume groupings. The water that drops from these may deposit further calcium carbonate, which accumulates and hardens into a series of sharp mounds or hillocks called stalagmites

Starch is an organic compound occurring in granules in nearly all green plants, and especially in the seeds of dicotyledonous and cereal plants, potatoes, etc In its pure form starch is a tasteless, odourless white powder, and is a carbohydrate consisting of carbon, hydrogen, and oxygen

Star Chamber, an ancient tribunal of State in existence in 1486 and possibly earlier, charged with the duty of trying offences against the Government, unfettered by the ordinary rules of law It was in effect a Privy Council entrusted with judicial functions, and the present Judicial Committee of the Privy Council to some extent represents the older tribunal Under Charles I the Star Chamber was used by the King and his party in the most unjust manner to persecute their opponents, and became such a scandal that in 1641 it had to be abolished

Starling (*Sturnus vulgaris*), a well-known European bird now common in many parts of the world It has handsome plumage, shot with greens and purples and nests in holes and crevices Flocks of starlings are often seen wheeling in the air, thousands roost on buildings in the heart of London. Other European species are the Spotless and Rose-coloured starlings. The latter sometimes wanders to the British Isles

States-General, national assembly in which the chief estates of the realm were represented as separate bodies The name, though not the institution, has survived in the Netherlands, where the two houses of parliament are known as states-general In France the states-general consisted of three orders, clergy, nobility, and commons Philip IV first summoned it in 1302 to support him in his quarrel with Pope Boniface VIII While absolute monarchy was establishing itself it met rarely, and not at all from 1614 until 1789, when it was convoked as a last resort by Louis XVI But when it met it declared itself the National Assembly which marked the beginning of the revolution.

Statute of Westminster, 1931 An Act of parliament which gave a basis of equality to the British Dominions. The Dominions as well as the United Kingdom were defined by the Balfour Memorandum of 1926 as "autonomous communities within the British Empire, equal in status, in no way subordinate one to another in any aspect of their domestic or external affairs, though united by a common allegiance to the Crown, and freely associated as members of the British Commonwealth of Nations" The Statute was the sequel The Dominions are sovereign States governed solely by their own Parliaments and Governments. *See* **C27**(2).

Steam Engine, a machine whereby steam becomes the active agent of the working of machinery, and of very wide application The leading types of steam engine are (*a*) condensing, or low-pressure engines, where the steam is generated by a boiler, (*b*) non-condensing, in which the cylinder exhausts its steam into the open air Engines of the latter type are used where portable engines are required

Steam Hammer, invented by the Scottish engineer James Nasmyth (1808-90) in 1839, which proved of great utility in the development of the iron trade The hammer itself, which is fixed to the end of a piston-rod passing through the bottom of an inverted cylinder, often weighs as much as 80 or 100 tons, and is so perfectly controlled by the steam power that its action can be so accurately gauged that it could be made to crack the glass of a watch without actually breaking it, or brought down upon a mass of molten iron with a force representing many hundreds of tons

Stearin is the portion of fatty matters and oils which remains solid at an ordinary temperature, and is a compound of stearic acid with glycerine It is largely used in the manufacture of candles and for other commercial purposes With caustic soda stearin forms a soap (sodium stearate), which is present in most commercial soaps which contain sodium palmitate and oleate in addition

Steel, an alloy of iron and carbon, with varying proportions of other minerals The famous blades of Damascus and steels of Toledo were made by the cementation and crucible method The metal produced by the "Bessemer process" (*q v*) is of the highest value for structural purposes, rails, etc The United States, Germany, U S S R, and United Kingdom are the leading countries in the world in steel production *See also* **Stainless Steel.**

Stellite, an important alloy for the manufacture of cutting tools It contains chromium, cobalt usually some tungsten, and a small quantity of carbon

Stereotype, a metal cast taken from movable type which has been set up in the ordinary way The first to introduce the process in practical form in this country was William Ged, of Edinburgh, who made stereotype plates in 1730 An impression of the type matter is first taken by means of a mould of prepared plaster of Paris or moistened sheets of specially prepared paper, and when molten stereo metal is poured upon the mould and allowed to cool and harden, the stereo plate is formed, and can be printed from as a solid block for some time

Steroids, A class of structurally related compounds, based on a system of condensed rings of carbon and hydrogen, which are widely distributed in animals and plants Included in the steroid family are sterols, found in all animal cells, vitamin D, sex hormones, bile acids, and cortisone, a drug used in the treatment of rheumatic fever

Stethoscope, an instrument by which the action of the heart and other organs of the chest can be heard and gauged It was invented by Laënnec, of Paris, in 1816, and consists of a cylinder, one end having a funnel-shaped opening which is placed against the chest, while the other end is held to the listener's ear There is also a binaural stethoscope, which has two india-rubber tubes for the ears

Stibnite, the chief ore of antimony, chemically it is antimony sulphide Steely-grey in colour

Stirrup, a loop of metal U-shaped strap suspended from the sides of the saddle, used for mounting and to support the horseman's foot Some authorities allege their use as far back as the early Iron Age, and it is generally believed that they were used in battle in A D 378, when the Gothic cavalry defeated the legionaries of the Emperor Valens at Adrianople Stirrups relieved the tension on the rider's knees and so enabled him to be armed from top to toe.

Stoat, a slender, carnivorous mammal with short legs, related to the weasels. The stoat is distinguished from the latter by its longer tail, which has a black tip. The black tip is retained even in the winter when the animal turns white, the fur then being known as "ermine." It is found in northern latitudes, and is abundant in Arctic America

Stole, ecclesiastical vestment worn by priests over both shoulders and by deacons over the left shoulder only.

Stoma (pl **stomata**), microscopic pores on the surfaces of leaves through which gaseous exchanges take place and water is lost. It has been estimated that a single maize plant bears 200 million stomata, usually closed at night.

Stone-Flies, comprise the order of insects called *Plecoptera*, which includes some 700 species, of which about thirty occur in Britain The wings are membranous, and two long, thread like feelers protrude at the tail end. The larvae are aquatic

Stonehenge, a remarkable collection of Bronze Age monuments arranged in two circles, 340 ft in diameter, standing on Salisbury Plain, Wiltshire Modern archaeological research dates origin back to between 1860 and 1500 B C The fallen trilothon and stones of the outer circle were re elected in 1958 *See also* **J13(1).**

Stork, a family of heron-like birds with long bills, freely distributed over Europe, Asia, Africa, and S America The White Stork is an occasional visitor to England, and, more rarely, the Black Stork, these are the only two European storks

Stratosphere, a layer of the earth's atmosphere, which begins 6-7 miles above the earth The attraction of the stratosphere as a medium for air travel rests upon the absence of storms, indeed weather phenomena as commonly understood do not occur, there being no vertical temperature gradient in the stratosphere and no convection currents

Stratum (pl. strata), a bed or layer of rock.

Strontium. This silver-white metallic element was discovered by Hope and Klaproth in 1793, and isolated by Sir Humphry Davy in 1808 The chief strontium minerals are celestite (sulphate) and strontianite (carbonate). Compounds of strontium give a brilliant colour to fireworks and signal flares Radioactive isotopes of strontium (strontium-90) are formed as fission products in nuclear explosions and tend to collect in bone on account of the chemical similarity of strontium and calcium (*q v.*). This genetic hazard is a cause of great alarm. *See* **Fall-out.**

Study, a piece of music written primarily as a practice-piece for perfecting technique. Many of the Studies (Etudes) of Chopin have considerable merit as music

Sturgeon, a large fish found in northern seas and rivers with five rows of bony plates along the back and sides and pointed mouth with four barbels Caviare is prepared from sturgeon ova Since the reign of Edward II all sturgeon caught off the coasts of Britain, except in certain privileged places, have belonged to the Sovereign

Sublimation, when a solid substance is heated and turns into vapour without passing through the liquid stage and then condenses as a solid on a cold surface, it is said to "sublime" and the process is called "sublimation" Iodine behaves in this way, and sublimation is used as a method of purifying it

Submarine, the first submarine the *Nautilus*, was designed by Robert Fulton and tried out in the river Seine and in the sea off Brest in 1801. The idea was too revolutionary to find acceptance and it was not until electricity for under-water propulsion became available that the submarine underwent extensive development Britain became interested about 1900 and the Germans developed it and made it into an instrument of warfare The Royal Navy's first nuclear submarine *Dreadnought* was launched in Oct 1960, a second is under construction and a third planned. The first voyage under the North Pole was made in 1958 by the American nuclear-powered submarine *Nautilus* (*q v*) A fleet of American nuclear-powered submarines armed with *Polaris* missiles have an anchorage at Holy Loch, Clyde

Suez Canal, connecting the Mediterranean and the Red Sea, was built by the French engineer Ferdinand de Lesseps and opened in 1869. An Egyptian company, *Canal Maritime de Suez*, was formed in 1866 with a capital of 200 million francs. The British Government acquired

176,602 shares out of a total of 400,000 for £4 million (value Mar. 31, 1956, £28,982,544). Its length is 101 statute miles, minimum width 196 ft. 10 in. (navigation channel), and the maximum draught of water allowed for vessels using the canal is 34 ft. The average time for transit through the canal is eleven hours seventeen minutes. Under the Convention of 1888 all nations were granted freedom of navigation without discrimination in peace or war. The right was recognised by Egypt in the Anglo-Egyptian Agreement of 1954, under which Britain agreed to give up the Suez base. The Suez Canal Company was nationalised by the Egyptian Government without warning on July 28, 1956.

Suffragette, member of the Women's Suffrage Movement who in the early part of this century agitated to obtain the parliamentary vote. The movement ended in 1918, when women of 30 were given the vote. In 1928 a Bill was passed which granted equal suffrage to men and women. The leaders of the Women's Suffrage Movement were Mrs. Pankhurst and her two daughters, Sylvia and Dame Christabel, Mrs. Fawcett, Nellie Kenny, and others.

Sugar, to the chemist the term is a generic one covering a group of carbohydrates, including cane sugar (sucrose), glucose, fructose, and maltose. In ordinary parlance sugar means sucrose, which is obtained from the sugar cane, sugar beet, or sugar maple.

Sulphur, an elementary, brittle, crystalline solid, symbol S, abounding in the vicinity of volcanoes. It is yellow in colour. It occurs in combination with other elements, as sulphates and sulphides, and allied with oxygen, hydrogen, chlorine, etc., is of great commercial utility. Used in its pure state it constitutes the inflammable element in gunpowder; it is also used for matches and for making sulphuric acid.

Sulphuric Acid, a compound of great commercial importance, used in a variety of manufactures, and composed of sulphur, oxygen, and hydrogen.

Summer Time. In 1916 an Act was passed advancing Greenwich Mean Time by one hour during the summer months, calculated to save light and fuel by making use of an extra hour of daylight. This Act was made permanent in 1925, and summer time was to begin on the day following the third Saturday in April, or if that day was Easter Sunday, the day following the second Saturday, and end on the day following the first Saturday in Oct. By the Summer Time Act, 1947, the periods of summer time are now fixed each year by Order in Council.

Sumptuary Laws. Both the Greeks and Romans passed laws against luxury. In England regulations against luxury in food were promulgated under Edward II and subsequently. A series of Acts of Parliament, beginning in 1363, placed restrictions on apparel, graduated according to rank. In 1603, most of these laws, which had already fallen into abeyance, were repealed.

Sun, one of the millions of stars in the universe, the centre of the solar system, estimated to be distant from the earth 93,004,000 miles, to have a diameter of 865,000 miles, and a volume a million times that of the earth. It rotates on its axis from east to west, though not as a solid, the solar equator turning once in about 25¼ days and the poles in about 34 days. Large spots are observed on the sun—varying in size from 30,000 miles in diameter—which form and disappear at irregular intervals. The area of the disc covered by the spots, however, reaches a maximum roughly every 11 years, when the sun's heat seems rather greater than usual and magnetic storms more frequent. Spectrum analysis show that the sun is composed of many elements found in the earth. Its surface temperature is about 6,000° C. The apparently inexhaustible heat of the sun, which has maintained life on the earth for millions of years, is derived from the destruction of matter, involved in the transmutation of hydrogen nuclei into helium nuclei, in which process about four million tons of matter is destroyed every second. At this rate of conversion the sun will go on radiating for 30,000 million years. The Soviet space rocket *Lunik I*, fired on 2 Jan. 1959, became the first artificial planet of the sun. *See also* **F7** and for an account of the aurora **F50–52**.

Supersonic, pertaining to speeds greater than the speed of sound waves. In air at sea-level sound waves travel at about 760 m.p.h., and a plane or projectile moving faster than this (at sea-level) would be *supersonic*. Not to be confused with **ultrasonic** (*q.v.*). Aircraft travelling at supersonic speeds produce shock waves in the air somewhat analogous to the bow waves of fast-moving ships. These shock waves are regions of intensely disturbed air which are perceptible as *supersonic bangs*. *See also* **Mach Number.**

Surface Tension. The surfaces of fluids behave in some respects as though they were covered by a stretched elastic membrane. This property is called "surface tension." The action of detergents may be attributed in part to a reduction in the surface tension of water, allowing it to wet the surface of dirty articles.

Surrealism. The aim of the Surrealist school of painting and sculpture is to overcome the barriers between conscious and unconscious mind, the real and unreal worlds of waking and dreaming. As such it has a long and respectable ancestry, although the term was not in use until 1922 when it was picked by André Breton from Guillaume Apollinaire who had used it in connection with certain works by Chagall. However, Bosch in the 15th cent., Fuseli and Goya in the 18th, and many other purveyors of the weird and fantastic were the forerunners of modern Surrealism. The modern movement has broadly speaking taken two different directions: the first was towards complete fantasy and absurdity which took the form of "found objects" —*e.g.*, a bird-cage filled with sugar-cubes and a thermometer, a bottle dryer, a bicycle wheel, or abstract works with strange and apparently irrelevant titles such as Paul Klee's *Twittering Machine*; the second towards highly detailed and realistic paintings of objects placed in strange juxtapositions—*e.g.*, the flawless rendering and high degree of verisimilitude of Salvator Dali's trees with limp watches drooping over their branches or Georgio de Chirico's deserted and classical-looking streets with long arcaded perspectives and a lone statue or a bunch of bananas in the foreground. These, said Lautréamont, are as "beautiful as the chance encounter of a sewing-machine and an umbrella on an operating table." On the whole Surrealism has spent its initial force and become almost respectable; its idea of strange juxtapositions now widely commercialised, finds a place in advertisement illustrations and in the more sophisticated forms of window-dressing.

Surtax an additional duty of income tax, chargeable on total income in excess of £2,000. The starting level on *earned* incomes is £5,000 or more depending on personal allowances. Payable on Jan. 1 following year of assessment, so that surtax for 1963–64 is payable on Jan. 1, 1965. Charged on a sliding scale. *See* **L60.**

Swans, large, graceful birds which together with the ducks and geese form the family Anatidae. There are three European species with white plumage, the Mute Swan, distinguished by its orange bill with black knob, being the best known and a familiar sight on the rivers and ornamental lakes of this country. Two wild swans are winter visitors here, the Whooper and Bewick's Swan. The "pen" (female) and "cob" (male) mate for life and the young swans are called "cygnets."

Swan-upping. The annual marking of the Thames swans which takes place during the third week of July. This ancient ceremony dates back to the 15th cent. when all the Thames swans were declared to be Royal birds owned by the Crown. Two city guilds—the Vintners' and Dyers' Companies—own one third of the 600 swans now on the Thames. This privilege was granted to them by King Edward IV. in return for money grants. Vintners' birds are marked with a nick on each side of the bill, the Dyers' with a nick on the right side only. The Queen's birds are unmarked.

Sweet Potato. This plant (*Ipomoea batatas*), which is a climbing perennial belonging to the convolvulus family, has thick roots that are rich in starch, and are eaten like potatoes. A native of the W. Indies and Central America, new varieties of sweet potato have been bred which stand cooler climates and can be grown

as far north as Cape Cod. The sweet potato of New Zealand is called the Kumara

Swift, a bird so-called from the extreme speed of its flight, resembling a swallow but related to the humming-bird It has long, scythe-like wings, sooty-black plumage and greyish-white chin There are several species inhabiting most parts of the world, particularly the tropics The British breeding bird is among the latest to return from Africa and the earliest to go Swifts are the only birds to use saliva for their nests. One oriental species builds its nest entirely from saliva, and this jelly-like substance is much prized by the Chinese for their birds-nest soup

Sword, weapon used in personal combat, originally made of bronze The Romans introduced the iron sword, 20 in. long During the Middle Ages the most famous blades were those made by the Arabs at Damascus and those made at Toledo

Symbiosis. When two organisms live together and both derive mutual benefit from the association, the partnership is known as symbiosis An example is the symbiosis of an alga and a fungus in lichens, another is the ordinary pea plant and the bacteria which live in the nodules on the pea's roots

Symphony, a "sonata for full orchestra," usually consisting of four movements In Beethoven's Third Symphony the first movement is in typical sonata form, consisting of an exposition of two subjects followed by a development The second movement is a funeral march on a ternary plan (*i e*, 1–2–1) The third movement is a Scherzo on two subjects, while the fourth movement is an air with variations.

Syncopation, a displacement of the accent in music For instance, in four-beat time the accent is normally on the first beat It it were on any of the other beats the music would be syncopated This device has frequently been used in classical music, but it is the very essence of jazz

Synods, assemblies of heads or representatives of state and ecclesiastics for settling disputes relating to Church authority and government *See also* **Oecumenical Council**

Synoptic Charts. These are meteorological charts on which a synopsis of observed weather conditions is recorded using symbols of the international weather code

T

Tabard, a cloak or outer garment worn in mediaeval days by the peasantry The name was also applied to a garment worn by knights over their armour

Tailor-Bird, name of a small group of warblers, familiar in India and China, and remarkable for their habit of sewing leaves together to enclose their nests The bill is used as needle, vegetable fibre as thread, and a knot is tied to prevent it slipping

Taj Mahal, the white marble mausoleum built at Agra by Shah Jehan in memory of his favourite wife who died in 1629 Over 20,000 men were occupied for over twenty years in its erection

Takahe or **Notornis,** large New Zealand bird of the rail family which for many years was believed to be extinct Small colony found in 1948 in remote valley of mountainous part of the S Island The bird is strictly protected.

Take-over Bid describes an offer made to all the shareholders of a company to purchase their shares at a named price and conditional upon acceptance by the holders of a named proportion of the total share issue If accepted the purchaser thus gains control of the company

Tallage, in Norman times, were taxes levied by the Crown upon lands of the royal demesnes. The levying of tallage was taken away by a statute of 1340 which required the consent of Parliament for all direct taxes.

Tallow, the more solid portions of animal fat, and prepared from beef, mutton, etc, by melting at a low temperature. Stearin is its chief constituent. Used for making candles, soap, etc

Tally Office, in the Exchequer, was the department of the Government in which tallies were kept, representing the acknowledgment of moneys paid or lent; in 1834 the Houses of Parliament were burnt down through the overheating of a stove with discarded Exchequer tallies.

Tambourine, a light, small, single-headed drum with loose metal discs let into the side of the hoop so that they jingle when the tambourine is shaken An older name for it is the timbrel

Tammany, a New York democratic organisation, sprang out of an old benevolent society named after an Indian chief, and has exerted a powerful influence over political movements in New York The leaders of the organisation have used their power when their party has been successful at the polls to appoint their nominees to every prominent office, and have exacted bribes for concessions and privileges, and generally Tammany rule has meant wholesale corruption Of this there is ample evidence in the disclosures of the Tweed and other Tammany frauds, and in the fact that the "Boss" usually contrived to make himself wealthy.

Tannins are chemical substances obtained from a variety of plants and trees, from oak-bark, and from galls They are used in the leather trade, the tanning process making the skins resistant to decay

Tantalum, a scarce bluish metallic element, symbol Ta, discovered by Ekeberg in 1802. Chemically related to vanadium and niobium, it is usually associated with the latter in nature For several purposes it can be used in place of platinum, and it finds application in the making of surgical instruments Tantalum is very hard, and resistant to acids (other than hydrofluoric acid), it is used in alloys

Taoism. *See* **J42.**

Tapestry, a fabric largely used in former times for wall decoration and hangings It was known to the ancient Greeks, but in its modern form came into prominence in the 15th and 16th cent, when it was manufactured in a marked degree of excellence by the weavers of Flanders, especially those of Arras The manufacture was introduced into England early in the 17th cent, and was attended by considerable success. At the present day the term is applied to worsted cloths for furniture coverings, and there are also various kinds of tapestry carpets now made The most famous tapestries of olden times were the Aubusson Tapestry and the Savonnerie The Gobelin Tapestry factory, originated in Paris in the reign of Francis I, is still a national establishment *See also* **Bayeux Tapestry.**

Tapioca, a food-substance yielded by the tuber of a tropical plant, called the manioc or cassava plant, poisonous in its raw state, but purified by roasting

Tapirs. The tapirs constitute a family close to the horse family and the rhinoceros in the Ungulate order They have four toes on the front feet and three on the hind The snout is drawn out into a short trunk. The largest tapir is the Malayan tapir, which stands 3½ ft. at the shoulder Four species occur in Central and S America

Tar is a dark viscid product obtained from the destructive distillation of wood, coal, peat, etc Wood tar is acid owing to the presence of acetic acid ("pyroligneous acid") The highest proportion of coal tar goes into road making. Distillation of coal tar yields many valuable compounds, including benzene, phenol (carbolic acid), naphthalene, and creosote, the final residue after distillation is pitch Based on the chemical manipulation of compounds from coal tar is the preparation of many perfumes, food essences, drugs, antiseptics, and plastics.

Tarantula, the name given to a large range of big hairy spiders Music was supposed to cure their sting, hence the Tarantella dance.

Tarpeian Rock at Rome received its named from the tradition that Tarpeia, the daughter of the Governor of the Citadel who betrayed the fortress to the Sabines, was crushed to death by their shields and buried beneath the rock. From this height persons guilty of treason were hurled to death

Tartaric Acid is prepared from tartar (potassium hydrogen tartrate) deposited in wine vats during fermentation. "Cream of tartar" is purified potassium hydrogen tartrate, which is incorporated in baking powder. Tartaric acid is also used in the manufacture of effervescent salts, and in medicine (*e g.,* "tartar emetic").

Tartars (*or* **Tatars**), an Asiatic race who overran parts of Asia and Europe in the 13th cent. Tartar is also a term used to denote a person of irascible temper, a vixen or shrew, to "catch a tartar" was to encounter more than was bargained for

Tate Gallery, named after its founder, Sir Henry Tate, at Millbank, S W, was opened in 1897. Sir Henry Tate bore the cost of the building (£80,000) and also contributed the nucleus of the present collection "The Turner Wing," the gift of Sir Joseph Duveen, was added in 1910 The collection is thoroughly representative of British art and has been extended several times to include modern foreign art

Tay Bridge spans the Tay at Dundee, is over two miles in length, and was opened for traffic on June 20, 1887 A previous bridge, completed in 1877, was blown down on Dec 28, 1879, as a railway train was passing over it

Tea was introduced into England about the middle of the 17th cent, when it was a great luxury, and fetched from £6 to £10 a pound It is an Asiatic plant, native properly to China, Japan, and India Up to about 1885 most of the tea imported into this country came from China, the bulk now comes from India and Ceylon

Teal, the smallest of the European ducks and next to the Mallard the commonest British species It is a handsome bird and a very swift flier, but not as swift as the Garganey or Summer Teal

Te Deum, the song of praise ("Te Deum laudamus"—"We praise Thee, O God"), is supposed to have been the composition of St. Ambrose in the 4th cent and is used in Roman Catholic and English Church services

Telecommunications. The sending of messages over a distance The term is generally applied to the sending of messages by telegraph, telephone, or wireless, or by a combination of such means The first submarine telegraph cable between England and France was laid in 1850 and, following Hertz's investigations into electric waves, Marconi's invention led to Britain being linked with Europe by wireless telegraphy in 1899. The first permanently successful telegraph cable across the Atlantic was laid in 1866 The first telephone service between London and Paris was opened in 1891 The electro-magnetic telephone was invented by Alexander Graham Bell, a Scottish-born American, in 1876 The first submarine telephone cable to span the Atlantic was laid in 1955 which enables speech to be transmitted over a distance of 2,000 miles Before that, transatlantic communication was by radiotelephone, the first circuit having been opened in 1927, and ship to shore telephonic communication in 1930 London is an international switching centre, through which telephonic communication is maintained by land lines, submarine cables, and wireless channels combined Ships and aircraft are largely controlled by wireless signals, broadcasts of weather reports help shipping, aircraft, and farmers The performance of *Telstar* in July 1962 in relaying television programmes showed that intercontinental communication by satellites in space is practical

Telemetry, measurement at remote distances by means of a radio-link from the object (missile or satellite) to the ground The third Russian sputnik, for instance, carried apparatus for measuring, among other things, the pressure and composition of the atmosphere, and the intensity of different kinds of radiation from the sun Its radio transmitter, powered by solar-energy batteries, sent out the information in coded form by means of uninterrupted signals at 20 005 megacycles with a duration of 150–300 milli-seconds

Telepathy and Clairvoyance. *See* **J43.**

Teleprinter, a telegraph transmitter with a typewriter keyboard, by which characters of a message are transmitted electrically in combinations of 5 units, being recorded similarly by the receiving instrument, which then translates the matter mechanically into printed characters The telex or public teleprinter service provides direct person-to-person transmission of written messages

Telescope, an optical instrument for viewing objects at a distance, "the astronomer's intelligencer" Lippershey is credited with construction of the first in 1608; Galileo constructed several from 1609 and Newton was the first to construct a reflecting telescope. The ordinary telescope consists of an object-glass and an eye-lens, with two intermediates to bring the object into an erect position A lens brings it near to us, and the magnifier enlarges it for inspection A refracting telescope gathers the rays together near the eye-piece and is necessarily limited as to size, but the reflecting telescope collects the rays on a larger mirror, and these are thrown back to the eye-piece. The world's largest reflectors are at Mount Palomar Observatory, California (200 in), Mount Wilson Observatory, California (100 in), the McDonald Observatory at Mount Locke, Texas (82 in), and the Victoria B C Observatory (72 in) At the Royal Observatory, formerly at Greenwich, now at Herstmonceux, Sussex, a 98 in *Isaac Newton* telescope is being installed The *Hale* 200 in telescope at Mount Palomar is the largest ever made and has revealed objects never before photographed. It is able to probe space and photograph remote galaxies out to a limiting distance of 2,000 million light years The *Schmidt* telescope at Mount Palomar has been used to make a huge photographic map of the universe Manchester University has constructed at Jodrell Bank, Cheshire, a completely steerable radio-telescope with a paraboloid aerial 250 ft in diameter This telescope is the largest of its kind in the world Early in its career it tracked the Russian earth satellites and the American lunar probes *See* **Observatories** *and* **F48–51.**

Television, or the transmission of images of moving objects by radio True television was first demonstrated by J L Baird at the Royal Institution in London in 1926 The B B C began television broadcasts in 1930 The first television exchange across the Atlantic was made in July 1962 by way of the *Telstar* satellite

Tellurium, a relatively scarce element, symbol Te, discovered in 1782 by Reichenstein Chemically it behaves rather like sulphur; its salts are known as tellurides It occurs chiefly combined with metals in ores of gold, silver, copper, and lead It is a semiconductor, and some of its compounds (also semiconductors) are coming into use in technical devices

Templars were soldier knights organised in the 12th cent for the purpose of protecting pilgrims in their journeyings to and from Jerusalem, and obtained their name from having had granted to them by Baldwin II a temple for their accommodation At first they were non-military, and wore neither crests nor helmets, but a long wide mantle and a red cross on the left shoulder They were established in England about 1180 During the crusades they rendered valuable service, showing great bravery and devotion In the 12th cent they founded numerous religious houses in various parts of Europe and became possessed of considerable wealth It was this that caused their downfall Kings and Popes alike grew jealous of their influence, and they were subjected to much persecution, and Pope Clement V abolished the Order in 1312 Edward II in 1308 seized all the property of the English Templars The English possessions of the Order were transferred to the Hospitallers of St John, afterwards called the Knights of Malta *See also* **Hospitallers, Knights, Teutonic Order.**

Temple, a building dedicated to the worship of a deity or deities Those built by the ancient Greeks at Olympia, Athens, and Delphi were the most famous The Temple of Diana at Ephesus was another The Temple of Solomon at Jerusalem was destroyed and rebuilt several times. Herod's Temple was destroyed by the Romans in A D 70

Temple Bar, an historic gateway that until 1879 stood at the western entrance to Fleet Street near the bottom of Chancery Lane In olden times it was the custom to impale the heads of traitors over this gateway It has been at Theobald's Park, Cheshunt, since 1888.

Tempo, a musical expression referring to the pace at which a composition is to be played, and generally used in combination with a qualifying word, as "Tempo Ordinario," ordinary time.

Tenor, the third voice in a male voice choir, *i e*, between alto and bass. The name is also

applied to instruments of equivalent pitch, *e g*, tenor saxophone

Terbium, an element, symbol Tb, discovered in 1842 by Mosander, belonging to the group of rare-earth metals.

Teredo, the scientific name of the ship-worm, a peculiar bivalve mollusc, which lodges itself when young on the bottoms of wooden ships and bores its way inwards, causing much injury

Termites, also known as *White Ants*, though they are not related to the true ants and are placed in an entirely different insect order (*Isoptera*) They abound in the tropics and also occur in temperate countries, though only two species are common in Europe. There is no British species They live in colonies and their nests take the form of mounds of earth and wood, cemented together with saliva, and up to 20 ft in height Five separate castes are recognised, three of them being capable of reproduction and the other two are sterile

Tern. This slender, gull-like bird has long pointed wings, a deeply-forked tail, pale grey and white plumage, black cap, and is a very graceful flier There are several species, some of which are summer migrants to Britain The Arctic tern winters in the Antarctic, returning to find a nesting place in the spring

Terrapin, a kind of fresh-water tortoise. There are several species widely distributed in the Northern Hemisphere

Tertiary Rocks, in geology the rocks formed during the Caenozoic era comprising the Eocene, Oligocene, Miocene Pliocene and Pleistocene periods *See* **Geological Time Scale, F30.**

Teutonic Order, of German military knights, was founded in the Holy Land at the end of the 12th cent for succouring the wounded of the Christian army before Acre They were dispersed in the 15th cent but the Order continued to exist until 1809, when Napoleon I confiscated its properties In 1840 the order was resuscitated in Austria as a semi-religious knighthood *See also* **Hospitallers, Knights, Templars.**

Thallium, a blue-grey metallic element, symbol Tl, discovered by Crookes in 1861 It is obtained from the flue dust resulting from the burning of pyrites for sulphuric acid manufacture.

Thallophytes *or* **Thallophyta,** the division of the plant kingdom which includes fungi, algae, and bacteria *See* **F27(1).**

Theodolite The instrument used by surveyors for measuring angles in the horizontal and vertical planes, also used in meteorology for following balloons to measure the speed and direction of wind

Therm. The charges for gas for lighting and heating (formerly reckoned at per cubic foot) are now based on the calorific, or heat, value of the gas, and the unit used is termed a therm The therm is 100,000 British thermal units

Thermodynamics, a term first applied by Joule to designate that branch of physical science which treats of the relations of heat to work What is called the first law of thermodynamics is thus stated by Clerk Maxwell "When work is transformed into heat, or heat into work, the quantity of work is mechanically equivalent to the quantity of heat." In one of its many formulations, the second law asserts that "the heat tends to flow from a body of hotter temperature to one that is colder, and will not naturally flow in any other way" *See* **F16(2).**

Thermo-electric Devices If two wires of different materials are formed into a loop and if the two joins are kept at different temperatures a current flows in the loop This was discovered by Seebeck in 1822, and the device is called a thermocouple The electric current could in principle be made to drive some useful machine, and the energy comes from the heat that is absorbed by the thermocouple—if one part of the thermocouple is not hotter than the others it will not work. It has long been realised that this is a device that converts heat directly into electricity without raising steam and driving dynamos as in a power-station However, until recently nobody has used thermocouples for much besides temperature measurement, for which they are exceedingly useful. The new development is the manufacture of semiconductors (*q v*); for the thermoelectric effects of these new materials are much greater than those of metals. A material much studied in this connection is a compound of bismuth and tellurium, bismuth telluride It now seems practicable to generate useful electricity from suitably designed thermocouples For example, the U S S R produces a thermoelectric device which uses the heat from the chimney of a domestic oil-lamp to produce enough electricity to work a radio Presumably this is very useful in remote parts with no electricity supply But the possibilities do not stop there Indeed, an eminent Russian authority has stated that thermocouples could produce electricity direct from the warmth of sunlight on a scale and at a cost comparable with conventional fuel-burning power-stations Even if solar energy cannot be so used, it might be possible to use the heat of nuclear reactors, but this means that the thermoelectric devices would have to stand up to very heavy radioactivity and still work It is not surprising, however, that many firms are showing great interest in thermoelectricity these days

Thermometer, an instrument by which the temperature of bodies is ascertained The most familiar kind of thermometer consists of a glass tube with a very small bore containing, in general, mercury or alcohol This expands or contracts with variation in the temperature, and the length of the thread of mercury or alcohol gives the temperature reading on a scale graduated in degrees Various forms of thermometer are used for particular purposes

Thermonuclear Reactions. *See* **Nuclear Fusion.**

Thirty-nine Articles. *See* **Articles.**

Thistle, Order of *See* **Knighthood.**

Thorium, a scarce, dark grey, metal element, symbol Th, discovered by Berzelius in 1828. All substances containing thorium are radioactive Chief source of thorium is monazite sand, big deposits of which occur in Travancore (India), Brazil, and the U S A Considered important as a potential source of atomic energy since the discovery that it can be transmuted into U233, which is capable of fission like U235

Thorough Bass, a musical term applied to a voice part accompanied by numerals, showing the chord applicable to each note The term also refers to the entire science of harmonic composition

Thrush, a large family of song birds of the *Passeriform* order, distributed all over the world The British species include the robin, redstart, nightingale, song-thrush (or mavis), blackbird, mistle-thrush, ring-ouzel of the mountains, and large numbers of migrant fieldfares and redwings from northern Europe are winter visitors.

Thunder, the sound heard after the occurrence of a lightning flash It is due to vibrations of the air along the path of the flash, which are set up by the sudden heating (and expansion) followed by the rapid cooling (and contraction) to which the air is subjected It is unusual for thunder to be heard more than 10 miles away, the distance being estimated roughly by allowing 1 mile for every 5 seconds which elapse between seeing the flash and hearing the thunder Continued rolling of thunder results from the zig-zag nature of the flash and the multiple strokes of which it is composed, variations in the energy developed along the path, and echo effects. Thunderstorms are caused by powerful rising currents of air within towering cumulonimbus clouds and are most frequent during the afternoons and evenings of sunny summer days

Thursday, the 5th day of the week, named after Thor, the Scandinavian deity To the ancient Romans Thursday was *dies Jovis*, or Jupiter's day

Tides, the periodical rise and fall of the waters of the ocean and its arms, are due to the gravitational effect of the moon and sun Newton was the first to give a general explanation of the phenomenon of the tides He supposed the ocean to cover the whole earth and to assume at each instant a figure of equilibrium, under the combined gravitational influence of earth, sun, and moon, thus making and controlling the tides At most places there are two tides a day, and the times of high- and low-water vary according to the positions of the sun and moon

relative to the earth When earth, moon and sun are in line (at full moon and new moon) the gravitational pull is greatest and we get "spring" tides When sun and moon are at right angles (first and third quarters of the moon's phases) we get the smaller "neap" tides

Tiers Etat, the lowest of the three estates of the realm as reckoned in France—nobility, clergy, and *tiers état*—prior to the Revolution

Tiger, a powerful carnivorous animal of the cat family, which occurs in India and certain other parts of Asia Its skin is of a tawny yellow, relieved by black stripings of great beauty of formation Some tigers attain a length of from 9 to 12 ft

Timpani, the kettledrums in an orchestra *See* **Drums.**

Tin is a white, metal element, symbol Sn (Latin *Stannum*), whose commonest ore is cassiterite (tin oxide), which occurs in Malaya, Indonesia, Bolivia, Congo, Nigeria, and Cornwall It protects iron from rusting, and the tin coating on tinplate is applied by dipping the thin steel sheet in molten tin or by electrolysis Tin alloys of importance include solder, bronze, pewter, and Britannia metal

Tit *or* **Titmouse**, a small insectivorous bird of the woodlands and forests, bright of plumage and very active and agile, often seen hanging upside down searching for food There are over fifty species, eight of which occur in Britain the Great and Blue Tits, familiar in gardens and countryside, the Cole Tit, Marsh Tit, Willow Tit, Bearded Tit, Long-tailed or "Bottle" Tit, and the Scottish Crested Tit

Titanium, a scarce metal, symbol Ti, difficult to extract from ores found in association with oxygen in rutile, anatase, and brookite, as well as with certain magnetic iron ores It combines with nitrogen at a high temperature Discovered by the Rev William Gregor in 1791 Titanium alloys, being very resistant to stress and corrosion, and combining strength with lightness, are finding wide application not only in marine and chemical engineering but in the building of aircraft, rockets, and the nuclear-energy field Titanium dioxide is now widely used in making paints

Tithes, an ecclesiastical tax consisting of a tenth part of the annual produce known to the ancient Jews, and first imposed by Christian authorities in the 4th cent, although not made compulsory in England before the 9th cent Tithes derived from land are termed "praedial," those derived from cattle being styled "mixed," while others are personal After the passing of the Tithes' Commutation Act of 1836, tithes were gradually converted into rent charges, and to-day the old form of tithes exists only to a small degree Consult Tithe Act of 1936

T N.T. (Trinitrotoluene). A high explosive formed by the action of a mixture of nitric and sulphuric acids on toluene Not highly sensitive to shock, it can be used in shells without danger, and is exploded by a time, or detonator, fuse Apart from wartime applications, it is used in blasting in quarries and mines

Toad, an amphibian, differing from the frog in having a dry, warty skin, a heavier, squat build and shorter limbs It has a similar metamorphosis, is largely nocturnal, and will wander far from water after the breeding season Two toads occur in Britain, the Common Toad and the Natterjack The latter can be identified by the narrow light stripe running down the middle of the back

Tobacco is made from the leaves of various narcotic plants of the *Nicotiana* family, which contain a volatile oil and an alkaloid called nicotine Tobacco is largely grown in America, India, Japan, Turkey, Greece, Canada, Italy, Indonesia, Bulgaria, Philippines, France, Congo, China, S and N Rhodesia, S. Africa, S America, and other countries of a warm climate It undergoes various processes of preparation The leaves are first dried, then cut into small pieces, moistened and compressed, and in this form it is known as cut or "shag" tobacco, when moistened with syrup or treacle and pressed into cakes, it is Cavendish, when twisted into string form, it is "twist" or "pig-tail" For cigars the midribs of the dry leaves are removed, and what is left is moistened and rolled into cylindrical shape. For snuff, the tobacco leaves are moistened and allowed to ferment, then dried, powdered and scented *See* **P32(2)** for the connection between Tobacco-smoking and Lung Cancer

Toga, an outer robe worn by the ancient Romans and corresponding to the pallium of the Greeks It was white and made of wool

Tolls. Payments for privileges of passage were first exacted in respect of ships passing up rivers, tolls being demanded on the Elbe in 1109 Tolls for land passage are said to have originated in England in 1269, toll-bars being erected at certain distances on the high-roads in the 17th cent., where toll had to be paid for all vehicles passing to and fro After about 1825 they began to disappear, but still linger on some country roads and bridges Tolls on London river bridges ceased in 1878–79.

Tone Poem *or* **Symphonic Poem**, a musical work of a serious nature and of symphonic dimensions in which the composer has not adopted the forms and conventions of the true symphony

Tonic Sol-Fa, a system of musical notation in which monosyllables are substituted for notes. Thus the major diatonic scale is represented by Doh, Ray, Me, Fah, Soh, La, Te, Doh The system was invented by a Miss Glover of Norwich in about 1840 and has proved of great assistance in the teaching of music in schools

Tonsure, the shaven part of the head of a Roman Catholic ecclesiastic, dates from the 5th or 6th cent In the Roman Catholic Churches only a circle, or a crown, is shaved, while in the Greek Church shaving is forbidden

Topaz, a transparent mineral gem, being a silicate and fluoride of aluminium and generally found in granitic rocks Its colour is yellow, but it also occurs in pink and blue shades The best kinds come from Brazil

Topiary, the art of clipping and trimming trees, shrubs, etc, into ornamental shapes This art goes back to Elizabethan times when gardens were formal and the shapes simple and symmetrical By the end of Queen Anne's reign topiary had become much more elaborate, and all kinds of fanciful shapes were produced

Tornado, a violent whirlwind, characterised by a black, funnel-shaped cloud hanging from heavy cumulonimbus Usually tornadoes are only a few hundred feet in diameter and occur frequently in the Mississippi region of the U S A, where it has been estimated that the wind speeds within them may exceed 200 m p h In West Africa the term is applied to thundery squalls

Tortoises and Turtles, are cold-blooded reptiles, four-footed, and encased in a strong shell protection, the shells of some species being of beautifully horny substance and design, in much demand for combs, spectacle frames, and ornamental work. It is the custom to designate the land species as tortoises and the aquatic kinds as turtles The green turtle, so called because its fat has a green tinge, is in great demand for soup Together the tortoises and turtles make up the reptilian order called *Chelonia*, the biggest representatives of which are the giant land tortoises of the Galapagos Islands, reaching a weight of 500 lb and living a century Some of these giant tortoises are even said to have reached 200 or 300 years of age

Toucan, a South and Central American family of brilliantly coloured birds, remarkable for their huge bills Toucans live on fruit, are of arboreal habits, and nest in holes There are about 37 species

Touchstone, a kind of jasper called by the ancients "Lydian stone," of economic value in testing the quality of metal alloys, especially gold alloys The testing process is very simple The alloy is drawn across the broken surface of the Touchstone, and from the nature of the mark or streak it makes the quality of the alloy can be ascertained.

Tourmaline, a mineral occurring in different colours in prismatic crystals It is a well-known example of a pyro-electric crystal, *i e*, one that has a permanent electric polarisation It is a double silicate of aluminium and boron, and occurs in Cornwall, Devon, South America, and Asia.

Tournaments were equestrian contests between military knights and others armed with lances, and frequent in the Middle Ages. The Normans introduced them to England

Tower of London was a royal palace from the time of the Conqueror, who began the building of the White Tower in 1078 Later kings made considerable additions Between the 15th and 18th cent many princes and nobles were executed or imprisoned here, and here Henry VI, Edward V, and his brother were put to death The Crown Jewels are kept at the Tower, and in the Armoury a fine collection of armour of various dates is preserved The attendant staff are called Yeomen Warders of the Tower Their style of dress is of the Tudor period

Trade-Mark, a mark used in relation to goods for the purpose of indicating a connection in the course of trade between the goods and some person having the right, either as a proprietor or registered user, to use the mark Trade-marks can be registered, the registration holding good for 7 years and being renewable thereafter indefinitely for periods of 14 years Infringement of a registered trade-mark renders the infringer liable to damages

Trade Winds form part of the circulation of air round the great permanent anticyclones of the tropics and blow inwards from north-east and south-east towards the equatorial region of low pressure Atlantic trades are more regular than those of the Pacific The belts may extend over 1,500 miles of latitude and together with the Doldrums, move north and south in sympathy with the seasonal changes in the sun's declination, the average annual range being about 5 degrees of latitude The discovery of the regularity of the trade winds is usually credited to Columbus

Trafalgar, Battle of, was fought off Cape Trafalgar on Oct 21, 1805, between the British under Nelson and the French and Spanish under Villeneuve and Gravina It was a complete victory for the British, but Nelson was killed

Trafalgar Square. The site has often been referred to as the finest in Europe It was conceived originally as a square by John Nash (1752–1835) when the project was considered of linking Whitehall with Bloomsbury and the British Museum It was to be named after the new monarch as King William the Fourth's Square but on the suggestion of George Ledwell Taylor (a property owner near the site) alteration to the more popular name Trafalgar Square was agreed to by the King On the north side the National Gallery was planned by Nash and erected by William Wilkins on the place of the Royal Mews—a work of William Kent a century before The lay-out was the idea of Charles Barry but he did not approve the erection of the Nelson column (which see) His idea was for the square to have a grand flight of steps from the north side with sculptural figures of Wellington and Nelson but the Commons decided otherwise and the column as designed by William Railton was begun in 1840 The two fountains by Barry were supplanted in 1948 by ones designed (1938) by Sir Edwin Lutyens Executed in Portland stone they are flanked by some bronze sculptures In the same year memorial busts of Lords Jellicoe and Beatty were placed by the north wall

Transept, the portion of a church which extends across the interior between the nave and the choir

Transistor. An electronic device consisting of a small piece of semiconducting solid (usually germanium or silicon) to which contact is made at appropriate places by three wires The three parts resemble in function (not construction or behaviour) the cathode, anode, and grid of a thermionic valve, and transistors can perform many of the operations that valves have hitherto been used for in radio, television, etc They possess several advantages over valves since there is no need for evacuated glass bulbs nor for a heated emitter to give off electrons This leads to much greater compactness and economy as well as to a much longer life Nevertheless, there are certain limitations to their use, and they are not yet suitable as substitutes for valves in all cases The device was invented by the Americans Bardeen, Brattain, and Shockley in 1948 and has assumed vast technological importance

Transubstantiation. *See* **J43.**

Treasure-Trove, a legal term applying to money, plate, or bullion found hidden in the earth, or elsewhere, and for which there is no owner The treasure legally belongs to the Crown, but it is the practice to reward the finder with the full value of the property on its being delivered up Coroners Act, 1887, provides that inquests may be held, but not as to title as between the Crown and any other claimant

Treble, the highest voice in a male voice choir This is, of course, a boy's voice, the highest adult male voice being the alto In a mixed choir the treble part is sung by sopranos

Tree Frog. The true tree frog occurs most commonly in America and Australasia The common European tree frog is a brilliant green animal, the adhesive discs at the tips of its fingers and toes enabling it to cling to trees, etc, with ease

Tree Shrew, an arboreal insectivorous mammal of Asia belonging to the family *Tupaiidae* Tree shrews are related to the shrews, though in appearance they resemble squirrels except for their sharply pointed snout They occur in Borneo, Siam, China, and Malaya Some zoologists classify them as primitive primates

Trent, Council of, the longest and one of the most important in the history of the Roman Catholic Church, was convened to combat the doctrines of Martin Luther It first sat in 1545, the last sitting being in 1563 At this Council the general policy, principles, and dogmas of the Roman Catholic Church were authoritatively settled

Triangle, in music a metal percussion instrument in the form of a triangle which, when struck by a metal rod emits a sound of no particular pitch

Triassic *or* **Trias**, the earliest geological period in the Mesozoic era, which began some 225 million years ago Triassic formations 25 000 ft thick occur in the Alps *See* **F30** Modern insects were appearing, and also small reptile-like mammals Other important Triassic animals were dinosaurs, ichthyosaurs (marine reptiles), and pterosaurs (flying reptiles)

Tribunes, name assigned to officers of different descriptions in ancient Rome The original tribunes were the commanders of contingents of cavalry and infantry The most important tribunes were the tribunes of the plebs, first elected in 494 B C as the outcome of the struggle between the patrician and the plebeian orders They held the power of veto and their persons were sacred

Trichoptera This is the insect order comprising the Caddis-flies These are moth-like insects, having hairs on the wings They are usually found fluttering weakly near water The larvae are aquatic and are remarkable for the cases (caddis cases) which they build out of sticks, small stones, sand grains, and shells

Tricolour, the flag of the French Republic since 1789, consisting of three nearly equal vertical bands of blue, white, and red (ratio 90 99 111)

Trilobites, extinct marine arthropods, most abundant in the Cambrian and Ordovician systems Their appearance may be roughly described as resembling that of a woodlouse, and like that animal the trilobites were capable of rolling their bodies up into a ball

Trinity. The Christian doctrine that God exists in three persons, all co-equal, and indivisible, of the same substance—God the Father, God the Son (who became incarnate as Jesus), begotten of the Father, and God the Holy Ghost, proceeding from Father and Son The system denying the Trinity is Unitarianism (*see* **J43**)

Trinity House, on Tower Hill, London, was incorporated in 1514 as an association for piloting ships, and has ever since been entrusted with various matters connected with the regulation of British navigation Since 1854 the lighthouses of the country have been under its supervision The acting Elder Brethren act as Nautical Assessors in Marine causes which are tried by the High Court of Justice

Trio, strictly a musical composition for three voices or instruments. The third movement,

of a classical symphony is usually in three-beat time and the second subject of the movement, which is of ternary form, is often called the Trio. Thus, Minuet and Trio, Scherzo and Trio

Triptych, a picture, carving, or other representation, with two swing doors, by which it could be closed in, frequently used as an altar-piece Also a writing tablet in three parts, two of which folded over the one in the centre

Trireme, an ancient vessel with three rows of oars of great effectuality in early naval warfare Mentioned by Thucydides It was a long, narrow vessel propelled by 170 rowers The Romans copied it from the Greeks.

Trisagion ("thrice holy"), an ancient Jewish hymn, still regularly sung in the service of the Greek Church A version of it—"Tersanctus"—also forms part of the Anglican Eucharistic service

Tritium, a radioactive isotope of hydrogen which has three times the weight of the ordinary hydrogen atom It is produced by bombarding an isotope of lithium with neutrons and has a half-life of 12½ years, decaying with the emission of β-particles (electrons)

Triumvirate, a term used to denote a coalition of three persons in the exercise of supreme authority. The first Roman triumvirate was that of Pompey, Julius Caesar, and Crassus, 60 B C, the second was that of Mark Antony, Octavus, and Lepidus, 43 B C

Trombone, a bass wind instrument which has a tube of variable length By moving the slide, which shortens or lengthens the tube, the player causes the trombone to emit different notes

Tropic-Bird, a long-tailed sea bird, of which there are 3 species (the Red-billed, the White-tailed and the Red-tailed), frequenting the tropical regions of the Atlantic, Pacific, and Indian oceans. They are commonly called Bo'sun Birds

Troposphere. The atmospheric layer which extends from the earth's surface to the stratosphere. As a general rule the temperature in the troposphere falls as altitude increases *See* **Atmosphere.**

Troubadours, lyric poets who flourished from the 11th to the end of the 13th cent, chiefly in Provence and the north of Italy They were often knightly amateurs, and cultivated a lyrical poetry intricate in metre and rhyme and usually of a romantic amatory strain They did much to cultivate the romantic sentiment in days when society was somewhat barbaric and helped considerably in the formation of those unwritten codes of honour which served to mitigate the rudeness of mediaeval days. *See also* **Jongleurs.**

Trouvère *or* **Trouveur**, mediaeval poet of northern France, whose compositions were of a more elaborate character—epics, romances, fables, and chansons de geste—than those of the troubadour of the south Flourished between the 11th and 14th cent.

Truffles are subterranean edible fungi much esteemed for seasoning purposes There are many species, and they are found in considerable quantities in France and Italy, less commonly in Britain. They are often met with under beech or oak trees, and prefer calcareous soils, but there are no positive indications on the surface to show where they are, and they are not to be cultivated Hogs, and sometimes dogs, are used to scent them out, the former, by reason of their rooting propensities, being the most successful in the work

Trumpet, a brass wind musical instrument in which different notes are produced by the operation of three "valves"

Tsetse, an African dipterous fly belonging to the same family as the house-fly It is a serious economic pest as it transmits the protozoon causing African sleeping sickness when it pierces human skin in order to suck blood, which forms its food *See* **Gammexane.**

Tuatara or *Sphenodon punctatum*, a primitive lizard found in New Zealand It has a rudimentary third eye on the top of the head, this is called the pineal eye and corresponds to tissue which in mammals forms the pineal gland

Tuba, an alternative name for the Bass Saxhorn in E flat or F *See* **Saxhorn.**

Tube Foot, the characteristic organ of locomotion of starfishes and kindred animals. They are arranged in pairs along the underside of the arms, and their sucker like ends can grip a surface very tightly The action of the suckers depends on hydraulic pressure.

Tudor Period extends from 1485 to 1603, The first Tudor sovereign was Henry VII, descended from Owen Tudor, then followed Henry VIII, Edward VI, Mary, and Elizabeth, the last of the line

Tuesday, the third day of the week, named from the Saxon deity Tuisto, Tiw, or Teusco To the Romans it was the day of Mars

Tuileries, a French royal and imperial palace dating from 1564 It was attacked by insurgents during the outbreaks of 1792, 1830, and 1848, and was burned down during the Commune of Paris in 1871

Tumulus, a mound of earth raised over the bodies of the dead The mound of Marathon, enclosing the bodies of the Athenians who were killed in the famous battle with the Persians, is a celebrated tumulus Such mounds were commonly raised over the tombs of the distinguished dead in ancient times, and sometimes enclosed heavy structures of masonry The Roman "barrows" were tumuli Evidences of such mounds are frequent in prehistoric remains

Tun, a liquid measure formerly in general use, but now obsolete A tun of ale was 216 gallons

Tuna *or* **Tunny**, a large marine fish belonging to the mackerel family, frequenting the warm waters of the Atlantic, Pacific, and Mediterranean Tuna fisheries are an important industry

Tundra is the name of a vast plain of treeless Northern Russia with small lakes and morasses scattered here and there, but almost devoid of vegetation It is a cold, bare region, where only the reindeer can find sufficient sustenance

Tungsten, a hard, brittle metal, symbol W (it was formerly called wolfram), silver to grey in colour Its chief ores are wolframite (iron and manganese tungstate) and scheelite (calcium tungstate). Tungsten is alloyed in steel for the manufacture of cutting tools, also in the non-ferrous alloy stellite (*q v*) Electric lamp filaments are made from tungsten Tungsten carbide is one of the hardest substances known and is used for tipping tools

Turbines propelled by steam provide power for the propulsion of many ships, and on land steam turbines are a principal source of power, being used in large central electricity stations, for instance, to convert heat energy into electrical energy. Gas turbines have recently come into use in aeroplanes, and gas-turbine railway locomotives are being developed The first gas-turbine ship had its trials in 1947, just half a century after the first steam-turbine ship

Turbot, a large flat fish, highly valued as food It often attains from 30 to 40 lb in weight Its flesh is white and firm It is confined to European waters, and is caught by line or trawl

Turkey, a fowl of American origin, brought to Europe from America soon after the discovery of that country It was a domesticated bird in England in the first half of the 16th cent

Turpentine, an oily substance obtained from coniferous trees, mostly pines and firs It is widely used especially in making paints and varnishes, and also has medicinal properties

Turquoise, formerly called Turkey-Stone, is a blue or greenish-blue precious stone, the earliest and best specimens of which came from Persia It is composed of a phosphate of aluminium, with small proportions of copper and iron India, Tibet, and Silesia yield turquoises, and a variety is found in New Mexico and Nevada It derives its name from the fact that the first specimens were imported through Turkey

Turtle Dove, a summer visitor from Africa to southern England. It is a small, slender bird with reddish-brown upper parts, pinkish throat, black tail with white edges, and a repeated purring note

Tweed. A rough-surfaced fabric of the twilled type, usually all-wool, though cheaper kinds may include cotton Of a soft, open, flexible texture, it may have a check, twill, or herringbone pattern. Harris, Lewis, Bannockburn, and Donegal tweeds are well known. "Tweeds" is said to have been written in error by a clerk for "twills"

Twelfth Night is the eve of the feast of the

Epiphany, and in olden times was made the occasion of many festivities It was the most popular festival next to Christmas, but is now little observed

Twilight is the light which is reflected from the upper portion of the earth's atmosphere when the sun is below the horizon (before sunrise or after sunset) The term is most usually understood to refer, however, to the evening light, the morning light we call dawn. The twilight varies in duration in different countries, according to the position of the sun In tropical countries it is short, in the extreme north it continues through the night.

Tyburn, a former small tributary of the Thames, which gave its name to the district where now stands the Marble Arch, Hyde Park. Here public executions formerly took place

Tycoon, the title by which the commander-in chief of the Japanese army (virtually the ruler of Japan) was formerly described by foreigners (In Japanese *taikun* means great lord or prince) The term is now applied, usually in a derogatory sense, to an influential business magnate.

Tympanum is, in architectural phraseology, the triangular space at the back of a pediment, or, indeed, any space in a similar position, as over window or between the lintel and the arch of a doorway In ecclesiastical edifices the tympanum is often utilised for sculptured ornamentation

Tynwald, the title given to the Parliament of the Isle of Man, which includes the Governor and Council (the Upper House), and the House of Keys, the representative assembly This practically constitutes Home Rule, the Acts passed by the Tynwald simply requiring the assent of the Sovereign

Typhoon. The tropical cyclone of the China Seas which brings winds of hurricane strength and torrential rains, most frequently in late summer or early autumn

U

Uhlan, a light cavalry soldier armed with lance, pistol, and sabre and employed chiefly as skirmisher or scout Marshal Saxe had a corps of them in the French Army, and in the Franco-German war of 1870 the Prussian Uhlans won fame

Ultramarine, a sky-blue pigment obtained from *lapis lazuli*, a stone found in Tibet, Persia, Siberia, and some other countries A cheaper ultramarine is now produced by grinding and heating a mixture of clay, sulphur, carbonate of soda, and resin

Ultrasonics, sound waves of frequency so high as to be inaudible to humans, *i e*, about 12,000 cycles per sec and upwards Ultrasonic waves are commonly produced by causing a solid object to vibrate with a suitably high frequency and to impart its vibrations to the air or other fluid The object may be a quartz or other crystal in which vibrations are excited electrically, or a nickel component which is magnetically energised There are numerous technical applications, *e g* submarine echo sounding, flaw detection in castings, drilling glass and ceramics, emulsification Ultrasonic waves are an important tool of research in physics.

Ultra-Violet Rays. These are invisible electromagnetic rays whose wavelengths are less than 3,900 A (Angstrom = one-hundredth of a millionth of a centimetre) The sun's radiation is rich in ultra-violet light, but much of it never reaches the earth, being absorbed by molecules of atmospheric gases (in particular, ozone) as well as by soot and smoke particles One beneficial effect of ultra-violet light on human beings is that it brings about synthesis of vitamin-D from certain fatty substances (called sterols) in the skin The wave-lengths which effect this vitamin synthesis also cause sun tan and sun burn Ultra-violet lamps (which are mercury-vapour discharge lamps) are also used for sterilising the air inside buildings, their rays being lethal to bacteria Many substances fluoresce under ultra-violet light, for instance, zinc silicate glows green, while cadmium borate throws out red light This phenomenon is applied practically in fluorescent lamps, the light of requisite hue being secured by judicious mixture of the fluorescent materials which coat the lamp *See* Electric Light.

Umbra, the full shadow of the earth or moon during an eclipse, the half shadow is called penumbra

Uncials were a form of written characters used in times prior to the 10th cent ; while smaller than capitals they were larger than the later minuscule The term uncial was a misapplication of St Jerome's *litterae unciales*, "inch-high" letters

Unction, the act of anointing with oil, a symbol of consecration practised in the Roman Catholic, Greek, and other Churches, but not in the Protestant *Extreme unction* is the rite of anointing a dying person with holy oil This function consists in anointing the eyes, ears, nostrils, mouth, the palms of the hands, and the soles of the feet

Underdeveloped Countries are countries in which primitive methods of production still largely prevail Most of the population are peasants, carrying on agricultural pursuits on small-holdings without much use of capital, and the industrial production is largely in the hands of individual craftsmen working without expensive capital instruments Many of these countries are now trying to carry through large plans of industrialisation, but are severely hampered by lack of capital resources, as they need to import capital goods for which they find it difficult to pay with exports, especially when the "terms of trade" (*see* G7) are unfavourable to primary producers The need for capital imposes on such countries the necessity of a high rate of saving out of their national incomes, but this is difficult to enforce in view of the deep poverty of most of the people They accordingly stand in need of help from the advanced countries, both with capital loans at low interest rates and gifts *See* G11

Underground Gasification, the process of converting coal into gas underground Briefly an "underground gasworks" comprises two approximately vertical shafts connected by a gallery through the coal seam, which is ignited Air is led down one of the shafts, and the gas produced is drawn off from the second shaft. The technique was worked out by the British chemist, Sir William Ramsay, but it was not until 1933 that it was tried seriously—in the Donetz coalfield in Russia America, Italy, and Belgium are experimenting with underground gasification, British experiments ended in 1959

Unicorn, a fabulous single-horned animal In heraldry its form is horse-like, with the tail of a lion and pointed single horn growing out of the forehead

Union Jack. *See* N10.

Union of Great Britain and Ireland was proposed in the Irish Parliament in Jan 1799 after the 1798 Rebellion and came into force on Jan 1, 1801 The troubled history of Ireland, associated with the question of self-government, nationalism, land, and religion, culminated in the Easter revolution of 1916 A treaty giving the 26 southern counties independence in 1921, as the Irish Free State, was followed by a period of internal dissention In 1937 a new constitution was enacted in Eire in which no reference was made to the Crown This, however, left in force the External Relations Act of 1936 and with its repeal in 1948, Eire separated itself from the British Crown and thus severed the last constitutional link with the Commonwealth, and became an independent Republic

Union, Treaty of, was the treaty by which Scotland became formally united to England, the two countries being incorporated as the United Kingdom of Great Britain, the same Parliament to represent both, Scotland electing sixteen peers and forty-five members of the House of Commons Uniformity of coins, weights, and measures was provided for, Scottish trade laws and customs were assimilated to those of England, and as regards religion and the practices of the law, Scotland was to continue as before This Act was ratified on May 1, 1707.

United Nations. *See* Section C.

Universe in astronomy means not only the star system (of which the sun and planets are a small part) but all the countless star systems or nebulae

which may be separated from each other by millions of light-years. *See* **F3–7.**

Universities are institutions of higher education whose principal objects are the increase of knowledge over a wide field through original thought and research and its extension by the teaching of students. Such societies existed in the ancient world, notably in Greece and India, but the origin of the University as we know it today lies in mediaeval Europe, the word *universitas* being a contraction of the Latin term for corporations of teachers and students organised for the promotion of higher learning. The earliest bodies to become recognised under this description were at Bologna and Paris in the first half of the 12th cent., Oxford was founded by an early migration of scholars from Paris, and Cambridge began with a further migration from Oxford. Other Universities sprang up all over Europe, including three in Scotland—St. Andrews (1412), Glasgow (1451), and Aberdeen (1494)—which were followed by Edinburgh in 1582. These six bodies remained the only Universities in Great Britain until the foundation in 1826–29 of University and King's Colleges in London (resulting in the establishment of the University of London in 1836) and of the University of Durham in 1832. The period since 1850 has been a great century of academic growth. There are (1963) eighteen degree-giving Universities in England (Birmingham, Bristol, Cambridge, Durham, Exeter, Hull, Keele, Leeds, Leicester, Liverpool, London, Manchester, Nottingham, Oxford, Reading, Sheffield, Southampton and Sussex), one in Wales (the University of Wales with Colleges at Aberystwyth, Bangor, Cardiff and Swansea), four in Scotland (Aberdeen, Edinburgh, Glasgow and St. Andrews), and one in Northern Ireland (Queen's University, Belfast). In addition the Manchester College of Science and Technology, the Royal College of Science and Technology, Glasgow, and St. David's College, Lampeter (which confers two degrees) receive Treasury grants. The establishment of Universities is also proposed for East Anglia (at Norwich), Essex (at Colchester), Kent (at Canterbury), Lancaster, Warwick (at Coventry), and York, and others are under consideration. The Republic of Ireland has Trinity College, Dublin (founded in 1592), and the National University of Ireland, with its three constituent University Colleges at Dublin, Cork, and Galway. The 19th cent. also saw a wide extension of the University movement throughout the British Empire, the early important foundations being McGill (1821), Toronto (1827), and Laval (1852) in Canada, Sydney (1850) and Melbourne (1853) in Australia, New Zealand (1870), South Africa (1873), Bombay, Calcutta, and Madras in 1857 in India, and the University of the Punjab (1882) in the present Pakistan. Since the war a number of Universities and University Colleges have been instituted in Commonwealth countries—in the West Indies, in East and West Africa and Rhodesia, in Malaya, India, and Pakistan. In the U.S.A. the development of higher education has left the universities less sharply defined than in Europe and the Commonwealth, but there are 1,458 (1961) institutions of higher education covering 3,370,000 students, the best-known Universities being Harvard, Yale, Princeton, Columbia, and Chicago. The range of studies that may be pursued at a University covers humanities and sciences, and includes training for the liberal professions. It is customary for Universities to confer degrees on students who reach certain educational standards, the principal titles being those of Bachelor, Master, and Doctor in the particular discipline. In England a certain emphasis has always been placed on the provision of residential facilities for students; the ancient Universities of Oxford and Cambridge are entirely collegiate in character, while the modern Universities have halls of residence for a growing proportion of their students. Russia has developed higher education more rapidly than anywhere else in the world. (The number of students in higher education has grown from 105,000 in 1914 to 2,396,000 in 1960.) In Great Britain in 1963 there were about 115,000 full-time University students (one-quarter women) compared with 50,000 in 1939. 43% were studying arts subjects and 57% a scientific or technical subject (24% taking pure science). Of all these students 17% went to Oxford and Cambridge, 20% to London, 40% to other Universities and University Colleges, 6% to Wales, and 17% to Scottish Universities. Of these 82% held scholarships, exhibitions or other awards from public or private funds. *See also* **N23–26.**

University Boat-race. *See* **U37.**

Uranium, a metal, symbol U, discovered by Klaproth in 1789 in pitch-blende. It is a white metal which tarnishes readily in air. Great developments have followed the discovery that the nucleus of the uranium isotope U^{235} undergoes fission, and uranium minerals have become very important since it was found that atomic energy could be released controllably by taking advantage of fission. Previous to the second world war the uranium content of all the uranium ores that were mined was estimated at 1,000 tons. Before atomic energy work began to take the major part of the world's output of uranium minerals, the chief users of uranium compounds were the ceramics and textile industries. *See also* **Nuclear Reactors, Nuclear Fission, F12(1).**

Uranus. This planet was discovered by Herschel in 1781. Its diameter is 32,000 miles and its average distance from the sun is 1,783 million miles. It has five small satellites.

Ursa Major, the Greater Bear, or "Charles's Wain," a constellation familiar to all observers because of the brilliance of the seven stars forming its outline. It never sets in these latitudes.

Ursa Minor, the Lesser Bear Constellation, has, like Ursa Major, seven prominent stars, of which the pole star is the brightest.

Utopias. *See* **J43.**

V

Vaccination, a system of inoculation against small-pox discovered by Dr. Jenner in the 18th cent. In Great Britain it is usual for all infants at the age of three months to be vaccinated unless the parent conscientiously believes that it would be harmful to the infant's health. *See* **P11(2).**

Valency. A term used by chemists to describe the combining ability of an element with respect to hydrogen. Thus oxygen, which forms water, H_2O, with hydrogen is said to have a valency of two, nitrogen (forms ammonia, NH_3) three, and carbon (forms methane, CH_4) four. Chlorine forms hydrogen chloride, HCl, and is said to be monovalent. This empirical approach cannot account for valency in such compounds as carbon monoxide, CO, which appears to require both elements to have the same valency. With the discovery of the electron it was realised that the concept of valency and chemical bonds is intimately concerned with the electronic structure of atoms, and theories have been advanced to explain why the same element can have different valencies in different compounds. Iron, for example, can have a valency of two ($FeCl_2$, ferrous chloride) or three ($FeCl_3$, ferric chloride).

Valentine's Day, the 14th Feb., is a festival in celebration of St. Valentine, one of the Christian martyrs of the 3rd cent. A sweetheart or Valentine is chosen on that day and letters or tokens sent secretly to the object of affection.

Valhalla, in Scandinavian mythology, is the special Paradise to which the souls of warriors slain in battle were transported. The term is also generally used to designate a burial place of great men.

Valkyries, the chosen handmaidens of Odin, appointed to serve at the Valhalla banquets. Their most important office, however, according to the Norse mythology, was to ride through the air at a time of battle and point out the heroes who were to fall. It is one of these Valkyries who is made the heroine of Wagner's opera "Die Walküre."

Vampire *or* **Werewolf,** according to ancient superstition, was a spectre in human form which rose from its grave in the night-time and preyed upon the living as they slept, sucking their blood, and then returning to the grave.

Vampire-Bats, blood-eating bats of tropical

America. They puncture the skin with their incisor teeth, leaving a wound that bleeds profusely The blood is lapped up by the bat, not sucked

Vanadium, a scarce metallic element, symbol V, whose chief ores are carnotite and patronite. Some iron ores contain it Most of the vanadium commercially produced finds its way into vanadium steels, which are used for tools and parts of vehicles, being hard, tough, and very resistant to shocks The oxide is used as a catalyst in industry, especially in making sulphuric acid

Vandals were a Teutonic race who ravaged Gaul, Spain, and North Africa in the 5th cent, and finally attacked the city of Rome, drawing down upon themselves universal opprobrium for their wanton destruction of beautiful objects and monuments

Vanilla, a climbing orchid of tropical America, found also in Asia, the dried fruit of certain species furnishes the agreeable aromatic vanilla of commerce, though most vanilla essence now used is prepared synthetically

Varnish is of two leading kinds: spirit varnish, made from resinous substances dissolved in spirit, and oil varnish, in which the dissolving agent is linseed oil and turpentine

Vatican, the Papal residence at Rome, a famous palace on the hill adjacent to St Peter's Its museum is a rich treasure-house of literary and artistic objects

Vauxhall Gardens, a famous London pleasure resort from the early part of the 18th to the middle of the 19th cent. It was here that many great singers appeared, where the earliest balloon ascents were made, and where there were fine displays of fireworks.

Vein. *See* **Lode**

Venus, the brightest of all the planets, whose orbit lies between that of Mercury and the earth, second in order from the sun (*see* **F6**) It can approach the earth to within 25 million miles At wide intervals Venus passes across the sun's disc ("transit of Venus") The first transit was recorded in 1639, since then four have occurred, in 1761, 1769, 1874, and 1882, and the next is due in 2004 Little was known about the planet because of its obscuring atmosphere (much carbon dioxide and water vapour) until the American research spacecraft, *Mariner II*, passed within 21,600 miles of the planet on 14 Dec 1962 and gave data about its atmosphere, rotation period, etc The surface temperature on Venus was found to be far too hot for life as known on earth Unlike the earth there was no evidence that Venus has a magnetic field

Venus Fly-trap, a well-known insectivorous plant (*Dionaea muscipula*) occurring in Carolina in damp mossy places It is related to the Sundew The leaf is the organ that catches the insects The leaf blade is in two halves, hinged along the centre line Each half bears three sensitive hairs called "trigger hairs" When an insect touches a trigger, the two halves of the leaf clap together, trapping the insect between them, when it is digested by a secretion (digestive enzymes) from the leaf, which afterwards absorbs the soluble products

Vermilion, a pigment obtained from cinnabar, but generally made from a mixture of one part of sulphur with four of mercury It yields a bright red colour

Vernalization. Seeds which, after being exposed to a low temperature, produce plants that flower earlier than usual are said to have been "vernalized" This technique of seed treatment devised by Lysenko is called vernalization It is claimed to have been widely used in Russia to obtain cereal crops in places where climatic conditions are favourable for only a short season

Versailles, Treaty of. The Peace Treaty, 1919, ending the first world war The first half was devoted to the organisation of the League of Nations Among the territorial changes Germany ceded Alsace-Lorraine to France, Posen and the Corridor to Poland Germany undertook to disarm, to abolish universal military service, to keep only a small army of 100,000 and a small navy. Her colonies were to be shared out among the Allies under League Mandates. Reparations were to be paid, but were gradually reduced and entirely ceased in 1932 Hitler took unilateral action against the Treaty especially in regard to rearmament and the annexation of Austria. Hitler's attempt to change the eastern frontiers was the immediate cause of the Second World War

Victoria and Albert Museum, in Kensington, London, was begun in 1852 as the Museum of Ornamental Art at Marlborough House. The present building was completed in 1909, and has the following nine departments, Architecture and Sculpture, Ceramics, Engraving, Illustration and Design, Metalwork, Paintings; Woodwork, Textiles, Library (of books on art) and Book-production, and the Dept of Circulation The Bethnal Green Museum is a branch of the V and A

Victoria Cross, an order of merit for conspicuous valour, awarded to members of the Army, Navy, and Air Force, was established in 1856 In July 1959 it was announced that all holders of the V C. for whom the British Government is responsible would receive a tax-free annuity of £100

Vienna Congress, sat at Vienna from Sept 1814 to June 1815 and settled the delimination of the territories of the various European nations after the defeat of Napoleon The Treaty of Vienna which resulted gave Ceylon, Mauritius, Cape Colony, Heligoland, Malta, and part of Guiana to England, France was not permitted to hold more territory than she had possessed at the outbreak of the Revolution in 1789 Austria took Northern Italy, Russia part of Poland, and Prussia, part of Saxony and the Rhenish province Except for one or two changes the clauses of the treaty were maintained for over forty years

Viet-Minh, the Indo-Chinese (Annamite) national movement led by Ho Chi-Minh which resisted French rule from 1945 to 1954, when agreement was reached at the Geneva Conference

Vikings. Scandinavian pirates who from the 8th to the 10th cent. were the terror of northern waters Sometimes the Viking raids reached south to the Mediterranean and east to the White Sea, and they ventured as far as Greenland and North America Their leader Rurik founded the first Russian kingdom of Novgorod They excelled in shipbuilding, were fine sailors and splendid craftsmen

Vinegar. This condiment and preservative is a weak solution of acetic acid (3-9%) formed by the oxidation of ethyl alcohol by the action of bacteria on alcoholic liquor (wine, beer, cider, fermented fruit juices, or malted cereals) Wine vinegar is usually red, malt vinegar is brown The name vinegar is derived from the latin *vinum aigre*, bad wine *See also* **Acetic Acid.**

Vinyl Plastics are polymers made from derivatives of ethylene, examples are polyvinyl chloride (P V C), which is used in making plastic pipes and kitchen utensils, among other things; polyvinyl acetate used in the paint industry and in bonding laminated articles like plywood, and polystyrene (poly vinyl benzene) used in making electrical fittings and for lenses

Viola, a stringed instrument of the violin type but rather larger than the violin. Music for the viola is written mainly in the alto clef, though the treble clef is used for the higher notes

Violin, a stringed instrument rather smaller than the ancient viol from which it derives It is held under the chin for playing, the right hand bowing while the left hand "stops" the strings The violin has been used in its present form since the 16th cent, the most famous maker being Antonio Stradivari of Cremona

Violoncello, a member of the violin family of stringed instruments whose pitch corresponds with that of the bass voice. It is played while between the knees as was the old *viola da gamba*

Viper, a family of poisonous snakes of which there is one example in Britain, the common viper or adder, only found in very dry localities

Virginal, an English keyboard instrument of the harpsichord type greatly in vogue during Elizabethan times.

Virgo, the 6th constellation of the Zodiac, lying between Leo and Libra It has seven prominent stars ranged in the form of the letter "Y." One of these stars is of the first magnitude, the other six being of the third magnitude.

Virtues, Cardinal. *See* **Cardinal Virtues.**

Visibility is defined by the distance at which

the farthest of a series of objects, specially selected to show against the skyline or in good contrast with their background, can be distinguished. Visibility depends chiefly upon the concentration of water or dust particles suspended in the air. Instruments are available to measure the obscurity of the atmosphere more directly, including that at night. A large lapse rate of temperature and a strong wind are favourable to good visibility, a small lapse rate, calm or light wind favourable to bad visibility. Fog is when the visibility is less than 1,100 yds.; mist or haze when it is between 1,100 and 2,200 yds. *See* Pollution.

Viscount, a title of rank coming between that of Earl and Baron. The title originally stood for deputy-earl. The first English Viscount was Viscount Beaumont, created in 1440.

Vitamins, name of a group of organic substances found in relatively minute amounts in certain foodstuffs, essential for growth and the maintenance of normal bodily structure and function. The Hungarian biochemist Szent-Györgyi, who first isolated vitamin C or ascorbic acid, defined the vitamin as "a substance that makes you ill if you don't eat it!" *See* P42(2).

Vitriol, the old name of sulphuric acid, represented in its pure form by oil of vitriol. Sulphate of copper is blue vitriol, sulphate of iron green vitriol, and sulphate of zinc, white vitriol.

Vivandière, a female camp follower informally attached to French military regiments, and acting as vendor of liquors, fruits, etc.

Vizier, more correctly Vizir, literally "burden bearer" or helper, originally the chief minister of the Abbasid (second of the two great dynasties of the Mohammedan empire) Caliphs.

Volcanoes are vents through which magma reaches the surface as lava flows, or as the solid products, *e.g.*, ashes and bombs, of explosive eruption. The vent may be cylindrical or it may be a long fissure. The former type usually builds up cones, *e.g.*, Vesuvius. The most active volcanoes of modern times have been those of Etna, Vesuvius and Stromboli in Italy; Hekla in Iceland, and Mont Pelée in Martinique. The last-named was in violent eruption in 1902, when the chief town of St Pierre was completely destroyed and many lives were lost.

Vole. There are three species of British vole, the Field-vole, the Bank-vole, and the Water-vole.

Volt, the electro-motive force unit, named after Volta, and defined in terms of the coulomb, the second, and the joule. *See* N13(1).

Vraic, a name for seaweed in the Channel Islands, where it is extensively used as a manure.

Vulgate, a term used to designate the Latin version of the Scriptures sanctioned by the Council of Trent.

Vulture, a famous bird of prey of two distinctive groups, that of the Old World, whose nostrils are separated by a bony partition, and the New World vulture, which has no such division. Vultures feed on carrion and are the great scavengers of tropical regions. The European species are the Griffon Vulture and the Egyptian Vulture, which, however, have seldom been known to visit England. Vultures have no feathers on the head and neck.

W

Wading Birds, *Charadriiformes*, an order of migratory, long-legged, long-billed birds, frequenting marshes and shallow waters. They include the plovers, avocets, stilts, oystercatchers, curlews, phalaropes, godwits, dunlins, sandpipers, redshanks, greenshanks, snipe, woodcocks, the pratincole of the Mediterranean, and the sun bittern of tropical America. Many species breed in Britain.

Wagtails, familiar long-tailed small birds, the most common British species being the Pied or Water (with sub-species White) Grey and the Yellow (sub-species Blue). Wagtails nest in holes and are active of habit.

Walloons, name given to the French-speaking population of the southern provinces of Belgium, in contrast to the Flemings or Dutch-speaking population of the northern provinces. The Walloon areas contain the mining and heavy industries of the country, the Flemish regions are more agricultural. Walloons number *c* 3 million, Flemings *c* 5 million. The *Mouvement Populaire Wallon* desires an autonomous Wallonia within the Belgian state.

Walpurgis Night, the night before May 1st, when witches and creatures of evil are supposed to have liberty to roam. Named after St Walpurgis, an English nun, who went on a mission to Germany in the 8th cent. There is a famous Walpurgis night scene in Goethe's *Faust*.

Walrus, a very large marine mammal, related to the seals having in the upper jaw two large curved tusks, which average in length from 15 in. to 2 ft. It lives on bi-valve molluscs, and inhabits the Arctic seas. An adult walrus can exceed 12 ft in length and weigh over a ton.

Wapentake, the ancient name given in the northern counties to territorial divisions corresponding to the Hundreds of southern counties.

Warblers, a family of small, lively song-birds closely related to the flycatchers and thrushes. Represented in Britain by about 36 species, including the chiffchaff, one of the earliest spring visitors, willow-wren, wood-warbler, blackcap, garden-warbler, whitethroats, sedge- and grasshopper-warbler.

Water is the simplest compound of hydrogen and oxygen. It is formed when an electric spark is passed through a mixture of the gases, and is a product of combustion of all hydrogen-containing compounds, *e.g.*, petrol, coal, coal gas, and wood. Water is essential to living matter, and is the medium which carries food to animals and plants. Salts in hard water may be removed by distillation of the water or by a process known as ion-exchange (water softening). Pure water freezes at 0° C and boils at 100° C and is used as a standard of temperature on this scale. It has a maximum density at 4° C. Heating water above 100° C converts it into steam, which is used under pressure to convert heat energy into useful work, as in electrical power stations and steam engines. Water gas is a mixture mainly of carbon monoxide and hydrogen formed by blowing steam and oxygen through red-hot coke: it is used as a fuel. Water is one of the very few compounds which freezes from the surface down rather than from the bulk of the liquid up. This property has important consequences on the preservation of life in rivers and lakes when they are frozen over.

Waterloo, Battle of, was fought on June 18th, 1815. The Allies (British, German, and Dutch) under Wellington and Blücher defeated the French under Napoleon. This ended Napoleon's career.

Waterloo Bridge, crossing the Thames, was built by Rennie, and opened in 1817. It had nine arches, each of 120 ft. span, was built of granite, and had a length (including approaches) of 2,456 ft. The present bridge, completed in 1942, and formally opened Dec. 10, 1945, is a fine example of reinforced concrete construction. (Architect, Sir Giles Gilbert-Scott.)

Water-Spider, an interesting little animal which spins a sac of silk on a water-plant, which it uses as a sort of diving bell. Into this bell it introduces bubbles of air, one at a time, thus the spider is enabled to remain below the surface a considerable time.

Waterspout, whirling tornado-like cloud, occurring at sea. It begins as a cone of cloud tapering slowly downwards, the sea surface becoming disturbed, on reaching the centre of the cloud of spray the spout takes on the appearance of a column of water. A number of these vortices may form fairly close together at about the same time, their duration ranging up to 30 minutes.

Watling Street, the name of the old Roman road which ran from the Channel ports by way of London to Shropshire. *See also* Roman Roads.

Watt. A unit of electrical power equivalent to 1 joule of work per second. 746 watts equal 1 horse-power, and the kilowatt (1,000 watts) is about 1⅓ horse-power. *See* N13(1).

Wax, the name applied to certain substances or mixtures which are solids having little crystalline form and may be regarded as solidified oils. They are used for various purposes, such as the making of wax candles, bleaching, and making artificial flowers and anatomical models, also in pharmacy for blending in the composition of plasters, ointment, etc. The best-known natural wax is beeswax, and there are others,

such as spermaceti, obtained from the sperm whale, and Chinese wax, which is a cerotyl cerotate.

Waxbill, a small Oriental and African bird of the *Estrildidae* family, with wax-like bill and beautifully variegated plumage. The Java sparrow, and the Blue-breasted waxbill are attractive, and often find their way into cages.

Wayz-Goose, the name given to a festive gathering of people employed in printing and other works, so called from the fact that in earlier times a goose was the principal dish of the feast.

Weasel. A carnivore mammal found in Britain, smallest member of the group including the Stoat, Polecat, and Pine-marten, about 8 in long. Its fur is reddish on the upper side of the animal, white on the under side; it may all turn white in winter with the exception of the tail.

Weather, the factors determining to-morrow's weather are so manifold, variable, and complex that the task of the meteorologist is no easy one. There are still people who cling to the idea that weather is determined by the phase of the moon, but their predictions have no scientific backing, and can be dismissed. Changes in temperature, humidity, and speed of air masses can best be measured by instruments designed for the purpose. Weather forecasts are now a regular feature of the B B C broadcast, the information being supplied by the meteorological staff of the Air Ministry. By taking into account the peculiar character of any part of the country, whether coastal, high- or low-lying, industrial, sheltered, precise forecasts for that particular region can be made up to twenty-four hours ahead and sometimes longer. The British Isles lie in the path of depressions moving north-eastward across the Atlantic. It is the frequency, intensity, and speed of these centres of low pressure, which give these islands such changeable weather. On the other hand, when an anticyclone builds up and embraces the British Isles, settled weather is fairly certain, the type of weather, whether dull or cloudless, warm or cold, depending mainly on the direction of the wind in the particular area concerned and the time of year. An American earth satellite, *Vanguard II*, was launched in Feb. 1959 to serve as the first "weather-eye" in space. *See* **F51–3**

Weather Lore. Before instruments were invented to measure atmospheric conditions, man relied on his own observation of wind and sky, behaviour of birds and animals, and came to associate certain phenomena with types of weather. Many popular weather rhymes have survived the centuries, and as long as forecasting is confined to the next 24 hours there is perhaps something to be said for them, particularly those dealing with the winds. What is very unlikely is that next year's summer can be predicted from this year's winter, or that one month's weather is related to that of another. The study of past records reveals too many exceptions for such predictions to be of much use in forecasting.

Weaver Bird, the popular name for a large group of finch-like birds belonging to the family *Ploceidae*, found principally in Africa but also in Southern Asia, Australia, and Europe and remarkable for their habit of building nests formed of blades of grass dexterously interwoven and suspended from the boughs of trees.

Weaving has been practised since before any times of which we have record. The Egyptians credit the invention to Isis, the Grecians to Minerva. The main principle of the weaving loom is the same to-day as it was thousands of years ago, a warp extends lengthwise through the loom, the threads being held in separate regular order by being passed through a reed or "slay," while the weft is crossed through alternating threads of the warp by means of a shuttle which holds the weft. Thus the fabric is built up. Weaving was done by hand up to the early part of the 19th cent., when Cartwright's steam-power loom was introduced, and is now in universal use. The Jacquard loom for weaving figured designs dates from 1801.

Wedding Anniversaries are first, Cotton, second, Paper; third, Leather, fourth, Fruit and Flower; fifth, Wooden; sixth, Sugar, seventh, Woollen, eighth, Salt; ninth, Copper, tenth, Tin, twelfth, Silk and Fine Linen; fifteenth, Crystal; twentieth, China, twenty-fifth, Silver, thirtieth, Pearl, fortieth, Ruby, fiftieth, Golden, sixtieth, Diamond.

Wednesday, the 4th day of the week, derived its name from Woden or Odin, the Norse god of war.

Weever, a genus of sea-fishes which possess the power of inflicting stings by means of the dorsal fin and a spine on the gill cover.

Weevil. The term is applied to members of a group (called Rhynchophora) of beetles with a snout at the end of which is the mouth. Certain weevils are serious pests in granaries, while the cotton-boll weevil does enormous damage.

Weights and Measures. Crude standards of weights and measures existed in the ancient world, and the degree of standardisation increased as civilisation progressed. Weight was taken from the grain, which is still the smallest unit. Ancient measures were based on the natural proportions of the human body, the digit or breadth of the middle part of the first joint of the forefinger being taken as the lowest unit. Under Richard I standards of weights and measures had to be provided for the whole kingdom by the sheriffs of London. Today the Standards Department of the Board of Trade is responsible for the national standards of weights and measures. *See* **N11–13**

Werewolf, a man or woman, who according to mediaeval belief, could be turned by witchcraft or magic into a wolf, eat human flesh or drink human blood, and turn into himself again. This belief was widely held in Europe, and similar superstitions prevail among most primitive peoples, *e g*, the "leopard man" of certain African tribes. Lycanthropy (from Gr = wolf-man) is a form of madness in which the patient imagines himself a beast.

Westminster Abbey stands on the site of an old church and Benedictine foundation of the 7th cent. It was rebuilt under Edward the Confessor, and again under Henry III, and important additions were made by Edward II, Edward III, Richard II, Richard III and Henry VII, the latter erecting the beautiful eastern chapel in the perpendicular style which bears his name. The western towers and front were rebuilt by Wren in the 18th cent. It contains tombs of many sovereigns, of the Unknown Warrior, and many other illustrious men are commemorated by monuments.

Westminster Cathedral, seat of the Roman Catholic Archbishop of Westminster. It was designed by J F Bentley and built between 1895 and 1910. It is of red brick, in early Christian Byzantine style with a domed campanile, 283 ft high, and a decorative interior.

Westminster Hall, adjoining the Houses of Parliament, was built as a Banqueting Hall by William Rufus, and many courtly festivals were held there in succeeding centuries. King John established the Law Courts there. It now forms a gigantic hallway, leading to the Houses of Parliament. Extensive repairs to the Hall have recently been carried out. Many famous people (Charles I, Sir Thomas More, Warren Hastings) have been tried there.

Whale, a completely aquatic mammal, the fore-limbs are modified to form fin-like paddles and there is virtually no external trace of the hind-limbs. There are two major groups of whales—the *Toothed Whales*, including the Sperm-whale (Cachalot), Dolphins, Killer-whales, and Porpoises, and the *Whalebone Whales*. In the latter a series of whalebone plates grow down from the roof of the mouth, and, being frayed at their edges into a hairy fringe, together constitute a filtering mechanism. The animal takes in sea water containing minute organisms on which it feeds; the mouth is then closed and the tongue raised when the water is forced out through the filter, on which is left the food. As the tongue is lowered, the whalebone plates straighten up, flicking the food on to the tongue, which transfers it to the gut. Most whale oil is obtained from the thick layer of fat under the skin (blubber), but in the Sperm-whale there is a large reserve of oil in the head. The oil is used for making candles, margarine, and soap. Ambergris used in perfumery comes from the intestine of whales.

The number of whales that may be killed in a season is limited by International Convention

Whimbrel, a bird of the Curlew family, more common in Scotland than in England.

Whinchat, a small migratory bird, a breeding visitor to Britain (Apr to Oct), bright brown plumage, with prominent eye stripe

Whip, an M P. responsible to his Party for the organisation of the voting M P s He is responsible for ensuring the presence of (or whipping up) a sufficient number of members to carry the vote through

Whip-poor-Will, the name of the American nightjar, which gets its name from its three-syllable call-note It is a nocturnal bird, catching its insect food on the wing It has been known to hibernate for as long as three months

Whirlpool, a circling current of water often of great power, capable of drawing into its centre and submerging small vessels. The most famous whirlpool is the maelstrom on the Norwegian coast

Whirlwind, a sudden circular rush of opposing winds, which often causes much damage

Whisky, an ardent spirit distilled from malt or other grain, and containing a large percentage of alcohol. It has a greater consumption than any other spirit, and is of many kinds, Scotch and Irish whiskies being chiefly consumed in this country, and being of pot still or patent still production, or a blend of the two Whisky is the most heavily taxed product, in 1661 a duty of 4*d* a gallon was imposed, today the duty is £10 10*s* 10*d* on a proof gallon American whiskies are mostly distilled from corn (maize), or rye *See* **Alcohol.**

Whitebait, the name given in Great Britain to young fish, mainly herring and sprat, sold and eaten when about 2 in long In New Zealand the whitebait is the juvenile of a native fish called "inanga" It is about 2 in long, wholly transparent, and belongs to the family of freshwater fish *Galaxia*

White Elephant, a term in common use to designate a gift that causes the recipient more trouble or cost than it is worth, derived from an oldtime custom of the Kings of Siam who presented a white elephant to a courtier whom it was desired to ruin

Whitehall Palace, erected within sight of Westminster Abbey in the 13th cent , was the residence of the Archbishops of York until Henry VIII took possession of it in 1530 Thenceforward to 1697, when it was burned down, it continued to be the favourite town residence of royalty, and to the Stuarts especially it was a great centre of court festivities In those days, with its grounds, it extended from the Strand to the river. The only portion of Whitehall now standing is the Banqueting Hall built by Inigo Jones, on a scaffold projected from the front of which Charles I was beheaded A block of new government buildings has recently been built on part of the site of the old Palace

White House, the official residence at Washington of the President of the United States

Whitsuntide, the festival celebrating the descent of the Holy Ghost and occurring seven weeks after Easter.

Whole-tone Scale, a musical scale all of whose intervals are tones This scale has been popularised by Debussy

Whydah Bird, the widow-bird of Equatorial Africa The Paradise Whydah is remarkable for the long tail and handsome black-and-scarlet plumage of the male during mating season

Widow Bird, certain species of African weaver birds with predominantly black plumage In the breeding season the male birds are strikingly beautiful, with scarlet and buff markings and long tail feathers They are social parasites and trick other birds into rearing their young

Wigeon, a surface-feeding duck of northern Europe, known in Britain more as a winter visitor than a nesting bird. It feeds in flocks in the muddy estuaries and has a characteristic "whee-oo" call

Willow, a water-side-loving tree of the genus *Salix*, to which the osiers belong The best cricket-bat blades are made from a white willow, *S alba* var. *caerulea*, a fine tree with bluish-green leaves, mostly found in Essex. Willow is also used for polo balls. Weeping willow, *S. babylonica*, is native to China and is the willow seen on Old China willow-pattern plates. It was introduced into England at the end of the 17th cent

Wind, air set in motion by special atmospheric conditions, is of various degrees, from a slight rustling breeze to a hurricane. Winds are *constant*, as in trade winds or anti-trade winds, *periodic*, as in monsoons and other wind-visitations occurring according to influences of season; *cyclonic* and *anti-cyclonic*, when their motion is spiral, *whirlwinds*, *hurricanes*, and *tornados*, when high temperature and great density induce extreme agitation Ordinarily, a wind is named from the point of the compass from which it blows, or it may be expressed in degrees from true north The *sirocco*, the *mistral*, and the *simoom* are local forms of winds of great velocity A *blizzard* is a biting blast of icy temperature *See also* **N10**

Windmills were in use in the East in ancient times but were not much seen in Europe before the 13th cent Wind sawmills were invented by a Dutchman in the 17th cent , and one was erected near the Strand in London in 1633 Great improvements have been made in these mills in recent years especially in the United States, where, by the application of the windshaft principle, much space is saved and the mills can be used for pumping, grinding, and other purposes

Windows (Old Norse *vindauga* = wind-eye), an opening in a wall of a building to admit light and air, and to afford a view of what is outside In northern Europe windows, as the derivation of the word implies, were first used for ventilation and glass was not used in private houses before the end of the 12th cent. In early Gothic (12th cent) windows were still small and narrow, with rounded heads In Early English (13th cent) they became longer and the heads pointed In the Decorated period (14th cent) windows were mullioned (divided by slender bars into panes) and the pointed heads often traceried In Tudor times when the Renaissance had found its way to England, windows were larger and the bay-window (projecting from the wall) and the oriel window (*q v*) were much in vogue, in the late 18th cent curved bays (called bow-windows) became fashionable Sash windows (invented by the English) with wooden frames and divided into equal rectangular panes were used in Queen Anne and Georgian houses Their design was influenced by a passion for symmetry, they were very efficient ventilators. The French window reaches to the floor and has double casements opening as doors A Dormer window is a vertical window set on the sloping side of a roof One of the main features of modern architecture is the large area devoted to windows a development made possible by improved heating systems Windows are now mass-produced in stock sizes and patterns

Windsor Castle, the famous British royal residence on the banks of the Thames, as it now stands, was mainly built by Henry III , though a royal residence had existed there from the time of the Conqueror Additions were made by Henry VIII , Elizabeth, and Charles II Windsor Park and Forest comprise over 13,000 acres

Wine, the fermented juice of the freshly-gathered grape There are innumerable varieties, each obtaining its distinctive character from the species of wine producing the grape, the locality of the vineyard, method of cultivation, etc Wines are of three main kinds *sparkling*, as in champagne, due to their having been bottled before fermentation is complete, *beverage*, when the must has been fermented out before bottling Such wines include the famous red and white wines of Burgundy, Bordeaux and the Rhone valley and the white wines of the Rhine Moselle and Loire valleys Wines are *fortified* by the addition of brandy before fermentation is complete, examples being Port and Sherry The principal wine-producing areas of the world are France, Italy, Algeria, Spain, Portugal, Rumania, Argentine, Yugoslavia, U.S S.R., Greece, Germany, Hungary The alcoholic content of wine varies widely, but is usually in the range 8–20% by volume.

Wireworm, the larva of the click beetles. Wireworms are a serious pest of grass, cereal crops, potatoes, etc

Witan *or* **Witenagemot**, the name given to the Great Council of the Anglo-Saxons, "the Council of the Wise Men," and composed of the leading nobility

Witchcraft. *See* **J45.**

Woad, a plant (*Isatis tinctoria*) that in olden days was largely used in England for the blue dye obtained from the leaves. It is a biennial plant belonging to the same family (*Cruciferae*) as the wallflower and is still cultivated in some parts.

Wolves, well-known carnivorous animals still found in many parts of Europe, but not existing in Britain since the middle of the 17th cent.

Woodcock, a wading bird, greatly valued for its flesh. It is a member of the snipe family, and breeds in Britain. The parent bird is able to carry its young between its thigh and body when flying to and from the feeding spots. It is one of the birds protected by the Game Laws.

Wood-Louse, any terrestrial isopod crustacean of the *Oniscidae* family. They have segmented bodies and 14 legs, and feed mostly on decaying matter, animal and vegetable. The best known is the Pill Wood-louse (*Armadillidium*), which rolls itself into a ball when touched.

Woodpecker, a familiar tree-climbing, insectivorous bird of conspicuous plumage, of which three species are found in Britain, the green woodpecker or yaffle (because of its harsh cry), the great and lesser spotted woodpeckers. They build in the hollows of trees. Yaffle has a long sticky tongue for licking up ground insects, especially ants. The other two obtain insects by digging into tree trunks with strong, chisel-like bills, spearing the insects with a sharp tongue. The metallic drumming sound made by the birds in spring is thought to be caused by their beaks hammering away at some hard resounding substance.

Wood's Metal, an alloy with a very low melting point (65° C, which is under 150° F) so that a spoon made of it will melt when used to stir a cup of tea. Contains bismuth 4 parts, lead 2 parts, tin 1 part, cadmium 1 part. Its use as a heat exchanger has now been largely superseded by silicone oils, which have a wider temperature range.

Wool is a fibre, made up of very long protein molecules. It has been largely grown and used in the manufacture of cloth in England since before the Roman invasion. It is grown on the backs of sheep, and is of various kinds, according to the breed of sheep from which it is derived. Wool differs from hair in that it has a wavy, serrated fibre, its curl being a notable characteristic, whereas hair has a smooth surface comparatively free from serratures. Long wools are mostly used for the manufacture of worsted goods, and short wools for woollen cloths, though the improvements in machinery in recent years have enabled manufacturers to utilise short wools to a great extent for dress fabrics as well as for woollens. The finest wools are obtained from the fleece of the Spanish merino sheep. Australia, New Zealand, and the Argentine are the greatest wool-producing countries.

Woolsack, the name given to the seat occupied by the Lord Chancellor in the House of Lords. It is a large square bag of wool, without back or arms, covered with red cloth. At the time when it was first used, in the reign of Edward III, wool was the great staple commodity of the country and, it is said, chosen for the seat of judges as a constant reminder of the main source of the national wealth. The Lord Chancellor is said to be "appointed to the woolsack."

Work. When a force moves its point of application, *e.g.*, when one exerts force in pushing a car along, the product of the force times the distance moved is a quantity known as "the work done." Work requires a source of energy (*q.v.*), conversely, energy can be converted into work. Machines are largely for converting suitable forms of energy into useful forms of work. Both work and energy are measured in the same units, *e.g.*, foot lb, ergs, joules (*q.v.*)

World Council of Churches. *See* **J45.**

World Population. According to the United Nations Statistical Yearbook (1962) the world's estimated population in 1961 was 3,101,000,000 which included 700 million people in China, 445 million in India, 221 million in the Soviet Union, 435 million in Europe (excl. the Soviet Union), 265 million in Africa, 217 million in Latin America, 186 million in the United States, and 95 million in Japan. World population is increasing at a rate of 54,000,000 a year.

Worsted, a fabric made from long wools or wools mixed with cotton or other fibrous material. It was first manufactured at, and derived its name from, Worstead in Norfolk, in the 14th cent. Norwich was, until the latter part of the 18th cent., the headquarters of this industry, but now for more than 100 years the worsted manufacturing centre has been Bradford.

Wren, a family of small passerine birds possessing upturned tails and most abundant in South America. The British species is an interesting singing bird with a surprisingly loud note for its size.

Wryneck, a tree creeping bird related to the woodpecker, of grey-brown plumage. It is a summer visitor to Britain, and gains its name from the snake-like way it curves its neck.

X

Xenon a rare gaseous element, symbol Xe, occurring in minute quantities in the atmosphere, discovered by Sir William Ramsay and M. W. Travers in 1898. *See* **Rare Gases.**

X-Rays were discovered in 1895 by Professor Rontgen, of Wurzburg, while experimenting with a Crookes vacuum tube, when the fact was accidentally revealed that a photographic plate, contained in a dark box and exposed to its rays, was affected. To the X-rays the box was transparent. X-ray photographs are now commonly taken to obtain information about objects enclosed within solid bodies; they enable bullets and any solid bodies of metal, as well as bones, etc., in the body to be perfectly located and investigated. The discovery has proved of great advantage in surgical operations. X-rays are used to determine the structure of matter; the atoms in a substance may be located and their relative positions determined by photographing reflections of the X-rays by the specimen. *See* **F11(1), 13(2).**

Xylem, the woody tissue of higher plants whose function of the xylem is to conduct water and mineral salts upwards, and to provide mechanical support.

Xylophone, a musical instrument consisting of a series of tuned wooden bars of varying dimensions. It is played by striking the bars with wooden hammers held in the hands.

Y

Yacht, a light vessel now much used for pleasure trips and racing. The first yachting club was the Cork Harbour Club, started about 1720, and in 1812 the Royal Yacht Squadron was founded at Cowes. The Royal Thames Yacht Club dates from 1823. The most famous international yachting trophy is *The America's Cup*.

Yak, a curious, long-haired ox, found in Tibet, used as a beast of burden, and also kept for milk and meat.

Yam, the root of the 150 species of *Dioscorea*, which grows in Asia, America, Africa, and Australia, used as a substitute for the potato.

Yard, a standard measure of 36 in., the word being derived from the Saxon gyrd, or rod. To abolish minute discrepancies which exist in various national definitions of the yard and the pound, new *international scientific standards* came into force on Jan. 1, 1959: yard = 0.9144 of a metre, pound = 0.45359237 of a kilogram. The yard and pound are thus defined by reference to the metre and the kilogram. By international agreement the metre has recently been defined by reference to the wavelength of Krypton-86 light. *See* **N11.**

Yeast, a unicellular fungus which contains enzymes promoting fermentation. In brewing and wine-making the yeasts are important. The baker uses yeast to make bread rise; yeast is incorporated in the dough and ferments some of the starch present, yielding carbon dioxide gas which expands and aerates the bread in the baking process.

Yellowhammer, a common British bird of the bunt-

ing family, of lemon-yellow and brown plumage. Nests on or near the ground.

Yeomen of the Guard are a body of Foot Guards established in the reign of Henry VII. for the protection of the Royal Person. Yeomen are now about 100 in number, and their duties consist in being present on ceremonial State occasions, the yearly distribution of Maundy Money, and the searching of the vaults of the Houses of Parliament on Guy Fawkes' day "Beefeater" is the nickname of both Yeomen of the Guard and Yeomen Warders of the Tower, and they both wear the style of dress of the Tudor period, but with one distinction, the Yeomen of the Guard wear a cross belt, the Warders do not.

Yeti, opinions differ as to whether this is a mythical inhabitant of the Himalayas, a primitive primate or bear Evidence to date is inconclusive

Yew, an evergreen tree, the wood of which in olden days was in great demand for bow-making

Yoga *See* **J45.**

York Minster, one of the oldest and finest of English cathedrals, is 524 ft long, its nave is 240 ft broad, and the central tower is 216 ft high The present edifice, in parts, dates back to the 12th cent, but a church stood on the site in the 7th cent In 1829 it was set on fire by a lunatic named Jonathan Martin, and the destruction that then took place cost £60,000 to restore

Ytterbium, a chemical element discovered by Urbain in 1907: one of the group of rare earth metals.

Yttrium, a chemical element discovered by Mosander in 1842. It is found in a few rare minerals such as gadolinite, xenotime, fergusonite, and euxenite. One of the group of rare-earth metals.

Z

Zaibatsu, great and powerful family trusts, including the Mitsui, Mitsubishi, Sumitomo, and Yasuda, who held a position of unparalleled influence in Japan before the second world war, for in their hands was concentrated almost the entire economy of the Japanese nation. It was a major war aim of the Allies to break these trusts, but their economic power has been largely restored

Zamboni Pile, a dry galvanic battery, which can provide small amounts of high-voltage current over a very long time At Oxford a couple of Zamboni Piles have kept a bell ringing for over a hundred years. These Piles in the second world war were perfected and produced in quantity, being the most convenient source of current for infra-red signalling devices

Zebra, an African quadruped of whitish-grey colour, with regular black stripings, perhaps the most beautiful member of the Equine family Rather larger than an ass and smaller than the horse, it has a tufted tail, is of light build, wild, and fleet of foot; there are several species, and the Quagga and Burchell's Zebra (ground colouring yellow), as well as the True Zebra, belong to the group.

Zebu, a species of oxen having a large hump on the shoulder and short horns. In India and some parts of Africa these animals are domesticated and used as beasts of burden. They are of a light grey colour and very docile. Their flesh makes good food-meat, the Hindus, however, do not slay them but regard them with much veneration.

Zen Buddhism. *See* **J46.**

Zenith, the highest point in the heavens above an observer's head, the opposite pole to the Nadir

Zero, the cypher signifying nothing. The West is indebted to the Arabs for it, who probably got it from the Hindus and passed it to European mathematicians towards the end of the Middle Ages The zero has also been found in Babylonian cuneiform. The Greeks had no such symbol, which hindered the development of their mathematics. The use of zero led to the invention of decimal fractions and to the later developments in astronomy, physics and chemistry. Absolute zero on the temperature scale is the lowest temperature theoretically possible (when no heat whatever is present) and equal to −273 15° C.

Zeta, the name given in former times to the closet or room, above a church porch, where the sexton lived and guarded the documents of the church Zeta is also the name of the machine at Harwell (zero energy thermometer assembly) designed to solve some of the problems of thermonuclear reactions

Zinc, a familiar metallic element, symbol Zn, known to the ancients, and used by them in the making of brass It occurs as the sulphide, carbonate, etc. The ores of zinc are crushed, roasted, and reduced with coal. In combination with copper it constitutes the familiar alloy called brass, and zinc itself is much used for roofing and other protective purposes. Zinc ores are mined in Canada, the U S A , Mexico, Poland, Australia, Russia, Italy, Spain, and many other parts of the world Zinc smelting is carried on in most industrial countries, including Great Britain

Zirconium, metallic element, symbol Zr, was discovered by Klaproth in the sand of the rivers of Ceylon in 1789 The crystalline metal is white, soft, and ductile, in its amorphous condition it is a blue-black powder Zirconium is used in atomic reactors as containers for fuel elements, since it does not absorb neutrons

Zither, an ancient musical instrument consisting of strings stretched on a frame which is held in the left hand The right hand plucks the strings with a plectrum

Zodiac, an imaginary zone or belt of the sky enclosing the circuit over which the principal planets travel It is divided into 12 equal spaces of 30 degrees each, comprising respectively the 12 signs of the zodiac—Aries, Taurus, Gemini, Cancer, Leo, Virgo, Libra, Scorpio, Sagittarius, Capricornus, Aquarius and Pisces The idea of the zodiac originated with the Babylonians about 2000 B C and passed by way of the Greeks to the Western world

Zodiacal Light, a faint cone of light occasionally seen stretching along the zodiac from the western horizon after evening twilight or the eastern horizon before morning twilight It is believed to be due to the scattering of the sun's light by dust particles in orbit round the sun and extending beyond the earth Recent observations at the high altitude station at Chacaltaya in the Andes suggest that the dust is travelling round the sun in regular planetary orbits

Zollverein, any of the customs unions successively formed under the leadership of Prussia among certain German states for maintaining uniform duties and tariffs against foreign countries and free trade among themselves The administration was finally merged in the German Empire of 1871

Zonda, a warm moist wind in Argentina of great velocity blowing from the north or northwest, and, like the Sirocco in Southern Europe, causes much discomfort It happens when a depression is moving across the pampas, bringing with it a mass of air from the humid tropics. It is followed by a refreshing wind from the south-east.

Zone, an imaginary geographical belt encircling the earth There are five zones—the Torrid Zone, from tropic to tropic; two Temperate Zones, from the tropics to the Polar Circles, and two Frigid Zones, from the Polar Circles to the North and South Poles respectively.

Zoological Gardens of London were opened in 1828, and belong to the Zoological Society of London They contain one of the largest and most varied collections of living animals in the world The Society maintains an open-air zoo at Whipsnade, on the edge of Dunstable Downs; this was opened in 1931.

Zoology, the science of animal biology, treating of the structure, classification, and distribution of the various members of the animal kingdom.

Zoroastrianism. *See* **J46.**

Zouaves, a body of French light infantry, first recruited from an Algerian tribe; afterwards composed of selected French soldiers retaining the Oriental uniform.

Zulus, a native African people occupying Zululand, which later became part of Natal, Union of S Africa. They are a brave race, and in a war with Great Britain in 1879 inflicted severe defeats upon our troops. The Zulu king, Cetewayo, was finally defeated and taken prisoner, and his country annexed.

NOBEL PRIZE WINNERS (1901–1962)

These prizes, founded by the will of Dr Alfred B Nobel (1833–96) are five and are awarded each year for the most important discovery or development in (1) physics, (2) chemistry, (3) physiology and medicine, (4) the most distinguished literary work, (5) the best effort towards the promotion of peace

YEAR	PHYSICS	CHEMISTRY	PHYSIOLOGY AND MEDICINE	LITERATURE	PEACE
1901	W C. Roentgen (G)	J H van't Hoff (D)	E v Behring (G).	R F A Sully Prudhomme (F)	H Dunant (Sw), F Passy (F)
1902	H A Lorentz (D), P Zeeman (D)	E Fischer (G)	R Ross (B)	T Mommsen (G)	E Ducommun (Sw), A Gobat (Sw)
1903	H Becquerel (F), P Curie (F), Marie Curie (F)	S Arrhenius (S)	N R Finsen (Da)	B Bjornson (N)	Sir W. R Cremer (B)
1904	Lord J W S Rayleigh (B).	W Ramsay (B)	I P Pavlov (R)	F Mistral (F), J Echegaray (Sp)	Institut de Droit International
1905	P Lenard (G)	A v Bayer (G)	R Koch (G)	H Sienkiewicz (P)	Bertha von Suttner (Au)

Literary Companion

TABLE OF CONTENTS

English Verse

This section of the *Cyclopaedia* is concerned with English verse since the time of Chaucer, with its different metres and rhymes. The poet's subtle verse patterns of metre and rhyme are indeed one of his most potent means of expression, and by keeping an attentive ear to them we are helped to catch his meaning.

A glance at any good anthology of English poems written during the last five or six centuries will show what a rich variety of traditional verse patterns the contemporary poet now has at his disposal, whatever may be his mood or theme. Our poet laureate, Masefield, has made great use of these time-honoured forms. For his leisurely "Dauber," he employs the stately "rhyme-royal" stanza that was no longer new even to Chaucer. His sonnets are of Shakespearean design, and for his brisk "Reynard the Fox" he uses the octosyllabic couplet in which the Puritan poet, Marvell, once hymned the newly discovered "remote Bermudas."

Many poets, however, find the traditional forms are not sufficiently flexible for modern needs, and they may so drastically modify them as to make them, at first sight, unrecognisable.

One of the most indefatigable experimenters has been Dame Edith Sitwell. In the notes to the Penguin selection of her poetry she says:

> "At the time I began to write, a change in the direction, imagery, and rhythms in poetry had become necessary, owing to the rhythmical flaccidity, the verbal deadness, the dead and expected patterns, of some of the poetry immediately preceding us.
>
> "Rhythm is one of the principal translators between dream and reality. Rhythm might be described as, to the world of sound, what light is to the world of sight. It shapes and gives new meaning."

Placing so high a value on rhythm, Edith Sitwell sets herself, in her early "Façade," to tireless experiment in the effect on rhythm or metre of all kinds of subtle devices in the use of sound, until, as she says, her experiences led to the poem "Gold Coast Customs." This poem, written in 1929, is "about the state that led up to the second World War," and is prophetic in its vision of

"That sick thick smoke from London burning."

When we first read "Gold Coast Customs" we are shocked and and stunned by this portrayal of the ruthless and heartless savagery of our so-called civilisation. The shock is driven home by the metre, a savage staccato of stabbing lines, that echoes the fevered heart-beat of those indifferent to poverty and suffering, of the "rich man Judas, brother Cain." It also echoes "the beating of the drums that heralded the Customs, as they were called, in Ashantee, a hundred years ago, when, at the death of any rich or important person, slaves and poor persons were killed so that the bones of the dead might be washed by human blood."

Only when we recover from our shock and look carefully at the verse, do we realise that this blood-curdling metre, apparently entirely new, is written according to age-long principles, and uses for the most part an irregular tattoo of the iambs and anapaests that are the ground beat of most of our finest verse.

As Day Lewis has said in the Preface to the Penguin selection of his poems:

> "We must never think of 'modern poetry' as something in a vacuum, or something that started in 1900 or 1917 or 1930. Every good poem has grown out of the compost of all the poetry ever written."

Of his own poems Day Lewis goes on to say, "Contrary to received opinion about modern verse, nearly all my poems 'rhyme and scan,'" and the same may be said of most of our highly original contemporary poetry, such as that of W. H. Auden or Dylan Thomas.

The poet's intensely individual music is played on the age-old instrument of metre and rhyme, and the better we understand the instrument, the keener will be our enjoyment of the poet's skill and genius.

Even verse that cannot be called poetry—verse that is mechanical, uninspired, lacking that intensity of insight and expression that we recognise as poetic—even this mediocre verse can teach us something of the poet's instrument. A homely nursery rhyme like "Humpty Dumpty" can help us to appreciate the metre of Ariel's unearthly song, "Where the bee sucks."

It is for this reason that the following guide to versification throws its net wide, gathering together for our consideration patterns as diverse as those of the mediaeval ballad and the modern Frenchified triolet, of the flippant clerihew, and the grave blank verse of Wordsworth's "Prelude."

Reference

The following account of our verse is illustrated by quotations and by constant reference to the numbered poems in the new edition of "The Oxford Book of English Verse," 1939.

Thus "OBEV 16" means "Oxford Book of English Verse," New Edition, Poem No. 16.

I. INTRODUCTION. STRESS, METRE, AND RHYME.

If we listen carefully to spoken English, we shall observe that there is a natural tendency to stress some syllables more than others. In the following sentence, for example, the greater stress normally falls on the syllables whose vowels are marked with an acute accent, which is the usual way of indicating stress.

"The expréss léft Mánchester at séven."

It is obvious that in this sentence the stress falls in a quite haphazard way, and it is for this reason that we recognise the sentence as prose, for the essential difference between English prose and verse is that in prose the stress falls at random, while in verse the stressed syllables occur according to some regular pattern.

If we mark the stressed syllables in the following line from Wordsworth,

"And lóud hallóos and scréams and échoes lóud,"

it is immediately clear that the stress occurs regularly. The line is in fact, composed of a simple stress pattern of an unstressed syllable followed by a stressed (e.g., and lóud) which is repeated throughout.

It is a regular pattern of stress, such as this, that in English verse constitutes what we call "metre." Metre in Greek means simply "measure," and it is always by stress that we measure our verse.

Another feature that distinguishes our verse from prose is the use of rhyme, although rhyme, unlike metre, is not essential to verse.

II. METRE.

Different Kinds of Feet.

In English verse the unit of stress pattern constitutes a foot, the foot of verse being comparable to the bar of music.

English verse uses several kinds of feet, some of two syllables, or disyllabic, some of three syllables or trisyllabic, and occasionally a foot of four syllables.

Disyllabic feet are of four kinds

The Iamb, consisting of an unstressed syllable followed by a stressed, *e g.* "return."

The Trochee, consisting of a stressed syllable followed by an unstressed, *e g.*, "river"

The Spondee, consisting of two stressed syllables, *e g.*, "dóor mát."

The Pyrrhic, consisting of two unstressed syllables, *e g.*, in the phrase "into tówn," "into" is a pyrrhic.

Trisyllabic feet are of four kinds

The Anapæst, consisting of two unstressed syllables followed by a stressed, *e g.*, "as you wish"

The Dactyl, consisting of a stressed syllable followed by two unstressed, *e g.*, "árchery."

The Amphibrach, very rarely used, consisting of a stressed syllable between two unstressed, *e g.*, "delighted."

The Tribrach, still more rare, consisting of three unstressed syllables, *e g.*, last three syllables of "incommúnicable."

A four-syllabled foot is very occasionally found

The Choriambus, which may be thought of as a trochee followed by an iamb, *e g.*, "Tóll for the bráve"

Different Kinds of Metrical Line.

Based on the different kinds of feet are the different kinds of English metre, which may be compared with the "time" in music.

Disyllabic metres may be either iambic or trochaic, for it is impossible to speak at any length using only pyrrhic or spondees, and the most common trisyllabic metres are anapæstic or dactylic. Examples of different kinds of metrical line follow.

Iambic Line.

"I stróve with nóne for nóne was wórth my strife."
[OBEV 584]

Trochaic Line.

"Hóme art góne and tá'en thy wáges."
[OBEV 150]

Anapæstic Line.

"With a héy and a hó and a héy noninó."
[OBEV 147]

Dactylic Lines.

"Wit with his wántonness,
Tásteth death's bitterness."
[OBEV 177]

Amphibrach Lines.

"Most friendship is feigning, most lóving mere fólly
Then héigh ho, the hólly!
This life is most jolly"
[OBEV 146]

Choriambic Line.

"Kéntish Sir Býng stóod for his Kíng."

Variations in Metre.

Satisfying poetry is rarely entirely regular Mechanical regularity is soon wearisome to the ear and is a characteristic of doggerel The poet satisfies our love of rhythm in a more interesting and subtle way by introducing all kinds of variations and inversions, while at the same time maintaining the throb of the basic metre. An account of the chief variations follows

Elision.

Elision is the suppression in pronunciation of a vowel or a syllable.

In the anapæstic line,

"The Assýrian came down like a wólf on the fóld"

the second foot appears to have four syllables, but in fact the "i" of "Assýrian" is elided or dropped before the "a" as shown by the little bracket. The elision of "i," which is pronounced "y" and known as "consonantal y," is especially common, and occurs in such words as "familiar," "opinion" Elision is often shown by the use of the apostrophe as in "heav'n" In "heav'n" we see one of the many conventional elisions of poetry, like "'tis," "'twas," "did'st," "o'er," "e'er," "'gainst," and many more.

Substitution.

Substitution is the use of a foot different from that of the metre in which the poem is written In the following examples we can see the effect on iambic verse of some common substitutions.

Of a Trochee.

"Stiffen the sinews, summon up the blóod"
Shakespeare, "Henry V."

Here the initial trochee gives force and emphasis.

Of a Spondee

"Rócks caves, lákes féns, bógs déns and shádes of death."

In this extraordinary line of Milton's the spondees slow down and weight the verse.

Of a Pyrrhic

"They flý forgótten as a dréam"

Here the pyrrhic in the third foot gives lightness to the line.

Of a Dactyl

"Chattering his téeth for cóld that did him chill"

When a dactyl replaces an iamb it is usually in the first foot as in this typical instance from Spenser, where the dactyl gives emphasis and variety to the line.

Of Anapæsts.

"And the cóming wind did róar more lóud
And the sáils did sigh like sédge"
[OBEV 562]

The initial anapæsts in these two lines from "The Ancient Mariner" give an effect of hurry and speed.

Additional Syllable.

An additional syllable may be added to either the beginning or end of a line.

Feminine Ending.

A feminine ending is an extra unstressed syllable that is added after the final stressed syllable of a line, giving a gentle falling inflexion. It is often used in blank verse and is a marked characteristic of Shakespeare's later plays, *e.g.*,

"Be not afear'd; the isle is full of noises,
Sounds and sweet airs that give delight and hurt not."

Anacrusis.

Anacrusis is the use of an extra syllable before the first regular foot of the line.

Dropped Syllable.

It sometimes appears that a line is a syllable, or syllables, short, until we realise that a suspense or pause occupies the time that would have been taken by the missing syllable. The dropped syllable can be indicated by the "caret" mark, thus ^. The following technical terms are used for lines that are short of syllables.

Catalectic Line.

This leaves off in the middle of the last foot, as in the trochaic line

"Éver lét the fáncy róam,"

or the dactylic line,

"Ríngs on her fíngers and bélls on her tóes."

The catalectic line is common in trochaic and dactylic verse, for it is in keeping with the tendency of English verse to end on a stressed syllable.

Acephalous Line.

This omits the first syllable of the line, as in the anapæstic line,

"That hóst with their bánners at súnset were séen."

The Cæsura.

The cæsura is a special kind of pause, quite different from that which indicates a dropped syllable. It is a pause about the middle of a line and is usually indicated by a pause in the sense, *e.g.*,

"Both hungered after death, both chose to win or die."

Two Ways of Describing Metre.

The Classical.

The actual names that we have been using for the different kinds of feet and metres are derived from Greek. It is most important, however, to realise that in the classical languages they had a different meaning, for Greek and Latin verse was written on a quite different principle from ours, and was scanned according to the "quantity" or length of the syllable, and not according to stress. Thus an iamb in Greek and Latin consisted of a short syllable followed by a long, marked thus, ᴗ –, and a trochee of a long syllable followed by a short, marked – ᴗ.

In English verse the length of the syllable is totally irrelevant. For instance, the line,

"Pólly pút the kéttle ón and léts have téa"

begins with five trochees, all consisting of two *short* syllables.

The application of Greek words to English metres is confusing only if we forget that in English verse the criterion is stress.

The Modern.

Some writers, however, prefer new ways of describing our verse, and the most popular method is set out below.

A foot is called a period.
A disyllabic metre is called duple or double time.
A trisyllabic metre is called triple time.
A period with the stress on the first syllable is said to be falling.
A period with the stress on a second or third syllable is said to be rising.

III. RHYME.

Another thing that gives a formal pattern to English verse, and distinguishes it from prose, is rhyme. It is not essential to our verse, much of our verse being rhymeless.

Rhyme is a similarity in sound in words occurring normally at the ends of lines. In true rhyme the last stressed syllable and consonants following it are the same, while the sounds preceding the stressed vowel are different, *e.g.*, "cage/page," "pleasure/treasure."

The Types of Rhyme.

The most familiar division of rhyme is into masculine, feminine, and triple rhyme, but we also distinguish broken and Leonine rhyme.

Masculine, Male, or Single Rhyme.

The final syllable is stressed, *e.g.*, "cage/page," "joy/boy."

Feminine, Female, or Two-syllabled Rhyme.

The syllable before the last is stressed, and the final syllable unstressed, *e.g.*, "pleasure/treasure," "bending/lending."

Triple or Tumbling or Three-syllabled Rhyme.

The antepenultimate syllable is stressed. Triple rhyme is normally found in light or comic verse like that of W. S. Gilbert or in this punning "Epitaph on a Dentist."

"Stranger! Approach this spot with gravity!
John Brown is filling his last cavity."

In "The Bridge of Sighs" [OBEV 662] Hood dares to use it in a serious poem with such rhymes as "scrutiny/mutiny."

Broken Rhyme.

Broken rhyme, where more than one word is needed to complete the rhyme, is occasionally used, *e.g.*, "estate/their gate."

Leonine Rhyme.

Although rhyme normally occurs at the end of the line, we also find verse where the first half of the line rhymes with the second. This device, known as Leonine rhyme, is frequently used in Coleridge's "Ancient Mariner" [OBEV 562], *e.g.*,

"The ice did split, with a thunder-fit."

Poetic Licence in Rhyme.

The difficulty of rhyming in English is considerable, for many words have not a single rhyming word, some have only one, others very few. Certain licences are therefore allowed to the poet in the following ways:

Eye Rhyme or Printers' Rhyme.

Here words rhyme only to the eye, as "love/move." Keats in "Meg Merrilies" uses "rushes/bushes."

Identical Rhyme.

Here the same syllable or word is used twice so that the line rhymes with itself, *e.g.*, "part/impart" [OBEV 562], "universe/this verse" [OBEV 617]. The use of rhyming words spelt differently but pronounced identically is also a poetic licence, *e.g.*, "wright, write, right."

Cockney Rhyme.

Keats' use of Cockney rhymes has been much criticised, *e.g.*, "mourn/torn," "faces/vases," "briar/attire" There is still considerable difference between Northern and Southern pronunciation of English, and many eminent poets have availed themselves of a Southern pronunciation in rhyming "dawn/morn," although in the North of England the "r" of "morn" would be sounded

Assonance.

Assonance is sometimes used instead of rhyme, and occurs frequently in early folk poetry and less formal verse. It consists in a similarity in the accented vowels and those which follow, but not in the consonants, *e.g.*, "feet/creep," "skin/swim"

Perversion of Rhyme.

Modern poets, following Wilfrid Owen, have sometimes used a deliberate perversion of rhyme, which should not be confused with assonance Wilfrid Owen opens his bitter poem "A Terre" with the following stanza

"Sit on the bed I'm blind and three parts shell
Be careful, can't shake hands now, never shall
Both arms have mutinied against me,- brutes
My fingers fidget like ten idle brats"

The deliberate falsity of rhymes like "shall/shell," and "brutes/brats" conveys Owen's horror at the disintegration and collapse of the First World War

Recording of Rhyme Schemes.

The conventional way of noting rhyme schemes is to call the first series *a*, the second *b*, and so on Normally each new series is indented, *e.g.*,

"Joyful, joyful! *a*
When virginity *b*
Seeks all coyful *a*
Man's affinity *b*
Fate all flowery, *c*
Bright and bowery *c*
Is her dowery! *c*
Joyful, joyful" *a*

W. S Gilbert, "Yeomen of the Guard"

IV. THE STANZA.

Some poems are divided into groups of lines, which strictly speaking are called "stanzas," though in popular language they are often known as "verses" Generally the stanzas of a poem are uniform, but sometimes they are varied as in Milton's "Lycidas" [OBEV 325].

V. ENGLISH VERSE FORMS.

English poetry uses an immense wealth of verse forms, distinguishable from each other by the predominating metre and also by the pattern of rhyme and the kind of stanza—or by the absence of rhyme and stanza. An account of these follows.

Iambic Metres.

The metre most natural to the English language is undoubtedly the iambic.

With Iambic Pentameter as Basis.

The iambic pentameter of five stresses and ten syllables, also called the iambic decasyllabic line, is more used than any other, and is the basis of the following forms

Blank Verse. Blank verse, consisting of unrhymed iambic pentameters, is the metre of Shakespeare's plays, Milton's "Paradise Lost," Wordsworth's "Prelude," and Tennyson's "Idylls of the King" In the hands of such masters it is a most flexible instrument, especially when diversified with the eleven-syllabled line with a feminine ending Shakespeare used the metre with increasing freedom, though it must be remembered that some apparent variations are due to the different pronunciation of Elizabethan times.

The following lines of blank verse occur in Wordsworth's "Prelude," Book III. He is describing his rooms in St John's College, Cambridge

"And from my pillow, looking forth by light
Of moon or favouring stars, I could behold
The antechapel where the statue stood
Of Newton with his prism and silent face,
The marble index of a mind for ever
Voyaging through strange seas of Thought, alone"

Heroic Couplet The heroic couplet, consisting of iambic pentameters rhyming in pairs, was in Elizabethan times called "riding rhyme," possibly because it is the metre of The Prologue of Chaucer's "Canterbury Tales," and of many of the tales themselves It became the most fashionable metre of the eighteenth century when it was used by Pope, Goldsmith, and Johnson Keats later employed it in "Lamia"

The *Closed Couplet* was, in the heyday of the couplet's vogue, considered the most polished and correct Here the sentence form exactly coincides with the couplet and the rhyme has a clinching effect, *e.g.*,

"True ease in writing comes from art, not chance,
As they move easiest who have learned to dance"

Pope was the supreme master of the closed couplet, and eschewed variations such as enjambement, or the Alexandrine

Enjambement is a variation used by poets before Pope's time and revived by the Romantic poets. In enjambement the sentence flows over from one line or couplet to the next, and the click of the rhyme is submerged, *e.g.*, Keats' description of Lamia in her serpent form with skin of "dazzling hue"

"And full of silver moons, that, as she breathed,
Dissolv'd or brighter shone, or interwreathed
Their lustres with the gloomier tapestries"

Keats, "Lamia"

The Alexandrine, another variation, is a line of six iambic feet Dryden made frequent use of the Alexandrine but Pope parodied it in the brilliant line that serves as a mnemonic

"A needless Alexandrine ends the song,
That, like a wounded snake, drags its slow length along"

The triplet, another variation, consists of three lines rhyming together The third line is frequently an Alexandrine

Rhyme Royal Rhyme royal has seven iambic pentameters, rhyming ABABBCC. Used by Chaucer in "Troilus and Cressida" [OBEV 14 and 15] and Shakespeare in "Lucrece," it was revived by Masefield in such poems as "Dauber"

Spenserian Stanza. The Spenserian stanza has eight iambic pentameters followed by an Alexandrine, rhyming ABABBCBCC Invented by Spenser in "The Faerie Queene," it was used by Byron in "Childe Harold," Keats in "The Eve of St. Agnes," and Shelley in "Adonais"

Elegaic Stanza. The Elegaic stanza has four iambic pentameters, rhyming ABAB It is also called the "heroic quatrain," quatrain meaning a four-lined stanza. This form is best known through Gray's "Elegy" [OBEV 465].

"Omar Khayyám" Stanza.

The "Omar Khayyám" stanza receives its name from its use by Fitzgerald in his translation of the "Rubaiyat." It has four iambic pentameters, rhyming AABA.

Ottava Rima. Ottava rima, also called the octave stanza, has eight iambic pentameters, rhyming ABABABCC It was used by Byron in "Don Juan," and by Keats in "Isabella."

Terza Rima. Terza rima has stanzas of three iambic pentameters with a linking rhyme scheme ABA, BCB, CDC, etc The concluding stanza is rounded of with an extra line rhyming with its central line, *e g*, DEDE, constituting, in effect, a heroic quatrain. Used by Dante, the verse has been adapted by English poets Shelley's "Ode to the West Wind" [OBEV 617] uses modified terza rima, the final rhymes being DEDEE.

The Sonnet. A sonnet has fourteen iambic pentameters Perfected in Italy by Petrarch, who died in 1374, it was introduced into England in the sixteenth century. There are two chief types of sonnet.

The Petrarchan, or Italian, sonnet has an "octave" of eight lines, rhyming ABBAABBA, followed by a "sestet" of six lines, where some variety of rhyme schemes is found. The strictest Petrarchan sonnets have either two "tercets" of three lines each, with rhymes CDECDE, or else three pairs of lines rhyming CDCDCD.

An example of sestet rhyming CDECDE is Milton's "On His Blindness" [OBEV 327]

Examples of sestets CDCDCD are Wordsworth's "Upon Westminster Bridge" [OBEV 534] and Keats' "On First Looking into Chapman's Homer" [OBEV 641].

Not all of these examples observe the natural pause between octave and sestet which is characteristic of the strict Italian form, and many of our finest sonnets depart from the original rhyme scheme in both octave and sestet.

A lesser-known Petrarchan sonnet by Keats:

'To one, who has been long in city pent,
 'Tis very sweet to look into the fair
 And open face of heaven,—to breathe a prayer
Full in the smile of the blue firmament.
Who is more happy, when, with heart's content,
 Fatigued he sinks into some pleasant lair
 Of wavy grass, and reads a debonair
And gentle tale of love and languishment?
Returning home at evening with an ear
 Catching the notes of Philomel,—an eye
Watching the sailing cloudlet's bright career,
 He mourns that day so soon has glided by
E'en like the passage of an angel's tear
 That falls through the clear ether silently."

The *Elizabethan, or Shakespearean,* sonnet consists of three quatrains with the rhymes ABAB/CDCD/EFEF/ concluded by a couplet rhyming GG. The couplet often clinches the thought.

Examples are Shakespeare's sonnets [OBEV 155–174], and Keats' last sonnet [OBEV 644].

Other Iambic Metres.

Many of our iambic verse forms use a shorter or longer line than the pentameter.

The Octosyllabic Couplet. The octosyllabic couplet consists of lines of four stresses and eight syllables, and the lines rhyme in pairs English poets like Marvell have used this metre effectively, *e g.*, "A Garden" [OBEV 365, *see also* OBEV 367, 370]. It is the metre of Masefield's "Everlasting Mercy" and "Reynard the Fox."

The Ballad. There are two chief kinds of ballad metre

(a) *Strict Ballad Form* consists of stanzas of four iambic lines, the first and third with four stresses, and the second and fourth with three, with the rhyme scheme ABCB. The fine old ballads "Sir Patrick Spens" [OBEV 381] and "The Wife of Usher's Well" [OBEV 388] are in this metre. Coleridge, in "The Ancient Mariner" [OBEV 562] shows how many varieties of stanza can be based on the simple ballad stanza

"*Fourteeners*" is the name given to a form which is simply a re-arrangement of the ballad quatrain as a rhyming couplet of two iambic lines with seven stresses, as in Macaulay's "The Armada."

(b) *Less Strict Ballad Form, or Long Metre,* consists of stanzas of four iambic lines each with four stresses, the rhyme scheme being ABCB or ABAB Many ancient ballads, such as "Thomas the Rhymer" [OBEV 379], are of this type.

"In Memoriam" Metre. This, the metre of Tennyson's "In Memoriam," is like the less strict ballad metre in having four iambic lines, each with four stresses, but its rhyme scheme is ABBA.

Short Metre. Short metre, rarely used, consists of iambic quatrains, each line having three stresses and the rhyme scheme being ABCB

English Hymn Metres. Most English hymns are written in short iambic lines, and English hymnology names them according to the number of syllables. The most common are·

Common Metre, or 8686, with rhymes ABAB, *e g.*, "O for a thousand tongues to sing" ["Songs of Praise" 595]
Long Metre, or 8888, with rhymes ABAB, *e g.* "When I survey the wondrous cross" ["Songs of Praise" 133]
Short Metre, or 6686, with rhymes ABCB, *e g.*, "Blest are the pure in heart" ["Songs of Praise" 455].

Double Iambic Metre. When we are accustomed to hearing verse we come to realise that stresses are not always of equal weight It is possible to distinguish in these "fourteeners" of Masefield a major stress, marked ˝ and a minor stress marked ´.

"Oh sőme are fónd of Spănish wine, and sőme are fónd of Frĕnch,
 And sőme'll swăllow táy and stúff fit őnly fór a wĕnch"
Masefield's "Captain Stratton's Fancy" [OBEV 939]

The lines have in fact four major stresses, and between the major stresses intervene three syllables, of which the middle has a minor stress. It is this alternation in the weight of the stress which gives its characteristic swing to such a poem as Chesterton's "The Rolling English Road" [OBEV 930].

Trochaic Metres.

Pure Trochaic Metre.

English poets seldom use a pure trochaic metre, partly because of the difficulty of rhyming, and partly because the continual feminine ending that it involves is not pleasing to the English ear. A few very short lyrics in this metre can be found, as Browne's Song "For her gait, if she be walking" [OBEV 251], but the only poem of any length is Longfellow's "Hiawatha," and the metre

of this *tour de force* tends to sound monotonous It consists of unrhymed lines, each of four stresses, *e g*,

"Líke a yéllow leaf in áutumn
Líke a yellow water-lily."

Modified Trochaic Metre.

Ever since the Middle Ages our poets have contrived to combine the advantages of a trochaic metre and of a masculine ending by the simple expedient of shortening the last foot of the line to a stressed monosyllable This catalectic, or shortened, trochaic line is found both in couplets and in stanza forms *The seven-syllabled trochaic couplet, also called the trochaic tetrameter*, consists of these catalectic, or shortened, lines rhyming in pairs, and is a gay, tripping measure, as in some passages of Milton's "L'Allegro" [OBEV 318]

"Haste thee nýmph and bring with thée
Jést and yóuthful Jollity"

Keats uses the metre in "Bards of Passion," and "Fancy" [OBEV 637 and 638]

Lyrics in modified trochaic metre are often found Herrick uses the seven-syllabled lines rhyming in pairs in "Cherry Ripe" and other lyrics [OBEV 264, 279, 280, 281] Edmund Blunden, in "Forefathers" [OBEV 965], uses it in a stanza rhyming ABABCC George Herbert in his lyric "Discipline" [OBEV 291] brilliantly combines five- and three-syllabled lines rhyming ABAB, *e g*.,

"Throw awáy Thy ród,
Thrów awáy Thy wráth,
Ó my Gód,
Take the gentle path"

Further Variations in Modified Trochaic Metre.

The modified trochaic line is especially subject to further variation

(*a*) It is often combined with a pure trochaic line, *e g*, in Hunt's poem "Jenny Kiss'd Me" [OBEV 600] where the catalectic and the complete trochaic line alternate regularly

(*b*) It often has an extra unstressed syllable preceding it (anacrusis), as in the second of these lines from Keats' poem "Fancy" [OBEV 638]

"In a dark conspiracy
To | banish Even fróm her ský."

The line that results might well be taken for iambic, and there are some passages in English poetry, such as lines in Milton's "L Allegro" [OBEV 318], which can be described either as irregular trochaic or irregular iambic lines! It depends on what the hearer judges to be the *basic* stress

Double Trochaic Metre.

Corresponding to double iambic metre there is a double trochaic metre W. S Gilbert effectively uses it in many of his patter songs, as in "Ferdinando and Elvira," *e g*.,

"Thén we let off páper crácкers, éach of which contáined a mŏtto,
And she lístened while I read them, till her mŏther tóld her nót to."

These lines, like those in double iambic metre, have four major stresses (marked ´), and between the major stresses three syllables, of which the middle carries a minor stress

A modified double trochaic metre, where the last foot is shortened to a stressed monosyllable, can be recognised in Tennyson's "Locksley Hall," or in Lewis Carroll's verses in "Alice in Wonderland":

"'Will you wálk a little fáster?' sáid a whiting tó a snail."

Trisyllabic Metres Generally.

Because of the irregularities incident to verse in anapæsts, dactyls, and amphibrachs, it is not easy to distinguish one trisyllabic metre from another. Swinburne, the past master of trisyllabic metres, often passes with great freedom from anapæstic to dactylic lines within the same stanza

Anapæstic Metres.

Pure Anapæstic

Anapæstic metre is used only in short poems, and often conveys a sense of speed and urgency The chief variation is the omission of one or two of the unstressed syllables at the beginning of a line Some of the best-known examples of anapæstic verse are Byron's "Sennacherib," Flecker's "The War Song of the Saracens," and Lewis Carroll's parodies, "'Tis the voice of the lobster" and "You are old, Father William," from "Alice in Wonderland"

The Limerick.

The limerick may be defined as a single anapæstic stanza, having the first two lines of three feet, the next two lines of two feet and a concluding line of three feet, with the rhyme scheme AABBA

The origin of the limerick is uncertain, but it became popular after the appearance in 1846 of Edward Lear's "Book of Nonsense" Lear's limericks differ from the contemporary type in that his final line is normally a repetition, adding nothing to the sense and repeating one of the previous rhyme words.

Most of our modern limericks are passed on by word of mouth, but some that concisely express some intellectual attitudes have appeared in print, as the following, on "Determinism"—

"There wás a young mán who said 'Damn!
It appears to me nów that I ám
Just a béing that móves
In predestinate gróoves,
Not a taxi or bus, but a trám'"

Dactylic Metres.

Pure Dactylic.

Like pure trochaic metre, pure dactylic metre has a feminine ending to the line, which makes rhyming difficult and does not satisfy the English ear. Very few serious poems keep consistently to a pure dactylic verse, and Robert Graves' "In the Wilderness" is most unusual in this respect, *e g*,

"Chríst of His gentleness
Thírsting and hungering
Wálked in the wilderness."

Modified Dactylic Metre.

Normally dactylic metre is modified in that a catalectic line is frequently used, where the final foot is shortened to a trochee or a stressed monosyllable, as in Hood's "Bridge of Sighs" [OBEV 662], the most remarkable dactylic poem in the language, *e g*,

"Óne more unfórtunate
Wéary of bréath
Ráshly impórtunate
Góne to her death."

Shakespeare also uses the catalectic line in the refrain to "Where the bee sucks" [OBEV 140]—

"Mérrily mérrily sháll I live nów
Únder the blóssom that hángs on the bóugh."

It is interesting to note how the catalectic dactylic line of the refrain is matched by the catalectic trochaic line of the verse.

Amphibrach Metres.

Pure Amphibrach Metre.

The amphibrach metre is extremely rare in English, although it occurs occasionally in a few lines, or a refrain, like that to "Blow, blow thou Winter Wind" [OBEV 146]. Laurence Binyon's

"Bablock Hythe" is one of the few poems to use amphibrachs continuously, e g.,

"Till súnset was rimming
The West with pale flúshes;
Behind the black rúshes
The lást light was dimming."

Modified Amphibrach Metre.

The pure amphibrach line can be used alternating with a catalectic line, shorn of its last syllable, as in Goldsmith's drinking song in "She Stoops to Conquer," Act I, Scene 2, e g.,

"Let schóol-masters púzzle their bráin
With grámmar and nónsense and learning."

Choriambic Metre.

There are few poems in pure choriambic metre Ruskin's quatrain "Trust Thou thy Love" [OBEV 753] is one of the few examples, e.g.,

"Trust thou thy Lóve, if she be próud, is she not swéet?"

Choriambic effects are often obtained incidentally, especially in blank verse, when the first foot of a line is a trochee.

Lionel Johnson frequently achieves the same kind of effect in lyric verses by substituting a choriamb for two iambs, as in the poem "By the Statue of King Charles" [OBEV 909], e g.,

"Cómely and cálm, he rides
Hárd by his ówn Whitehall."

Sprung Rhythm.

Sprung rhythm was practised by Gerard Manley Hopkins and his followers

Its distinction lies in the fact that in a foot of verse the first syllable is always stressed, and this stressed syllable may be followed by any number of unstressed syllables from none to three, or even more, as the occasion demands Hopkins has described sprung rhythm in the Preface to his "Poems."

Quantitative Classical Metres.

Since the Renaissance poets such as Spenser, Coleridge, and Tennyson have from time to time endeavoured to reproduce in English verse the complicated quantitative metres of Greek and Latin verse The difficulty, if not impossibility, of putting the stress on the long vowel in English has for the most part rendered such experiments interesting only to the scholar

It should always be remembered that the technical names, such as iamb and trochee, although borrowed from the classics, have in English verse a quite different meaning, referring never to quantity but always to stress.

Metrical Forms of French Origin.

It became fashionable during the last years of the nineteenth century for poets to imitate certain verse forms which had long been practised in France, some of them from the time of the troubadours.

Chaucer and Gower had in the fourteenth century used some of these forms, later English poets had occasionally experimented with some of them, and Swinburne, Austin Dobson, Edmund Gosse, and others did much to adapt and naturalise them, although their intricate rhyming patterns are very difficult to construct in a language so short of rhymes as English The most popular were the triolet, villanelle, rondeau, ballade, and sestina.

Characteristic of the Anglicised versions are:

1. Freedom as regards metre and length of line.

2. Complicated and exacting rhyme schemes, which permit of no such poetic licence as identical rhyme

3. A refrain line which recurs in certain stereotyped positions without any alteration of sound, although there may be significant alteration of meaning. Only the sestina is without a refrain

Triolet.

A triolet is a single stanza of eight short lines The first line is repeated as the fourth, and the first and second appear again as seventh and eighth. Only two rhymes are used, the scheme being: ABAAABAB.

The triolet was re-introduced into England by Bridges in 1873. Austin Dobson's "A Kiss" is a good example of the form.

"Rose kissed me today.
Will she kiss me tomorrow?
Let it be as it may,
Rose kissed me today,
But the pleasure gives way
To a savour of sorrow,—
Rose kissed me today,—
Will she kiss me tomorrow?"

See also Dobson's triolet "I intended an Ode" [OBEV 828]

Villanelle.

The villanelle has five stanzas, each of three lines, followed by one stanza of four lines It has a refrain which consists of the first and third lines of the first stanza These lines alternately form the last lines of the four middle stanzas, and reappear as a concluding couplet to the poem Only two rhymes are employed throughout Stanzas one to five rhyme ABA and stanza six ABAA.

Austin Dobson wrote several villanelles including the well-known "On a Nankin Plate" The following of Henley's is both a good example and description of the form

Villanelle by W E Henley

A dainty thing's the Villanelle
Shy, musical, a jewel in rhyme,
It serves its purpose passing well.

A double-clappered silver bell
That must be made to clink in chime,
A dainty thing's the Villanelle,

And if you wish to flute a spell,
Or ask a meeting 'neath the lime,
It serves its purpose passing well

You must not ask of it the swell
Of organs grandiose and sublime—
A dainty thing's the Villanelle,

And, filled with sweetness, as a shell
Is filled with sound, and launched in time,
It serves its purpose passing well

Still fair to see and good to smell
As in the quaintness of its prime,
A dainty thing's the Villanelle
It serves its purpose passing well.

Rondeau.

A rondeau is a short and compact verse form It has thirteen lines, usually of eight syllables, which use only two rhymes, and in addition a refrain, usually of four syllables, which introduces a third rhyme. This refrain consists of the first half of the opening line and is twice repeated, thus giving the rondeau fifteen lines all told The rondeau is divided into three stanzas with the following rhyme scheme: AABBA. AAB + refrain, C. AABBA + refrain C.

Austin Dobson wrote many rondeaus to this exacting plan, including the ingenious "You bid me try" and "In After Days" [OBEV 830].

A Rondeau by Austin Dobson:

You bid me try.

You bid me try, Blue-Eyes, to write
A Rondeau What!—forthwith?—to-night?
Reflect Some skill I have, 'tis true,—
But thirteen lines!—and rhymed on two!
"Refrain," as well. Ah, hapless plight!

Still, there are five lines,—ranged aright
These Gallic bonds, I feared, would fright
My easy Muse They did, till you—
You bid me try!

That makes them eight The port's in sight —
'Tis all because your eyes are bright!
Now just a pair to end in 'oo'—
When maids command, what can't we do
Behold!— the RONDEAU, tasteful, light,
You bid me try!

1876

Roundel.

The roundel is a variation of the rondeau Swinburne in his "Century of Roundels" wrote a hundred, and his pattern is usually followed It consists of nine full lines, plus the refrain (consisting of the opening half of the first line), which is twice repeated, giving eleven lines all told Only two rhymes are used throughout The roundel is divided into three stanzas with the following rhyme scheme ABA + refrain B, BAB, ABA + refrain B

Swinburne's roundel called "The Roundel" is especially interesting.

Rondel.

The rondel is a form of verse similar to the rondeau The modern English version consists of fourteen lines all told. Only two rhymes are used, and the initial two lines are repeated as lines 7 and 8 and again as lines 13 and 14 The rondel is frequently arranged in three stanzas with a rhyme scheme as follows ABBA, ABAB, ABBAAB

The rondel was revived in the nineteenth century by Bridges, Dobson, Gosse and Henley and Dobson's "Love comes back to his vacant dwelling" is one of the best known

Ballade.

There are several kinds of ballade, but the most popular modern form consists of three eight-lined stanzas followed by an envoy of four lines Each of the stanzas and the envoy end with a refrain The rhymes of the eight-lined stanzas are ABABBCBC, and of the envoy BCBC.

Austin Dobson wrote several ballades of this kind, the best known being, "This was the Pompadour's fan," and "And where are the galleons of Spain?"

Chaucer's "Balade," "Hyd, Absolon, thy gilte tresses clere," is of an earlier seven-lined type without an envoy.

A ballade by Austin Dobson

The Ballad of the Thrush.

Across the noisy street
I hear him careless throw
One warning utterance sweet,
This faint at first, and low
The full notes closer grow,
Hark! What a torrent gush!
They pour, they overflow—
Sing on, sing on, O Thrush!

What trick, what dream's deceit
Has fooled his fancy so
To scorn of dust and heat?
I, prisoned here below,
Feel the fresh breezes blow,
And see, thro' flag and rush,
Cool water sliding slow—
Sing on, sing on, O Thrush!

Sing on What though thou beat
On that dull bar, thy foe!
Somewhere the green boughs meet
Beyond the roofs a-row,
Somewhere the blue skies show,
Somewhere no black walls crush
Poor hearts with hopeless woe—
Sing on, sing on, O Thrush!

Envoy
Bird, though they come, we know,
The empty cage, the hush,
Still, ere the brief day go,
Sing on, sing on, O Thrush!

1883

The Chant Royal.

The chant royal is a longer form of ballade It has five stanzas of eleven lines and an envoy of five lines

The rhyme scheme is ABABCCDDEDE, and the envoy has rhyme DDEDE.

The Sestina.

The sestina has six stanzas, each of six lines The end words to the lines of the first stanza are repeated as end words in the other five stanzas, but in a different and stereotyped order The poem concludes with an envoy.

The first sestina published in English was by Gosse in 1877 Swinburne wrote many, including "I saw my soul at rest upon a day"

The Clerihew.

The clerihew is an amusing quatrain, so called after its inventor Edmund Clerihew Bentley It disdains regular metre and depends on the simple rhyme scheme AABB The distinctive characteristic of the clerihew is that it is concerned with some eminent person, who is named in the first line and then described in a wilfully fanciful way, the matter being dictated by the exigencies of the rhyme, as in Bentley's clerihew on J S Mill

"John Stuart Mill,
By a mighty effort of will,
Overcame his natural bonhomie
And wrote 'Principles of Political Economy'"

We might invent a clerihew for Pears Cyclopaedia, and say

"You will find *Pears Cyclopadia*
A simpler and speedier
Aid in your search for verity
If you do not use it with levity."

Free Verse or Vers Libre.

It is hardly possible to define anything so vague as Free Verse. It is characterised by a greater intensity of feeling and a more elevated language than is usual in prose, and has a rhythm that is different from that of poetry in that it is irregular, it has rhythm but not metre.

Free Verse is arranged in lines, but these lines have an indefinite number of syllables They have balance but no regularly recurring pattern of stress, and no rhyme

The best-known writer of Free Verse is Walt Whitman, whose "Leaves of Grass" was published in 1855

VI CONCLUSION.

The foregoing account is no more than a description of our traditional verse forms It in no way implies that verse is written according to rules

We have only to look at Shakespeare's lyrics [OBEV 133-174] to realise how brilliantly free and inventive the poet can be in devising new and delightful patterns of verse—many of them so subtle as to be very difficult to define All that the students and critics can do is to follow in the poets' wake, endeavouring to understand and elucidate the forms that the maker has created.

Figures of Speech

We constantly use figurative language without realising it When we say that we are "browned off," "fed up," "at the end of our tether," we do not expect to be taken literally. We are in fact employing metaphors

An understanding of metaphors and other figurative expressions enables us to use our language with greater confidence and effectiveness. It also helps us to understand more fully what others have written Especially is it valuable when we read a good novel, play, or poem, for to the creative writer figurative language is as natural as the air he breathes

The following guide to our figures of speech is arranged alphabetically for ease of reference.

Alliteration. A kind of repetition. Two or more words in close succession begin with the same letter, or sound, usually a consonant. Up to the fourteenth century much English verse was written according to an alliterative principle, as in this modernised quotation from "Piers Plowman"

"I had *w*andered me *w*eary so *w*eary I rested me
On a *b*road *b*ank by a merry-sounding *b*urn."

A strong tendency to alliteration still survives in our poetry Shakespeare ridicules it in the mechanical's play in "A Midsummer Night's Dream" (Act V, Scene 1) in such lines as—

"Whereat, with blade, with bloody blameful blade,
He bravely broach'd his boiling bloody breast."

Anti-climax. See **Bathos.**

Antithesis. A figure of speech where ideas are so set out that they are in sharp contrast to each other, *e g*.

"Better to reign in Hell than serve in Heav'n."
Milton.

"To err is human, to forgive divine"
Pope.

Apostrophe. A figure of speech where the speaker or writer suddenly breaks off and directly addresses some other person who may be present either in the flesh or only in the imagination Often it is not a person but a thing, abstraction, or personification that is addressed, as in Milton's famous apostrophe, "Hail, holy light" in "Paradise Lost," Book III, line 1. Apostrophe can be used with comic effect, *e g*.

"She turns, O guardian angels stop her
From doing anything improper."

(This couplet is also, incidentally, an example of bathos)

Assonance. (1) Assonance is correspondence of vowel sounds. For instance, in the opening lines of the "fairy song" in "A Midsummer Night's Dream" (Act II, Scene 3) there is a play on only three vowels, and this repetition helps towards the effect of a magic charm, *e g*.

"Philomel, with melody, Sing."

In Tennyson's poem "Break, break, break" the repetition of the "o" sound in the second line is like an outcry of grief, *e g*.

"On thy cold grey stones, *O* sea."

(2) Assonance is sometimes used instead of rhyme, especially in early folk poetry. Here there is correspondence of one word with another in the accented vowel and any vowels which follow, but not in the consonants, *e g*, in "King Estmere," "Spain" is rhymed with "same," and "barone" with "home."

Bathos or Anti-climax. A figure of speech that consists of a sudden and ludicrous descent from lofty to trivial things In "The Rape of the Lock" Pope wittily used bathos to satirise the frivolity of the woman of fashion, who lacking all sense of proper feeling, casts the same "screams of horror," and "shrieks to pitying heav'n,"

"When *husbands* or when *lapdogs* breathe their last"

The careless writer may fall to bathos which is unintentionally comic in its effect The word "bathos" in Greek means "depth"

Climax. A figure of speech where ideas are set out in such a way that each rises above its predecessor in fable. In Greek the word "climax" means a ladder One of the finest examples is in Shakespeare's "The Tempest" (Act IV, Scene 1) when Prospero says,

"And like the baseless fabric of this vision
The cloud-capp'd towers, the gorgeous palaces,
The solemn temples, the great globe itself,
Yea, all which it inherit, shall dissolve."

Epigram. A concise and pointed saying, effective by its wit and ingenuity It often uses antithesis S. T Coleridge's definition of this form is in itself an epigram, *e g*.

"What is an epigram? a dwarfish whole:
Its body brevity, and wit its soul"

Euphemism. A figure of speech where a harsh or distressing expression is replaced by one that is gentler, if less accurate Thus we may call a lie a "flight of fancy," or a "terminological inexactitude" There is a striking instance of euphemism in "Macbeth" (Act I, Scene 5), when Lady Macbeth, planning the murder of her guest, Duncan, says, "He that's coming must be provided for"

Hypallage or "**Transferred Epithet.**" A figure of speech where an adjective, or adverb, is separated from the word to which it belongs grammatically, and is transferred to some other word in the sentence, its unusual position giving it a kind of emphasis The word "obsequious" is thus transferred in the sentence "A lacquey presented an obsequious cup of coffee"

Hyperbole. A figure of speech where there is a deliberate use of exaggeration for the sake of effect as in the phrase "tons of money" Lady Macbeth uses hyperbole when she says, "Here's the smell of blood still, all the perfumes of Arabia will not sweeten this little hand" (Act V, Scene 1).

Writers of film trailers frequently indulge in hyperbole.

Innuendo. A figure of speech where something is hinted at, or suggested, but not openly stated. Dickens uses innuendo to suggest Scrooge's stinginess by saying, "Darkness was cheap, and Scrooge liked it."

Irony. (1) A figure of speech where the speaker says one thing but intends the opposite to be understood Shylock uses the word "courtesies" ironically when he says,

"Fair sir, you spit on me on Wednesday last,
You spurn'd me such a day, another time
You call'd me dog, and for these courtesies
I'll lend you thus much moneys."
"Merchant of Venice" (Act I, Scene 3).

The use of irony can clearly be seen in Shakespeare's "Julius Cæsar" in Antony's well-known speech to the citizens. They gradually realise

that when Antony repeats that Brutus and the rest are "honourable men," he is speaking ironically, and intends the opposite. When they fully perceive this they cry, "They were traitors . . . villains, murderers." ("Julius Cæsar," Act III, Scene 2.)

(2) *Dramatic irony* is the use of words which have a second inner significance that is not realised by some of the actors in a scene. For instance, in Sheridan's "School for Scandal," Act IV, Scene 3, Sir Peter admires Joseph Surface's useful screen, and Surface replies, "Oh yes, I find great use in that screen." He and the audience know, but Sir Peter does not, that at that very moment the screen is concealing Peter's own wife who had rashly visited Joseph.

It is helpful to remember that in Greek the word "irony" means "dissimulation."

Litotes. A figure of speech which is really a special kind of understatement (or Meiosis). Instead of making a positive statement (*e.g.*, "This is a difficult task") we might use Litotes, and say "This is no easy task," thus expressing a positive by the negative of its opposite.

Malapropism. An amusing inaccuracy in vocabulary. Words that have an accidental similarity in sound may become confused in the speaker's mind and the wrong word may come uppermost. Thus Mrs. Malaprop complains that the disobedience of her niece gives her, not "hysterics," but "hydrostatics." It is not surprising that Mrs. Malaprop, of Sheridan's "The Rivals," has given her name to this kind of verbal confusion though many before her time, including humble folk in Shakespeare's plays, have uttered malapropism. Bottom, in "A Midsummer Night's Dream," says that in the wood they "may rehearse more obscenely" when he means "obscurely."

Meiosis. A figure of speech where a deliberate understatement is made for the sake of effect. English people are especially fond of Meiosis and often use it colloquially, in such an expression as "He made a very 'decent' contribution," meaning a very "generous" contribution. The full meaning of what we intend is often conveyed by the tone of voice, *e.g.*,

"This is *some* war."

Metaphor. It is helpful to think of the figure of speech, metaphor, as a condensed simile. In metaphor one thing is not merely *compared* to another, as in simile, but is boldly spoken of as if it actually *were* that other. Thus Bacon, in the following metaphor, does not say books are *like* food, but speaks of them as if they actually *were* food, *e.g.*, "Some books are to be tasted, others to be swallowed, and some few to be chewed and digested."

Metaphor is usually defined as the transfer of a name, or descriptive term, to some object to which it is not properly applicable, thus making an implicit comparison. Shakespeare uses nautical terms to describe our human situation when Brutus says,

"There is a tide in the affairs of men which, taken at the flood, leads on to fortune" ("Julius Cæsar," Act IV, Scene 2).

In *Mixed Metaphor* two or more inconsistent metaphors are used of the same object, as when, speaking of a suspicion, someone said, "I smell a rat, I see it in the air, but I will nip it in the bud."

Metonymy. A figure of speech where a person or thing is not named directly, but by some associated thing. Instead of saying, "The prisoner addressed the magistrate," we might use metonymy, and say, "The prisoner addressed the bench." Similarly, "a speech from the Lord Chancellor" is sometimes called "a speech from the Woolsack."

Onomatopœia. The use of words which imitate or echo the sounds they suggest, *e.g.*,

"Seas half-frozen slushed the deck with slime."
Masefield

Oxymoron. A figure of speech where words that are usually contradictory are combined in one expression, *e.g.*, "bitter-sweet."

"I know this is a joyful trouble to you."
"Macbeth," Act II, Scene 1

Paradox. A figure of speech where a statement is made that at first sight seems contradictory, or absurd, *e.g.*,

"The rule of the road is a paradox quite:
If you keep to the left, you are sure to be right."

and

"The child is father of the man."
Wordsworth

Pathetic Fallacy. A figure of speech where it is assumed that things of nature have feelings like those of human beings, *e.g.*,

"And daffadillies fill their cups with tears."
Milton

In Greek "pathos" means "feeling."

Personification. A figure of speech where some abstraction, or some inanimate thing is represented as a person, *e.g.*,

"Rule, Britannia."

"But look the dawn in russet mantle clad
Walks o'er the dew of yon high eastern hill."
Hamlet, Act I, Scene 1

Personification is really a special kind of metaphor.

Pun. The use of words so as to convey a double meaning, as in Belloc's couplet

"When I am dead, I hope it may be said
'His sins were scarlet, but his books were read.'"

In the three puns that follow there is a suggestion of a banking transaction! "The Egyptians received a check on the bank of the Red Sea which was crossed by Moses." Puns, which were popular in the nineteenth century, especially with Lamb and Hood, are now out of favour.

Simile. A figure of speech which makes a comparison pointing out a similarity between things otherwise unlike. It is usually introduced by "like" or "as," *e.g.*,

"Men fear death as children fear to go in the dark."
Bacon.

"His own thought drove him like a goad."
Tennyson.

Spoonerism. An accidental transposition of the sound of two words, so called after Rev. W. A. Spooner, warden of New College, Oxford, *e.g.*,

"You have hissed all my mystery lectures" for
"You have missed all my history lectures."

Synecdoche. A figure of speech where the name of a part is used for the whole, or the whole for the part, *e.g.*,

"A fleet of a hundred sail",

meaning of a hundred ships.

Synecdoche is really a special kind of Metonymy.

Transferred Epithet. See **Hypallage.**

Literary Forms

Allegory. A description or story which has a second and deeper significance below the surface The characters are really personifications, usually representing some vice or virtue Allegory flourished in the Middle Ages, but the best-known allegory in the world is Bunyan's "Pilgrim's Progress" (1678), which has been translated into over a hundred different languages and dialects On the surface "The Pilgrim's Progress" is the story of a journey in which the hero encounters many difficulties but at last reaches his destination Its inner meaning is the progress of the Christian soul through life on earth Spenser's "Faerie Queene" (1589 and 1596) is a more subtle and complex allegory, capable of several interpretations, religious, ethical, and political Allegory has been described as extended metaphor. *See* **M10–11.**

Autobiography. The story of a man's (or woman's) own life, written by himself The autobiography is becoming increasingly popular, recent excellent examples being Stephen Spender's *World within World*, Richard Church's *Over the Bridge* and Laurie Lee's *Cider with Rosie*

Ballad. There are two chief types of ballad

1 A light song, often sentimental, as was the Victorian ballad, or a popular song, often of a personal kind, praising or attacking some notability

2 A traditional poem, passed on by word of mouth Many of our traditional ballads date from the 15th century They tell some stirring tale, as do the many ballads about Robin Hood Sometimes they record an actual occurrence, like the ballad "The Battle of Otterbourne," which tells of a Border skirmish, fought in 1388 Such ballads are enlivened by lively dialogue, and they use a special kind of stanza, which is described on **M5.**

Ballade. A short highly stylised poem, with a strict verse form *See* **M9**

Biography. A narrative telling the life story of some actual person, usually a well known figure The most famous biographer of classical times was Plutarch, who in the 1st century A D wrote his series of parallel "Lives" of twenty-three Greeks and twenty-three Romans The English translation of this provided Shakespeare with some of the plots of his plays Boswell's *Life of Samuel Johnson* (1791) is our best-known English biography

Burlesque. The aim of burlesque is to make us laugh by ridiculing the work of some other writer Sometimes it treats his serious subject in a mocking way Sometimes it takes the form of an absurd imitation or caricature of his style Some of our most successful burlesques are dramatic in form, like Sheridan's "The Critic," produced in 1779. This has a play within a play, called "A Tragedy Rehears'd," a brilliant burlesque of the sentimental, historical plays so popular in his time. Danny Kaye's film, "The King's Jester," is a burlesque of pseudo-historical films

Chant Royal. A poem of a strictly formal kind, French in origin *See* **M9.**

Clerihew. A single-stanza verse form, four lines long. *See* **M9.**

Comedy. A play which is happy and amusing in tone, but not necessarily light or superficial A comedy always has a fortunate conclusion Shakespeare's "Twelfth Night" and Oscar Wilde's "The Importance of being Earnest" are typical examples.

Drama. A play in verse or prose, where the story is unfolded and the characters represented through the actions and speeches of actors on a stage It is essential to good drama that there should be some kind of dynamic action and some conflict between the characters. In comedy the conflict is usually open and external "As You Like It," for instance, begins with a quarrel between Orlando and Oliver But most of the world's finest tragedies reveal also an inner conflict in the soul of man. In "Hamlet," the hero is at odds with many people, including his mother, the king, Ophelia, Polonius, and Laertes, but all these struggles are of secondary significance, compared with the conflict in his own mind Even a play like "Waiting for Godot," which reduces incident and conflict to a minimum, must make some concession to the demand of the audience for the dynamic Drama cannot be static Occasionally poets have written dramas which they knew were not practicable for the stage Shelley's lyrical dramas, "Prometheus Unbound" and "Hellas," are of this kind *See* **Section I.**

Eclogue. In classical literature a brief poem, usually in the form of a dialogue between shepherds It was a popular form in the time of the Renaissance, Spenser's "Shepheardes Calendar" (1579) consists of twelve eclogues one for each month of the year

Elegy. A lyric poem of lamentation for the dead Gray's "Elegy in a Country Church-yard" (1750) is the best-known English elegy It reflects in a general way on the "destiny obscure" of the humble folk who are buried in a quiet church-yard probably that of Stoke Poges, but most elegies mourn the death of only one person Such are Shelley's "Adonais" (1821), on the death of Keats, and Matthew Arnold's "Thyrsis" (1867), commemorating his friend Arthur Hugh Clough Tennyson's "In Memoriam" (1850) is unusual, in that it is not a single elegy, but a series of elegiac poems, inspired by the poet's grief for the death in 1833 of his friend Arthur Hallam

Epic. A very long narrative poem, usually consisting of several books The epic tells of the splendid deeds of some hero of history or legend, and is frequently concerned with war. Some of the world's greatest epics are the Greek "Iliad" and "Odyssey," ascribed to Homer the Latin "Aeneid" of Virgil, the Hindu "Mahabharata" and Milton's "Paradise Lost," whose hero is God himself The epic is distinguished by its sustained dignity of style

Epilogue. *See* **Prologue**

Essay. The word essay, derived from the French, means literally an "attempt" or "endeavour," and as a literary term it applies to a short prose composition which attempts to present the author's reflections on any subject he chooses As a literary form the essay derives from the French "Essais" of Montaigne, first translated into English by Florio in 1603. Our first English essayist was Francis Bacon, who published between 1597 and 1625 three volumes of his essays, brief, pithy, and objective in character. In course

of time the essay has become more subjective and personal, especially in the hands of Lamb, Hazlitt, and contemporary writers.

Extravaganza. A composition, musical or literary, which uses improbable and fantastic elements and incidents A good example of narrative extravaganza is Thackeray's *Rose and the Ring* (1855), in which, for instance, Gruffanuff's husband, the footman, is, because of his rudeness, turned into a door-knocker. Extravaganzas are frequently dramatic in form, and most pantomimes may be regarded as such.

Fable. A very brief story designed to teach some lesson or moral The characters of the story are often animals, birds, or insects, which converse like human beings The most famous of all fables are those attributed to Aesop, and those of La Fontaine, the French writer of the 17th century.

Farce. A species of dramatic comedy whose whole aim is to excite laughter It does not scruple to use improbable characters and incidents and absurd situations "Charley's Aunt" is a typical farce

Lampoon. A coarse satire (q v) attacking an individual Lampoons are usually short The word itself is derived from a French word meaning "drinking song"

Limerick. A single-stanza verse form, 5 lines long and with a formal metre and rhyme scheme *See* **M7.**

Lyric. In ancient Greece a lyric was originally a poem meant to be sung to the accompaniment of the lyre, a stringed musical instrument rather like a small harp Later the word was used for a poem with song-like qualities, short, usually divided into verses, and expressing the feelings of the poet. The lyric flourished in England in the Elizabethan age as witnessed by the lovely lyrics scattered through Shakespeare's plays Neglected in the 18th century, it became popular again with the Romantic poets of the 19th century Odes, elegies, and sonnets are all species of lyrics

Mask or Masque. A dramatic entertainment performed by amateurs and originating in the court masquerade The action or plot of the masque is of the slightest and there is little concern with portrayal of character, for the masque gives pleasure by means of its verse music, and dancing, and its elegant costume and scenery It was very popular in the 16th and 17th centuries, and from 1605 Ben Jonson wrote many court masques, for which Inigo Jones designed original costumes and settings Our best-known examples are Shakespeare's masque in Act IV of "The Tempest" and Milton's "Comus"

Melodrama. There are two meanings of the word melodrama.

1 In the early 19th century a melodrama meant a play, usually of a romantic and sensational kind, in which songs were inserted, and where an orchestra accompanied the action The musical comedy of today might be regarded as its modern counterpart

2 Today the word melodrama is used of an inferior kind of play, which deliberately excites the emotions by its sensational and violent happenings, but which has a happy ending We should be careful to distinguish melodrama, which uses violence for its own sake, from serious plays, like "Hamlet" or "King Lear," where violent acts are only incidents necessary to a profound interpretation of human conduct

Memoirs. The word is normally used of a record of events of which the author has some personal experience or special source of information

Miracle Plays. Mediæval verse plays produced from the late 14th to 16th centuries by the town guilds and performed in the market-place, or other suitable open space They consisted of a series of dramatised stories from the Bible or Lives of Saints Each scene would be allotted to one of the guilds, which was then responsible for its production on a wheeled stage As soon as the actors of one guild had completed their scene, their stage would be trundled off, sometimes to another rendezvous, and would itself be succeeded by another stage with its scene, until a whole cycle of episodes had been performed Four great cycles of miracle plays are still extant called after the towns where they were probably performed, York, Coventry, Chester, and Wakefield The Wakefield cycle is often called the Towneley cycle The plays have not only a strong religious sense but also a lively comic spirit The Towneley cycle has some especially racy comic scenes One popular incident shows the noisy quarrel that results when Noah's wife refuses to go into the ark

Mock Heroic A species of parody (*q v*), caricaturing some play or poem written in a lofty and high-flown style "The Rehearsal" (1672), by Villiers, is typical It is an absurd imitation ridiculing the artificial and high falutin' heroic plays which were then in vogue.

Monody. In Greek literature an ode sung by a single voice, like our solo in music In English literature it signifies a poem of mourning for someone's death The elegies "Lycidas," by Milton, and "Thyrsis," by Matthew Arnold, were both called monodies by their authors

Monologue Originally a scene where one person of the drama spoke alone Today it usually means a dramatic composition for a single actor, such as the well-known Lancashire monologues presented by Stanley Holloway The word is also sometimes used as meaning soliloquy

Moralities or Morality Plays. Mediæval verse plays of an allegorical kind, which attempted to teach lessons of virtue, the persons of the drama usually being not real people but personifications Most Moralities date from the 15th century, the best known being "Everyman," which is Dutch in origin The hero, Everyman, is summoned by Death, and vainly appeals for help to his friends, Fellowship, Kindred, Goods, Knowledge, Beauty, and Strength, but all fail him Only his own Good Deeds will consent to accompany him on his last journey.

Mysteries or Mystery Plays. Some modern writers use the term "Mystery play" instead of "Miracle play" (*q v*) It is really an alternative title One critic tried to distinguish between "Mystery plays," as concerned with stories from the Gospels, and "Miracle plays," as concerned with the lives and deeds of Saints, but this distinction is not usually followed

Novel. A lengthy prose fiction in narrative form, telling a realistic story of people and their doings Its chief interest is in character and incident The first English novelist was Samuel Richardson, whose novels, especially *Pamela* (1740-41) and *Clarissa Harlowe* (1747-48), had a European reputation In the present century writers like James Joyce, and Virginia Woolf have written what have been called novels of the "stream of consciousness," where the interest lies not so much in the incidents as in the mind's response to events, and reflections

Ode. In classical literature an ode was a poem to be sung In English literature it signifies a

lyric poem, usually in rhyme, and is seldom longer than 150 lines It is usually in the form of an address, and lofty in its feeling and style The ode was popular with the romantic poets Some of our best known are Shelley's "Ode to the West Wind," and Keats' "Ode to a Nightingale," "Ode on a Grecian Urn," and "To Autumn," all of them published in 1820.

Parable. A brief story serving as an example of some general principle, usually ethical, which gives the story its significance Such is Christ's parable of the Good Samaritan Most parables are miniature allegories The parables of the Sower and the Good Shepherd are both allegorical in form.

Parody. A literary caricature, which mimics the themes and style of some other author in such a way as to make his faults seem absurd and laughable J C. Squire's *Tricks of the Trade* is an amusing collection of his skilful parodies of such writers as Byron, Wordsworth, and Masefield

Pastoral. A pastoral poem, romance, or play is one in which the life of shepherds or of simple rustic folk is portrayed in an idealised way Originating in Greek literature, the pastoral was revived at the time of the Renaissance Spenser's "Shepheardes Calendar" consists of twelve pastoral eclogues Shakespeare's "As You Like It" is a pastoral play, Milton's "Lycidas" is a pastoral elegy and his "Comus" a pastoral masque There is usually in the pastoral a deeper meaning below the surface A critic has said, "The shepherd's cloak was the acknowledged disguise of the lover, the poet, the courtier, the pastor of souls, the critic of contemporary life" In the pastoral form the charm of a simple setting and deeper significance are combined.

Prologue and Epilogue. Generally speaking, a prologue means a foreword, or preface, and an epilogue an appendix to a literary work, but the terms are often used more specifically when referring to a play. Here the prologue is a short speech in verse or prose spoken to the audience by one of the actors before the play begins, the epilogue a similar speech after its conclusion The prologue endeavours to put the audience into a receptive state of mind, the epilogue to ask for a kind reception to the play. Shakespeare's "Romeo and Juliet" has a prologue, his "As You Like It" an epilogue, spoken by Rosalind, who says, "Good plays prove the better by the help of a good epilogue" In the 18th century it was customary for a leading actor to speak the prologue and for a leading actress to make a plea for the play in the epilogue.

Romance The romance of the early Middle Ages was a fictitious tale in verse, telling the adventures of some hero of chivalry, the interest being in the incidents, sometimes of a supernatural kind, rather than in character. The most famous of these early romances is the French "Chanson de Roland" of the early 12th century. In the later Middle Ages a romance might be written in prose In the 16th and 17th centuries a romance meant a tale in either prose or verse in which the scenes and incidents were remote from those of real life Sir Philip Sidney's "Arcadia" (1590), written to entertain his sister, is of this type. Today the word romance is rather vaguely used of a tale of somewhat improbable events. Sir Henry Rider Haggard wrote several such romances, including *King Solomon's Mines* (1886) and *She* (1887).

Rondeau. A poem of a strictly formal kind, French in origin *See* **M8**

Rondel. A poem similar in form to the rondeau. *See* **M9.**

Roundel. A variation of the Rondeau. *See* **M9.**

Saga. The word saga, which is of Norse origin, and means story, is applied to the mediæval prose narratives of Iceland and Norway, especially those concerned with the traditions of Icelandic families and Norwegian kings William Morris, in his "Earthly Paradise," gives in "The Lovers of Gudrun" a version of the Icelandic Laxdæla Saga.

Satire. A work in either verse or prose attacking folly and vice Pope's "Dunciad," in verse, published between 1728 and 1743, ridicules contemporary authors and literary follies in a massive attack on dulness and literary hacks Swift's *Gulliver's Travels* (1726), which on the surface is a series of prose tales of travel to imaginary countries, is actually a comprehensive satire It begins, in the first book on "Lilliput," with incisive ridicule of the squabbles between English political parties and religious sects, and culminates, in the final book on the Houyhnhnms, in a devastating attack on all that is bestial in human nature Samuel Butler's *Erehwon* (an anagram of Nowhere), published in 1872, also uses a prose travel tale in his satirical exposure of Victorian convention and hypocrisy Although not precisely satires, many of Shaw's plays are satirical in spirit "Arms and the Man" may be considered in one of its aspects as a satire on war

Sestina. A poem of a strictly formal kind, French in origin *See* **M9.**

Skit. A light satire, often in the form of parody.

Soliloquy. In a soliloquy a man talks to himself, or utters his thoughts aloud regardless of the presence of others who may hear him The word is usually applied to such utterances by a character in a play. The most famous soliloquies in literature are those of Hamlet.

Sonnet. A lyric poem of fourteen lines, with an intricate rhyme scheme *See* **M6.**

Squib. A brief, sharp satire (*q.v.*) attacking an individual

Threnody. A term from the Greek, seldom used today It means a song of mourning, especially a lament for the dead.

Tragedy. A play, or other literary work, which is preoccupied with the serious and unhappy aspects of life It is sombre in tone and ends with misfortune Shakespeare's "Macbeth" and Ibsen's "Ghosts" are typical tragedies.

Tragi-Comedy. The word is used in two different ways

(*a*) It may denote a play (or very occasionally a story) which combines both tragic and comic elements Chekhov's "The Cherry Orchard" is a tragi-comedy of this type.

(*b*) It may also mean a play which is for the most part sombre in theme and tone, but which has a happy conclusion, like Shakespeare's "The Winter's Tale"

Trilogy. In Greek literature a series of three tragedies, like Aeschylus' trilogy, the "Oresteia," written when he was nearly seventy, in the 5th century B C. In modern times the word trilogy is applied to any sequence of three literary works which are related to each other in subject and theme.

Triolet. A single-stanza verse form, eight lines long, and with a very formal pattern, French in origin *See* **M8.**

Villanelle. A poem of a strictly formal kind, French in origin *See* **M8.**

How to Enjoy a Poem

Many people who enjoy listening to music, and seeing paintings, find it difficult to appreciate poetry, and a few suggestions as to how we may approach a poem may be useful. A very good practice is to read the poem aloud. Poetry uses the musical sounds and rhythms of words, and although the printed words on the page may seem flat, like a score of music, the actual sound and rhythm of the spoken words help the lines to come alive. It is best when reading or hearing a poem for the first time to keep an open mind, ready to receive whatever impression it may make and trying to suspend judgment. Someone was once looking at a piece of modern statuary that he could not understand and was foolishly condemning, when a friend who was an art critic said, "Just walk round it." In the same way we can, as it were, walk round the poem until its significance begins to dawn on us. We must remember first and foremost that a poet normally uses words not literally, but with a figurative meaning. He loves to speak of one thing as if it were another. When Keats describes the pleasure he has had in his wide reading he speaks of books as if they were countries and he himself a traveller

"Much have I travell'd in the realms of gold,
And many goodly states and kingdoms seen"
OBEV 641.

Making out the Meaning. Remembering always that the poet normally speaks in images, we need to pay close attention to the words he uses if we are to enjoy their full meaning. I. A. Richards describes in his book *Practical Criticism*, 1929, how he gave a group of people, undergraduates and others, unfamiliar poems to read and then asked for their written interpretations. In the light of these, he formulated certain principles which aid one in "making out the meaning," which as he rightly says is the fundamental problem. He distinguished four kinds of "meaning": the plain "sense" of the poem, the "feeling," the "tone" and the "intention," and many readers of poetry now find it enlightening to consider a poem from these four aspects. The plain "sense" is arrived at simply by deciphering the words, and incidentally the punctuation, in an attempt to find out what the poet actually says. Readers do not always take the trouble to do this. Another aspect of meaning is the poet's "feeling" for his subject. Does he, for instance, express awe, tenderness, anger, amusement? Then there is his "tone" towards the reader. Is it confidential, or appealing, or didactic? Finally Richards speaks of the "intention" of the poem, the whole aim that the writer is trying to pursue.

Distinguishing Subject and Theme. Another illuminating way of looking at a poem is to distinguish between its subject and its theme, for they are seldom identical. A poet loves to transpose his experience into another setting, and below his surface narrative or description, we usually find a secondary meaning, the theme, which is the core of the poem. Often there are many such themes, subtly woven together. Keats chose for the subject of one of his odes a Grecian urn (OBEV 632), but the themes of the ode are manifold, one being the magic of art which captures for ever the fleeting moment. Similarly, Shelley addressed an ode to the West Wind, and here one of the main themes is a plea for poetic inspiration (OBEV 617).

The Formal Aspects of the Poem. Other pointers to its meaning are the formal pattern of the poem—the literary form in which it is cast, the versification (*see* **M2–9**), the kind of imagery, or figures of speech (*see* **M10–11**). The great poet suits the form to the meaning, as the glove fits a hand, and although the form, like the glove, is something external, it can give a clear indication of what is within.

Study of Shakespeare's Sonnet 73 (OBEV 162).

"That time of year thou may'st in me behold,
When yellow leaves, or none, or few do hang
Upon those boughs which shake against the cold—
Bare ruin'd choirs where late the sweet birds sang.
In me thou see'st the twilight of such day,
As after Sunset fadeth in the West,
Which by and by black night doth take away,
Death's second self that seals up all in rest.
In me thou see'st the glowing of such fire,
That on the ashes of his youth doth lie,
As the death-bed, whereon it must expire,
Consum'd with that which it was nourish'd by.
This thou perceiv'st, which makes thy love more strong,
To love that well, which thou must leave ere long."

Kinds of Meaning. Searching for the plain "sense," we find here three clearly defined images, the first of very late autumn,

"When yellow leaves, or none, or few do hang
Upon those boughs which shake against the cold——"

Then follows an image of twilight, the brief phase after the sunset has faded and before the fall of night. The third image is of a dying fire, glowing amid its ashes. All these, says Shakespeare, "thou may'st in me behold." All three, then, suggest that phase in man's life that follows the prime, the decline towards death. The "feeling" of these first twelve lines is sombre and foreboding, and in its "tone" the poem speaks to one alone—"thou may'st behold," "thou see'st." Then when we reach the concluding couplet we perceive the "intention" of the poem. It is a love poem.

"This thou perceiv'st, which makes thy love more strong,
To love that well, which thou must leave ere long."

The sober reflections on decline and death are set against a statement of steadfast love.

Subject and Theme. We can also approach the poem trying to distinguish "subject and theme." Then we perceive more clearly the theme of the imminence of death, which gradually develops and gathers momentum. For instance, the trees are called "bare ruin'd choirs" where the birds no longer sing, and this suggests a ruined empty abode from which the voice has flown, the spirit departed. Then the "black night" which succeeds twilight is "Death's second self," and the fire lies on the ashes "As the death-bed, whereon it must expire."

The very colours of the poem are suggestive. A picture is painted in sombre greys and black, lit up by a dull glow soon to be engulfed in darkness, the yellow leaves on the bough, the sunset fading into twilight, the fire dying on the ashes. It is like the chiaroscuro of a Rembrandt painting.

Formal Pattern. If we now attend to the formal patterns of the poem we find how exquisitely they match the sense. The poem is a sonnet (*see* **M6**), that is a brief lyric poem of only fourteen lines, expressing feeling in a taut and concentrated way. There is no room for digression, every word counts.

As we expect from a Shakespearean sonnet we find the rhyme scheme ABAB CDCD EFEF GG. This indicates that the poem will naturally take the design of three quatrains and a concluding couplet. Then how exquisitely and precisely each image is contained within the brief compass of its quatrain, and how apt are the metaphors in which the images are expressed.

Even so we have no longer exhausted the significance of this short poem. Much is left to discover, and light is shed by the sonnets that precede and follow it in Shakespeare's sequence.

FAMILIAR FOREIGN PHRASES AND CLASSICAL QUOTATIONS

Fr., French. Gr., Greek. Ger., German. It., Italian. L., Latin. Sp., Spanish.

à bas (Fr.), down, down with.
ab extra (L.), from without.
ab incunabulis (L.), from the cradle
ab initio (L.), from the beginning
ab intra (L.), from within
à bon chat, bon rat (Fr.), to a good cat, a good rat, well attacked and defended, tit for tat, a Rowland for an Oliver
à bon marché (Fr.), cheap, a good bargain
à bras ouverts (Fr.), with open arms
absente reo (L.), the accused being absent
absit invidia (L.), let there be no ill-will, envy apart.
ab uno disce omnes (L.), from one specimen judge of all the rest; from a single instance infer the whole.
ab urbe conditâ (L.), from the building of the city, i.e., Rome.
a capite ad calcem (L.), from head to heel
à chaque saint sa chandelle (Fr.), to each saint his candle; honour where honour is due
à cheval (Fr.), on horseback
à compte (Fr.), on account, in part payment.
à corps perdu (Fr.), with might and main
à couvert (Fr.), under cover, protected, sheltered
ad astra (L.), to the stars
ad calendas Græcas (L.), at the Greek calends, i.e., never, as the Greeks had no calends in their mode of reckoning
à demi (Fr.), by halves, half-way
a Deo et rege (L.), from God and the king
ad hoc (L.), arranged for this purpose, special
ad hominem (L.), to the man, to an individual's interests or passions, personal
adhuc sub judice lis est (L.), the case has not yet been decided.
a die (L.), from that day
ad infinitum (L.), to infinity
ad interim (L.), in the meantime
ad libitum (L.), at pleasure
ad modum (L.), after the manner of
ad nauseam (L.), to disgust or satiety
ad referendum (L.), for further consideration
ad rem (L.), to the purpose, to the point
ad valorem (L.), according to the value
affaire d'amour (Fr.), a love affair
affaire d'honneur (Fr.), an affair of honour, a duel
affaire de cœur (Fr.), an affair of the heart
a fortiori (L.), with stronger reason
à gauche (Fr.), to the left
à genoux (Fr.), on the knees
à haute voix (Fr.), aloud
à huis clos (Fr.), with closed doors; secretly
à la belle étoile (Fr.), under the stars; in the open air.
à la bonne heure (Fr.), well timed, all right, very well; as you please
à l'abri (Fr.), under shelter
à la mode (Fr.), according to the custom or fashion
à la Tartufe (Fr.), like Tartuffe, the hero of a celebrated comedy by Molière; hypocritically
al fresco (It.), in the open air, out-of-doors
al più (It.), at most
alter ego (L.), another self.
à merveille (Fr.), to a wonder; marvellously.
amor patriæ (L.), love of country
amour-propre (Fr.), self-love; vanity
ancien régime (Fr.), the ancient or former order of things.
anguis in herba (L.), a snake in the grass
anno Christi (L.), in the year of Christ
anno Domini (L.), in the year of our Lord
anno mundi (L.), in the year of the world
annus mirabilis (L.), year of wonders, wonderful year
ante bellum (L.), before the war.
ante lucem (L.), before light
ante meridiem (L.), before noon
à outrance (Fr.), to the utmost, to extremities, without sparing.
à pied (Fr.), on foot.
à point (Fr.), to a point, just in time, exactly right.
a posse ad esse (L.), from possibility to reality
ariston metron (Gr.), the middle course is the best, the golden mean.
arrière-pensée (Fr.), hidden thought; mental reservation
au courant (Fr.), fully acquainted with
audi alteram partem (L.), hear the other side.
au fait (Fr.), well acquainted with, expert
au fond (Fr.), at bottom
auf Wiedersehen! (Ger.), till we meet again
au pis aller (Fr.), at the worst
au revoir (Fr.), adieu till we meet again
aut vincere aut mori (L.), either to conquer or to die, death or victory
a verbis ad verbera (L.), from words to blows.
a vinculo matrimonii (L.), from the bond of matrimony.
à volonté (Fr.), at pleasure.
a vostra salute (It.) } to your health.
à votre santé (Fr.) }
a vuestra salud (Sp.) }
bas bleu (Fr.), a blue-stocking, a literary woman.
beau monde (Fr.), the world of fashion
beaux esprits (Fr.), men of wit, gay spirits.
beaux yeux (Fr.), fine eyes, good looks.
ben trovato (It.), well or cleverly invented
bête noire (Fr.), a black beast, a bugbear
bon gré mal gré (Fr.), with good or ill grace; willing or unwilling
bonhomie (Fr.), good-nature, artlessness
bonne bouche (Fr.), a delicate or tasty morsel.
bon vivant (Fr.), a good liver, a gourmand
brutum fulmen (L.), a harmless thunderbolt
canaille (Fr.), rabble
candida Pax (L.), white-robed Peace
casus belli (L.), that which causes or justifies war
causa sine qua non (L.), an indispensable cause or condition
caveat emptor (L.), let the buyer beware (or look after his own interest).
cela va sans dire (Fr.), that goes without saying, needless to say
ceteris paribus (L.), other things being equal
chacun son goût (Fr.), every one to his taste
cogito, ergo sum (L.), I think, therefore I exist
comme il faut (Fr.), as it should be
compos mentis (L.), sound of mind; quite sane.
compte rendu (Fr.), an account rendered, a report or statement drawn up
conditio sine qua non (L.), a necessary condition
conseil de famille (Fr.), a family consultation
consensus facit legem (L.), consent makes the law
consilio et animis (L.), by wisdom and courage
consilio et prudentia (L.), by wisdom and prudence
constantia et virtute (L.), by constancy and virtue.
contra bonos mores (L.), against good manners
contretemps (Fr.), an unlucky accident, a hitch
cordon bleu (Fr.), blue ribbon, a cook of the highest class
cordon sanitaire (Fr.), a line of guards to prevent the spreading of contagion or pestilence

M V.O. (5th); M.B.E.

Younger sons of the younger sons of Peers

Baronets' younger sons

Younger sons of Knights in order of their fathers

Naval, Military, Air, and other Esquires by Office.

Women take the same rank as their husbands or as their eldest brothers; but the daughter of a Peer marrying a Commoner retains her title as Lady or Honourable. Daughters of Peers rank next immediately after the wives of their elder brothers, and before their younger brothers' wives Daughters of Peers marrying Peers of lower degree take the same order of precedency as that of their husbands, thus the daughter of a Duke marrying a Baron becomes of the rank of Baroness only, while her sisters married to commoners retain their rank and take precedence of the Baroness Merely official rank on the husband's part does not give any similar precedence to the wife Dames Grand Cross (G C.V O or G B.E) rank after wives of Baronets and before wives of Knights Grand Cross. Dames Commanders (D C V O or D B E) rank after wives of Knights Grand Cross and before wives of Knights Commanders.

Precedence is formed by statute, patent, or usage, but the chief regulations regarding the order of precedence were settled by Parliament in the reign of Henry VIII.

Precedence locally, in county or city, has not been promulgated by written code, but in Counties the Lord Lieutenant stands first, and secondly the Sheriff, and therefore in Cities and Boroughs the Lord Lieutenant has social precedence over the Mayor, but at City or Borough functions the Lord Mayor or Mayor will preside. At Oxford and Cambridge the High Sheriff takes precedence of the Vice-Chancellor.

PRECEDENCE IN SCOTLAND

The Sovereign

The Duke of Edinburgh

The Duke of Rothesay (eldest son of the Sovereign)

Younger son of the Sovereign.

The Lord High Commissioner during sitting of General Assembly.

The Duke of Gloucester, the Duke of Windsor, uncles of the Sovereign

The Prime Minister

Keeper of the Great Seal of Scotland (Secretary for Scotland), if a peer

Keeper of the Privy Seal of Scotland, if a peer

Hereditary Lord High Constable of Scotland

Hereditary Master of the Household in Scotland

Dukes, as in English precedence

Eldest sons of Dukes of Blood Royal

Marquesses, as in England.

Eldest sons of Dukes

Earls as in England.

Younger sons of Royal Dukes

Eldest sons of Marquesses

Younger sons of Dukes

Keeper of the Great Seal of Scotland (Secretary for Scotland), if not a peer.

Keeper of the Privy Purse, if not a peer.

Lord Justice-General.

Lord Clerk-register

Lord Advocate

Lord Justice Clerk.

Viscounts, as in England

Eldest sons of Earls.

Younger sons of Marquesses.

Barons, as in England.

Eldest sons of Viscounts

Younger sons of Earls

Eldest sons of Barons

Knights of the Garter

Privy Councillors not included in above ranks

Lords of Session (by date of appointment)

Younger sons of Viscounts

Younger sons of Barons

Sons of Life Peers

Baronets

Knights of the Thistle

Knights of St Patrick

Knights of other Orders as in England

Solicitor-general for Scotland.

Lord Lyon King of Arms

Sheriffs Principal (except as shown above).

Knights Bachelor

Sheriffs Substitute.

Companions of Orders as in England.

Commanders of Royal Victorian Order.

Commanders of the British Empire Order.

Eldest sons of younger sons of Peers.

Companions of Distinguished Service Order

Member of Fourth Class of Royal Victorian Order

Officers of British Empire Order

Eldest sons of Baronets.

Eldest sons of Knights of the Garter, of the Thistle, and of St. Patrick.

Eldest sons of Knights.

Members of Fifth Class of Royal Victorian Order.

Members of British Empire Order

Younger sons of Baronets.

Younger sons of Knights.

Queen's Counsel.

Barons-feudal.

Esquires.

Gentlemen.

MODES OF ADDRESS TO PERSONS OF RANK

ROYALTY

Queen.

Begin: Madam, *or* May it please Your Majesty, *or* Lord —— presents his duty to Your Majesty
Address: The Queen's Most Excellent Majesty
Speak to as: Your Majesty

Princes and Princesses, Dukes and Duchesses of the Blood Royal.

Begin: Sir (*or* Madam)
Address: His (*or* Her) Royal Highness the Prince (*or* Princess) ——
His (*or* Her) Royal Highness the Duke (*or* Duchess) of ——
Speak to as: Your Royal Highness

NOBILITY.

Dukes and Duchesses

Begin: My Lord Duke
Address: His Grace the Duke of ——, K G, etc
Speak to as: Your Grace

Begin: Madam
Address: Her Grace the Duchess of ——
Speak to as: Your Grace

Marquesses and Marchionesses

Begin: My Lord Marquess, *or* My Lord
Address: The Most Hon the Marquess of ——.
Speak to as: Your Lordship

Begin: Madam
Address: The Most Hon the Marchioness of ——
Speak to as: Your Ladyship

Earls and Countesses

Begin: My Lord
Address: The Right Hon the Earl of ——, *or* The Earl ——
Speak to as: Your Lordship

Begin: Madam
Address. The Right Hon the Countess of ——, or The Countess ——.
Speak to as. Your Ladyship

Viscounts and Viscountesses

Begin. My Lord
Address The Right Hon. Viscount, *or* Viscount ——.
Speak to as Your Lordship

Begin: Madam
Address The Right Hon the Viscountess ——.
Speak to as: Your Ladyship

Barons and Baronesses

Begin: My Lord
Address. The Right Hon Lord ——
Speak to as: Your Lordship

Begin: My Lady
Address: The Right Hon Lady ——
Speak to as: Your Ladyship.

Baronets

Begin: Sir
Address Sir (Christian name and surname), Bt

Knights Bachelor

As Baronet, except that the word Bt is omitted.

THE CHURCH

Archbishops

Begin: My Lord Archbishop, *or* Your Grace
Address: His Grace the Lord Archbishop of ——
Speak to as: Your Grace.

A retired archbishop is addressed as The Most Rev. Archbishop ——

Bishops.

All Bishops, whether Diocesan or Suffragan, are addressed by the spiritual title "Lord."

Begin: My Lord Bishop
Address: The Right Rev the Lord Bishop of ——
Speak to as: Your Lordship

It is usual to accord to Colonial Bishops the courtesy title of "Lord Bishop," and they are addressed in the same manner as English Bishops Assistant and retired Bishops are not addressed as "Lord Bishop" but as The Right Rev Bishop ——, *or* The Right Rev (surname), D.D

Begin. Right Rev Sir

Deans

Begin: Very Reverend Sir
Address: The Very Rev the Dean of ——

Archdeacons

Begin Venerable Sir
Address. The Venerable the Archdeacon of ——

Canons

Begin Reverend Sir
Address: The Reverend Canon ——
Speak to as Canon ——

The Pope

Begin Your Holiness *or* Most Holy Father
Address To His Holiness the Pope

Cardinals

Begin My Lord Cardinal *or* My Lord
Address To His Eminence Cardinal ——

The Chief Rabbi

Begin Very Rev and Dear Sir
Address To the Very Rev the Chief Rabbi *or* To the Very Rev (Dr) ——

Rabbis

Begin Rev and Dear Sir
Address To the Rev Rabbi (Dr) ——

THE LAW.

Lord Chancellor

Begin According to rank
Address: The Right Hon the Lord High Chancellor
Speak to According to rank

Lord Chief Justice

Begin According to rank, if a peer, otherwise as a Judge
Address. The Right Hon the Lord Chief Justice of England

Lord Justice of Appeal

Begin: Sir.
Address The Right Hon the Lord Justice ——
Speak to as Your Lordship (addressed on the Bench as "My Lord")

Lord of Appeal in Ordinary and his Wife

As Baron and Baroness.

Judges

Begin: Sir
Address The Hon Mr Justice —— *or* The Hon. Sir —— (if a Knight)
Speak to as Your Lordship (addressed on the Bench as "My Lord")

Judges of County Court.

Begin: Dear Judge ——
Address His Honour Judge —— (addressed on the Bench as "Your Honour")

Justices of The Peace

Address The Right Worshipful ——, J.P. (addressed on the Bench as "Your Worship")

LORD MAYOR.

Begin: My Lord.
Address: The Right Hon the Lord Mayor of —— (London, York, Belfast, etc.).
Speak to as: Your Lordship.

LORD PROVOST.

Begin: My Lord Provost, *or* My Lord.
Address: The Right Hon. the Lord Provost of Edinburgh (or Glasgow)
Speak to as: Your Lordship.
(The Lord Provost's wife is called Lady Provost.)

MAYORS.

Begin: Sir.
Address: If of a city—The Right Worshipful the Mayor of ——. If of a borough—His Worship the Mayor of ——.
Speak to as: Your Worship

DIPLOMATIC SERVICE.

AMBASSADORS.

Begin: Sir, My Lord, etc., according to rank.
Address: His Excellency (in other respects according to rank) H B M. Embassy
Speak to as: Your Excellency.

CONSULS.

Begin: Sir
Address: (Christian name and surname), Esq., H B M Agent and Consul-General, *or* H B M Consul-General, *or* H B M. Consul, *or* H B M. Vice-Consul.

GOVERNORS-GENERAL.

Begin: According to rank
Address: His Excellency (ordinary designation), Governor of——.
Speak to as: Your Excellency

PRIVY COUNCILLORS.

The courtesy title of "Right Honourable" is accorded all Privy Councillors (all members of the Cabinet are privy councillors, and the office is conferred for life). In the case of peers below the rank of Marquess, who already have a right to it in virtue of their peerage, the rank of Privy Councillor is indicated by the letters "P C." after the name Wives do not share the title.

Address: The Right Hon ——
Admiral the Right Hon. Sir ——
The Right Rev the Right Hon the Lord Bishop of ——
The Most Hon. the Marquess of ——, P.C.

BUSINESS LETTERS.

Business letters to persons of rank can either be written in the third person (grammatical pitfalls must be guarded against), in which case they are not signed, or in the first person plural.

3rd person.
Messrs —— present their compliments to the Right Hon the Earl of —— and ——.

1st person plural
Begin: Your Lordship

ORDERS OF CHIVALRY

Garter
K G.
The Most Noble Order of the Garter (1348). *Ribbon* Garter blue, not worn in undress uniform. *Motto* Honi soit qui mal y pense (*Evil to him who evil thinks*).

Thistle
K.T.
The Most Noble and Most Ancient Order of the Thistle (1687). *Ribbon* Green, not worn in undress uniform. *Motto* Nemo me impune lacessit (*No one provokes me with impunity*).

Saint Patrick
K.P.
The Most Illustrious Order of St. Patrick (1783). *Ribbon:* Sky blue, not worn in undress uniform *Motto:* Quis separabit? (*Who shall separate?*)

Bath
G.C.B. (Knight Grand Cross), (Mil & Civ).
K C.B. (Knight Commander), (Mil. & Civ).
C.B. (Companion), (Mil.).
The Most Honourable Order of the Bath (1399). *Ribbon:* Crimson. *Motto* Tria juncta in uno (*Three joined in one*) (Remodelled 1725 and 1815 and enlarged 13 times since.)

Order of Merit
O.M. (Mil. & Civ.)
The Order of Merit (1902). *Ribbon:* Blue and crimson. Ranks after G.C.B. before K C.B.

Star of India
G C S.I. (Knight Grand Commander)
K.C S.I. (Knight Commander).
C.S I. (Companion).
The Most Exalted Order of the Star of India (1861). (Since enlarged 8 times.) *Ribbon:* Light blue, with white edges. *Motto:* Heaven's Light our Guide.

Saint Michael and Saint George
G C.M.G. (Knight Grand Cross).
K C.M G. (Knight Commander).
C.M.G. (Companion).
The Most Distinguished Order of St. Michael and St George (1818). *Ribbon:* Saxon blue, with scarlet centre. *Motto:* Auspicium melioris aevi (*Token of a better age*).

Indian Empire
G.C.I.E. (Knight Grand Commander).
K.C I.E. (Knight Commander).
C.I E. (Companion).
The Most Eminent Order of the Indian Empire (1877). (Since enlarged 8 times.) *Ribbon.* Imperial purple. *Motto* Imperatricis auspiciis (*Under the auspices of the Empress*).

Victorian Order
G.C.V.O. (Knight or Dame Grand Cross).
K.C.V.O. (Knight Commander).
D.C.V.O. (Dame Commander).
C.V O. (Commander).
M.V.O. (Member).
The Royal Victorian Order (1896). *Ribbon:* Blue, with red and white edges. *Motto.* Victoria.

British Empire
G.B.E. (Knight or Dame Grand Cross).
K.B.E. (Knight Commander).
D.B.E. (Dame Commander).
C.B.E. (Commander).
O.B.E. (Officer).
M.B.E. (Member).
The Most Excellent Order of the British Empire (1917). *Ribbon.* Rose pink edged with pearl grey with vertical pearl stripe in centre (Mil Div.); without vertical stripe (Civ. Div.). *Motto:* For God and the Empire.

Companions of Honour
C.H.
Order of the Companions of Honour (1917). *Ribbon:* Carmine, with gold edges. Ranks after G.B.E. and before K.B.E.

Victoria and Albert
V.A.
The Royal Order of Victoria and Albert (for Ladies) (1862). (Since enlarged 3 times.)

Crown of India
C.I.
The Imperial Order of the Crown of India (for Ladies) (1878). *Ribbon:* Light blue watered edged white, worn as bow on left shoulder.

UNITED KINGDOM COINAGE

The Royal Mint is authorised to issue coins of the following denominations and specifications :—

Denomination.	Standard Weight
Gold:	Grains
Five Pound Piece	616·37239
Two Pound Piece	246·54895
Sovereign	123·27447
Half Sovereign . . .	61·63723
Cupro-Nickel:	
Crown	436·36363
Half-Crown	218·18181
Florin	174·54545
Shilling	87·27272
Sixpence	43·63636
Silver:	
Maundy Fourpence . . .	29·09090
Maundy Threepence . . .	21·81818
Maundy Twopence . . .	14·54545
Maundy Penny	7·27272
Nickel Brass.	
Threepence	105·00000
Bronze	
Penny	145·83333
Halfpenny	87·50000

Gold Coinage in Britain consists of eleven-twelfths of fine metal and one-twelfth of alloy. fineness, 916·66. Two hundred and forty troy ounces of standard gold are coined into 934 sovereigns and one half-sovereign; one troy ounce is, therefore, worth £3 17*s* 10½*d*, and one ounce of pure gold is nominally worth £4 4*s* 11½*d* The minimum weight at which a sovereign is allowed to remain current unchallenged is 122½ grains; that of half-a-sovereign 61¼ grains Any person to whom it is tendered may break, cut, or deface any gold coin below the least current weight, but light gold coin which has not been illegally dealt with is received by the Bank of England on behalf of the Mint at its full face value

Cupro-Nickel. The first change in the silver standard since the reign of Queen Elizabeth was made in 1920, when the degree of fineness was reduced to 500 parts in a thousand as against 925 1946 marked the end of the silver coinage. To provide silver bullion for industry and for a fund towards the redemption of our silver debt to America a large number of the silver coins were withdrawn from circulation. They have been replaced by coins made of cupro-nickel, composed of 75% copper and 25% nickel. Maundy money is, however, made of silver, at the standard of 925 parts per 1000

Bronze is employed in minting United Kingdom coins and its composition has varied slightly from time to time. At present it consists of 97% copper, ½% tin, and 2½% zinc

Nickel Brass. The twelve-sided threepenny piece is composed of copper 79%, zinc 20%, and nickel 1%

No person is permitted to coin any token to pass for, or as representing, any British piece of money under a penalty of £20.

New Coinage. A proclamation approving new designs for coinage was signed by H M the Queen in Council on November 25th, 1952. These coins became legal tender on January 1st, 1953, and include coin in gold as well as in silver-cupro-nickel, mixed metal, and bronze

The principal design is that of the uncrowned head of Elizabeth II, which is the work of Mrs Mary Gillick, C.B.E. This is used on the coinage of the United Kingdom, Canada, Australia, New Zealand, South Africa, Ceylon, and Southern Rhodesia, though the inscriptions vary in each country. The Queen is shown wearing a laurel wreath tied at the back with a flowing ribbon above two rows of curls at the nape of the neck. The inscription on the obverses of the cupro-nickel coins issued after the 1st January, 1954, reads " ELIZABETH · II · DEI · GRATIA · REGINA " and on the obverses of the gold, silver, nickel-brass and bronze coins " ELIZABETH · II · DEI · GRATIA · REGINA · F : D : "

The reverse sides of the coins are as follows.—

Half-crown, shield of the Royal Arms surmounted by the Crown, prepared by Mr E. G. Fuller and modelled by Mr. Cecil Thomas, F.R B S

Florin, circular pattern of thistles, shamrock, and leeks about a double rose This is the first time a Welsh emblem has decorated the United Kingdom coinage as an integral part of the design, prepared by Mr E. G Fuller and modelled by Mr Cecil Thomas, F R B S

Shilling, shield of the English quartering of the Royal Arms surmounted by the Crown, design prepared and modelled by Mr. W M Gardner The Scottish shilling shows a shield of the Scottish quartering of the Royal Arms surmounted by the Crown, also designed and modelled by Mr W M. Gardner

Sixpence, garland of interlaced rose, thistle, shamrock, and leek, designed by Mr. E. G. Fuller and modelled by Mr. Cecil Thomas, F R B S

Threepenny piece, chained portcullis surmounted by a coronet, designed and modelled by Mr W M Gardner

There is no change on the reverse of the bronze coinage (coppers), which will continue to bear, on the *penny* the figure of Britannia, familiar since Charles II, and on the *half-penny*, a sailing-ship inspired by the *Golden Hind*, designed by Mr. T H. Paget, O B E

The coins of Colonial territories, in accordance with tradition, bear the crowned head of the Sovereign, designed for the present Reign by Mr Cecil Thomas, F.R B S.

The *five-shilling pieces* issued to commemorate the Coronation bore on the obverses an equestrian effigy of Her Majesty by Mr. Gilbert Ledward, R A , and on the reverses a design by Mr E G Fuller modelled by Mr. Cecil Thomas, F R B S of the four quarterings of the Royal Arms each contained in a shield and arranged in saltire with, in the intervening spaces, a rose, a thistle, a sprig of shamrock and a leek. Upon the edges of the coins was the inscription, " FAITH AND TRUTH I WILL BEAR UNTO YOU "

The designs specified for *crown pieces* issued after the 1st January, 1954 are Mrs. Gillick's uncrowned effigy for the obverses and the same design as shown on the reverses of the Coronation crown pieces for the reverses.

LEGAL TENDER

Bank of England Notes are issued for sums of 10*s*., £1, and £5. 10*s*. and £1 bank-notes are legal tender in Great Britain and Northern Ireland, and £5 bank-notes in England and Wales only. The old £1 notes (without the portrait of the Queen), £5 notes dated prior to 21 September 1956, and all notes of higher denominations have ceased to be legal tender; they are, however, still exchangeable at the Bank.

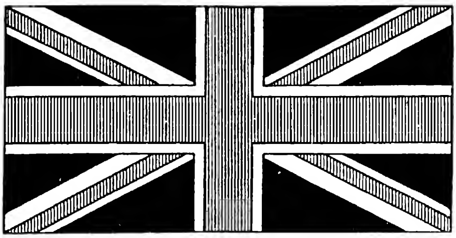
Gold Coins if not below the minimum current weight, are legal tender; but, unless otherwise authorised by or on behalf of the Treasury, persons resident in the United Kingdom holding sovereigns or other gold coin must, under the Exchange Control Act, 1947, offer that coin for sale to an Authorised Dealer.

Silver and/or Cupro-Nickel Coins are legal tender for sums not exceeding £2, nickel-brass threepenny pieces for sums not exceeding 2*s*., and bronze coins for sums not exceeding 1*s*. No one can demand " change ".

Treasury Notes of the value of 10*s*. and £1, which were first issued during the First World War, ceased to be issued in November 1928; though no longer legal tender, they remain exchangeable at the Bank of England.

THE UNION JACK

The present Union Jack is composed of three heraldic crosses, viz, the cross of St Andrew, forming the blue and white basis, upon which lies the red and white cross of St. Patrick; and upon the whole rests the red and white cross of St. George, dividing the flag vertically and horizontally The original Union Jack combined only the St George and St Andrew crosses and was adopted in 1606 by order of James I who as James VI of Scotland succeeded to the throne of England in 1603 No further alteration was made in the flag until January 1st, 1801, when the Irish Parliament was dissolved and the Act of Union came into force



It is flown on the following days on Government and Public buildings (from 8 a m to sunset) —

Feb 6 (1952)	H M the Queen's Accession	June 10 (1921)	Duke of Edinburgh's Birthday
„ 19 (1960)	Prince Andrew's Birthday	Aug 4 (1900)	Birthday of H M Queen Elizabeth the Queen Mother
Mar 31 (1900)	Duke of Gloucester's Birthday.	„ 15 (1950)	Princess Anne's Birthday
Apr. 21 (1926)	Birthday of H M the Queen	„ 21 (1930)	Princess Margaret's Birthday
„ 25 (1897)	Princess Royal's Birthday.	Nov 14 (1948)	Prince Charles' Birthday
May 24	Empire Day.	„ 20 (1947)	The Royal Wedding Day.
June 2 (1953)	Coronation Day.		

and on the occasion of the "official" Queen's birthday, Remembrance Day and the opening and closing of Parliament by the Queen.

The *Royal Standard* is hoisted on buildings in which Her Majesty the Queen is actually present

THE BEAUFORT SCALE OF WIND FORCE

Beaufort number	*Wind*	*Effect on land*	*Speed* M p h	*Speed* Knots
0	Calm	Smoke rises vertically	Less than 1	Less than 1
1	Light air	Direction shown by smoke but not by wind vanes	1–3	1–3
2	Light breeze	Wind felt on face, leaves rustle, wind vanes move	4–7	4–6
3	Gentle breeze	Leaves and twigs in motion, wind extends light flag	8–12	7–10
4	Moderate breeze	Raises dust, loose paper and moves small branches	13–18	11–16
5	Fresh breeze	Small trees in leaf begin to sway	19–24	17–21
6	Strong breeze	Large branches in motion; whistling in telegraph wires, difficulty with umbrellas	25–31	22–27
7	Moderate gale	Whole trees in motion; difficult to walk against wind	32–38	28–33
8	Fresh gale	Twigs break off trees, progress impeded	39–46	34–40
9	Strong gale	Slight structural damage occurs, chimney pots and slates blown off	47–54	41–47
10	Whole gale	Trees uprooted and considerable structural damage	55–63	48–56
11	Storm	Widespread damage, seldom experienced in England	64–75	57–65
12	Hurricane	Winds of this force only encountered in tropical revolving storms	Above 75	Above 65

WEIGHTS AND MEASURES.

I. WEIGHTS AND MEASURES LEGALLY PERMITTED UNDER THE WEIGHTS AND MEASURES ACTS.

I. IMPERIAL WEIGHTS AND MEASURES.

AVOIRDUPOIS

1 dram (dr.)	27.34375 grains (gr.)
16 drams	1 ounce (oz.) = 437.5 gr.
16 ounces	1 pound (lb.) = 7000 gr.
14 pounds	1 stone
28 pounds	1 quarter
4 quarters	1 hundredweight (cwt.) = 112 lb.
20 hundredweight	1 ton = (2240 lb.)

TROY WEIGHT

1 pennyweight (dwt.)	24 grains
480 grains	1 ounce

The only unit of troy weight which is now legal for use in trade in this country is the ounce Troy, and weighings of precious metals are made in multiples and decimals of this unit.

The term *carat* is not a unit of weight for precious metals, but is used to denote the quality of gold plate, etc., and is a figure indicating the number of 24ths of pure gold in the alloy, *e.g.*, a 9 carat gold ring consists of nine parts of pure gold and fifteen parts of base metals.

CAPACITY MEASURE

4 gills	1 pint
2 pints	1 quart
4 quarts	1 gallon
2 gallons	1 peck
4 pecks	1 bushel
8 bushels	1 quarter
36 bushels	1 chaldron

There is no legal equivalent of the gallon in terms of cubic inches, but the most up-to-date scientific determination gives the figure 1 gallon = 277.420 cubic inches.

APOTHECARIES' WEIGHT

20 grains	1 scruple
3 scruples	1 drachm
8 drachms	1 ounce

While the apothecaries' ounce is the same as the troy ounce, there is no such thing as an apothecaries' or troy pound of 12 ounces. The troy pound has been obsolete for many years.

The Avoirdupois system is normally used for retailing chemicals in quantities of a ¼ ounce and over, whilst the metric system is used for the newer drugs. The metric system (with apothecaries' equivalents) is also used for formulæ and prescriptions in the *British Pharmacopœia*.

APOTHECARIES' FLUID MEASURE

60 minims (min.)	1 fluid drachm
8 fluid drachms	1 fluid ounce
20 fluid ounces	1 pint

There are 437½ grains weight of distilled water at 62° F. in 1 fluid ounce.

LINEAR MEASURE

1 nail	$\frac{1}{16}$ yard
1 link	7.92 inches
12 inches	1 foot
3 feet	1 yard
5½ yards	1 rod, pole, or perch
4 rods, etc.	1 chain or 100 links (22 yd.)
220 yards	1 furlong
8 furlongs	1 mile = 1760 yards

SQUARE MEASURE

144 sq. inches	1 sq. foot
9 sq. feet	1 sq. yard = 1296 sq. inches
30¼ sq. yards	1 sq. rod, pole, or perch
40 sq. rods	1 rood
4 roods	1 acre = 4840 sq. yards
640 acres	1 sq. mile

(To convert decimal parts of an acre into roods and perches, multiply by 4 to give roods and decimals of a rood, and multiply this decimal by 40, to give perches and decimals of a perch.)

CUBIC OR SOLID MEASURE.

1728 cu. inches	1 cu. foot
27 cu. feet	1 cu. yard

The relationship between the yard and the bushel is not legally defined. A relationship (based on that of the gallon in "Capacity Measure" above) would be 1 cu. yard = 21.022 bushels.

The *international pound* and *international yard* for science and technology are defined thus:—

The international yard = 0.9144 metre

The international pound = 0.45359237 kilogram

2. METRIC WEIGHTS AND MEASURES.

LINEAR MEASURE

10 millimetres (mm.)	1 centimetre (cm.)
10 centimetres	1 decimetre (dm.)
10 decimetres	1 METRE (m.)
10 metres	1 dekametre (dam.)
10 dekametres	1 hectometre (hm.)
10 hectometres	1 kilometre (km.)

SURFACE OR SQUARE MEASURE.

100 centiares	1 are = 100 sq. metres
100 ares	1 hectare = 10,000 sq. metres

CAPACITY.

10 millilitres (ml.)	1 centilitre (cl.) = 10 c.c.
10 centilitres	1 decilitre (dl.) = 100 c.c.

CAPACITY (*cont.*).

10 decilitres	1 LITRE (lit.) = 1000 c.c.
10 litres	1 dekalitre (dal.)
10 dekalitres	1 hectolitre (hl.)
10 hectolitres	1 kilolitre (kl.) = 1 cu. metre

WEIGHT

1000 micrograms	1 milligram (mg.)
10 milligrams	1 centigram (cg.)
10 centigrams	1 decigram (dg.)
10 decigrams	1 GRAM (gm.)
10 grams	1 dekagram (dag.)
10 dekagrams	1 hectogram (hg.)
10 hectograms	1 kilogram (kg.)
The metric carat	0.2 gram

3. IMPERIAL AND METRIC EQUIVALENTS.

LINEAR MEASURE.

IMPERIAL TO METRIC.

1 inch	2.54 centimetres
1 foot	30.48 centimetres
1 yard	0.914399 metre
1 pole (5½ yards)	5.0292 metres
1 chain (22 yards)	20.1168 metres
1 furlong (220 yards)	201.168 metres
1 mile (8 furlongs)	1.6093 kilometres

METRIC TO IMPERIAL.

1 millimetre	0.03937 inch
1 centimetre	0.3937 inch
1 decimetre	3.937 inches
1 metre	39.37011.3 inches
1 metre	3.280843 feet
1 metre	1.0936143 yards
1 dekametre	10.936 yards
1 hectometre	109.36 yards
1 kilometre	0.62137 mile

SQUARE MEASURE.

Imperial to Metric.		Metric to Imperial.	
1 sq. inch	6.4516 sq. cm.	1 sq. cm.	0.15500 sq. inch

II. ELECTRICAL UNITS.

Until 31st December, 1947, the electrical units in general use were the so-called International Units, having been defined by the International Conference on Electrical Units held in London in 1908. These units were based upon specifications for a column of mercury and a silver voltameter which defined the International Ohm and International Ampere respectively, as units which for practical purposes could be accepted as equivalent to the fundamental theoretical units derived by multiplying the corresponding centimetre, gram, second (C.G.S.) electromagnetic unit by an integral power of ten. The International Units were not exactly equal to the fundamental units, and as the accuracy of all measurements increased, the discrepancy became increasingly troublesome.

The International Committee of Weights and Measures, which had succeeded the 1908 Conference, met in Paris in 1946 and decided to abolish the International Units, and as from 1st January, 1948, to use throughout the world the fundamental units themselves, which are known as Absolute Units. The decision meant that the units in common use at that time changed by various amounts up to 5 parts in 10,000.

The International Units and corresponding Absolute Unit values are as follows.—

Ohm. The International Ohm is the resistance offered to an unvarying current by a column of mercury of height 106.3 cm., 1 sq. mm. cross-section and weight 14.4521 grams at the temperature of melting ice (0° C.).

1 International Ohm = 1.00049 Absolute Ohm.

1 Absolute Ohm = 10^9 C.G.S. electromagnetic units.

1,000,000 Ohms = 1 Megohm.

AMPERE. The International Ampere is that steady current which in flowing through a specified solution of silver nitrate, deposits silver on the cathode at the rate of 0 001118 gram per second.

1 International Ampere = 0 99985 Absolute Ampere

1 Absolute Ampere = 0 1 C G S. electromagnetic unit.

VOLT The International Volt is that steady electromotive force which applied to the ends of a conductor, whose resistance is 1 International Ohm, causes a current of 1 International Ampere to flow

1 International Volt = 1 00034 Absolute Volt

1 Absolute Volt = 10^8 C.G S. electromagnetic units

1000 volts = 1 Kilovolt.

WATT Energy is supplied to a circuit at the rate of 1 International Watt if the current in it is 1 International Ampere and the pressure across it is 1 International Volt.

1 International Watt = 1 00019 Absolute Watt.

1000 watts = 1 Kilowatt.

1 Kilowatt-hour = 1000 watts supplied for a period of 1 hour = Board of Trade Unit.

COULOMB The unit of quantity, and is the quantity passing in 1 second when the mean current is 1 ampere

1 Coulomb = 0 1 electromagnetic unit.

HENRY The unit of inductance, defined as the inductance of a circuit in which the induced electromotive force is 1 volt when the inducing current changes at the rate of 1 ampere per second.

1 International Henry = 1 00049 Absolute Henry

1 Absolute Henry = 10^9 C G S. electromagnetic units.

FARAD The unit of capacity, and is that capacity which is charged to a difference of pressure of 1 volt by 1 coulomb

1,000,000 microfarads = 1 farad.

1 International Farad = 0 99951 Absolute Farad

1 Absolute Farad = 10^9 C G S. electromagnetic unit.

HOW TO CORRECT PRINTERS' PROOFS

Marginal mark	Meaning	Corresponding mark in text
δ/	Delete (take out)	Cross through
δ	Delete and close-up	Above and below letters to be taken out
stet	Leave as printed (when words have been crossed out by mistake)	Under letters or words to remain
caps	Change to capital letters	Under letters or words to be altered
s.c.	Change to small capitals	Under letters or words to be altered
caps & s.c.	Use capital letters for initial letters and small capitals for rest of words	Under initial letters and under the rest of the words
l.c.	Change from capitals to lower case	Encircle letters to be altered
bold	Change to bold type	Under letters or words to be altered
ital.	Change to italics	Under letters or words to be altered
rom.	Change to roman type	Encircle words to be altered
w.f.	(Wrong fount.) Replace by letter of correct fount	Encircle letter to be altered
9	Invert type	Encircle letter to be altered
X	Replace by similar but undamaged character	Encircle letter to be altered
	Insert (or substitute) superior figure or sign	(Or encircle letters or signs to be altered)
	Insert (or substitute) inferior figure or sign	(Or encircle letters or signs to be altered)
	Close up—delete space between letters	Linking words or letters
#	Insert space	
eq.#	Make spacing equal	Between words
less#	Reduce space	Between words
trs.	Transpose	Between letters or words, numbered when necessary
centre	Place in centre of line	Indicate position with
	Move to the left	
	Move to the right	
n.p.	Begin a new paragraph	Before first word of new paragraph
run on	No fresh paragraph here	Between paragraphs
spell out	The abbreviation or figure to be spelt out in full	Encircle words or figures to be altered
	(Caret mark.) Insert matter indicated in margin	
	Insert single quotation marks	
	Insert double quotation marks

SCOTTISH AND IRISH SILVER MARKS

EDINBURGH . .	1700		1800	
GLASGOW . .	1700		1800	DUBLIN .	1700		1800	
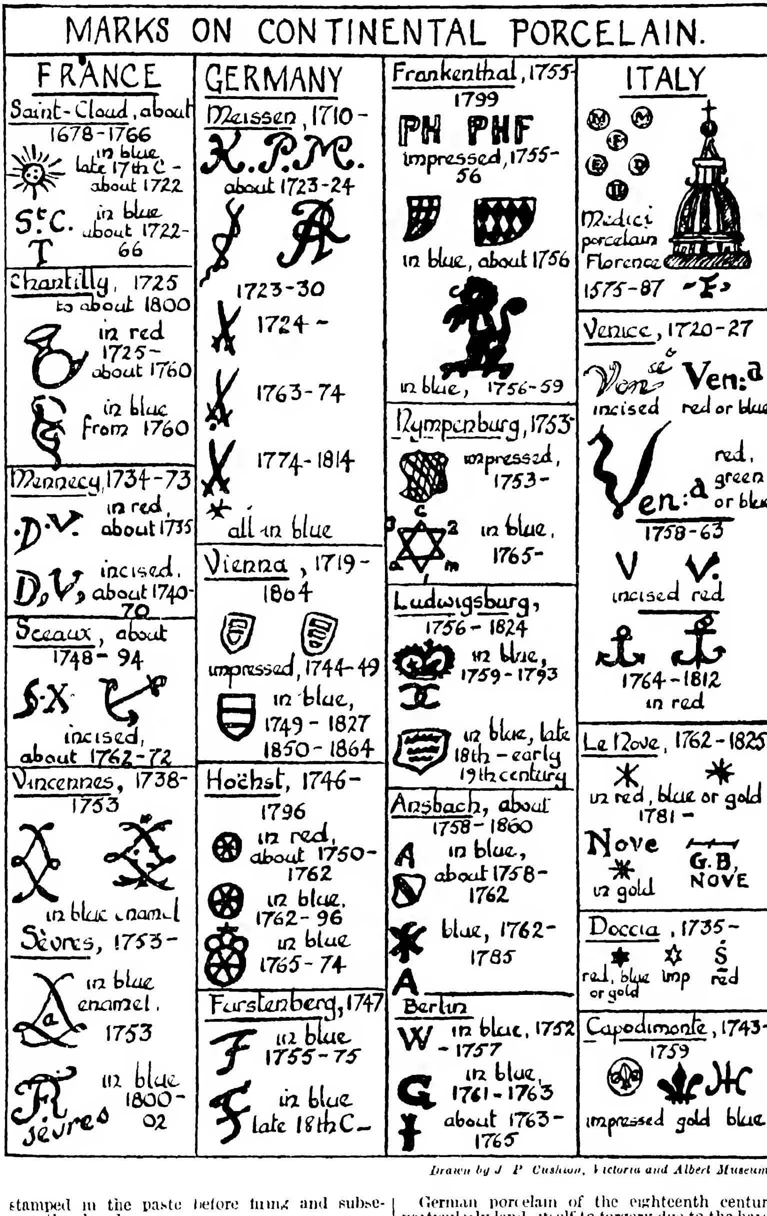
The earliest fully-developed factory-mark is that of late-16th-century Italian porcelain made at Florence, but it was not until 1724, when the Meissen factory adopted the crossed swords from the arms of Saxony, that the practice was generally taken up by most pottery factories worthy of note

In 1766 French manufacturers were compelled by law to mark their products with a mark previously registered with the police, but elsewhere marks similar to those of the reputable factories were adopted Many factories used marks designed to look like the crossed swords of Meissen, whilst the English factories of Bow, Lowestoft, Derby, and Worcester made no attempt to disguise their occasional use of the device.

Many initials and numerals often found on porcelain are no aid to the identification of its place of manufacture and are merely the mark of a workman for factory or record purposes, pattern or mould numbers The safest mark to accept as genuine is that which has been incised or



Drawn by J P Cushion, Victoria and Albert Museum.

stamped in the paste before firing and subsequently glazed

The most widely used method of marking wares during the 18th century was by painting or printing in underglaze-blue which is generally accepted as authentic, but all painted, printed, or stencilled marks applied over the glaze could be added to a piece with the intention of deceiving. Any refiring of old wares is generally revealed by black specks in the glaze

German porcelain of the eighteenth century particularly lends itself to forgery due to the hard-paste material then used still being available, and reproductions were made throughout the 19th century, but all tend to have an over-clean finish not in keeping with the original. Chelsea wares were also widely copied but owing to the soft-paste used for their manufacture are far easier to detect when produced in the harder material

BANK AND PUBLIC HOLIDAYS

In *England, Wales, N. Ireland* and *The Channel Islands* it is ordained that the Bank Holidays shall be: Easter Monday, Whit Monday, first Monday in August, Boxing Day (first weekday after Christmas) The Channel Islands have in addition special Bank Holidays on New Year's Day and Liberation Day

N. Ireland and the *Irish Republic* have a special Bank Holiday on St Patrick's Day, March 17th

The Stock Exchange is closed on Bank Holidays Good Friday, January 1st and on Saturdays throughout the year

The Queen's birthday (when decreed) is observed in the Customs and certain other Government establishments as a holiday.

In *Scotland* it is enacted that the Bank Holidays observed shall be New Year's Day, first Monday in May, first Monday in August. There are also special Spring and Autumn holidays in Edinburgh and Glasgow

GAME

Game is defined under the game laws as including hares, pheasants, partridges, grouse, heath or moor game, black game, deer, rabbits and (in Scotland) ptarmigan. The close times for game are as follows (the dates given are inclusive)

Black (or Heath) Game	Dec 11 to Aug 19 (Aug 31 in Somerset, Devon and New Forest)
Grouse (or Moor Game) and (in Scotland) Ptarmigan	Dec 11 to Aug. 11
Partridge	Feb. 2 to Aug 31
Pheasant	Feb 2 to Sept 30

Deer, hares and rabbits are also protected to a limited extent

CLOSE TIMES FOR SPORTING BIRDS

Birds for which the close season is Feb 1 to Aug. 31 (inclusive) —

Godwit, bar-tailed; Plover, grey; Coot; Redshank, common; Curlew (other than Stone Curlew); Moorhen; Whimbrel; Plover, golden

Birds for which the close season is Feb 1 to Aug 31 (inclusive) (except below high water mark when it is Feb 21 to Aug 31 (inclusive) ·

Wild duck of the following species —

Common pochard	Long-tailed duck	Teal
Common Scoter	Mallard	Tufted Duck
Gadwall	Pintail	Velvet
Garganey Teal	Scaup-duck	Scoter
Goldeneye	Shoveler	Wigeon

Wild geese of the following species —

Bean-goose	Grey Lag Goose	White-fronted
Canada Goose	Pink-footed Goose	Goose

Birds for which the close season is Feb 1 to Sept 30 (inclusive) —

Capercaillie; Woodcock (in Scotland Feb 1 to Aug 31)

Birds for which the close season is Feb 1 to Aug 11 (inclusive) —

Snipe, common; Snipe, jack.

THE COUNTRY CODE

GUARD AGAINST THE RISK OF FIRE. Great damage is done every year to crops, plantations, woodlands, and heaths. A match or cigarette thrown away or a pipe carelessly knocked out, picnic fires not properly put out or lighted near dry crops, can quickly start a blaze.

FASTEN ALL GATES. If animals get out of a field they stray As a result they may do serious damage to crops, suffer injury on the roads, or eat food that is harmful.

KEEP DOGS UNDER CONTROL. Animals are easily frightened, even by small, playful dogs. Stillbirths may be the result.

KEEP TO THE PATHS ACROSS FARM LAND. Crops are damaged by treading; flattened crops are difficult to harvest. Grass is a valuable crop.

AVOID DAMAGING FENCES, HEDGES, AND WALLS. If these are damaged, gaps will be caused. Where a man goes, an animal may follow.

LEAVE NO LITTER. Litter is not just unsightly, but often a danger as well. Broken glass and tins may injure animals and harm machinery

SAFEGUARD WATER SUPPLIES. Countrymen often depend on wells and streams for water for themselves and for their animals.

PROTECT WILD LIFE, PLANTS, AND TREES. Wild animals should not be disturbed, plants uprooted, or trees treated roughly.

GO CAREFULLY ON COUNTRY ROADS. If there is no footpath, walkers are generally safer on the right, facing on-coming traffic Care and patience are needed by motorists when passing farm animals.

RESPECT THE LIFE OF THE COUNTRYSIDE. Many of the machines and much of the business stock on which the farmer depends for his livelihood have to be kept in the open. Take care not to damage them.

42.2	108	− 12.2	10
40	104	− 15	5
36.7	98	− 17.8	0
35	95	− 20	− 4
32.2	90	− 25	− 13
30	86	− 30	− 22
26.7	80	− 35	− 31
25	77	− 40	− 40

To reduce Fahrenheit to Centigrade, subtract 32 degrees and multiply by 5/9, to reduce Centigrade to Fahrenheit, multiply by 9/5 and add 32 degrees

An alternative method, perhaps easier to remember, is to add 40 to the given figure, multiply by 5/9 (°F to °C) or 9/5 (°C to °F) and subtract 40

UNIVERSITY DEGREES—COLOURS OF HOODS

Aberdeen

M A	Black corded silk lined with white silk and edged round cape and cowl
D Litt	Scarlet superfine cloth lined with white silk
B D	Black corded silk lined with purple silk
D D	Scarlet superfine cloth lined with purple silk
B L	Black corded silk edged [illegible]
LL B	Black corded silk lined [illegible]
LL D	Scarlet superfine cloth lined with light blue silk.
M B, Ch B	Black corded silk lined with crimson silk
Ch M.	White corded silk lined with crimson silk
M D	Scarlet superfine cloth lined with crimson silk
B Sc.	Black corded silk lined with green silk
D Sc	Scarlet superfine cloth lined with green silk
B Sc (Agric)	Black corded silk edged with green silk
B Sc (Eng)	Black corded silk with green and white silk
B Sc (For)	Black corded silk with waved green silk edging
B Com	Black corded silk edged with lilac silk
Ph D	Scarlet superfine cloth lined with black ribbed silk

Note —All the hoods of this university are of the full type, with rounded capes, but have no liripipe to the cowl or hood portion proper

Belfast, The Queen's University

B A	Black ribbed silk edged with white fur and the neck edged with watered blue silk
M A	Black ribbed silk lined and edged with watered blue silk
D Litt	Scarlet superfine cloth lined with white silk and edged with watered blue silk
B D	Black ribbed silk lined with white silk and edged with watered blue silk
D D	Scarlet superfine cloth lined with black silk and edged with watered blue silk
LL B	Black ribbed silk lined with pink silk and edged with watered blue silk
LL D	Scarlet superfine cloth lined with pink silk and edged with watered blue silk
M B, B Ch, B A O	Black ribbed silk lined with scarlet silk and edged with watered blue silk
M Ch.	Ribbed red silk lined with white silk and edged with watered blue silk
M D	Scarlet superfine cloth lined with scarlet silk and edged with watered blue silk
M A O	Black ribbed silk lined with purple silk and edged with watered blue silk
B Mus	Blue silk lined with white silk and edged with watered blue silk
D Mus	Scarlet superfine cloth lined with blue silk and edged with watered blue silk
Ph D	Scarlet superfine cloth lined with violet silk and edged with watered blue silk
B Sc	Black ribbed silk lined with green silk and edged with watered blue silk
M Sc	Ribbed red silk lined with green silk and edged with watered blue silk
D Sc	Scarlet superfine cloth lined with green silk and edged with watered blue silk
B Sc (Econ)	Black ribbed silk lined with rose pink silk and edged with watered blue silk
M Sc (Econ)	Rose pink silk lined with white silk and edged with watered blue silk
B D S	Black ribbed silk lined with grey silk and edged with watered blue silk
B Agric.	Black ribbed silk lined with yellow silk and edged with watered blue silk
M Agric	Red ribbed silk lined with yellow silk and edged with watered blue silk

Note —Bachelors and Masters' hoods are of the simple shape and Doctors of the full shape All the hoods have the neck portion at least edged with the pale blue watered silk peculiar to this University

Birmingham

B A*	Black ribbed silk lined for 3" with watered electric blue
M A	Black ribbed silk fully lined with watered electric blue
B D	Black ribbed silk lined with watered cobalt blue
D D	Scarlet superfine cloth lined with watered cobalt blue
LL B	Black ribbed silk lined for 3" with watered bronze green silk
LL.M.	Black ribbed silk fully lined with watered bronze green silk
LL.D	Scarlet superfine cloth lined with watered bronze green silk.
M B, Ch B	Black ribbed silk lined for 3" with watered cardinal silk
Ch M.	Black ribbed silk fully lined with watered cardinal silk
M D	Scarlet superfine cloth lined with watered cardinal silk
B Mus	Black ribbed silk lined for 3" with watered orange silk
D Mus	Scarlet superfine cloth lined with watered orange silk
Ph D	Crimson cloth, lined with the watered silk of the Faculty
B Sc	Black ribbed silk lined for 3" with watered grey silk
M Sc	Black ribbed silk fully lined with watered grey silk
D Sc	Scarlet superfine cloth lined with watered grey silk
D Litt	Scarlet superfine cloth lined with watered electric blue silk
B D S	Black ribbed silk lined for 3" with watered dark red silk
M D S	Black ribbed silk fully lined with watered dark red silk
B Com	Black ribbed silk lined for 3" with watered terra-cotta silk
M Com	Black ribbed silk fully lined with watered terra-cotta silk
B Soc Sc, M Soc Sc	Follow the scheme for Bachelors and Masters above with 3" of the watered silk of the Faculty

Note —All hoods are of the full shape, similar to London, all the capes having well-rounded corners

(In all Faculties)

All hoods are lined throughout with the University silk, a turquoise blue taffeta All Bachelors' hoods (other than B D and B Mus) are of black ribbed rayon, of the improved Oxford Burgon shape The B D is of black superfine cloth of the same shape as the Doctors'. The B Mus. is of the same shape as the B A , LL B and B Sc , but is of cream figured damask silk. The Ph D is of claret coloured cloth The D Mus is of the same shape as the Doctors' (*i e.* of the improved Oxford Doctors' shape) but is of cream figured damask silk. All the Higher Doctors' hoods are of scarlet superfine cloth with semi-circular cape of the improved Oxford Doctors'. The necks of all hoods are cut in one piece with a single central seam and no neck bands are let in Edging of all hoods is forbidden except that Masters' hoods are ordered to be edged ½″ with the lining silk (turquoise blue) round the cape portion only · all Masters' hoods are of the London shape, with well-rounded cape.

B Pharm	Light Blue and Grey and Black.
M Pharm	Black, Light Blue and Grey
M Ed	Light Blue and Lilac and Black.

Note —All hoods in this University are of the full, Cambridge, shape All Bachelors' hoods are of black stuff, lined for 3" only with light blue silk The hoods of all Masters and of Bachelors in Divinity are of black silk, and lined throughout with light blue silk.

The hoods of Doctors in Philosophy are of claret coloured silk or cloth lined throughout with light blue silk The hoods of the Higher Doctors are of scarlet superfine cloth lined throughout with light blue silk

All hoods in this University are bound (cowl portion only) with a ribbon of the appropriate faculty colour

The Faculty colours are —

Arts	Cherry red	Pharmacy	Dove grey
Theology	Purple	Agriculture and Horticulture	Green
Law	Maroon		
Music	Pink	Engineering and Mining	Light Navy blue
Education	Lilac		
Science	Royal blue		

Oxford

B A	Black, half-lined and edged with white fur
M A	Black silk, lined crimson or shot crimson silk
B D	Black, lined fine ribbed black silk
D D	Scarlet superfine cloth, lined fine ribbed black silk
B C L	Medium blue silk, lined or trimmed with white fur
D C L	Scarlet superfine cloth, lined crimson silk
B M , B Ch	Medium blue, half-lined and edged with white fur.
M Ch	Black silk, lined and edged with blue silk
D M	Scarlet superfine cloth, lined crimson silk
B Mus	Lilac silk, half-lined and edged with white fur
D Mus	Cream silk brocade with apple-blossom embroidery lined with cherry crimson silk
D Litt. / D Sc	Scarlet superfine cloth, lined with grey silk
B Litt	Light blue, half-lined and edged with white fur
B Sc	Same as B Litt
B Phil	Dark blue silk lined with white silk
D Phil	Scarlet superfine cloth, lined navy-blue silk

Note —The Oxford Bachelors' hoods (except B.D & B Phil) and the M A hood are either of Burgon or Oxford shape The B Phil and M Ch. hoods are always of Oxford shape The B D and all Doctors' hoods are of the correct full apron shape B A , M.A , M Ch and B D hoods are of corded black silk, the other Bachelors' hoods are of corded or ribbed silk of the colour shown, lined or trimmed with white fur When the Burgon shape is used the hood is half-lined and edged with fur, but for the Oxford shape only an edging of fur is used

Reading

B A, M A., D Litt., B Sc, M.Sc., D Sc., Ph D.	All Reading hoods are lined with cream coloured silk Bachelors' hoods are of dark blue lined with cream silk to a depth of 3" All hoods are full shape All Doctors' hoods are of scarlet superfine cloth fully lined with cream silk, of the full shape, except Ph D , which is of crimson cloth lined with cream silk (maroon Russell-Cord is generally used)

St. Andrews

USEFUL FACTORS

$(a+b)^2 = a^2+2ab+b^2$
$(a-b)^2 = a^2-2ab+b^2$
$a^2-b^2=(a+b)(a-b)$
$a^3+b^3=(a+b)(a^2-ab+b^2)$
$a^3-b^3=(a-b)(a^2+ab+b^2)$
$x^4+x^2y^2+y^4=(x^2+xy+y^2)(x^2-xy+y^2)$
$a^3+b^3+c^3-3abc=(a+b+c)(a^2+b^2+c^2-ab-bc-ca)$
$a^2(b-c)+b^2(c-a)+c^2(a-b)=-(a-b)(b-c)(c-a)$
$bc(b-c)+ca(c-a)+ab(a-b)=-(a-b)(b-c)(c-a)$
$a(b^2-c^2)+b(c^2-a^2)+c(a^2-b^2)=(a-b)(b-c)(c-a)$

ARITHMETICAL PROGRESSION

Last term $= a+(n-1)d$

Sum to n terms $= \frac{n}{2}[2a+(n-1)d]$

GEOMETRICAL PROGRESSION

pth term $= ar^{p-1}$

Sum to n terms $= a\frac{r^n-1}{r-1}$ or $a\frac{1-r^n}{1-r}$

Sum to infinity when $r<1$ $= \frac{a}{1-r}$

PERMUTATIONS AND COMBINATIONS

$$^nP_r = n(n-1)(n-2)\ldots\ldots(n-r+1) = \frac{|\underline{n}}{|\underline{n-r}}$$

$$^nC_r = \frac{n(n-1)(n-2)\ldots\ldots(n-r+1)}{|\underline{r}} = \frac{|\underline{n}}{|\underline{r}\;|\underline{n-r}}$$

BINOMIAL THEOREM

$$(a+x)^n = a^n + na^{n-1}x + \frac{n(n-1)}{1.2}a^{n-2}x^2 + \ldots + {}^nC_r a^{n-r}x^r + \ldots\ldots + x^n$$

MENSURATION FORMULÆ

LINES
- Pythagorean Theorem $a^2 = b^2+c^2$
- Circumference of circle $= 2\pi r$

PLANE AREAS
- Parallelogram $= bh$
- Triangle $= \frac{1}{2}bh$
- Trapezium $= \frac{1}{2}(a+b)h$
- Circle $= \pi r^2$
- Ellipse $= \pi ab$

CURVED SURFACES
- Cylinder = circum. base × height
- Cone = $\frac{1}{2}$ circum. base × slant
- Conical Frustum $= \pi(R+r)s$
- Sphere $= 4\pi r^2$

VOLUMES
- Prism (or Cylinder) = area base × height
- Pyramid (or Cone) = $\frac{1}{3}$ area base × height
- Prismoid $= \frac{h}{6}(A+B+4C)$
- Sphere $= \frac{4}{3}\pi r^3$

TRIGONOMETRY

(a) $\pi = 3.14159$.. [approximations are $\frac{22}{7}$ and $\frac{355}{113}$]

A Radian $= 57^\circ\ 17'\ 44.8062470964''$

(b) $\sin^2\theta+\cos^2\theta = 1$

(c)

Degrees	0°	30°	45°	60°	90°
Radians	0	$\frac{\pi}{6}$	$\frac{\pi}{4}$	$\frac{\pi}{3}$	$\frac{\pi}{2}$
Sine	0	$\frac{1}{2}$	$\frac{1}{\sqrt{2}}$	$\frac{\sqrt{3}}{2}$	1

(i) $R = \frac{a}{2\sin A} = \frac{b}{2\sin B} = \frac{c}{2\sin C} = \frac{abc}{4\Delta}$

$r = \frac{\Delta}{s} = (s-a)\tan\frac{A}{2} = \quad =$

$r_1 = \frac{\Delta}{s-a} = s\tan\frac{A}{2}$

Area of a quadrilateral inscribable in a circle.
$= \sqrt{(s-a)(s-b)(s-c)(s-d)}$

$\frac{\sin\theta}{\theta} = 1$, when θ is very small.

$\sin\alpha + \sin(\alpha+\beta) + \sin(\alpha+2\beta) + \ldots$ to n terms
$$= \frac{\sin\left\{\alpha + \frac{n-1}{2}\beta\right\}\sin\frac{n\beta}{2}}{\sin\frac{\beta}{2}}$$

$\cos\alpha + \cos(\alpha+\beta) + \cos(\alpha+2\beta) + \ldots$ to n terms
$$= \frac{\cos\left\{\alpha + \frac{n-1}{2}\beta\right\}\sin\frac{n\beta}{2}}{\sin\frac{\beta}{2}}$$

MISCELLANEOUS DATA.

1 metre = 100 cm = 1000 mm = 0.001 Km
1 yard = 3 ft. = 36 in = 0.9144 metre.
1 mile = 8 fur = 320 po. = 1760 yards
1 hectare = 100 ares (10,000 sq. metres) = 2.4711 acres
1 acre = 4840 sq yds. = 0.40468 hectare.
1 litre = 0.001 c metre = 1.75980 pints.
1 gallon = 4 qt = 8 pt = 0.1606 c. ft = 4.546 litres.
1 quarter = 8 bush = 32 pk = 64 gal.
1 Kilogram = 1000 g = 0.001 tonne
1 lb. = 16 oz = 7000 grains = 453.6 grams
1 ton = 20 cwt = 80 qr. = 2240 lbs
1 litre of water weighs 1 kg. 1 c. ft of water weighs 62.3 lbs
1 gallon of water weighs 10 lbs
A circle of a radius r has a circumference $2\pi r$ and an area πr^2, where $\pi = 3.1416$, $\frac{1}{\pi} = 0.3183$, $\pi^2 = 9.8696$.
Base of natural logarithms is $e = 2.7183$.
The acceleration of a falling body is 32.2 feet per sec. per sec, or 981 cm per sec per sec
1 horse-power = 550 foot pounds per second = 746 watts.
1 atmosphere = 760 mm of mercury (30 in.) = 1.03 Kg. per sq cm = 14.7 lbs. per sq. inch = 1010 millibars.
1 statute mile = 5280 feet = approx. 1.6 kilometres.
1 sea mile = 6080 feet = approx. 2000 yds.
1 cable = $\frac{1}{10}$ sea mile
1 shackle = $\frac{1}{8}$ cable
1 knot = 1 sea mile per hr = approx. 100 ft. per min.
1 ton (ship capacity) = 100 c ft of water

Gravity—"g" at lat. 45° 980.6 | Poles 983.2
(*cm /sec /sec.*) Equator 978.0 | Greenwich 981.17

Earth—Mean Diameter = 7918 miles.
Mean distance from Sun = 93,004,000 miles
Mean Density = 5.53 gm./cm ^{3}
Mass = 5.9×10^{21} tons.
Sun—Diameter = 865,400 miles.
Volume = 1,300,000 times that of Earth.
Mass = 332,000 times that of Earth.
Moon—Mean distance from Earth = 238,857 miles.
Diameter = 2,160 miles.

Mechanical Equivalent of Heat.

= 778 ft. lb. in lb. ° F. units
= 4.18×10^7 ergs in grm ° C units

Latent Heats (calories per gm) of fusion, Ice = 79.6
of vaporization, Water = 539
of fusion, Lead = 6

Velocity of light *in vacuo* = 186,282.6 miles per second.

MECHANICS

$$v = u + ft$$
$$s = ut + \tfrac{1}{2}ft^2$$
$$v^2 = u^2 + 2fs$$
$$P = mf$$
$$\text{or } P = \frac{w}{g}f$$

Time of swing of Pendulum—

$$t = 2\pi\sqrt{\frac{l}{g}}$$

AREAS AND VOLUMES

$\pi = 3.14159$

CHEMICAL NAMES OF COMMON SUBSTANCES

Alcohol = Ethyl Alcohol (C_2H_5OH).
Alum = Potassium Aluminium Sulphate ($K_2SO_4.Al_2[SO_4]_3.24H_2O$).
Aqua fortis = Nitric Acid (HNO_3).
Bi-Carbonate of Soda = Sodium Hydrogen Carbonate ($NaHCO_3$).
Blue Vitriol (Blue Stone) = Copper Sulphate ($CuSO_4.5H_2O$).
Boracic Acid = Boric Acid (H_3BO_3).
Borax = Sodium Borate ($Na_2B_4O_7.10H_2O$).
Calomel = Mercurous Chloride (Hg_2Cl_2) (laxative, non-poisonous).
Chalk = Calcium Carbonate ($CaCO_3$).
Common Salt = Sodium Chloride (NaCl).
Corrosive Sublimate = Mercuric Chloride ($HgCl_2$) (violently poisonous).
Epsom Salts = Magnesium Sulphate ($MgSO_4.7H_2O$).
Fire Damp = Methane (CH_4) + air.
Glauber Salts = Sodium Sulphate ($Na_2SO_4.10H_2O$).
Green Vitriol = Ferrous Sulphate ($FeSO_4.7H_2O$).
Hypo = Sodium Thiosulphate ($Na_2S_2O_3.5H_2O$)
Lime = Calcium Oxide (CaO).
Oil of Vitriol = Sulphuric Acid (H_2SO_4)
Plaster of Paris = Calcium Sulphate ($(CaSO_4)_2H_2O$).
Red Lead = Triplumbic Tetroxide (Pb_3O_4).
Sal Ammoniac = Ammonium Chloride (NH_4Cl).
Sal Volatile = Impure Ammonium Carbonate ($[NH_4]_2CO_3$).
Saltpetre = Potassium Nitrate (KNO_3).
Salts of Lemon = Potassium Hydrogen Oxalate (KHC_2O_4).
Spirit of Salt = Hydrochloric Acid (HCl).
Sugar of Lead = Lead Acetate ($Pb[C_2H_3O_2]_2.3H_2O$)
Verdigris = Basic Copper Acetate ($-Cu[C_2H_3O_2]_2.Cu[OH]_2$)
Vinegar = Dilute Acetic Acid ($C_2H_4O_2$)
Washing Soda = Crystalline Sodium Carbonate ($Na_2CO_3.10H_2O$).
White Lead = Basic Lead Carbonate ($2PbCO_3.Pb[OH]_2$).

SEA AREAS USED IN WEATHER FORECASTS

mendeleevium *	Mv	101	256	zirconium	Zr	40	91.22

* In the cases of these elements, which are very rare or not found in nature, but have been artificially prepared, atomic weight in the chemical sense is meaningless, the integral mass of the most stable isotope known is given

Note The new elements with an atomic number higher than that of uranium 238 (element 92) are termed Transuranics The discovery of element 103 was announced in April 1961, to be known as lawrencium in honour of E O Lawrence, inventor of the cyclotron

GAS LAWS

Boyle's Law (1662) pV = constant

Charles' Law (1787) $\frac{pV}{T}$ = constant

Van der Waal's equation $\left(p+\frac{a}{V^2}\right)(V-b) = RT$ where a and b are constants.

Adiabatic expansion of a gas pV^{γ} = constant where $\gamma = \frac{C_p}{C_v}$.

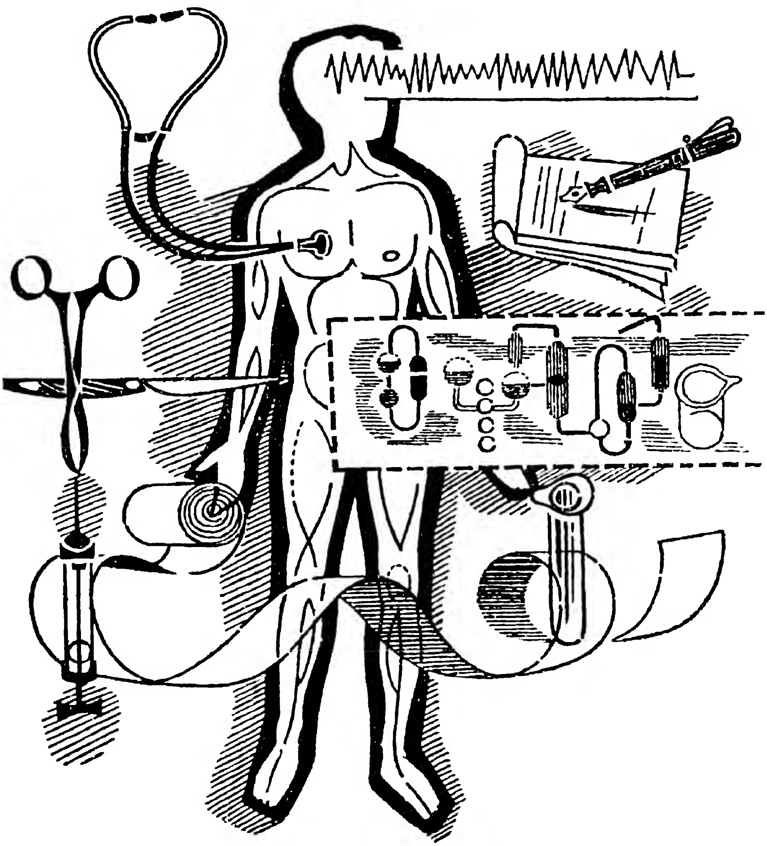
Medical Matters



In recent times it has become apparent that people want to know more about medicine. The choice is thus not between knowing and not knowing but between accurate and inaccurate information. Here we attempt to give an objective account of recent developments, but not to usurp the function of the family doctor.

TABLE OF CONTENTS

Medical Matters

PART I. INTRODUCTION.

(a) HOW TO USE THE SECTION.

Diseases do not exist in watertight compartments, but doctors arrange them according either to their cause or the area of the body affected. This plan has been followed here, and at the beginning of each part an account of the group of diseases under discussion is given. Unless you know enough already, you would be wise to read it.

Here is some advice about your attitude to disease in general, and your use of this section in particular.

First of all, and obviously, no book is a substitute for the doctor, and when you are ill you must see him. There are good and bad doctors, competent and incompetent ones, just as in any other profession or trade, so choose a doctor you can trust, *and then believe what he tells you and carry out his advice*. There is no use complaining about the whole medical profession just because you are dissatisfied with your own G.P. If you are, you should change him.

Secondly, *never* believe what you hear from non-medical sources. Literally millions of people are made miserable every year by taking to heart nonsense told them by others, who may well be quite unaware of the harm they do, or even have the very best intentions. In any medical matter ask your doctor, and ignore your next-door neighbour's asked-for or unasked-for advice. Doctors are sometimes wrong, but they are much less likely to be wrong than someone without a medical education. Remember, too, that the statement that there is no cure for a disease does not necessarily mean that it is deadly: baldness, for example, if not curable, is hardly serious.

Thirdly, don't try to diagnose your own trouble or decide what treatment you think you should have. This section will have failed completely in its intentions if it puts you in the position of a character described by an English humourist, who, from a medical dictionary, discovered that he had every disease listed in it with the solitary exception of housemaid's knee. Diseases which appear to the layman to have the "same" symptoms may be vastly different in seriousness: influenza and poliomyelitis, for example, may in the initial stages, appear very similar. So also may stomach ulcer and cancer of the stomach. No human being is infallible, but it is most important that you should go to the person who is best fitted to know—your doctor.

Lastly, you should not be misled into thinking that you can always tell the seriousness of a disease by the general appearance of the patient. Children, in particular, may have a high temperature, or even be delirious, on one day, and the next be out of bed and wanting to get back to school. On the other hand, many of the most dangerous fevers (as we shall see later) are accompanied by a low temperature and do not appear particularly dramatic in the initial stages. Thus a young woman who may be aware of nothing wrong but lack of energy and getting easily tired may be dangerously ill with tuberculosis of the lungs.

The best rule is to seek medical advice either when you have suddenly become ill with symptoms you don't understand or (and this is equally important) if you have gradually been feeling less fit over a period of time. Perhaps, too, it is wise to call your doctor if you have been ill with *anything* for more than three days. You should *not* call in a specialist before seeing your G.P., as is so often done in America and on the Continent. Specialists are very clever, but are naturally prejudiced in favour of their own subject: for example, an eye specialist will be predisposed to think of your headache in terms of eyestrain, an ear, nose, and throat specialist in terms of sinus trouble, and a psychiatrist in terms of mother-in-law trouble. Therefore you should first have a check from your G.P., who knows a little of all these things and probably a great deal about you and your past history. He will then advise you about a specialist if necessary.

(b) NEW VIEWS ON MEDICINE

(1) Body and Mind. In former times, or, at least during the nineteenth century, the body was regarded as a sort of machine belonging to you in much the same way that you own your watch. You went to your doctor and, in effect, said: "Now what on earth are you going to do about my stomach?"—and you spoke as if, somehow, your stomach didn't have anything to do with the *real* you—it was just an awkward thing that happened to be annoying you. But we know now that this is not so—that your body *is* you, that it is a fort fighting against such enemies as poisons, parasites, germs, cancer, injuries, things you are sensitive to (which we call allergens), and two others—not enough of the right kind of food, and anxiety. Your anxieties and worries can kill you just as surely as the other agents, and can prevent recovery or retard it when you are already ill.

A stomach ulcer therefore is not just something that is happening to you—you are happening to it. Your fears, your jealousies, your hatreds, your inability to get on in life, can be (in some cases) just as deadly as germs or poisons—in fact, they act by setting free glandular poisons in your blood-stream. Scientists have discovered a reaction which they call the "stress response," and we now know that stress can ultimately lead to sickness or death without any bodily injury at all. Thus, Dr. L. J. Saul, a leading American doctor, writes: "Emotional stress in which there is no physical damage can produce responses which lead to actual damage and even to death." Rats in the laboratory can be killed through long exposure to fear caused by loud noises or other forms of shock without even being touched.

This stress factor is emphasised not because it is more important than the other enemies of the body or mind (it would be better to say body-mind), but because, as we shall see later, it does cause serious diseases, and, secondly, as mentioned already, it influences the process of recovery. A person who is afraid or has no hope is less likely to recover from pneumonia or another disease than one who is hopeful, who has peace of mind and confidence.

(2) New Views about Health. A great deal of nonsense has been talked about the healthy life: at one time we were told to take eighteen chews to each bite, to do deep breathing, to take plenty of exercise, to get lots of fresh air, to eat regularly (or to indulge in peculiar diets). But more recently,

eminent doctors have cast doubt on most of these fancies. Exercise is perfectly all right if you like it, but athletes who indulge in violent exercise have not always been noted for longevity. Fresh air is pleasant and stimulating, but, where actual breathing is concerned, it is no better than the air in most rooms. Certainly, one of the problems of our time is air pollution by smoke and Diesel fumes, which are highly dangerous, but at present we are considering ordinary fresh air in comparison with the air indoors, and, in this case, the experts say there is little difference so far as health is concerned.

A balanced diet containing correct amounts of the basic food substances is essential, but there is no evidence that when, or at what intervals, you eat makes the slightest difference—unless you are a sufferer from stomach ulcer, in which case it is necessary that the intervals between meals should not be too long. The whole business of having meals at fixed intervals is nothing but a social convention, and in modern life obviously a matter of convenience.

Sleep, too, is a necessity. But different people require vastly different amounts of sleep. Some manage on as little as three hours, others seem to believe that they need ten or more, and there are well-authenticated records of people who never sleep at all. For example, a certain Dr Pavoni in Northern Italy did not sleep for sixty years and made a virtue of necessity by specialising in night calls! Insomnia is unpleasant, but its only harmful effect results not from sleeplessness itself but from worry about it, for many people seem to believe that if they do not sleep they will go mad or at least become seriously ill. This is quite untrue.

In a number of studies of men and women who lived to a ripe old age it was found that the only factors in common between them were that they had a good balanced diet of healthy food, that they had contented minds, and that they were interested in something which gave them an aim in life. They also came of long-lived families—for living a long and healthy life depends partly upon heredity.

So the main rules of health are: do not think too much about your health unless it gives you trouble, have an interest in life and be prepared to sacrifice a lot for it (nothing useful has ever been done by those who are always "taking care" and being over-cautious), eat a good balanced diet, do not worry, and have a contented mind.

(3) New Drugs. A great surgeon, the first of the moderns, was Ambrose Paré, who died in 1590, and one of his best known sayings was "I apply the dressing, but God heals the wound." He was quite right, for until about forty years ago, or even less, all the physician could do was to put the patient in as favourable a state as possible to enable his body to cure itself. That is to say, there were hardly any specific drugs—drugs that had a direct effect on the disease. There was quinine, discovered by the Spaniards in America, which was specific for malaria, and there were iron (specific for anaemia) and digitalis (specific for certain types of heart disease), but otherwise nothing until the nineteenth century, when Paul Ehrlich discovered Salvarsan, which is specific for syphilis. Ehrlich died in 1914, having conceived the brilliant idea of drugs which he described as "magic bullets"—*i.e.*, drugs which, like bullets, would be aimed at the real cause of the disease. They would, that is to say, be specific.

Since then a large number of such drugs have been discovered. First, the antibiotics, such as penicillin, discovered in 1928 by Sir Alexander Fleming with the co-operation of Sir Howard Florey and Dr E. Chain, who, in 1939, were able to make penicillin available to the public in sufficient quantities by new techniques of production. Penicillin is practically non-poisonous (although it is possible to become allergic to it, sometimes with serious results). It can kill some germs in a dilution of one part of penicillin to one hundred million parts of water; it is effective against streptococci, the cause of blood-poisoning, sepsis in wounds, and many other diseases, and also against the germs of anthrax, gonorrhoea, meningitis of some types, syphilis—a whole list of plagues which have troubled man for centuries. Blood-poisoning, whether from wounds or childbirth, used to be almost incurable—now the rate of cure is 80–90 per cent.; anthrax and gonorrhoea have an almost 100 per cent. rate of cure. In pneumonia the rate is about 90 per cent., and early syphilis can be cured in a week, instead of the previous two to three years.

But this was only the beginning. Other antibiotics—streptomycin, terramycin, erythromycin, and many others—are helping to wipe out the terrible scourges of the human race, in particular, in the case of streptomycin, tuberculosis. The sulpha group of drugs—sulphonamide, sulphaguanidine, sulphathiazol, etc.—have also proved a great boon. Then there are the new drugs which have created a revolution in psychiatry—the tranquillisers which relieve anxiety, the drugs which clear up certain types of depression, and substances such as chlorpromazine which make it possible to nurse formerly violent patients in the wards of a general hospital. The antihistamine drugs help in many cases of allergy, the anticoagulants prevent further attacks of coronary thrombosis, and almost every day new and powerful aids in the fight against disease are discovered.

Of course, these potent new drugs are not without their concomitant risks, and it might even be said that, within limits, the more useful the drug the greater the risk of side-effects. That is why they should be used with discretion and not for every trivial illness in which their only effect may be to shorten slightly the course of a condition which, left alone, would recover of itself. Yet in Britain and other technically-advanced countries indiscriminate prescribing is common, largely because of pressure on the doctor from his patients and the drug firms. The busy mother whose child has a mild sore throat is not going to see the child sweat it out when she knows from past experience that a dose of penicillin can remove the fever and most of the symptoms within twenty-four hours. She is unlikely to listen to the argument that the slower process is capable of increasing the body's resistance to future attacks, or that repeated administration of penicillin may create germs which are insensitive to it in a future emergency, or, worse still, produce an allergy to the drug. The thalidomide tragedy of 1962–3, when a new sedative, hailed as being both effective and safe (cases were quoted of would-be suicides who had taken up to 100 of the tablets without loss of life), resulted in the birth of children with undeveloped arms and legs to mothers who had used the drug in early pregnancy, and prolonged neuritis in some adults, has been quoted against the drug industry as an example of cut-throat competition allowing new preparations on the market before they had been exhaustively tested. But the truth is not quite so simple. There can be no reasonable question that the drug industry needs to be under stricter control, that its methods of advertising its wares to the doctor are wasteful, importunate, and often in bad taste, that different firms put out what is virtually the same drug under various trade names which merely leads to confusion, that the "authorities" quoted in the advertising of some drugs are often obscure individuals in countries not noted for the high standard of their practice of medicine writing in equally obscure journals, and that many drug firms make grossly inflated profits at the expense of our National Health Service. On the other hand, it must be remembered that some of the best drug firms have played a major part in medical progress. We would not have aspirin, the safer sulpha drugs, the drugs which have created a revolution in psychiatry, without the research done by these firms. So far as thalidomide is concerned, the fact is that nobody previously had seriously considered the possibility of a drug capable of causing deformity in the unborn child, and, if they had done, it is quite likely that the danger would still have been undiscovered, since only one laboratory animal responds to thalidomide in the same way as man.

The drug had been exhaustively tested by all ordinary methods before being put on the market, and for a number of years (during which, in Germany, it was on sale to the public without prescription because of its apparent safety), millions of people took it without any ill-effects either immediately or subsequently. Its terrible side-effects were, in fact, limited to those mothers who used it in early, not later, pregnancy, and in a lesser degree to a small proportion of adults who developed unpleasant, but not dangerous, symptoms of neuritis.

The taking of any effective drug is always a calculated risk. We have mentioned that the use of penicillin—a drug which is almost completely non-poisonous—may nevertheless cause other germs and fungi to multiply in the body with unpleasant results. This is because penicillin wipes out, not only the disease-producing germs it is being used to destroy, but the penicillin-sensitive harmless germs which hold the other potentially harmful germs at bay. Thus those who keep on sucking penicillin lozenges for a real or imaginary sore throat may develop a black tongue due to the spread of a fungus normally present but kept under control. Other antibiotics, described as "wide range" because they wipe out an even greater variety of germs than penicillin, also kill the organisms responsible for the absorption and possibly the creation of vitamin B in the body, thus causing severe vitamin deficiency. Since thalidomide is believed to have produced its bad effects by the destruction of vitamin B, the possibility that these new antibiotics could lead to the same results if used in early pregnancy must lead to greater caution in their use. Tranquillisers made by various firms vary from the wholly useless to the very useful, but both can have unpleasant side-effects. One type is prone to lead in a small number of cases to severe depression, others may lower the blood-pressure to a degree that causes fainting attacks, and serious blood and liver diseases are not unknown if not common. Both tranquillisers and the antihistamine drugs can cause some people to become extremely drowsy—an obvious danger if one drives a car or works on heights. Even aspirin causes gastric hæmorrhages (admittedly usually on a small scale) in those who use it, such haemorrhages are ordinarily unknown to the patient, and insignificant, only discoverable by chemical tests. They do not detract from the usefulness of aspirin, still one of the safest drugs, but those with gastric trouble would be better to avoid it.

None of this should deter the patient from being advised by a doctor he trusts to use whatever drugs are prescribed. it *should* deter him from putting emotional pressure on his doctor to obtain drugs unwillingly given. It is high time that we gave up the notion that no patient should leave the consulting-room without a prescription for some pill or potion, for something like 40 per cent. of patients simply require advice about the conduct of their life from their diet to their relationships with others rather than medicine of any kind. The housing shortage, a bullying boss, or a nagging mother-in law cannot be removed by a tranquilliser—in fact, a tranquilliser, by making a man or woman feel better, may prevent them from constructively solving problems which exist in the real world. We should all learn to rely as little on drugs as possible: stop taking tranquillisers or pep pills when we are merely worried about something that any normal person would worry about, or because we are just "fed-up", stop using antibiotics (which are badly needed elsewhere in the world) for trivial infections in which they are anyhow useless, stop swallowing vitamin pills which do not relieve tiredness and are merely wasted on this overfed nation, stop buying any patent medicine whatever. Modern drugs are potent and effective, they are a dagger to destroy the enemy of disease. But, like a dagger, those who play about with them incompetently and unnecessarily are liable to get badly hurt.

(4) New Methods in Surgery. Only a few years before the Second World War many surgeons were saying that surgery had reached its extreme limits. It was impossible, they believed, to improve on the delicate techniques then reached. But events have proved them wrong. Operations on the heart, for example, which would have been inconceivable a short time ago are now carried out daily—the heart can be opened and defects of the all-important valves made good. "Blue-Babies" or adults with a heart disease which might have led to their death in a few years are now cured by surgery, and it is possible during such operations to cut off all the blood from the heart by deflecting it through tubes to an artificial heart outside the body—a machine which pumps the blood round the body whilst the real heart is at rest.

This however, will be described in more detail later.

Then there are the new anæsthetics, such as Pentothal, which are injected into a vein in the arm instead of being breathed in through a mask, as were ether and chloroform or ethyl chloride. Pentothal is much safer, and avoids the unpleasant after-effects of vomiting and nausea, which usually followed the old type of anæsthetic. Most curious of all anæsthetists use the poison curare, used by South American Indians to poison their arrow-heads. Curare produces paralysis, but in small doses merely gives the degree of muscle relaxation which is so important to the surgeon when he is operating.

Lastly, we might mention the new techniques of plastic surgery. Thus large areas of skin which have been destroyed by severe burns can be replaced by shaving off thin layers from another part of the body. These do not need to cover completely the whole damaged area: small pieces are scattered over the wound and gradually grow together. Corneal disease (the cornea is part of the "window" of the eye, and when it becomes opaque the patient cannot see) is treated by removing the diseased cornea and replacing it by a cornea removed from a dead body, or sometimes from an eye which has had to be removed from a live patient for other reasons. There are, in fact "cornea banks" where corneas are kept in refrigeration for future use, just as there are "blood banks" for use in blood transfusions. Other advances in surgery will be described elsewhere in the section.

(5) New Approaches in Social Medicine. Medicine has passed through many phases from the time when disease was regarded as a punishment from the gods or a sign of devil possession to the present era, when increasingly there is a tendency to look on society as the patient. Indeed, one commonly hears doctors and sociologists nowadays talking about "the sick society".

The early primitive stage came to an end, at least in one part of the world - when in Greece, five centuries before Christ, Hippocrates and others began to teach that all diseases were due to natural causes. But after the first ray of hope the outlook began to deteriorate when, during the Middle and Dark Ages (that is, from the fall of the Roman Empire right up to the fifteenth century), there was a return to the belief in devil possession and supernatural causes.

Eighteenth-century medicine in Europe was materialistic, regarding the body as a machine. It was founded upon a sort of pseudo-science—although, of course there were always individual exceptions, physicians such as Sydenham in England, who, avoiding all theories, based their work on observation of the patient. This mechanistic approach persisted right through the nineteenth century, but medicine became more and more truly scientific, and the century saw the most rapid advances in the field ever known until our own times: the discovery of germs by Pasteur, of antiseptics to combat them by Lister, of vaccination by Jenner and anæsthetics by the American Wells and the Scot Simpson. The use of the microscope by Virchow, who was a German, brought great advances in the understanding of disease and Ehrlich, another German, conceived, as we have already seen, the idea of "magic bullets" which would attack the germs at the

root of a disease without harming the patient. But one of the greatest of all these great men is perhaps the least known. His name was Edwin Chadwick.

From the earliest period of recorded history human communities had been constantly ravaged by great plagues which swept over their lands year after year, killing untold millions. Such plagues are recorded in the Bible and other ancient books, but, when town life became more and more common, as during the Roman Empire and the Middle Ages in Europe, the overcrowded conditions were even more favourable to the spread of disease. The Black Death of 1348–9 wiped out almost half the population of Europe. But, even in the first quarter of the nineteenth century in London, tens of thousands died from typhus, typhoid, and small-pox—and not only these, for periodically cholera would be brought into the country by travellers from abroad.

In the face of these terrible visitations the individual physician was helpless. He could not treat each one of the many sick even had he known how, and Chadwick's claim to fame rests on the fact that he was the first man to think in terms of *social* control of diseases, by so dealing with their causes that they were prevented from arising at all. In order to wipe out typhoid and cholera, he argued, we must ensure clean water supplies, for these diseases are caused by germs carried in polluted water. In order to attack typhus and plague, one must get rid of the lice which carry the germs of typhus and the rat-fleas which carry the germs of plague (including, of course, the rats, which, in turn, carry the fleas).

In the past, some attempts had been made to segregate the sick to prevent the spread of disease—for example, in the case of leprosy (which, strangely enough, we now know to be less infectious than most germ-borne diseases). But segregating those who are sick with typhoid or cholera is of little use if others are still drinking polluted water, just as it is of little use segregating plague cases if rats with their infected fleas are allowed to run at large. So these early attempts met with little success, due to lack of understanding of how the infections were passed on.

Chadwick was born in a Lancashire farmhouse where the children were washed every day all over, and he ruthlessly drove an obsession with cleanliness into the heads of his countrymen until, later in the century, it was possible for the German philosopher Treitschke to tell his class in Berlin: "The English think soap is civilisation." Although this remark was meant cynically, there is little doubt that soap, if it is not civilisation in itself, has played a greater part in making civilisation possible than many more elaborate remedies. A population riddled with chronic infectious illness has neither the time nor the energy to apply to the arts or sciences, and soap did a great deal to reduce infection.

One of the first Public Health measures was introduced by Chadwick and others when they brought in legislation to purify the water supply of London. Previously, the citizens had used water from the Thames (they still do, but only after it has been filtered and sterilised at the waterworks!), and from filthy, refuse-laden ponds and springs. Later, Chadwick helped to found the Poor Law Commission, and produced a Report in 1842, the principal suggestions of which were: a municipal water supply for all towns, scientific drainage both in town and country, and an independent health service with large powers for dealing with those who endangered the lives of others by polluting water or causing nuisances. He also proposed a national service for interment of the dead, for in those days bodies often remained for days in the overcrowded homes of the poor without burial.

What has the twentieth century contributed to the concept of social health? Well, of course, there has been a great deal of legislation along the lines initiated by Chadwick to control disease, and a great many other measures have been introduced concerned with the idea of positive health—not merely preventing bad health, but trying to bring about the highest possible state of good health. Orange juice, milk, and good meals for schoolchildren have brought about a transformation in child health which has become apparent to the least observant in the last ten or fifteen years. And the National Health Service is in the direct line of descent from early nineteenth-century legislation.

But in future years it is probable that the main achievement of the twentieth century in social medicine will prove to be its extension of the term "social health" to cover every aspect of community life, not only in such subjects as bodily health and its control of social means, but also such problems as mental illness, crime, delinquency, drug addiction, and so on. What we are now asking ourselves is: how far are these problems produced by society itself, and if this is the case, how far can we go in preventing them by social means?

Social medicine takes the view that these problems can never be dealt with solely by moralising and retribution, but only by dispassionately analysing causes and dealing with them. In this century we have developed a social conscience. Not always, it is true, a very well-informed social conscience, but at least this is a good beginning. There are organisations for dealing scientifically with delinquency, for dealing with problem children, for spreading knowledge about cancer in order to show people that it can be successfully treated if taken in time. The organisation known as "Alcoholics Anonymous" has, on the whole, been more successful in treating alcoholics by social means than have any of the individual medical methods. Mental illness is also treated by group methods, which, together with the new drugs, have revolutionised the position in mental hospitals. We can well say with John Donne, who died in 1631, that "no man is an island . . . every man's death diminisheth me, for I am involved in mankind." This is the attitude of twentieth-century social medicine.

Summary. Perhaps we can sum up our progress in the past hundred years more dramatically in terms of hard facts.

One hundred years ago, a surgical operation was never undertaken except under the gravest circumstances. There were no anæsthetics and no antiseptics, and the operation was carried out by a surgeon in a filthy tail-coat, stained with the congealed blood of countless operations (indeed the surgeons of that time took pride in the dirty condition of their coat as showing how much experience they had previously had). Germs and the part they play in producing disease were unknown, and Paul Ehrlich had not yet been born, so there were no "magic bullets" to attack syphilis, or sera for diphtheria and other diseases. The mentally ill were simply locked up with little treatment and subjected to such indignities as the strait-jacket and the padded cell; now they are given treatment which becomes more effective each year, the padded cell and strait-jacket have gone, and in the more progressive hospitals even the ward doors are not locked.

Only twenty years ago you would very likely have died if you had developed pneumonia, "childbed fever" after the birth of a child, meningitis, dysentery, typhoid, or tuberculosis. With such infections as blood-poisoning you would have had practically no chance at all. Today, the sulpha drugs and the antibiotics have changed all that. Syphilis and gonorrhœa were lifelong tragedies both to the patient and his family, but now they, too, can be conquered.

The National Health Service has brought the possibility of good treatment equally to all, and other bodies—some of them privately run—deal with alcoholism and neurosis, with rehabilitation of the mentally and physically ill, with spastics, birth control, and marriage guidance. It is up to us to see that all these facilities are used to the full by all who need them.

PART II. DISEASES ARRANGED ACCORDING EITHER TO THEIR CAUSE OR THE AREA OF THE BODY AFFECTED.

THE INFECTIOUS DISEASES

INTRODUCTION.

INFECTIOUS diseases are those which are caused by an invasion of the body by organisms from outside (the word "organism" simply means other living things, and we are using this word because, as will be seen later, it is not only what are known as "germs" which can cause infection). We know, too, that what is generally typical about this group is: (a) that the disease can be passed on from one person to another, and (b) that it is usually accompanied by a raised temperature or fever. Now (a), of course, is always true, because the definition of an infectious disease is one that can be passed on to others, but (b) is not always true, because a few infections produce little or no temperature, and also because it is possible to have a raised temperature (again in only a few cases) without any infection. For example, certain types of brain injury, tumour, or hæmorrhage can produce a raised—or lowered—temperature, and so can the injection of some foreign substance such as milk into the muscles. This is known as "protein shock," and was at one time used in the treatment of certain illnesses. Finally, solutions of dead germs, such as the anti-typhoid vaccine given to protect troops during the War, may lead when injected to very high temperatures. But, by and large, we are entitled to suppose that the patient with a raised temperature is probably suffering from an infection.

Types of Infection.

As we have seen, it is not only germs which cause infections—so from now on we shall give germs their proper name of "bacteria." Here is a list of the chief offenders which are liable to attack our bodies: bacteria, spirochætes, viruses, fungi, amœbæ, parasites, and worms. Of these, bacteria and viruses are by far the most important, but let us look at them all more closely.

Bacteria are tiny living things which can be seen only under a fairly powerful microscope. Some are like clusters of grapes (staphylococci), others are like rods which may be linked together in chains (streptococci). They are given these names because "staphylos" is the Greek word for a bunch of grapes, and "streptos" means a chain. Yet others are comma-shaped (such as the cholera vibrio), or shaped like a drumstick—a rod with a small knob at the end (the tetanus bacillus, which causes lockjaw).

It would be a mistake to think that all bacteria are harmful, for without some species we could not survive for long. Bacteriologists divide them according to their behaviour in the human body into three groups: saprophytic, parasitic or pathogenic, and symbiotic. The *saprophytic* organisms are the bacteria normally found in the skin, mouth, and intestines; they do us neither harm nor good. The *parasitic*, or as they are more usually called, pathogenic (i.e., disease-producing) organisms, are the harmful ones with which we are naturally more concerned. Lastly, there are the *symbiotic* organisms, which, whilst taking something from the body, give something in return. For example, cattle would not be able to digest the cellulose of the grass they eat were it not for helpful bacteria in the lower parts of the intestines, and there are certain bacteria in the large intestine of man which build up vitamin B2.

Bacteria have two peculiar characteristics: each reproduces by splitting into two separate individuals, a process which, incidentally, happens every hour or so, and it has been calculated that if no bacterium were destroyed, one individual could produce a mass of bacteria larger than the whole world in a matter of a few weeks (since each of the offspring also divides into two, which in turn divide again—the progression goes: one gives birth to two, these two to four, the four to eight, eight to sixteen, sixteen to thirty-two, and so on—you will see, if you work it out, that in a short period the figure becomes astronomical). Fortunately, many bacteria have accidents, so for the present the world is safe! The other curious thing about bacteria is that, barring accidents, they are potentially immortal. Under ideal conditions in which no bacteria were killed, none would die, for a bacterium there is no death from old age, no corpse except when it is actively destroyed. It simply goes on dividing, dividing, and subdividing for ever.

How, then, are bacteria destroyed? Briefly, the answer is that most are destroyed by the natural defences of the body of whatever host they are preying on, others are destroyed by antiseptics and the new drugs; and many are destroyed when they are excreted from the body in the sputum or through the bowels and land in places where they are dried up and cannot survive—although some bacteria in such circumstances can form what are called "spores," rather like the seed of plants, so making it possible for them to survive in a state of suspended animation for months on end until picked up accidentally by another unfortunate host. Finally, bacteria, in addition to all these possibilities, face another danger: they may themselves develop disease. This disease is caused by even more minute organisms known as bacteriophages (viruses which affect bacteria), discovered by the French bacteriologist d'Hérelle a good many years ago. Attack by bacteriophage causes whole groups of bacteria (known as "colonies") to disintegrate and become harmless.

Although bacteriophage has been used in the treatment of some diseases in human beings, this method has now been largely given up, since the new drugs are infinitely more effective.

Spirochaetes. Spirochætes, like bacteria, are minute organisms, but differ in being shaped somewhat like a corkscrew and in being able to move (which many bacteria cannot do). Their progress is produced by a sideways wriggling motion. The two main diseases caused by spirochætes are syphilis and spirochætal jaundice. Spirochætal jaundice is carried by rats, and is common in those who work in mines. It is now rare in Britain, but still occurs in Japan, Egypt, and Malaya; the infection is passed through the skin where the excreta of infected rats mingles with water on damp ground in the mire where miners kneel. Infection may also occur through eating infected food.

Viruses. Unlike bacteria, viruses are too small to be seen under an ordinary microscope. They can, however, be photographed in some cases under an electron microscope, which uses a magnetic field instead of a glass lens and a stream of electrons in place of a beam of light. Viruses cause such diseases as typhus, measles, mumps, poliomyelitis, smallpox, and chickenpox—not to mention such plant and animal diseases as tobacco mosaic disease and foot-and-mouth disease, which often have serious economic consequences. Other virus diseases are psittacosis (an infection of parrots and similar birds which can be transmitted to Man), swine fever in pigs, influenza in Man, and myxomatosis in rabbits. They also cause, it is believed, the common cold.

The main characteristics of viruses are, first, that they can only grow in living cells—unlike bacteria, which readily grow in the laboratory on plates containing a jelly made from meat broth, gelatin, milk, and other delicacies. The scientist, therefore, must keep them in portions of living tissue kept alive outside the body. Secondly, they are so small that they pass through the pores of the finest filter. Thirdly, a first attack usually produces immunity for life. Second attacks of the common virus diseases mentioned above are very rare, but, unfortunately, this rule does not apply to influenza or the common cold. Fourthly, there is reason to believe that viruses represent an extraordinary intermediate stage between the living and non-living; they can, for instance, be produced in crystalline form and yet are just as dangerous when "thawed out." Lastly, the virus diseases have proved for the most part to be

little affected by the new antibiotics and other drugs, although vaccination in smallpox and the injection of sera from infected patients in other infections may give immunity for longer or shorter periods.

Viruses are also responsible for typhus, yellow fever, sand-fly fever—familiar to troops in the Middle East during the last War—and dengue fever. All of these are tropical diseases, although typhus used to be common in England just over a hundred years ago. In this country virus pneumonia and virus hepatitis (a liver disease accompanied by jaundice) are not uncommon, although little known to the average layman.

Fungi. Some infections are caused by fungi—that is to say organisms belonging to the same group as moulds, mushrooms, and toadstools. Penicillin and some other antibiotics are produced from moulds, so, as in the case of bacteria, some fungi are helpful, they even help to destroy each other, for actinomycosis, the most serious of fungal diseases, which can cause infection of the jaw, the large intestine, and even the lungs, is destroyed by penicillin injections.

Most fungal infections are trivial and limited to the skin. But, although trivial, they can be unsightly and uncomfortable. Ringworm of the scalp, dhobie itch—an infection of the groin spread by infected underclothing—and so-called 'athlete's foot' are caused by a fungus.

Amœbae. Amœbæ are tiny, formless jelly-like masses, the largest of which (a harmless type found in stagnant ponds in Britain and elsewhere) is just visible to the naked eye. It is about the size of the head of a pin. Amœbæ move, in the species which are capable of moving, by pushing forward a part of the "jelly" in the appropriate direction and causing the rest to flow into the advancing portion. Like bacteria, they reproduce by dividing into halves, each of which becomes a new amœba.

The main human diseases caused by amœbæ are: amœbic dysentery (not to be confused with bacillary dysentery), sleeping sickness or trypanosomiasis, which is caused by a special kind of amœba known as a trypanosome, and malaria. All these will be discussed later in more detail, and all that need be said here is that these diseases, terrible though they once were, are well on the way to being controlled. We know, in fact, *what* to do in prevention and cure, and only human ignorance and lack of money (which is so freely spent on destructive ends) prevent them being wiped out altogether.

Parasites. These are small insects which live on the skin. The main ones in this country are lice, fleas, and the parasites of scabies. In themselves they are not dangerous, but some can carry the germs of very dangerous conditions: the flea, plague, the louse, typhus, and another, the mosquito, malaria and yellow fever.

Worms. Worms live in the human intestine, but the only common types found in Britain are threadworms, the tiny thread-like worms which cause irritability and itching in the skin of children, less often in adults, round-worms, somewhat resembling the ordinary garden earthworm, which seldom lead to symptoms, and tape-worms, which may reach a length of 10 or even 20 ft. Many parasitic worms (like some human beings) lead a double life—they spend part of their life in the human intestine and the other part in the muscles of another animal. The tape-worm, for example, whilst in the human intestine, lays eggs which pass out of the body in the excreta, and are then swallowed by pigs, especially in those parts of the world where human excreta are used as manure in the fields. In the pig, the eggs form cysts in the muscles—meat infected in this way is known as "measly pork"—and when, in turn, the meat is eaten by Man, the process in the intestine begins all over again.

Less common types, from our point of view, are the Russian tape-worm (which, as befits a Russian, grows to nearly 30 ft.!), this type is spread by caviare or undercooked infected fish. The small, leaf-shaped liver fluke, lays eggs which are passed into canals or pools in tropical countries in the urine of infected people, hatch out and enter a water snail, and finally leave the snail in the form of small parasites which pierce the skin of bathers, whence they pass to the liver and subsequently the bladder and rectum. This is a serious condition, as is also filariasis (another tropical disease), for which, unlike bilharzia—caused by the liver fluke—no cure is known. The tropical disease known as loa-loa is caused by a variety of filaria.

How the Infection is Spread.

Infection is spread in many ways, some of which have already been mentioned. In the common fevers found in Europe and elsewhere one of the most frequent ways is by *droplet infection*—that is to say, by minute drops carrying the germs which are coughed or sneezed into the air by someone already suffering from the disease. Such droplets can be projected into the air for 10 ft. or more, and when breathed in by someone within range infection may result. Next commonest mode of spread is perhaps by *infected food, water*, and the dirty hands of those who prepare food: cholera, dysentery, food-poisoning, and typhoid are spread in this way. Spread by *direct contact* is found in the venereal diseases (usually, but not always, spread by sexual intercourse with someone who already has the disease), and, of course, lice, fleas, and other parasites, including the scabies mite, are spread by contact with the infested individual—or sometimes with his clothes or bed linen. Spread through an *intermediary host*, whether it be lice, fleas, or mosquitoes carrying infection, or the various means adopted by worms, has already been described above, so no more need be said. Lastly, the infection may result from *bacteria already within the body*, for example, the bacillus coli which lives in the large intestine is there harmless, but if it gets into the bladder or the ureters (the tubes leading from kidney to bladder) a quite unpleasant result may follow in the form of cystitis or pyelitis.

How the Body Deals with Infection.

The body has many mechanisms of defence against intruders, but suffice it to say here that there are two main ones. First, substances known as antibodies and antitoxins are produced in the blood—the antitoxins to neutralise the poisons produced by the invaders, the antibodies to render them helpless, for example, by causing them to clump together so that they can more easily be dealt with by the second defence mechanism. This second mechanism is provided by the white cells in the blood, some of which (the phagocytes) act like amœbæ and swallow up and destroy the germs. Antibodies and antitoxins can be transferred from one individual to another and are used in medicine both to prevent infection and to cure it. This is known as immunisation, and can be active or passive. Active immunisation is produced by injecting either a solution of dead bacteria, as in the case of anti-typhoid injections, or by injecting live, but weakened, strains of the organism, as in the case of smallpox vaccination. In both cases the body is stimulated to produce its own immune substances. Passive immunisation is used either for people who have been in recent contact with infection or who are already ill, and in this case the antitoxins produced in another person who has had the illness are injected in the form of serum—*i.e.*, the liquid part of the blood without the blood cells. Active immunity may last a long time, but passive immunity is always short-lived.

Antiseptics.

We have already discussed the other ways in which bacteria are destroyed, and now need only make brief mention of antiseptics, and antibiotics. The earliest antiseptic was carbolic acid, used by Lister in his operating-theatre in the form of a fine spray directed throughout the operation on the wound, or sometimes in the form of steam from a kettle containing a solution of carbolic. But carbolic is dangerous, and since Lister's time many more useful antiseptics have been discovered. Acriflavine, thymol, and other old

favourites have been discarded too. The various forms of carbolic are still used to disinfect drains, but, to tell the truth, the use of antiseptics nowadays is very limited. In surgery the *antiseptic* method has given way to the *aseptic* method—instead of fighting sepsis we see to it that no possibility of sepsis is present before operating: all instruments, the surgeons' and nurses' hands, the skin, are sterilised—the instruments by boiling, the dressings by dry heat, the hands by soap and water, and almost the only antiseptic used is to clean the patient's skin in the area to be operated on.

Antiseptics are used as first-aid treatment for cuts and wounds, but should be applied only once as a general rule—that is, when the wound is first received. Even so, the modern doctor would probably prefer to use sulphonamide or penicillin powder.

Antiseptic sprays to purify the air of a room or to destroy germs lurking in the dust on the sick-room floor—or any other floor—are practically useless. To quote the *British Medical Journal*: "There is no good scientific evidence that any of the chemical air-disinfectants can control the spread of infection in places such as schools, offices, or cinemas. Nor is there good evidence that any substantial effect on the spread of illness can be obtained by disinfection of dust."

Neither is there any good reason to believe that mouth-washes and gargles have any effect other than making the mouth feel fresher and (temporarily) removing mouth odour—by covering it up with the scent of the antiseptic. Mouth-washes are in contact with the bacteria for far too short a time to have any damaging result, and in the case of tonsillitis and other diseases, all the important bacteria are hidden far out of any danger from gargles.

Antibiotics.

The antibiotics—penicillin, streptomycin, erythromycin, terramycin, aureomycin, and chloramphenicol—have already been dealt with, and only two important practical points need to be mentioned. These are that although most of such drugs are entirely safe under ordinary conditions, it is extremely dangerous for the layman to use them without medical guidance. If, for example, people get into the undesirable habit of sucking penicillin lozenges for sore throat and keep on doing this every time the sore throat returns, they may become sensitised to penicillin so that, when they become really ill—say, with pneumonia—the serious illness no longer responds to the drug. Or the same habit may make them allergic or hypersensitive to penicillin, and an injection given later may have serious and even fatal results. In any case it is doubtful whether such lozenges have any effect.

Another possibility is that excessive use of antibiotics may kill not only the dangerous bacteria, but also the ones which are helpful to the body. When this happens, other types of organism which are not affected by antibiotics will multiply in the absence of the bacteria which normally keep them under control. Thus chloramphenicol or aureomycin, by killing useful germs in the large intestine, may cause vitamin B2 deficiency, and when the non-sensitive organisms have their natural enemies removed they may step in and multiply, causing inflammation of the mouth, diarrhœa, and occasionally a fatal bowel infection.

General Treatment of Fevers.

Fevers are ordinarily heralded in by a rise in temperature which is noticeable either by a flushed face or by alternate sensations of heat and cold. These are known as "rigors," and a patient with a high temperature may be shivering.

A high temperature does not necessarily (especially in a child) mean that the trouble is serious—in diphtheria, for example, the temperature is ordinarily rather low, whereas in relatively trivial conditions it is often fairly high.

Even the trained physician finds it difficult to tell one fever from another in the early days, for most of the common fevers begin in more or less the same way. It is only when a rash or some other more definite sign becomes evident that a certain diagnosis can be made, and these may not show themselves until the patient has been feeling "run-down" and fevered for some days. Incidentally, although a clinical thermometer is a very useful thing when properly used, many a doctor must feel that, in unskilled hands, it is a menace. The "fussy" type of mother who is constantly taking her child's temperature whenever it looks in the slightest degree different from usual (probably it is simply feeling justifiably bored with its parents), not only causes anxiety to herself but also gives the habit of anxiety to her child. The child is made to feel that the world is a dangerous place, full of germs and all sorts of causes for fear—as indeed it is, but one needs a sense of proportion, and other dangers which we think much less about are at least as frightening and twice as deadly as most germs. Whatever you do, don't get the thermometer habit; your child, so far as fevers are concerned, is a good deal tougher than you.

Briefly, then, the way to treat a fever in the early stages before the doctor comes, and before one knows exactly what is wrong, is as follows:

(1) Put the patient to bed.

(2) Give little, and easily digested, food, if the patient wants none, give none.

(3) Give plenty to drink—the proprietary preparations containing lemonade and glucose are excellent, but water, weak tea with sugar, or home-made lemonade with squeezed-out lemon juice and sugar, are also suitable.

(4) There is no good reason for giving aspirin, unless to relieve headache or other pains. Since believing this goes against the grain of long-established tradition, we quote from a leading text-book on drugs: "The use of aspirin is very limited because the reduction of temperature is rarely necessary." For very high temperatures, the patient may be packed with ice (this is mainly for heat-stroke), but the most effective way in the fevers ordinarily met in this country is to give the patient a hot bath or sponge him with hot water. This opens the pores and increases sweating. Aspirin is a good pain-reliever, it reduces temperatures—which, as we have seen, is rarely necessary, but it does *not* cure colds or help you to sleep (unless, of course, the sleeplessness is caused by pain). Proprietary drugs containing aspirin with codeine or phenacetin are no better than aspirin alone.

THE INFECTIOUS FEVERS.

The remarks made above apply to the management of *any* fever, and we are now going to discuss particular infectious diseases, beginning with the common childhood fevers, then passing on to less common ones, tropical diseases, and worm and parasitic infestations.

The common infectious fevers are caused by bacteria or viruses, and it is useful to know the meaning of the following terms: *incubation period* is the time which elapses between being infected and developing symptoms; *prodromal period* is the time which elapses between the end of the incubation period and the appearance of a rash; *quarantine period*, the maximum time during which a person who has been in contact with the infection may develop the disease—it is usually two days more than the incubation period; *isolation period*, the time a patient is supposed to be isolated.

Views regarding the common infectious fevers have changed a good deal in recent years. Disinfection of rooms is now regarded as almost useless, and more cases are treated at home. Quarantine in the case of the common fevers is thought by a good many doctors to be a waste of time, since all it can do is to postpone infection from early childhood to early adult life, when it is

likely to be more serious For it is a characteristic of these fevers that they affect the adult much more violently than they do the child However, on this, and all other points, you will have to be guided by the opinion of your family doctor.

Virus Diseases.

First, we shall take the common virus diseases, measles, chickenpox, and rubella or German measles, then the other virus diseases, mumps, infective hepatitis, virus pneumonia, and some less common conditions which do not always produce a typical rash as in the case of the first three.

In nearly all of these fevers there is a long incubation period, and one infection gives immunity for life.

Measles. The first sign is the appearance of symptoms rather like a severe cold The eyes become red, and exposure to light is unpleasant, the nose runs, the throat becomes inflamed, and a dry, harsh cough develops There may be headache, and the temperature rises to 102° or more Usually the patient is a child between the ages of eight months and five years, and especially typical is the development of so-called Koplik's spots, which are small, bluish-white, raised spots seen on the inside of the cheek at the back of the mouth The rash begins on the fourth day, and shows on the forehead and behind the ears, spreading within a day downwards over the whole body. In another two days it starts to disappear, but often leaves behind a sort of brownish staining which may last for one to two weeks

Measles is not usually serious, but it can lead to complications, such as bronchopneumonia and infection of the ear, which are now preventable by the use of sulpha drugs or penicillin (although these drugs have no effect on the virus itself, but solely on the bacteria which have invaded the lungs and ear during the illness) The only other treatment is the use of cough medicine if cough is troublesome and aspirin for headaches Quarantine period for contacts is three weeks, isolation period three weeks.

Rubella or German Measles. A mild fever, similar to measles except that the rash is usually the first sign that anything is wrong, and the temperature is rarely above 100° The eyes may be pink, and there are enlarged glands at the back of the neck The rash disappears completely in thirty-six hours Quarantine period for contacts is twenty-one days, isolation period seven days from the appearance of the rash There are no complications

German measles, in itself, is harmless, but it has recently been discovered that if a woman gets the disease in the early months of pregnancy malformations in the child may appear at birth Hence some doctors believe that children should have the opportunity of contracting German measles before they grow up There is no special treatment, except the general rules for fevers given above

Chickenpox In children chickenpox is a mild fever which begins with the appearance of tiny blisters on the chest and back These later spread outwards to the legs, arms and face, and cause itching Treatment is the general one for fevers already described Calamine lotion or dusting powder will be helpful for the irritation, and the child's nails should be cut short to prevent scratching and infection of the spots Quarantine three weeks, isolation, until last scab disappears Whereas children are usually little bothered by chickenpox, young adults may be much more drastically affected—a temperature of 104° is not uncommon, and there may be severe headache.

Mumps Everyone knows the typical appearance of the patient with mumps—the swelling in the salivary glands in front of the ears which makes the face look full This causes pain later on, and it may be difficult to open the mouth Temperature is not usually high (about 101°). Although uncomfortable, mumps is rarely dangerous, but orchitis—swelling of the testicles—is sometimes a complication Fluid diet should be given if eating is painful, with mouth-washes, and rest in bed. Quarantine, twenty-six days, isolation for a week after the swelling has gone.

Infective Hepatitis "Hepatitis" means inflammation of the liver, and infective hepatitis, which is much the commonest cause of jaundice in young adults, is a virus infection of the liver In fact, this disease caused serious difficulties during the Italian campaign of 1943, and has probably become more frequent (or, at any rate, more frequently recognised) in this country since the War The main symptoms are fever, followed by jaundice, which is first noticed in the whites of the eyes as yellow staining, then in the skin The urine becomes coloured also, and this is most easily noticed if, on shaking in a bottle, the froth shows coloration If the froth remains white, no jaundice is present. Treatment is a matter for the doctor, but great care should be taken, both by the patient and those in contact with him, to wash the hands thoroughly after urinating or defæcating, after handling utensils from the sick-room, and both before and after eating, for the disease is very infectious

Virus Pneumonia Pneumonia is usually caused by bacteria, and when we speak of pneumonia, that is the type we ordinarily refer to Virus pneumonia is known by doctors as "pneumonitis," and is believed to be closely related to influenza. There is no specific treatment so far, and since diagnosis is a specialist matter, little more need be said except that the symptoms in general resemble those of ordinary pneumonia Psittacosis, another virus disease, can also lead to pneumonia, and although there is no specific treatment for virus infections of the lungs, it is always worth while trying the antibiotics or sulpha drugs in view of the possibility that the lung condition may be caused by a secondary invasion by bacteria

Influenza While serious epidemics of influenza take the form of a very dramatic and often fatal disease—for example, the epidemic of "Spanish 'flu" which followed the First World War killed more people than the actual fighting - the milder type more usually seen is difficult to distinguish from the common cold In fact, many people who complain of "a dose of the 'flu" are suffering from simple colds

However, a sudden onset aching in the muscles of the back and legs, and redness of the eyes, would suggest influenza, and especially typical is the depression and weakness which follow influenza but not a cold The measures suggested above for the general treatment of fever should be applied, but the depression and weakness which follow influenza may need special treatment by the doctor

Colds. Although everyone thinks he, or she, knows what a "cold" is, the issue is not so simple, for the symptoms of fever, running nose, and a run-down, "headachy" feeling are found in many illnesses They may be observed, as we have seen, in the early stages of measles before the arrival of the rash, or in a number of other fevers, such as whooping cough Mild attacks of influenza (see above) may resemble the common cold, and blocking of the nose with discharge and fever may be due to sinusitis– although here there is usually pain above, between, or below the eyes Lastly, similar symptoms result without any infection at all in allergic conditions, of which hay fever is a typical example

A great deal of research has been done on the common cold, and it has been shown that genuine colds are a virus infection, that they have nothing to do with getting cold or damp in bad weather, and that some people get colds when exposed to infection, whereas others do not

For all these conditions except the allergic type, the treatment is the same bed, if the temperature is raised, two tablets of aspirin three times a day (nobody could stop you taking them, anyhow), a soothing cough mixture if there is any irritation of the throat causing soreness, hoarseness, or cough, and inhalations of menthol or Friar's Balsam—a few crystals of menthol or a teaspoonful of the balsam in a pint of boiling water—to clear the head. If desired, an inhaler, "Benze-

drex" or one of the other proprietary ones, may be used in place of the menthol or balsam

Poliomyelitis. "Polio," or infantile paralysis as it used to be called, is a virus infection of the motor nerves—the nerves of movement—at the point where they leave the spinal cord. Fortunately, all the nerves are never affected, but only a few controlling one or more muscle groups. If these groups happen to be the ones controlling breathing or swallowing (which, fortunately, is not very common) the results may be serious, but ordinarily the muscles affected are those of the legs or arms. Poliomyelitis is most common in children under five years, but adults are also susceptible. Usually it occurs in small epidemics after hot weather, that is in Summer or Autumn, and it often seems to strike at fairly healthy normal people. This, however, is not because healthy people are specially prone as such, but because those living under less hygienic conditions are more likely to have developed immunity. In point of fact, the majority of cases of polio are so mild that they are never discovered at all, and paralysis does not develop, such people are specially dangerous, precisely because they pass unnoticed and spread the disease to others.

Like many other infections, polio begins with sore throat, fever, and sometimes vomiting five to ten days after contact. There may be severe headache and rigidity of the neck muscles. Paralysis is noted about the second or third day after this, and is usually at its maximum from the start, although this is not always the case. This stage lasts two or three weeks, by which time the temperature is down and the paralysis greatly improved, although further improvement may go on up to eighteen months after the acute stage.

Specific drugs are useless in this disease, but children should be given preventive inoculations or doses of the "live" oral vaccine as early as possible. However, when the illness is already present attention is directed to relief of discomfort, resting and splinting the affected limbs, and preventing spread of infection to others. The Kenny method, devised by Nurse Kenny, and much publicised as a means of reducing permanent paralysis, is not believed by most doctors to be any improvement upon orthodox methods. The use of the iron lung is restricted to cases where the muscles controlling breathing are attacked, and any permanent paralysis of the limbs can often be helped by surgical operation.

Encephalitis. This is an infection of the brain caused by a virus, first noted in Vienna in 1916. There was an epidemic in London in 1918, but it is not very common today.

Encephalitis begins with the same symptoms—headache, sore throat, and shivering—as most fevers, but the temperature is usually not much raised. This initial stage is followed by sleepiness (hence the name "sleepy sickness"—not to be confused with "sleeping sickness," a tropical disease found in Africa), weakness, delirium, and twitching of the muscles. There is often a curious expressionlessness in the face, known as Parkinsonism after the English physician who, in the early nineteenth century, described it as following certain diseases of the brain.

Encephalitis is a serious infection. Most unpleasant are its possible after-effects. Parkinsonism, which may persist and get progressively worse (see Paralysis Agitans), and what is known as Juvenile Pseudo-psychopathia. The latter is a very distressing condition in which children who have recovered from the physical effects of encephalitis later become delinquent: they are liable to show violence, lying, stealing, or become involved in sexual offences. Although they remain intelligent and know they are doing wrong, they are unable to control themselves. Of course, these after-effects do not occur in all cases. But the fact that criminal behaviour can be produced by physical disorders should be well noted by those who seem to suppose that almost everyone has complete control over his acts and that only the insane lack this control.

Smallpox. Smallpox was once common in Western Europe, and, as late as the early nineteenth century, was not unknown in Britain. Now, since the introduction of vaccination, it is comparatively rare in industrialised countries although minor epidemics have occurred here recently. Jenner, who introduced vaccination, noted that dairy-maids who had suffered from the mild disease known as "cow-pox," contracted from the udders of infected cows, and transmitted to the hand of the dairy-maid, did not develop smallpox. In fact, cow-pox is a mild form of smallpox modified by transmission through cattle. Vaccination should be carried out at the age of three months, and repeated at the ages of seven, fourteen, and twenty-one years—also at any time when an epidemic occurs.

Smallpox attacks people of all ages and is carried by excreta and droplet infection, but particularly by the dried scales on the skins of convalescent patients. It is now most common in the tropics.

The disease begins with shivering, headache and backache, and the temperature is raised to 102–104°. On the third day a rash appears, which turns into small blisters on the sixth day, and the blisters become filled with pus by the ninth day. On the twelfth day they burst and form crusts. Unlike chickenpox, in which the rash starts in the middle of the body and works towards the outer parts, smallpox produces a rash which begins in the scalp, forehead, wrists, and feet and then moves towards the middle.

Smallpox is a serious disease, and the result depends largely upon whether the patient has been vaccinated within seven years of the attack. Contacts should be vaccinated and kept under observation for sixteen days, the patient must be isolated until all the scabs have separated and the skin healed.

Glandular Fever. The other name for this illness is the jaw-breaking one of "infective mononucleosis," so we had perhaps better keep to the more common one. Glandular fever is an acute infectious disease of children, probably—but not certainly—caused by an, as yet, undiscovered virus. It occurs in epidemics at schools, especially in Spring, and the main symptoms are a high fever with enlargement of the lymph glands especially at the back and sides of the neck; there is also a sore throat. Usually the glandular swellings go down in about two to three days, but the patient may feel unwell and have a raised temperature for several weeks. The disease, however, is not dangerous.

Typhus. This disease used to be known as "jail fever," because it was frequent in prisons but overcrowding, poverty, and bad hygienic surroundings anywhere are suitable conditions for epidemics of typhus. Improved conditions in industrialised countries have made it unusual, since typhus is carried by a virus carried from one person to another by lice, and where lice are absent the virus is helpless to enter the human body.

Typhus comes on suddenly with a rise in temperature of about 102°, but within four days it may be as high as 107°. There may, or may not be a rash at this time, and in the second week when the temperature is at its highest, there is delirium, weakness, and a feeble pulse. The typical typhus rash appears about the fifth day as reddish blotches on the chest, abdomen, and wrists.

Typhus is, needless to say, very serious but responds to such modern antibiotics as chloramphenicol, aureomycin, and terramycin. Preventive measures are directed towards destroying all lice with D D T.

Rabies. Finally, we shall deal very briefly with a number of less common virus diseases beginning, as is appropriate, with *hydrophobia or rabies*, since it was in this infection that the great French scientist Louis Pasteur (1822—95) showed the possibility of prevention by vaccination. Unlike Jenner, with his ready-made cowpox virus which we have seen to be the virus of smallpox weakened by natural passage through cows, Pasteur had to weaken the rabies virus by passing it through rabbits. The rabbits were infected and after death the spinal cord was dried and powdered, a solution passed through another

rabbit, and so on until the virus was sufficiently weakened

Rabies is spread by the bite of infected animals, usually dogs, cats, or wolves, who are driven mad by the disease; in Trinidad, however, it has been spread by vampire bats. Those who are bitten usually show no symptoms for six weeks or more, but sooner or later convulsions and delirium arise, which within four to five days are fatal

There is no cure once the symptoms have developed, but Pasteur's serum, if given soon after the bite, prevents illness in the vast majority of cases—the sooner after the bite, the better the outlook Dogs should be muzzled in areas where the disease is common, but quarantining imported dogs has made the infection almost unknown here

Psittacosis This is another virus disease which is of interest mainly in that it is spread by birds of the parrot group, such as parrots, love-birds, macaws, and the rest It occasionally occurs here in people who have been in contact with birds of this type, and is serious both to the bird and its owner As in the case of rabies, quarantine regulations have greatly reduced the likelihood of infection in Britain

The symptoms of psittacosis are fever, cough, and bronchitis The disease is especially dangerous to old people, but it responds to the same antibiotics as typhus

Sandfly Fever, or phlebotomus fever, *Dengue*, or breakbone fever, and *Trench Fever* are all somewhat similar conditions in that they resemble influenza and are rarely fatal They are all due to viruses, spread in the first case by sandflies in tropical climates, in the second by mosquitoes in tropical climates, and in the third by lice in temperate climates They are all typical "soldiers' diseases", the first two were common in the Middle East and Far East during the last War, the third during the First World War in France

Yellow Fever Of all the virus diseases, only three can be prevented by vaccination—smallpox, hydrophobia, and yellow fever Yellow fever is carried by a mosquito known as Stegomyia, common in South and Central America and in African ports For its spread, it therefore needs a hot climate, the stegomyia mosquito, and an infected person.

In 1898 the United States was at war with Spain in Central America, where yellow fever was a serious problem Following this war the United States, by this time acutely aware of this terrible disease, asked a Dr G E Waring to deal with it in Havana, where it was rife But Waring died of yellow fever, as had many millions before him, without knowing its cause, and it was left to Walter Reed, who died in 1902, to prove the connection between the mosquito and yellow fever By a vigorous war on the mosquito, the disease has been eradicated from Havana and the West Indian islands, and Reed's discovery made possible the building of the Panama Canal (Ferdinand de Lesseps, the builder of the Suez Canal, had made a similar attempt in Panama, but had been beaten, amongst other factors, by yellow fever)

In yellow fever there is a sudden high temperature, aching of limbs and head, jaundice, and black vomit, the pulse-rate falls as the fever rises Previous vaccination seems to be preventive if undertaken in time

Conclusion.

All these virus diseases have this in common that for many there is no specific cure, although smallpox, rabies, yellow fever, and poliomyelitis can be prevented by vaccination, or by the social control of the creatures carrying the virus (social control is effective in stopping other virus diseases, as we have seen) There is usually a long incubation period. Finally, it seems that a new serum, known as gamma globulin, can give protection lasting about two weeks against polio, measles, and German measles Since the protection is very temporary, it is up to your doctor to consider whether the disease is serious enough to justify this protection or whether it is better to have the disease and ensure life-long protection.

Bacterial Diseases.

Bacterial diseases differ from virus infections in a number of respects their incubation period tends to be shorter, having the disease once does not often confer lifelong protection, and unlike virus diseases, most bacterial diseases respond to the new sulpha drugs and antibiotics In many cases it is possible to inoculate against the disease to prevent it occurring, as we have seen is possible with only a few of the virus diseases

Scarlatina This infection, usually known as scarlet fever, is found in connection with sore throats caused by a type of streptococcus One attack usually, but not always, produces immunity and most cases occur in children under twelve years old, rarely, however, in infancy The incubation period is commonly three days, and begins with sore throat, fever, headache, and vomiting The rash appears on the second day, first on the neck and chest, then over the rest of the body, it is in the form of a red background with bright red spots superimposed, and is most apparent in the arm-pits, on the front of the elbow-joints, the back of the knees, and in the groin The face is flushed, and there is an area of pallor around the mouth The throat is red, the tongue yellowish, but the yellow fur later gives way to a bright red "strawberry" appearance By the end of a week the patient, under favourable conditions, begins to feel better, and convalescence begins with the third week Complications are infections of the ear, kidney, and the heart

Medical opinion has greatly changed in recent years as to the treatment of scarlatina the old picture of fever hospital, disinfection, fumigation, and (as one authority puts it) "the baking of books and boiling of toys and clothes" has gone, and nowadays most cases are nursed at home with only simple precautions to prevent spread from throat to throat Large doses of penicillin or some other antibiotic are given, and in this way the likelihood of complications is much reduced Quarantine period those contacts who react positively to the Dick test (a skin test which shows up those who are still susceptible to the disease and thus not immune) may be kept in quarantine for a week, isolation period for the patient is four weeks

Diphtheria This used to be an extremely serious disease, but immunisation has made it milder and much less common, it is important, therefore, that all children should be immunised, although it should not be thought that this gives absolute protection Sometimes diphtheria vaccine and whooping-cough vaccine are combined, but there are those who disapprove of this procedure, so you should be guided by the opinion of your own G P

In a typical case of diphtheria the incubation period is about three days, the patient is a child who becomes ill and pale-looking (*i e*, the onset is not sudden, as in many fevers, but insidious), the temperature is only slightly raised to, perhaps, 99° or 101°, and although there may be no complaint of sore throat, examination will reveal inflammation with—and this is typical of diphtheria —a grey membrane spread over the tonsils, the palate, and the back of the mouth generally The diphtheria germ does not spread within the body It stays at the place where it entered (in this case the throat) and sends its toxins throughout the body

Even after the acute phase is over the patient must not be allowed to walk, because the diphtheria toxin is particularly poisonous to the heart The ordinary rule is at least one or two months in bed There is an anti-toxin which helps to get the patient over this stage, but the sensible thing to do is to have your child protected before infection occurs

Diphtheria also occurs in the larynx—in pre-inoculation days many children choked to death with this form of the infection, in the nose, and, although this is not generally known, wounds can be infected The so-called "Desert sores" of the North African campaign seem to have been caused by diphtheria-like organisms

Diphtheria may lead to paralysis of the throat, with difficulty in speaking or swallowing, and paralysis of the eyes or limbs, these are due to

neuritis caused by the influence of the toxin on the nerves.

Whooping Cough. For many years whooping cough has been regarded merely as a bother to the patient and a nuisance to others, as, in fact, a trivial disease. Unfortunately, this is not so because statistics show that it causes more deaths than polio, diphtheria, scarlet fever, and measles all put together.

Whooping cough begins in a child as an ordinary cold with cough and slight fever, and this stage lasts for a week or ten days. Then the "paroxysmal stage" begins as a series of coughs following in rapid succession, during which time the patient is unable to breathe. The "whoop" is caused by the noisy indrawing of breath when the fit stops. The face may become blue and congested. Bronchitis is usually present, and bronchopneumonia may result as a complication, so inoculation of all children before the disease has a chance to strike them is most important.

Once whooping cough has begun, there is no specific treatment, although modern drugs can reduce the frequency of the fits of coughing. The antibiotic chloramphenicol has been used for this disease, but the general opinion is that it is ordinarily of little benefit. Chinese physicians have described whooping cough as the "hundred-days cough," and the cough may, indeed, continue for at least a hundred days.

Food Poisoning Diseases.

Strictly speaking, there is no such thing as "food poisoning" if one is thinking of "poisoning" in terms of anything apart from germs. But not so long ago it used to be thought that decomposition of food in itself produced poisons known as "ptomaines" which were deadly to those who swallowed them. All food poisoning is caused by infection of food with bacteria and by no other cause—unless, of course, we are thinking of the kind of poisoning which is the concern of the lawyer rather than the medical man.

Here we are considering those diseases which are commonly spread by contaminated food or drink. The classification is not scientific, but then no scientific classification has as yet been devised. First, we shall deal with typhoid, paratyphoid, and dysentery—uncommon here in Britain, although Sonné dysentery is fairly frequent. Then there is gastro-enteritis (which means irritation of the stomach and intestines), which is caused by staphylococci and the germs of the salmonella group, and lastly, botulism, which is rare.

Typhoid and Paratyphoid. These diseases are spread by infected water, food, or hands—especially uncooked food, such as milk, salads, oysters, and shellfish. Flies, too, play some part in spreading the disease. Some people are "carriers" and carry and excrete the germs without being themselves affected; for example, "Typhoid Mary," a carrier in the United States in the early years of this century, spent a large part of her life in custody as a public danger, although she did not show any symptoms of typhoid. Nevertheless, this woman caused a great deal of illness in others in her chosen profession of cook.

The influence of Chadwick's propaganda for pure water supplies is shown by the fact that deaths from typhoid, still 332 per 1,000,000 in 1870, fell to 198 per 1,000,000 at the beginning of this century. In the 1920s the death-rate was only 25 per 1,000,000, and now it is even less.

Typhoid fever begins like most fevers with headache, raised temperature, and general feeling of unwellness. This stage lasts about a week, and then the rash appears in the form of rose-red spots on the front of the chest and abdomen and on the back. In the second week there is great weakness, sometimes diarrhœa, flatulence, and mental dullness, together with dry and cracked lips and tongue. The third week is the week, in hopeful cases, of gradual decrease in temperature and other symptoms, and the fourth week is the week of convalescence.

Complications are perforation of the intestine (which needs surgical treatment), delirium, and bronchitis.

Paratyphoid fever is a milder form of typhoid (there are two forms, A and B), ordinarily it can be diagnosed only by scientific tests. The main thing is to inoculate with T A B vaccine and to protect food supplies, treatment is with chloramphenicol.

Dysentery. Dysentery may be caused *either* by a bacterium or an amœba; the first type is known as bacillary dysentery, the latter as amœbic dysentery (which is dealt with under tropical diseases). Infection is spread in much the same way as in typhoid. There is high fever, abdominal pain, and diarrhœa, at first consisting of fæcal matter, then blood and mucus. In severe cases the death-rate used to be over 20 per cent.

Various bacilli cause dysentery. The common tropical types are the Shiga and Flexner groups, but in this country most epidemics are due to the milder Sonné group.

However, in all these infections sulphaguanidine, one of the sulpha drugs, brings rapid relief, but care must be taken to avoid infection of other people.

Diarrhœa and Vomiting. Leaving out typhoid and paratyphoid fevers and dysentery, there is a group of infections known as "D. & V."—diarrhœa and vomiting. In Britain D. & V. is mostly due to

(1) Salmonella infection.
(2) Staphylococcal infections.
(3) Other bacteria, ordinarily harmless, such as bacillus coli, when present in sufficient quantity.

Salmonella Infections are the most serious of this group, they affect the small intestine and produce vomiting, severe abdominal pain, and diarrhœa. These symptoms occur about one day after eating infected food and usually clear up within about two weeks, but occasionally death results. Salmonella bacteria are most likely to be found in meat, egg powder, vegetables, and ducks' eggs, but staphylococci are liable to grow in milk products, such as ice-cream and cream buns. Food poisoning from staphylococci is seldom severe, and recovery takes place in about a week. Nevertheless, it is extremely infectious, and causes a great deal of lost time in industry and temporary illness in institutions, for it is in such situations that it is most likely to occur.

Staphylococcal Food Poisoning has greatly increased in recent years, so it is important to know what circumstances are likely to cause it. The reason for its increase has nothing to do, as many people suppose, with the greater use of canned foods, but it has much to do with the greater use of communal feeding and canteen meals. It is *possible* for bacterial toxins in infected food to bring about illness even when the canning process has killed the bacteria, but it is certainly extremely rare. Canned foods, in fact, are much safer than so-called "fresh" foods in this respect—except when they have been opened, left about, and then re-heated. The same applies to the re-heating of any kind of food.

The real enemy is the canteen worker with a boil, a discharging nose, dirty hands, or a septic finger. Occasionally food may be infected in the larder by rats or mice, but the sort of canteen or restaurant where this can happen has little to commend it! Frankly, these infections are caused by dirty or stupid people who do not realise that their sore finger or boil can become someone else's diarrhœa and vomiting. Where children are concerned, the outlook is potentially more serious, and in the early part of this century the Summer-time "procession of baby coffins" was all too familiar. Infection is much more common in artificially fed babies or in older children who eat infected ice-cream. However trivial the condition may seem, diarrhœa and vomiting with fever in a child should never be ignored. Those in charge of canteens or restaurants must ensure that staff is supervised, that anyone with a septic infection is put off duty, and that all know about washing after visiting the lavatory and absolute cleanliness.

Bacilli normally present in the intestine, such

as bacillus coli, can cause infections if absorbed in large amounts, or if of a different strain from those in the patient's intestine. They are not usually serious.

Botulism. Now uncommon, this is the disease which used to be known as "ptomaine poisoning" on the theory that it was caused by poisons produced by bad food apart from germs. In the 1920s a party of picnickers at Loch Maree in the Scottish Highlands developed botulism and a number died, with the result that the disease attracted much public attention. Botulism is caused by a germ, the bacillus botulinus, which is peculiar in that, like tetanus, its poison attacks the nervous system rather than the intestines, resulting in fits, double vision, paralysis beginning in the face and spreading downwards, and difficulty in swallowing. It is found in tinned fruits or vegetables containing the toxin even when the germ has been killed, but, as we have already seen, the toxin comes from the bacilli, not from decomposition of food as such (in fact, food does not decompose in the absence of germs). Death is common in botulism, but an antitoxin is now available which, if used in time, can cure the disease.

Tuberculosis. No disease causes more public concern, and no disease is more difficult to describe, than tuberculosis, for, like the streptococcus or the staphylococcus, the tubercle germ can attack many different parts of the body and manifest itself in many ways Furthermore, it is a widely spread disease, infecting not only humans but also cattle, birds, and reptiles. But here we shall be concerned with those types common to Man—the human and bovine (i e, the type occurring in cattle which can be spread to man by infected milk).

The tubercle bacillus is particularly hardy, so that when coughed or spat out on the ground it continues to be infectious for a long time Infection is therefore caused by (*a*) drinking infected milk, (*b*) droplet infection through having germs coughed in the face, (*c*) breathing in infected dust. In other words, tuberculosis is caused by absorption through either the lungs or the intestines, the former is common in adults, the latter in children.

But there is a good deal more to the problem than this, we know, for example, that over 90 per cent. of people in industrialised countries have been infected with T B in early life and have conquered the infection So the question arises: what conditions predispose to T B —why do some people get over the early infection and others not? There are two answers to this question one is certain—that those who are impoverished and do not get enough food are liable to T B, the second is not so certain—that mental stress plays some part. Yet there is reasonably good evidence that such stress as a broken love-affair can cause lowered resistance to breakdown so that when germs are encountered infection will occur

In children, lung tuberculosis is not common, but tuberculosis of the bones and glands is, as is also infection in the abdomen, the kidney or spine, and, worst of all, tuberculous meningitis These are often of the bovine type from infected milk. Ordinarily, T B. in children is less serious than adult infections, but tuberculous meningitis used to be almost invariably fatal until streptomycin was discovered.

Adult tuberculosis usually occurs in the lungs or the pleura—the thin membrane surrounding the lungs In younger people miliary tuberculosis, which is a form of T B. blood-poisoning or septicæmia, is a very serious condition, and the infection spreads throughout the whole body in a few weeks

Lung infection begins gradually in someone who has previously felt unwell. There may be cough, and later blood-stained sputum (although blood which is coughed up does not necessarily prove that T.B. is present). Whatever means of treatment are used, the struggle between disease and patient is likely to be fairly long, but the outlook is now good. However, there is little reason to suppose that fresh air or a sanatorium in Switzerland produces any better results than treatment at home

Prevention depends on legal action ensuring tuberculosis-free herds of cattle; on control of spread of the disease by those "open" cases who carry germs in their sputum; on the use of vaccination in childhood with B.C G. vaccine (which you can ask your doctor about).

Many methods are used in treatment: new drugs, such as streptomycin and P.A S, lung surgery, rest, and so on. At any rate, tuberculosis is being got under control, but anyone who is worried can get a free X-ray at the nearest Mass Radiography Centre. For children, there are skin tests to show whether there is susceptibility to T.B.

Septicaemia. Commonly known as "blood-poisoning," is one of those diseases of which textbooks prior to the Second World war used to say: "death usually occurs"

Blood-poisoning occurs generally by spread from some septic area such as a wound (or even a small prick), after childbirth, or any place where certain germs have got admission to the body The most usual germ is the streptococcus, although the pneumococcus—which ordinarily causes pneumonia—and the staphylococcus may also cause septicæmia

Fever comes on suddenly and rises rapidly with headaches, sweating, and shivering The patient is obviously very ill, and later there is wasting and delirium The white blood cells increase in number Septicæmia sometimes occurs without any apparent local infection in those who are weak and debilitated

Pyaemia is a type of septicæmia which leads to the formation of numerous abscesses throughout the body Its symptoms are the same as described above, except that the causative germ is usually the staphylococcus, and abscesses are found which may need surgical treatment

However, in both conditions the state of affairs has been revolutionised by the use of the sulpha drugs and antibiotics, cure is now the rule rather than the exception

Septicæmia should be suspected when any small wound or cut is followed by high temperature and the symptoms described above

The word "*Toxaemia*" is used when the germs stay in their original position and produce symptoms by spreading their toxins throughout the body Tetanus, diphtheria, and some kinds of childbirth infection come into this category, the symptoms may vary from mild disturbance to severe illness.

Meningitis means inflammation of the meninges, the covering which, like a layer of plastic, lies over the brain and spinal cord, just as the pleura covers the lungs and the peritoneum covers internal organs in the abdomen (Hence inflammation of the pleura is known as pleurisy, and inflammation of the peritoneum as peritonitis)

Various germs may cause meningitis, for example, the bacillus of tuberculosis, the pneumococcus, which ordinarily causes pneumonia, and the streptococcus or staphylococcus, but ordinarily the word refers to *Cerebrospinal Meningitis* or "spotted fever" caused by the meningococcus and occurring at times as an epidemic. It is commonest in the years from infancy to the early twenties, and begins suddenly with headache, vomiting, and fever The temperature rises quickly, and pain develops in the back and legs, on the second or third day a rash appears on the body, and particularly on the inside of the thighs. Later there is stiffness of the neck, the head may be drawn back, vomiting persists, and the headache can be so severe as to cause the patient to scream with pain.

Fortunately, this type of meningitis (and most of the others) respond to treatment with antibiotics or the sulpha drugs, so the risks are very much less than formerly.

Pneumococcal Meningitis is an unusual complication of pneumonia, and the septic types (*streptococcal or staphylococcal*) arise either following an infected fracture of the skull or from infection of the ear or mastoid.

Tuberculous Meningitis has already been mentioned; originally always fatal, it is now treatable with streptomycin.

All these diseases are very much a matter for

specialist and hospital treatment, but it is worth while mentioning *benign lymphocytic meningitis*, in which, although all the symptoms of meningitis are present, recovery without specific treatment is invariable. Meningitis, which was during the First World War and after what polio is to us now, is no longer common, and when taken in time is easily treated.

Tetanus is usually known as "lockjaw" because there may be difficulty in opening the mouth, although this is simply part of a spasm of all the muscles of the body The tetanus bacillus is found in rich soil—hence the disease is less common in desert areas—and tetanus resembles rabies in that (*a*) it enters at a wound, (*b*) it affects the nervous system, (*c*) it results in fits and ultimately death However, active immunisation with T T (tetanus toxoid) has resulted in the disease becoming uncommon, and even when developed, treatment with antitoxin, anaesthetics, and curare may lead to cure

The bacillus is anærobic (*i e*, does not use oxygen) and is most likely to occur in such situations as when a man digging manure or working in his garden sticks a fork through his foot, or, in war-time, when he is wounded in soil contaminated with manure

Undulant fever, also known as Malta fever or abortus fever, falls into two types melitensis, which infects goats, and abortus, cattle and pigs Man gets the disease by reason of close contact with or drinking the milk of infected animals (The name abortus is given because abortion is produced in cattle and sows)

In Undulant Fever, as one would suppose, the fever goes up and down for two to three weeks, it may then go down and rise again, persisting for many months The disease may occur in Britain, but modern drugs are on the whole successful in dealing with it A striking feature of the disease is the combination of a high temperature with an appearance of relative well-being.

Another disease carried by mammals is *Glanders* or *Farcy*, spread by horses. In glanders there is discharge from the nose and sometimes pneumonia Occasionally the disease is fatal In farcy abscesses form, usually along the lymph vessels Both conditions are very contagious, and treatment is a matter for a specialist, infected horses should be destroyed.

Cholera Cholera could be classified under the head of food-poisoning, because it is mainly spread by infected water (however, like typhoid, it can also be spread by flies, infected food, and carriers), it could also be classified as a tropical disease, since, although it used to be found in Europe, it is now mainly rife in India.

Also like typhoid, cholera is caused by a bacillus, and can be prevented by early innoculation and care over food supplies—boiling water and milk, washing uncooked foods in chlorinated water, and keeping flies away

The fever begins in the usual way with a short incubation period, followed by abdominal pain, severe vomiting, and diarrhœa Later with the loss of fluid from the body there may be cramps in the muscles, diarrhœa increases, and the motions become of the typical "rice-water" type —*i e*, there is no solid matter, and the appearance is that of water to which a little milk has been added This stage is followed by collapse, with low pulse and cold hands and feet Death, if adequate treatment is not available, results in about 70 per cent of cases

Anthrax. The bacillus of anthrax, like that of tuberculosis, can exist outside the body for long periods, and, like that of tetanus, then takes the form of spores or seed-like bodies It is spread by infected cattle and horses, which get the disease from eating grass containing spores.

In human beings the form the disease takes depends on where the germ alights, sometimes it comes from infected shaving-brushes, when it causes a large sore, like a boil, on the face, known as "malignant pustule", sometimes it develops in those who inhale the dust from infected hides or wool (hence the name "wool-sorters' disease," which is a form of bronchitis with blood-stained sputum); lastly, it may arise through eating infected meat, when the result is intestinal anthrax.

In all cases the outlook is serious. Death is common, preceded by a high temperature, skin symptoms in the first instance, lung symptoms in the second, and food-poisoning symptoms in the third. Serum and arsenical preparations were formerly used, but now the sulpha drugs seem to offer more promise.

Diseases Caused by Fungi.

There are only two important groups of disease caused by fungus: the serious *actinomycosis* and the relatively harmless, if unpleasant, *ringworm*. Ringworm or tinea will be dealt with later, it affects the hair, the body, the groin (dhobie itch, already referred to), and the feet (athlete's foot). Actinomycosis is spread by a fungus in barley and grasses which may reach the human mouth, settle around bad teeth, and thence pass to the lungs, the bone of the jaw, and even to the intestines or brain Fortunately, this unpleasant fungus, which was once difficult to eradicate, has proved susceptible to penicillin.

The Venereal Diseases.

The venereal diseases are those caused—or at least that is what the name means—by the goddess of love, Venus, of course, causes a great deal of trouble, but venereal disease is not necessarily the worst she can do There are two diseases usually caused by sexual intercourse, and therefore described as venereal, others can be caused in this way, but are not usually so described

Gonorrhœa is the result of an infection by the gonococcus (*Neisseria gonorrhoea*) and ordinarily comes on after a period of three to seven days following intercourse However, babies can get an infection of the eyes, known as ophthalmia, from their mother if she is infected, and gonorrhoea in young children is often the result of being in contact with infected towels or clothes The disease in adults is evident when there is a thick, creamy discharge from the sexual organs and sometimes pain on passing water, in infants ophthalmia is prevented by the use of silver nitrate eye-drops at birth Gonorrhœa is fairly easily cured by the use of sulpha drugs or penicillin, but unfortunately venereal disease is increasing in recent years and drug-resistant forms are becoming more common.

Syphilis is more serious, and is nearly always caused by sexual intercourse Stories about lavatory seats are simply stories, although it is occasionally possible to get syphilis by other than sexual means for example, it has happened that a man playing football has been infected through his hand being grazed by the teeth of someone with syphilis But this is very unusual, although kissing can spread the disease Children, too, can be born with syphilis (the so-called congenital syphilis)

Adult syphilis begins with a sore, known as a hard chancre, at the point where the spirochæte of syphilis has entered, this may be on the lips, through kissing, on the sexual organs, through intercourse, and very rarely, as explained above, elsewhere In a short time the chancre disappears and all may seem to be well, but this primary stage is followed by a secondary stage with sore throat, a rash, headache, and enlargement of glands This, if left alone, also clears up, but is followed by the tertiary stage, in which a chronic infection develops in some part of the body which, presumably, is most susceptible in the particular individual. Thus there may be chronic syphilis of the skin, the bones, the heart, liver, or nervous system

In the nervous system, the commonest forms are the two diseases of *tabes dorsalis*, in which the spinal cord is infected, and G.P I. (general paralysis of the insane), in which the brain and mind are affected. These will be discussed under Nervous Diseases

In congenital syphilis the pregnant mother gives her child syphilis Such infants are often still-born or premature, they look wizened, like a little old man, and amongst other symptoms are eye

disease, "snuffles," a flattened nose, and when the adult teeth appear the front ones may be notched at the biting surface.

The treatment, of course, is very much a matter for a specialist, but diagnosis is usually made through the Wassermann blood test. It was for syphilis that Ehrlich produced his "magic bullet"—an arsenical drug, known as salvarsan This is still used in chronic cases, but when discovered early, penicillin seems to clear up the disease more rapidly. G.P.I., once hopeless, is now treated by malarial therapy with a good deal of success.

It is important to understand about venereal disease in general. (1) that it happens to many people who are no worse than anyone else, (2) that many patients believe themselves to have V.D. when, in fact, they have not, (3) that the best thing to do is to see your doctor as soon as possible—he is not concerned with your morals, and the sooner you go, the sooner you will get well; (4) every sore in the sexual area need not be V.D. There are other diseases which may be contracted as venereal infections

Chancroid produces small septic ulcers around the sex organs, with swelling of the local glands in the groin, which may suppurate It is caused by a bacillus, and can usually be cleared up by sulpha drugs within a week. Scabies and lice often pass from one body to another during sexual intercourse, but are not usually thought of as venereal in origin, although in many cases they are.

Tropical Diseases.

Nothing is more difficult than to define the term "tropical diseases" One might define them as the diseases which occur in tropical climates—but then measles occurs there too, and if they are defined as those diseases which are found *only* in the tropics, the solution is no easier, since leprosy, cholera, smallpox, and typhus are usually listed as tropical diseases, yet were found in this country until fairly recently—and the odd case still is

But what a story could be told about the conquest of those infections which were—and many still are—the scourge of humanity! One day when generals and dictators are forgotten we shall remember that great international army of physicians and bacteriologists who have saved millions of lives and infinitely reduced human suffering: Koch and Ehrlich of Germany, Pasteur and Roux of France, Ross and Jenner of Britain, Reed of America, Noguchi of Japan, and many others. We shall remember how the Jesuit priests brought quinine from Peru to Europe in 1638, the first drug to save people from malaria, how in tropical heat Ronald Ross (1857–1932) peered for hours through his microscope to discover the connection between malaria and the mosquito until the sweat running from his brow rusted the instrument, how Major Walter Reed's work in Havana (1851–1902) made possible the building of the Panama Canal, and think, too, of the American soldiers who died in helping him to find the cause of yellow fever In mentioning Jenner once more, we should recall Lady Mary Montagu (1689–1762), who brought the practice of vaccination to England from Turkey—or, rather, the practice of "variolation," which meant inoculating with the pus from smallpox cases This was, of course, a dangerous practice, but the idea was there. Noguchi, one of the great bacteriologists of the nineteenth century, was the son of a poor peasant. He often had to steal to get enough bread even to keep alive, but was later to help in our understanding of syphilis and many tropical diseases.

Yet there is still much to do. Take, for example, the case of Egypt, one of the world's poorest countries, supporting with the help of water from the Nile about 24 million people. But if the river gives food and drink it does other things, for it carries the disease of bilharzia, which kills thousands of peasants yearly. In the villages of Egypt as many as 90–100 per cent. of the population suffer from this terrible disease. The infantile mortality rate is the second highest in the world—29 5 per cent—seven times higher than that of Holland; the average expectation of life amongst the lower classes is thirty-one years, of the upper classes fifty to sixty years. The country is ridden with bilharzia, ankylostomiasis, malaria, plague, amœbic dysentery, typhus, tuberculosis, and pellagra. Blindness, due to trachoma and other diseases, affects tens of thousands. Such a situation cannot be treated simply by pouring drugs into the country, what is necessary is social control, to enforce purification of the water supplies, the use of insecticides such as D D T. to kill the disease-bearing pests, and removal of the causes of extreme poverty (tuberculosis and vitamin deficiencies which are common in Egypt are diseases of malnutrition).

Relapsing Fever, common in India and Africa, is caused by bad hygiene (rubbing infected lice into the skin), the germ is a spirochæte, similar to that of syphilis, but the disease is non-venereal Relapsing fever gets its name from the fact that the temperature remains high (103–106°) for about a week, returns to normal for a week, and rises again There may be three to five relapses of this sort. Cure can be brought about by the arseno-benzol drugs used in syphilis Lice, of course, should be dealt with

Epidemic Jaundice (also known as Weil's disease or—if you prefer it—ictero-hæmorrhagica spirochætosis), is also caused by a spirochæte, and spread by rats Now it is rarely found in Europe, although it occurred in the trenches during the First World War, in men working in sewers, and in the women who worked in the fish market of Aberdeen, which at one time was rat infested It is rarely fatal, but leads to high fever and jaundice Anti-syphilitic drugs are useless, but some of the new antibiotics may help

Yaws is also a spirochætal disease, common in the tropics and particularly in children It is unpleasant, but not serious, and tends to clear up in a year or so There are raspberry-like growths on the skin, which disappear with the drugs used in syphilis (although the condition is non-venereal) The Wassermann reaction, positive in syphilis, is also positive in yaws

Leprosy Whereas syphilis, relapsing fever, epidemic jaundice, and yaws are caused by spirochætes, leprosy is caused by a bacillus resembling the bacillus of tuberculosis Leprosy, in fact, should not be included here at all, for it is non-spirochætal, and not necessarily a tropical infection But, apart from all the difficulties of classification already mentioned, leprosy is usually thought of as a tropical disease (although it is fairly common in Iceland and used to be so in Western Europe), it *is* thought to be deadly contagious (although it is, in fact, only very slightly contagious), and it *is* thought to be incurable (although young ladies with a mission in life who wish to go to a leper colony will find that it can be cured). One wonders why leper colonies exercise so much more attraction over some people than mental hospitals, T B sanatoria, or cancer clinics, but there it is So there are many misunderstandings about this disease, and placing it in the wrong part of the medical section is probably the least

Leprosy is not hereditary, and not very infectious without intimate contact, although this contact need not be necessarily sexual It takes the from of nodules under the skin which form ulcers and can lead to the loss of a finger or toe At first there is fever and large red patches which coalesce to form swellings with loss of sensation The patches are on the face, forearms, and thighs, on the face they give a "leonine" appearance—*i e*, resembling the face of a lion. In other cases the main nerves in the forearm are affected, so that, as in the first type, the fingers and toes may drop off. Leprosy may go on for thirty or more years, sometimes getting better and then relapsing, occasionally recovery without treatment occurs. The treatment is an old Indian one in a modified form—chaulmoogra oil—and on the whole, it is fairly successful.

Plague is another disease caused by bacteria, common in Europe at one time, but now largely restricted to Asia. Nevertheless, it caused millions of deaths in Europe during the years

1348–49 and 1665 and was the "Black Death," which, indeed, changed the course of history. Interested readers may read Hans Zinnser's *Rats, Lice, and History* about this aspect of the disease. Plague is carried by the bite of the rat flea, but, once people become infected, spread may occur from one to the other by droplet infection—*i.e.*, by coughing and sneezing. After an incubation period of two to ten days, fever develops, rather like severe influenza, and in a day or two the glands in the groin begin to swell, followed perhaps by swelling of the glands elsewhere. This is the usual type of plague, but it is also possible to get disease of the lungs from droplet infection and blood-poisoning from infection of the blood-stream. Both the latter types are almost invariably fatal, and even the glandular type (bubonic plague) has a mortality of about 80 per cent. There is a vaccine to prevent plague before it develops and a serum which may be used on the sick.

Although we have little space to discuss the subject of plagues and epidemics in general, it is worth noting that serious epidemics have almost always followed wars, revolutions, and economic and political collapse. Thus the Black Death followed the break-up of the Roman Empire, and, in the fourteenth century, accompanied the end of mediæval civilisation. The Napoleonic wars were followed by other epidemics, and the wars of the 1830s in Europe were followed by influenza. In the most widespread outburst of influenza after the First World War, more people were killed by the disease than in all the fighting of four years. It is a reflection on the peculiar mentality of Man that this devastating epidemic, which affected almost the whole world, occupies little space in his history books—we still, with few exceptions, regard history as the doings of kings, queens, and generals. Yet, in 1918, 20 million men, women, and children died from influenza, and no cure has, as yet, been found! Later we shall see that many millions of people die yearly from starvation or vitamin deficiencies. Yet these facts—the real facts of life—we rarely hear about.

Protozoal Diseases.

Nearly all the diseases caused by protozoa are tropical diseases, although one of the best-known protozoans is the harmless amœba found in British ponds. Protozoal diseases are caused by these organisms, large in comparison with bacteria, which are really one-celled plants. Viruses are neither animals nor plants, are much smaller than the other two groups, and have some distinctive characteristics described elsewhere.

The only important diseases caused by protozoa are sleeping sickness or tryanosomiasis, malaria, and amœbic dysentery (as contrasted with bacillary dysentery), another disease, leishmaniasis—also known by the numerous names of kala-azar, dum-dum fever, and, in milder form, Delhi boil, Oriental sore, or Bagdad sore—will also be mentioned briefly. These infections are few, but important in their influence on Man, for, as Dr. Clark-Kennedy has pointed out, malaria until recently was responsible for one-fifth of all human sickness, sleeping sickness not so long ago caused a large part of Central Africa to be uninhabitable, and in some areas of the tropics there are probably more people with, than without, amœbic dysentery.

Malaria. The word, of course, means "bad air," just as "influenza" means "influence"—in Italian *influenza di freddo*—the influence of cold. Human beings have a natural tendency to suppose that, when two events occur together, then one must be caused by the other. Yet, although malaria and "bad air" may often go together, and influenza and cold, it does not follow that bad air (whatever that may be) causes malaria nor that cold causes influenza. In fact, the anopheles mosquito carries the amœba of malaria, and the mosquito prefers climates which some people might describe as "bad," but it is the amœba, not the air, which causes the disease. Anyhow, the unfortunate mosquito might well use the phrase honoured by many generations of schoolmasters: "It hurts me more than it hurts you!" For the mosquito, too, is sick, and passes on its sickness to the person it bites.

There are several types of plasmodium—which is the scientific name for this amœba—producing attacks of fever varying in severity and frequency: benign tertian, quartan, and malignant quartan. Entering the body from the mosquito bite, the parasites penetrate the blood cells, multiply there, and finally burst into the blood stream. When this happens the temperature rises, and then they return to the cells to carry out once more the same procedure. Depending on the type, the attacks of fever may be at intervals of three or four days, severe or milder. When someone with malaria is bitten by a mosquito the infection can be transmitted to the next person it meets, but malaria is not infectious from one person to another directly. Quinine, of course, is the time-honoured remedy, but many other drugs are now available, mepacrine, palmaquine, atebrin, and even a sulphonamide derivative known as promin have been tried. The drug must be taken long enough for the infection to die out, otherwise relapses can occur even after leaving a malarial country (but it is only fair to say that, just as some people continue to give themselves the title of "Major" when they have left the Army, so others long in Britain continue to describe attacks of cold or 'flu as "my old malaria again," when, to say the least of it, they are exaggerating).

Important as are the drugs used in the treatment of malaria, even more so is the control of the parasite-bearing mosquito. The eggs of mosquitoes hatch in water, and there the young or larvæ forms can be attacked by pouring oil on the surface of pools so that they are unable to breathe, or by introducing small fish which have a partiality for them. Adult mosquitoes can be killed by D.D.T. and other insecticides or kept away by nets over beds and skin creams. Finally, anti-malarial drugs can be taken in dangerous areas. Whereas mosquitoes were once well on the way to getting rid of Man, now Man is well on the way to getting rid of mosquitoes.

Blackwater Fever is a sequel to malaria in tropical Africa and some parts of India. Rather illogically, it is described as "Blackwater," although the urine is red and the skin is yellow, but the result is due to breaking down of the red blood cells by some malarial toxin. Possibly too much quinine may help in producing the illness. Treatment is to give plenty of fluids and no quinine or any other anti-malarial drugs in the early stages. The death-rate is about 25 per cent.

Trypanosomiasis or sleeping sickness—not to be confused with *sleepy* sickness, which has already been dealt with under the name of encephalitis lethargica—is essentially an African disease (although also found in tropical America) spread by the tsetse fly. Its cause is the type of protozoan known as a trypanosome, almond-shaped with vibrating membranes at the sides which enable it to move through the blood-stream, rather like a flat fish in the water.

There are three stages of the disease: first, the stage of fever with enlarged glands and a rapid pulse, which may continue off and on for three years, secondly, the stage of trembling hands, legs, and tongue, vacant expression, and slow and stumbling speech, thirdly, and lastly, the stage of low temperature, apathy, wasting of the muscles, and possibly death.

Treatment is with arsenical drugs—such as tryparsamide or Bayer 205—which give good results in early cases. Preventive measures in infected areas include the destruction of tsetse flies by insecticides, the cutting down of forests near rivers which are inhabited by tsetse flies, and some authorities have suggested the shooting of big game which may form a "reservoir" of the parasites, whence tsetse flies can carry them to human beings. For similar reasons infected people should not be allowed to move to non-infected areas.

Amœbic Dysentery, also known as *Amœbiasis*, is caused by the *Entamœba histolytica*, an amœba whose cysts are found in food, water, or spread by infected fingers or flies. There is mild fever and

diarrhœa which contains blood. The disease may become chronic, and can cause abscesses, usually in the liver but sometimes in the lungs. Amœbiasis is treated and usually cured by injections of emetine hydrochloride, but in the chronic phase the drug known as Yatren is used in the form of an enema.

Leishmaniasis, kala-azar, or dum-dum fever, is another amœbic disease, probably spread in this instance by the bite of sandflies. It is also known as tropical splenomegaly—enlargement of the spleen in ordinary language—since infection results in enlargement of the spleen and liver, low, irregular fever, and death within a year or so. A milder form, affecting the skin, is known as Delhi boil, Oriental sore, or Bagdad sore, does not lead to kala-azar, and is fairly readily cured. The cure for both conditions is to give injections of tartar emetic, which reduces the death-rate from kala-azar from 80 per cent. to about 5 per cent.

Diseases Caused by Parasitic Worms.

Many types of worms infest human beings and other animals. They are interesting for such reasons as their size (which may range from the almost invisible to 30 ft or more), their life histories, and their serious or trivial consequences on their hosts. We shall mention only a few groups here, and mainly the ones likely to be met with in Europe—the tapeworms, the roundworms, and the threadworms—although some tropical types will be described briefly.

Tapeworms, as we have seen earlier, like many other types of intestinal worm, lead a double life. What usually happens is that the worm breeds in the human intestine, the eggs pass out in the fæces, and are then swallowed by animals eating contaminated material. In the animal the eggs hatch out into larvæ—primitive forms which penetrate the muscle, forming cysts—and Man is infected in turn by eating its meat. Thus *Taenia Solium* gets into the flesh of pigs, which, if imperfectly cooked (measly pork), causes infestation of the intestine in Man. It reaches a length of about 10 ft. *Taenia saginata*, which reaches a length of about 20 ft., is spread in imperfectly cooked beef, and in Baltic countries *dibothriocephalus latus* gets into the human intestine from caviare or undercooked fish. It reaches the awesome length of 30 ft.

Now all the worms we have mentioned so far are found in the human intestine, and the cysts, which are much more dangerous and unpleasant, in the animal's muscles. But in some worms the reverse happens, with the adult in the animal's intestines and the cysts in Man. Thus in Australia the dog tapeworm (*taenia echinococcus*) produces cysts in both sheep and Man. This is known as hydatid disease, and may remain unsuspected until cysts in the lungs, liver, or elsewhere become infected or rupture. *Trichinella spiralis* is similar in action, being found in the intestines of pigs and getting into the muscles or other organs of Man. The main difference is that this worm migrates from the pig's intestines into its muscles, whence it reaches Man in undercooked pork meat or sausages. The muscular cysts cause swellings and sometimes pain. There are changes in the blood, swelling of the face and leg in the early stages, and fever. A minor epidemic occured in England in 1941. *Taenia echinococcus* and *trichinella spiralis* are small—not more than ¼ in. in length—but are more serious in their consequences than the large worms. Treatment is very difficult, and ordinarily all that can be done is to deal with individual cysts when they make themselves apparent.

The large tapeworms, *taenia solium* and *saginata* and *dibothriocephalus latus*, produce varying symptoms or none at all. Usually they are not discovered until some segments of the worm are excreted, but there may be mild indigestion, excessive hunger, and occasionally anæmia. However, when the worm is discovered the patient, not unnaturally, is likely to become anxious and uncomfortable at the thought of "having" a tapeworm; these symptoms are caused by the worry rather than the worm.

Treatment is, of course, a matter for a doctor, but purging followed by extract of male fern is usually successful. One has to make sure that the head of the worm has been removed, otherwise it will continue to grow.

Roundworms are similar both in appearance and size to ordinary earth-worms and the eggs reach Man, not from an animal, but from the contaminated fingers of someone else who handles food. They give rise to no symptoms, and are noticed only when discharged in the fæces or occasionally vomited up. They can be removed by the use of santonin.

Threadworms, as the name suggests, are like small ¼-½-inch-long pieces of white thread. They are very common in children, and live mainly in the cæcum—*i.e.*, the part of the large intestine near the appendix. The males, which are the smaller ones, remain there, but the females pass down towards the rectum at night-time and lay their eggs in the area around the anus. Infection is by contaminated hands handling food—especially uncooked food—and water. Threadworms are not serious, and cause few symptoms other than itching around the anus and between the legs, but heavily infected children may show symptoms of anæmia. The nervousness often shown by such children is usually the result of the irritation produced by the worms in the anal region. Infection is not common in adults, and in children tends to disappear at puberty.

Treatment is, in theory, simple, for the worms are easily destroyed by a number of drugs, such as gentian violet, thymol, or one of the proprietary remedies. Ointment is applied to the itching area, and the child should be prevented from scratching. However, since the eggs may lie about the house for some time, reinfection often happens, especially if there are several small children in the home who may pass the disease from one to another.

The idea that intestinal worms in general are likely to cause loss of weight by absorbing food eaten by the patient is largely mistaken, for, although it is true that they do live on this food, the amount taken is certainly not enough to be significant.

Tropical Worms. *Bilharzia* has been mentioned before in connection with its frequency in Egypt, although it is also found in other parts of Africa, Arabia, and Iraq. There are two main types: one infecting the bladder (*schistosomum hæmatobium*), the other the rectum (*schistosomum mansoni*). Bilharzia is more correctly known as schistosomiasis.

The parasite's fantastic life-history begins when a man bathes in infected water, and the small swimming forms known as cercariæ pierce and enter his skin—or they may enter the body by drinking infected water. From the skin they pass to the portal vein below the liver, remain there six weeks until they become adult and then swim against the blood-stream down to the pelvis, where the female lays eggs which have a sharp spine. The eggs penetrate into the bladder or rectum—depending on the type of fluke—and pass out in the fæces or urine. If they enter water they hatch out into small moving forms which seek out a water-snail, develop further in its body, and leave it in the form of cercariæ ready to find a new human victim. The female fluke is slender and round, about 1 in. in length, the male, flat and leaf-shaped, is about ⅓ in. long, and, as we have seen, their grisly courting takes place in the portal vein, whence the impregnated female passes to the bladder (hæmatobium) or rectum (mansoni) to lay her eggs.

Infection results in raised temperature and, in the urinary type, blood in the urine, in the intestinal type blood is found in the fæces, and there are symptoms resembling dysentery—*e.g.*, diarrhœa. Treatment in both cases is by injections of antimony tartrate. Needless to say, attempts should be made at prevention by telling people to avoid infected canals (usually easier said than done), and by periodically cutting off the water supply to the canals to kill the snails.

Without treatment, the disease may go on for many years, when it may recover of itself or lead to slow death. A third type of schistosomiasis is found in the Far East (*schistosomum japonicum*);

it is similar to the intestinal type described above, and the treatment is the same.

Hookworm Disease, or ankylostomiasis, is found in many parts of the world, especially in miners who work on damp ground. It has even been found in Cornwall! The tiny worm enters the body usually through the feet, passes through the blood-stream to the lungs, eats through into one of the bronchial tubes, climbs the windpipe, and passes down the œsophagus into the stomach to end up in the duodenum. It causes anæmia, can be fairly readily cured, but is occasionally fatal.

Elephantiasis. Some types of parasitic worm are spread by insects. Thus in *Filariasis* mosquitoes inject by their bites the infantile forms of a tiny worm which enters the lymphatic channels, there the blockage they cause leads to the swelling of the legs and the lower part of the body, known as elephantiasis. In the evenings, when mosquitoes usually fly, the newly born infantile forms pass into the blood-stream, where they are sucked up by other mosquitoes to infect more hapless humans. So far, no certain cure is known, but antimony tartrate in some cases seems to give good results.

Lice and other insect pests will be dealt with under skin diseases.

PHYSICAL INJURIES

INTRODUCTION.

Our bodies are subject to physical injuries as well as to bacteriological and other ones, so here we are going to deal with injuries caused by such things as falling, cutting and piercing, changes in pressure of the surrounding atmosphere, atomic radiation, and poisons. Obviously the subject is much too large to be dealt with except very briefly, and in any case most of these injuries, other than the most trivial, have to be treated by specialists.

Falling may occur either when we trip or slip or are knocked down whilst our feet are already on the ground, or when we fall from a height. In the first case we are likely to have to deal with fractures or bruises, but in the second the injuries, although of a similar nature, are more serious. Also, whereas in the first case there need be no great mystery about the injuries produced, in the second we have to consider a number of factors. For example, if someone falls out of a window a great deal depends on the momentum of their body when they hit the ground, and momentum is weight multiplied by velocity. So, by and large, the heavier the body and the farther it falls, the greater the damage is likely to be. Thus an ant could fall from the top of a skyscraper without much injury, because it is too light to possess much momentum, and a baby falling from a first-storey window is less likely to be badly injured than its mother should she fall.

Other factors, of course, are also important—for instance, *how* someone falls and *on what part of their body*. Falling on the head, other things being equal, is more dangerous than falling on the side. So, too, as parachutists are taught, some ways of landing are safer than others: it is important to have the muscles relaxed, to land feet first, and gradually as it were "crumple up." That is why drunk people often get off so lightly when they fall, since their muscles are relaxed.

Car Injuries are another type of "fall" peculiar to our own age of fast-moving transport. If we think of a fall as being essentially a change in momentum, then we can so describe the situation when a car or an aircraft travelling at speed is suddenly forced to stop. When this happens, the vehicle in which we are moving stops, but our body goes on, hence in air-liners suddenly brought to a halt the passengers may be thrown forward with such force as to be killed or seriously injured. (This, of course, is why seat belts are used prior to taking off or landing.) In a car, too, collision or sudden braking from great speed may cause the passengers to be thrown through the windscreen or against some part of the car, bringing about death, often from internal injuries, even when the vehicle itself is only slightly damaged.

Bruises and Abrasions. A bruise occurs when a blow to some part of the body damages the underlying tissues without breaking the skin. At first there may be little to see, but, later, bleeding under the skin causes the typical "black-and-blue" appearance, as in a black eye. The black-and-blue coloration is caused by breaking down of the blood pigments when they get into the tissues. A similar appearance can result without physical injury when a varicose vein ruptures. In both cases the coloration may pass down under the skin—thus a small ruptured vein in the thigh may cause black-and-blue pigmentation in the lower parts of the leg.

None of this is usually serious. If there is no pain, nothing need be done, but if there is, cold compresses or lead lotion on lint may help, the colour goes in its own good time, and is not changed by any treatment.

An *abrasion* is an injury in which the skin is broken without the injury being deep. It should be treated as a shallow wound—that is, it should be washed in soap and water and a clean dressing with Vaseline applied to prevent sticking. If desired, the injury may be washed with a reliable disinfectant (Milton, Dettol, or some other), but only the first time, and the *washing with disinfectants should not be repeated*. The reasons for this are (*a*) that all disinfectants delay healing if continued, (*b*) that, after the first application, the dangerous germs are deep down beneath the surface and out of reach.

Wounds may be classified in many different ways. Thus we may talk of superficial wounds, meaning that they are not deep—but a shallow wound in some parts of the body (for example, in the wrist or the neck) could be serious if one or other of the important blood-vessels or nerves lying near the surface are injured. Wounds in these areas must be treated as important if there is much bleeding or, in the case of the hand or foot, loss of feeling or movement. In fact, *any* wound needs medical attention in either of these circumstances, or if there is shock or the possibility of bacterial contamination.

Other wounds may be deep and wide on the surface, whereas some may be deep with a small entrance wound. The latter are known as penetrating wounds, and are usually due to sharp piercing instruments such as knives or bullets. There is likely to be a good deal of shock and hæmorrhage and greater or less damage to internal organs (although a penetrating wound may miss organs one would have expected it infallibly to pierce). If abdominal organs are penetrated sepsis may be spread from *inside* the body by the intestinal contents escaping into the abdominal cavity. This can result in peritonitis.

The Response of the Body.

It is typical of all living things that they react to changes in the environment, whether this takes place at the highest level of the mental processes or at the simpler level of response to injury or disease. This is what is described by scientists as the principle of *homeostasis*, which means that there exists a tendency to maintain the body in a constant state. Thus, to take some examples, if the body loses fluid from sweating, thirst arises and the urine becomes reduced in amount and more concentrated, so that, on the one hand, fluid input is increased and output decreased until the balance is restored. If salt is taken in excess of requirements the amount of urine is increased to wash away the excess. So, too, the amount of the sugar circulating in the blood normally remains constant no matter how much is taken in, the excess being stored in the liver in the form of glycogen, which is similar to starch, if still more sugar is taken in it is transformed into fat.

Now, when the surface of the body is broken, as in wounds, similar attempts at restoring the original state are made. First, bleeding occurs, which tends to wash away dirt and germs, then the blood clots, forming a sort of seal over the wound. New cells known as fibroblasts, increase in number and grow into the clot, knitting the edges of the wound together. Capillaries (*i.e.*,

tiny blood-vessels) grow into the clot, too, to carry to the injured area food for the growing cells and substances (antibodies) which combat any germs which have got in. Finally, the fibroblasts shrivel up and contact, drawing the edges of the wound together just as a doctor's stitches would, and the situation of the wound is shown only by white scar tissue.

It should be noted that the more complex body cells do not regenerate. When a muscle is cut, for instance, the cut area is not filled by muscle cells but by scar tissue; nerves can regenerate provided the injury is only to the nerve—the long filament which stretches from the parent nerve cell—but when the cell itself is destroyed regeneration is impossible. Even so, the body does its best; for the scar tissue uniting a cut muscle is strong and remains as a sort of adhesive holding the ends together, and in brain damage, although the destroyed cells never grow again, others take over their function as far as possible. (There are so many brain cells in excess of what we actually need that even quite extensive brain damage may lead to little practical defect, but much depends upon what area of the brain is affected.)

When sepsis occurs in a wound, whether it be a pin-prick or a larger injury, local attempts are made to solve the problem. We have seen that blood aids in this by creating substances which destroy the germs or their poisons, and the white blood cells, known as phagocytes, destroy the germs as an amœba swallows its prey. Substances known as agglutinins cause the germs to clump together so that they are more easily dealt with. Finally, new cells form a fence around the infected area, cutting it off from the rest of the body–this, of course, applies to boils and abscesses as well as to wounds.

If, in spite of these local defences, the sepsis spreads, the body responds by producing more phagocytes, more agglutinins, and more antibodies or antitoxins. Fever, too, occurs, and is one of the signs that a wound is septic and that the sepsis is spreading. But there are intermediate defences, because the lymph vessels carry the germs to the nearest lymph glands: in the arm-pit in the case of the arm, in the groin in the case of the leg, and elsewhere throughout the body. The passage through the lymph vessels is marked by red lines on the arm or leg (lymphangitis) or swelling of the glands (lymphadenitis). These, too, are danger signals after any sepsis, because they mean that the first line of defence has broken down and that medical treatment is urgently needed.

Haemorrhage may be small or great in amount, and may come from a vein or an artery. If from a vein, the blood is dark and flows slowly, if from an artery, it is bright red and the flow pulsates. If the bleeding is severe there is shock and the blood-pressure is lowered, but once the trouble is over, new blood cells develop in the bone marrow to replace those lost. A doctor may aid this process by giving iron in mild cases or by blood transfusion in more serious ones.

Of course failure may result. There may be shock, which is caused by the liberation from damaged cells of a substance known as histamine, and this may cause danger to life in some cases. Or infection sometimes breaks down each line of defence, leading to blood-poisoning. Or excessive bleeding which cannot be stopped can also lead to death—in the blood disease known as hæmophilia the blood fails to clot, and even a slight injury may bring about fatal results from continued slow bleeding.

Fractures are classified according to whether they are simple or compound, that is, whether there is a wound over the area or not, the latter being the more dangerous, because of the possibility of infection. Or one can classify them according to whether the broken parts are separated; for obviously parts which are not separated are likely to heal with greater ease (in children, when the bones are softer, the type of fracture known as the "greenstick fracture," in which the bones bend rather than completely break, is common). Lastly, they can be classified according to the bones broken; for, depending, of course, on the seriousness of any particular injury, the possible complications differ in various areas of the body. In head fractures, concussion, injury to the brain, serious hæmorrhage, and sometimes mental changes can occur; in spinal fractures, when the spinal cord which passes through the bony tube is damaged, there may be paralysis or death, depending on the level of the injury; in fractures of the ribs or pelvis internal organs, such as the lungs or bladder, may be torn or ruptured—although this is not too common.

Certain parts of the skeleton are more liable to fracture than others, so, although in theory any bone in the body may be broken—even the small bones of the hand, foot, or wrist—two of the best-known types of injury are Colles' fracture of the wrist (caused by falling on the outstretched hand) and Pott's fracture of the ankle (often caused by slipping off the edge of a pavement). These fractures, of course, are named after the surgeons who first described them. Signs of danger in the case of other types of fracture are: in the skull, unconsciousness, confusion, bleeding from the nose or ear. in the ribs, pain on taking a deep breath. in the pelvis, passing of blood in the urine. Injuries to the skull or spine should always be regarded as potentially serious, although they are not necessarily so.

Injuries to the skull take many forms. A blow may render the patient unconscious, and there is usually loss of memory for the few minutes *before* the accident, although this is not necessarily serious. On the other hand, a relatively slight blow may tear a blood-vessel (middle meningeal hæmorrhage), causing little or no disturbance of consciousness, but leading to death in a few hours. (For example, those who have been drinking may fall, apparently lightly, on the head, be taken to a police cell and found dead in the morning due to this type of hæmorrhage.)

Then there is the hazard of boxing which results from many blows to the head during fights—the condition of being "punch drunk." Such injuries can lead to loss of memory, mental dullness, and sometimes criminal behaviour, the "punch-drunk" boxer at the best degenerates into a sparring partner or a pathetic exhibit in a Fun Fair, taking on all comers. At the worst he may become an inmate of a prison or mental hospital.

Bones heal by the formation of a bony substance between the severed ends known as "callus." But first the bones have to be joined, and this is done by splinting or plaster casts, in some cases by nailing the bones (especially in the case of fracture of the head of the femur—that is, where the thigh bone joins the hip joint—a fracture often found in old people). Lastly, bone grafts can be used in difficult cases and a piece of bone from someone else or from the same person used to join the severed fragments.

Burns. Burns are ordinarily caused by fire or by boiling liquids, but they may also be caused by corrosive fluids, such as strong acids or alkalis. There are three degrees of burns: first-degree burns produce simply a slight redness of the skin, as in a mild scald, second-degree burns damage all but the deepest layers of the skin, third-degree burns cause damage right down to the tissues beneath. Generally speaking, burns are not dangerous if they involve less than one-third of the body's surface, but second- or third-degree burns involving more than one-third of the body are a serious danger to life.

So we have to consider, first, the depth of the burn, and secondly, its extent. The second factor is usually more important than the first. In any burns other than those which are trivial, the following rules must be observed:

(1) Treat for shock (i.e., warmth, hot, sweet tea; and disturb the patient as little as possible).

(2) Use *absolutely nothing* in the way of dressings on the burn, and certainly not ointments or fatty substances.

(3) If there is likely to be a long wait for medical attention, bathe or submerge the patient in a bath of salt or baking soda (one teaspoonful to a pint of water).

(4) Leave the burned clothes alone, and on no account try to remove them.

Skin Grafts. In any injury, whether it be a wound or burn, new skin grows in slowly from the edges. But this cannot go on regardless of the size of the wound, and so a large denuded area has to be filled in with skin from elsewhere, and ordinarily this is taken from the thigh. Grafts may be taken in the form of large shavings of the upper layers of the skin which are spread over the denuded area, or small pieces (about ¼–½ in. in diameter) may be scattered over it.

Injuries caused by Atmospheric Conditions.

Changes in atmospheric pressure are found in two circumstances: when we go very deep down or very high up. Ordinarily, the air at ground level presses on our bodies with a pressure of 14·7 lb. to the square inch, and this has two effects: it keeps the lungs expanded against the ribs, and so makes breathing possible (if the chest is punctured the lungs collapse, since the pressure is then the same on both sides of the chest wall), and it forces oxygen and nitrogen into the blood-stream (the oxygen is necessary to life, the nitrogen is not, but both gases are the main components of air).

Now, it follows that when atmospheric pressure increases more of these gases are dissolved, or forced, into the blood, and when it decreases the gases—nitrogen in particular—start coming out. This becomes a problem only when the nitrogen comes out too quickly due to a sudden reduction in pressure. For example, in deep-sea diving or in caissons—the diving-bells used in underwater engineering construction—pressure may rise to four times the normal because in diving-suits air has to be forced down and in caissons the pressure has to be raised to keep water out. If, in such a situation, decompression is too sudden the blood in someone being raised too rapidly to the surface literally effervesces: the nitrogen leaves it in the form of bubbles, which may cause pain in the muscles, temporary paralysis, or even death from bubbles reaching the brain. The muscle cramps, once known as "the bends," are now uncommon, since the risks are well known and decompression is gradual. The treatment is to send the man down again and raise him gradually.

A similar condition, *Decompression Sickness*, occurs in aircraft flying at a height of 30,000 ft. or more. Since pressures are lower at high altitudes, the nitrogen leaves the blood and causes symptoms like those of caisson disease, although milder. This, of course, does not occur in modern pressurised aeroplanes, in which the pressure remains constant at any altitude.

Sunstroke. Until fairly recently it was usual to distinguish between sunstroke and heat-stroke, the first being supposedly caused by the direct influence of too much sun, the second being caused by excessive heat—for example in a steel foundry. In point of fact, there is no such thing as sunstroke, and both conditions are caused by excessive *heat*, whether brought about by the sun or under industrial circumstances. There is, therefore, no need whatever for sun-helmets or spine pads in the tropics, for the fact is that the head can be exposed to any amount of sunshine, and, provided that the body is kept cool, the worst that can occur is painful sunburn (especially in those with bald heads).

The symptoms of heat-stroke are headache, dizziness, and high fever; treatment is directed to reducing the temperature by cold bathing, ice packs, and cold drinks. When the condition occurs in industry there may be cramps caused by excessive sweating; in this case saline solution—one teaspoonful of salt to a pint of water—should be given. Heat cramps occur mainly in hot, moist atmospheres: in stokers, miners, and steel workers.

Frost-bite. This condition, well known by name if not experience, occurs in climates where one is exposed to severe cold—especially when this is accompanied by high wind and great altitude. The cold causes the small blood-vessels, mainly of the feet and hands, to contract, and later there is release of histamine, which produces shock and dilation of the vessels. The result is œdema or swelling, large blisters, and gangrene. Frost-bite is avoided by the use of warm clothing and soft, well-greased boots or gloves.

The treatment which should not be used is the one read of in books—rubbing with snow; heat, too, is to be avoided. The proper treatment is to keep the part moderately warm between the thighs or armpits of a comrade, having previously cleaned it with mild antiseptic and covered with clean wool or gauze. Sometimes amputation is necessary, but this should be delayed as long as possible, since some degree of recovery is always likely.

Sea-sickness, which troubled Lord Nelson more than the French warships, has been widened in scope in the natural course of technical progress by the addition of train-, air-, and car-sickness. All are due to the same cause: a rolling or up-and-down motion which affects the organs of balance, and, it must be added, a large element of imagination. There are many modern drugs which can prevent the trouble: antihistamines, sedatives, hyoscine, amphetamine, but nearly all of these are unobtainable without a prescription, and in any case one has to discover by trial and error which is most suited to the individual case. The solution, then, is to ask your doctor's advice.

The Effects of Atomic Radiation.

Here we are concerned with injuries produced by rays similar in nature to those of light which cause sunburn, but shorter in wavelength and more penetrating. Such rays do not necessarily arise from the explosion of nuclear weapons, for they include X-rays and the alpha, beta, gamma, and neutron radiation produced by radioactive elements as they spontaneously disintegrate or disintegrate artificially in a cyclotron. In addition, they include the cosmic rays which enter the Earth's atmosphere from outer space, all of which are dealt with in greater detail in the Science Section.

Radiation of this type is dangerous to the human body, but it is dangerous in a selective way, damaging the skin, the bone marrow, and the sex cells. Thus, exposure to X-rays for a comparatively brief period leads first of all to reddening of the skin after an interval of from a few days to two weeks, and a still longer exposure causes permanent destruction of the hair follicles so that the hair does not grow again. The penalty for considerable exposure to X-rays or the emanations of radium is, as the early workers found to their cost, chronic ulceration with the possibility of cancer. But this is not all. Ionising radiation destroys the bone marrow which produces red blood cells, and can thus lead to fatal anæmia, known as aplastic anæmia. There is also considerable evidence that leukæmia, in which the white blood cells proliferate, is on the increase and may be caused by radiation. Acting on the sex cells of men and women, fertility is decreased, and those children who are born may be abnormal; large doses cause sterility. Nuclear weapons produce the ordinary results of any explosion—blast and burning—but radiation is their peculiar speciality, as was shown when the Japanese fishing-boat *Fukuryu Maru* was showered with radioactive dust during an experimental explosion at Bikini in 1954. In this case the fall-out of an explosion many miles away killed one of the crew, and subsequent study has shown that the radioactive cloud which follows such an event may travel several times around the world before settling. A report published by H.M. Stationery Office (*Hazards to Man of Nuclear and Allied Radiation*) in 1956 belittles the influence of atomic explosions, which, it says, at the present rate will not increase radiation more than 1 per cent. But what is given with one hand is taken away with the other, for it is pointed out that X-rays as used in medicine may increase the danger to the sex-cells by 20 per cent., and that H-bomb explosions produce radioactive strontium, which by replacing the calcium in our bones can cause serious disease. The amount of radioactive strontium in the atmosphere is already at a dangerous level, and if explosions continue the position in the not too distant future will be serious. It is known, too, that the total amount of radioactive material surrounding us is in-

creasing, whether from nuclear weapons, industrial sources, medical instruments, or even the apparently innocuous luminous wrist-watch. These are the facts, and even if the danger were a good deal less than it is, they would be worth considering.

Atomic Medicine.

Radiation of the type we have been discussing may also be useful to Man, and for many years it has been known that X-rays can not only bring about cancer but also cure it. More recently, however, use has been made of radio-isotopes—that is, elements which have been made radioactive in a cyclotron. In medical and biological research such elements are capable of being traced throughout the body by the use of special instruments, so that it is possible, for example, to find what happens to iron from the moment it is taken in to the moment when it is built into the red blood cells which carry oxygen around the body. Similarly, the growth of animals and plants may be studied in detail. Such activated atoms are known as "tracers," and it seems likely that much more will be found out about biological processes with their aid.

Radioactive substances are also used in the treatment of disease. Thus cancer of the thyroid has been treated for many years by means of radium or X-rays, which have the defect that they do not penetrate deeply enough unless they are so powerful as to damage tissues other than the tumour. Now, iodine entering the body ultimately reaches the thyroid gland, and when this iodine is made radioactive the radiation which destroys the cancer cells is given off within the gland itself. And it does this with the least possible damage to surrounding tissues, with the additional advantage that it can be taken by mouth in the form of a "radioactive cocktail."

DRUG ADDICTION

INTRODUCTION.

Poisoning.

This is a common enough event if we include under the term our own prejudices: "intestinal poisoning" (the polite name for constipation), alcoholism (if we don't like alcohol), and even meat (if we happen to be vegetarians). However, here we are talking of poisons in the sense that Dr. Crippen and other gentlemen understood—substances which are seriously dangerous to life. Such substances need not, of course, be used with any criminal intent, and in fact some of them gain entry to the body in quite innocent ways. Thus mercury, once used in the treatment of syphilis, can cause chronic poisoning, as also can lead and many other substances used in industry. There is, too, the curious state of *allergy*, dealt with elsewhere, in which substances not ordinarily harmful to human beings cause illness and sometimes death in those who are sensitive to them. There is nothing so harmless that it cannot cause harm to *someone*, nor is there anything so harmless that in sufficient amounts it cannot cause harm to *anyone*.

There are poisons such as prussic acid and its derivatives which are almost instantaneous in their action, others which, if given in relatively small doses, produce sooner or later symptoms which often mimic those of disease (*e.g.*, mercury, lead, arsenic). Some poisons have unusual effects, as strychnine, which causes fits, and curare, formerly used on the tips of poisoned arrows, which causes paralysis. Curare is now used in surgery to relax the muscles during an operation. Lastly, there are the supposed "poisons" which fond imagination endows with dangerous properties, particularly towards nagging wives, boring husbands and mothers-in-law; of these ground-up glass is perhaps the chief. Regrettably or otherwise, it must be reported that ground-up glass is completely harmless—unless, of course, the pieces are so large and sharp that even the least suspicious victim might have reason to wonder. So, too, cigarette ash, which is supposed to have an effect (one wonders what) when dropped in someone's drink, is quite innocuous. Sea-water, which, it is alleged, causes the shipwrecked mariner who is rash enough to drink it to go mad, produces no such effect—however, it does increase thirst.

Each poison has its appropriate antidote, but here only general rules can be given. These are (1) send immediately for a doctor; (2) give drinks of milk, white of egg, or strong tea; (3) afterwards, give as much as possible of a mixture containing a heaped teaspoonful of salt to a cup of warm water—which should cause vomiting; (4) when a narcotic poison has been taken (*i.e.*, one which makes the patient sleepy), keep him awake by walking him about and by giving strong tea or coffee.

Every doctor has the experience of being asked by patients from time to time whether the medicine they have been given is a "drug"—to which the only sensible answer would be: "It depends on what you mean by a drug." (The *Oxford Dictionary* defines the word as a "simple substance used alone or as an ingredient in medicine.") Thus defined, all medicines are drugs, from Epsom salts and baking-soda to heroin and cocaine. Presumably what the questioner really means is whether the drug is one that causes addiction; but this problem is not a simple one. Tea and coffee are drinks containing "drugs" such as caffeine to which many people are addicted in the sense that they would feel uncomfortable without them. In fact, at least four-fifths of the human race is addicted to some drug or another, and those who take strong purgatives every night are certainly addicts, even if they describe their abominations as "medicine." As Dr. Bergen Evans points out, it is probably a bad thing to take drugs, but it is unquestionably a bad thing to talk nonsense.

Let us be clear, then, about some basic facts. First, in many cases drug addiction is the *result* of being mentally unbalanced and not the *cause* of it; secondly, the drug addict as seen in the psychiatrist's consulting-room or the police court is a specially selected type, in that he is the one who is so obviously unbalanced as to be found out; thirdly, and as a corollary to the second point, the majority of drug-takers are apparently ordinary people who are never found out. For example, Coleridge and De Quincey, two of our greatest writers, took huge amounts of opium, and were both creative in their profession and lived to a ripe old age. Indeed, not much more than a century ago, opium was in fairly general use amongst the working-classes of this country both as a medicine and to add to their beer or tobacco. These people took opium as today we take cocktails, and did not necessarily become addicts, nor crave for more. In point of fact, alcohol is more dangerous than opium or morphine when taken in large amounts by unstable individuals, and one authority goes so far as to say that alcohol causes infinitely more murders, rapes, and crimes of violence than do morphine, heroin, cocaine, marijuana, and all other drugs combined. In the graphic words of Dr. J. D. Reichard, who is an authority on narcotics: "An alcoholic gets drunk, goes home and beats his wife, an addict to morphine gets 'high,' goes home, and his wife beats him." The narcotic drugs decrease rather than increase (as alcohol does) the sexual and aggressive impulses.

Taking narcotic drugs, except under medical advice, is both dangerous and a crime. But, morally, the crime belongs as much to society as to the individual. The drug addict, like the homosexual, is in two senses the result of social influences: in the first place, he is likely to be an over-sensitive and insecure individual who cannot stand up to the demands of our high-pressured competitive society. In the second place, when society (rightly or wrongly, since we are discussing facts, not morals) makes his behaviour illegal, he is forced into all sorts of subterfuges in order to carry on what to him is really a compulsive need. Hence, drug addicts are often the victims of blackmailers or steal in order to get supplies of the drug, just as homosexuals may be blackmailed or otherwise get into trouble with the law. Others may get supplies of their drugs easily or carry on their sexual peculiarities at home and never be found out.

Ordinarily well-balanced people need not fear becoming addicted to a drug prescribed them by

their doctor The treatment for those who do become addicts will not be discussed here, since the only hope for cure is in a hospital dealing with such cases.

Alcoholism.

This is a problem on its own in that its use is so widespread and, by and large, socially accepted But what makes a person an alcoholic is not only the amount he takes but the underlying emotional tensions which make alcohol an absolute necessity to him. It is possible for some people to drink a great deal but yet to be able to "take it or leave it," which is what the alcoholic cannot do

This is a subject about which most of us hold such strong opinions (not always based on fact), that we had better look at the medical evidence To begin with, it used to be taught that alcohol caused the following conditions alcoholic neuritis, chronic gastritis, cirrhosis of the liver, and certain forms of insanity, such as delirium tremens ("D T s"), and the so-called Korsakow's psychosis, in which there is loss of memory and finally dementia These statements are not untrue, but have to be modified by others cirrhosis of the liver is found in many people who have never drunk anything stronger than tea, and, although it may be found in alcoholics, is not very common, alcoholic neuritis (which is due to lack of vitamin B1) is common in heavy spirit drinkers, but not in beer drinkers—since beer contains the vitamin, gastritis can be caused by any over-indulgence in piquant foods or drinks, such as curries, strong tea which is constantly "stewed," or alcohol

It seems that the basic cause of physical disease due to alcohol is the same in all cases the alcoholic tends to neglect his food and to get gastritis from taking strong liquors on an empty stomach This leads both to insufficient vitamin B1 (which is necessary to the nervous system) being taken in, and insufficient of what is taken in being absorbed owing to the inflamed condition of the stomach lining Hence there is neuritis and, in bad cases, damage to the brain cells But perhaps the main damage is the social one, for, as Clark-Kennedy points out in his book *Human Disease*, "More damage is probably done by (alcohol) in weakening self-control and absorbing income, better spent in other ways, than by any permanent damage to a man's nervous system" As in narcotic addiction, the hunger for alcohol may lead to persistent lying in order to keep up appearances, disregard for family, loss of memory, lack of self-respect and control, loss of work, income, and the rest, in a life where the sole interest is more of the tipple—these are psychological effects imposed on an already unstable personality.

Treatment must ordinarily be carried out in a hospital, and various treatments, such as "Antabuse" or apomorphine, can be given—drugs which make the alcoholic violently sick if he partakes Other physicians rely mainly on psychotherapy, and some patients are helped by the body known as Alcoholics Anonymous (you will find the address of the local body in your telephone directory) Since the condition is a disease, "will-power" in the case of either alcohol or narcotics rarely has any effect

The effects of some other drugs are, very briefly:

Morphine leads to detachment from reality, freedom from worry and fear

Opium. The effects are similar, and results probably least harmful

Heroin is less likely to make the patient sleepy and more likely to lead to serious addiction—hence the recent move to ban its use altogether, even in medicine.

Cocaine ("Snow"), usually taken in the form of snuff or by injection, relieves temporarily depression, and gives an impression of heightening all physical pleasures. It produces cheerfulness, leads to rapid moral deterioration, and is the most difficult form of addiction to cure.

Marijuana allegedly stimulates sexual fantasies, but certainly decreases sexual ability. It is usually taken in cigarettes, and much nonsense has been talked about it An official committee promoted by the Mayor of New York found that in large doses marijuana impairs intellectual functioning, causes giggling and laughing (with an inability to do any harm whatever), does not affect the basic personality, and leads to no permanent deterioration. The doped cigarettes are known as "reefers," and the desire of those who use them to be thought "bad boys" leads them to exaggerate the effects of the drug. Thus a well-known jazz conductor announced that "tea (i e, marijuana) puts a musician in a real masterly sphere. Nothing can mess you up. You hear everything and you hear it right" This belief that reefers help the jazz musician is nonsense, for, regrettably, the truth is that it may *seem* to make the music sound better, but only to the musician, actually, the music is worse.

Barbiturates. Drugs such as phenobarbitone, medinal, veronal, are used in treating nervous illness. Except in excessive doses, there is no evidence that they do any harm at all, and some people take them for most of their lives Death can result from overdose, but the probability is that those who commit suicide with barbiturates would do so anyhow One danger, however, is that, after taking the original dose there may be forgetfulness, and an overdose taken which may lead to accidental death All sedatives and sleeping tablets are best kept in the custody of someone other than the person who takes them, unless the amount is small

Benzedrine or Amphetamine is a stimulant drug used in the treatment of depression, it is also used to reduce appetite in those who are slimming In the form of inhalers, amphetamine reduces congestion in the nose Wrongly used, the drug is taken by those who ought to have more sense in order to give them a "lift" In some people, amphetamine has little or no effect, but those who are worried or tense may well become more agitated with the drug, and large doses can cause complete inability to sleep and great excitement. It is, of course, also used by students before an examination in the belief that it gives confidence and clears the mind, but not even amphetamine can put into, or bring out of, the mind what is not already there Addiction to amphetamine and drugs such as "Drinamyl" containing it, is becoming a social problem

DISEASES OF THE BLOOD

INTRODUCTION.

The blood-stream is the canal system of the body which carries from one part to the other various substances essential to life. Thus it carries, partly in the red blood cells and partly in solution in the liquid part of the blood, the oxygen breathed into the lungs, and returns to the lungs to be breathed out the waste product known as carbon dioxide. From the intestines it carries the digested foodstuffs through a large system of veins (the portal system) to the liver, where they are changed in many ways to make them suitable for absorption by the cells of the body. The foodstuffs—fats, proteins, and carbohydrates—after change in the liver are discharged into the general circulation and excess amounts are stored for future use. *The liver* is the largest organ in the body, and lies just under the ribs on the right side. In addition to storing food, it also stores unneeded blood, to be given out when emergency calls, it destroys poisonous substances circulating in the blood (not always successfully, of course); it manufactures bile, which passes down the bile duct into the intestines to aid in the digestion of fats; lastly, it manufactures prothrombin, which is necessary to normal blood clotting. More will be said of the liver under the heading of Gastric and Intestinal Diseases.

As we have seen, the blood also carries those defence materials which help to destroy infection in any part of the body: the antitoxins and antibodies, and, of course, the white cells, some of which actively attack germs. Just as the blood

transports food around the body, so it transports the liquid waste matter not needed by the cells to the kidneys, which excrete it in the form of urine.

Blood consists of a liquid part, known as plasma, and floating in this are the red and white cells A cubic millimetre—that is, an area about the size of a pin's head—of this contains about 5 million red cells, mainly concerned with the transport of oxygen, and about 5,000 white cells, concerned with resistance to infection. There are different types of white cells—for example, the lymphocytes, the leucocytes, and the eosinophils (these are all given various names and subdivided in many ways). The red cells are usually known as erythrocytes. From examination of the blood, doctors can tell a great deal about the patient, thus less than the usual number of red cells signifies anæmia, too many, polycythæmia If the red cells are reduced in number, but too large, pernicious anæmia is possible; when they are reduced in number but too small, simple anæmia is the probable answer. In acute septic conditions or infections there is great increase in leucocytes —up to 30,000 or more—in some chronic infections or certain diseases, such as whooping cough and glandular fever, there may be increase in lymphocytes Eosinophils are increased in many allergic diseases.

Doctors also consider such factors as the number of platelets (which are very tiny cells connected with clotting), the fragility of the red cells, and the sedimentation rate, which is the length of time it takes the red cells to sink to the bottom of a tube of blood The time taken to coagulate is also important.

Two other organs also closely connected with the blood are the *bone-marrow* and the *spleen*. The spleen, on the opposite side of the body from the liver, farther back, and smaller, stores iron and blood. During development before birth, the spleen manufactures both red and white blood cells, but after birth the bone-marrow manufactures all the red cells and most of the white ones. However, all through life the spleen still makes certain types of white cell and has the further function of destroying the old red or white cells and retaining the iron for use in making new red cells. It also kills bacteria which have not been dealt with in other ways Unlike the liver, the spleen can be removed without danger to life, the liver cannot be removed, and even slight operations on it are dangerous.

Lymph Vessels and Glands.

These have already been mentioned They carry a milky or clear liquid known as lymph throughout the body. Lymph comes from blood plasma and passes through the glands, which are situated at strategic points. The glands act as a filter for germs, and red lines above an infected area or swollen glands indicate infection which has got beyond the point of entry. The main groups of glands, other than those inside the chest and abdomen, are at the back and sides of the neck, in the armpit, and in the groin All the lymph vessels meet in the chest, and the main vessel pours the lymph into the blood-stream just above the heart.

The Heart and Blood-vessels.

These will be described elsewhere, and here all that need be said is that blood is oxygenated in the lungs, passes into the heart, and is pumped around the body through the arteries As they become smaller towards the end of their destination, the arteries are called arterioles, which ultimately become smaller still—the capillaries, which pass into the venules or small veins, thence into the larger veins, and back to the heart with the used blood. In fact, there is more than 100,000 miles of the circulatory system in the body.

Blood diseases can be divided into various general groups. (1) those due to nutritional defects, such as pernicious anæmia, which is caused by lack of the anti-anæmic factor to be discussed later, or the simple anæmia caused by lack of iron and other substances in the food, (2) anæmia due to hæmorrhage or loss of blood in any form, (3) anæmia due to breaking-up of the red cells, as in blackwater fever following malaria, (4) anæmia caused by such damage to the bone-marrow that new blood cells are not produced, (5) a final group of little-understood diseases of the blood cells or lymphatic system. We shall consider these in turn.

NUTRITIONAL DEFICIENCY ANÆMIAS.

Pernicious anaemia is due to lack of something within the body, known as the "intrinsic factor," which is normally secreted by certain glands in the duodenum and at the lower end of the stomach. Together with the "extrinsic factor," taken into the body in protein foods, the two form a substance stored in the liver without which blood formation does not occur No matter how much of the extrinsic factor is taken in, it is of no avail if the intrinsic factor is not secreted. Why the glands should stop working is not known, but anæmias similar to pernicious anæmia sometimes occur after the stomach has been removed by surgical operation, or during diseases, such as sprue, which damage stomach or intestinal function. However, most cases of pernicious anæmia are not due to these causes—they simply happen. The patient is usually an adult, over the age of thirty-six, who complains of weakness, pallor (of a typically lemon-yellow type), shortness of breath, soreness of the tongue, and swellings of the ankles. The red blood cells are greatly reduced in number, but each cell is larger than normal, and the size of the spleen and liver may be increased. In this disease the stomach does not secrete hydrochloric acid. Formerly this type of anæmia was invariably fatal in a period varying from a few months to one or two years, but in 1924 Dr Minot of Boston in America began to give raw liver to some seriously ill patients, and found that they recovered. The raw liver supplied the intrinsic factor, and, so, it was found, did dried stomach extract. Nowadays, nobody need die of pernicious anæmia, which is treated with concentrated liver extracts and vitamin B12. If, however, the anæmia has gone on for a long time without treatment, there may be signs of damage to the spinal cord with weakness of the legs and areas of loss of feeling

Simple Anaemia is due to inadequate diet so far as iron, vitamin C, and other substances are concerned The red cells are reduced in number, but they are not, as in pernicious anæmia, enlarged This is the commonest type of anæmia in this country, and is what is usually described as "bloodlessness" Unlike pernicious anæmia, ordinary anæmia is *not* helped by liver extract, and is cured by iron tablets It is important to realise that the fact that people look pale does not prove that they are anæmic One can tell more effectively by finding pallor on the inner side of the lower eyelid, or by having a blood test taken, but, ordinarily, paleness, breathlessness, and swelling of the ankles denote anæmia There are so many medicines containing iron on sale that you had better ask your doctor's advice before taking them

Anaemia after Haemorrhage might seem to refer only to loss of blood after an injury, and so it often is But in this case unless the blood loss is great it will soon be replaced by the bone-marrow Perhaps more important, because less obvious, is the simple sort of anæmia caused in women by excessive menstrual loss. This demands treatment of the basic cause by a doctor. Usually in bad wounds blood transfusion is necessary, in chronic loss in women giving iron and preventing the loss is the correct treatment

Anaemia Due to Breaking-up of the Red Cells is found in many conditions, most of them unknown in Britain The best-known is blackwater fever, already described, in which the red cells are damaged in malaria and dark blood pigment appears in the urine—hence the name "blackwater" None of them has any importance here, and, in any case, medical advice is necessary.

OTHER DISEASES OF THE BLOOD.

Some blood diseases are due to the inability of the bone-marrow to produce more blood cells. Two important ones are *aplastic anaemia* and *agranulocytosis*. The first may happen without apparent cause, or be produced by X-rays, radium, some antibiotics, and some sulpha drugs—indeed by many drugs, in the long run, it is fatal. Agranulocytosis, if discovered in time, can be cured. The main obvious distinction between the two is the severe ulceration of the throat found in agranulocytosis and not in aplastic anæmia, and, although agranulocytosis can be caused by over-indulgence in certain drugs, it is more usually a sequel to such severe infections as tonsillitis, pneumonia, or septicæmia. Other diseases are due to something which has gone wrong with the production of white blood cells, and chief ones being the leucocytes, which are manufactured in the bone-marrow, and the lymphocytes, made in the bone-marrow and partially in the lymph glands. Disease of these cells, in which they increase vastly in number at the expense of the red cells, is called *leukaemia*, and there are three types.

(1) *Chronic Myeloid Leukaemia*, where disease of the bone-marrow causes decrease in the number of red cells and increase in the number of leucocytes—perhaps to half a million per cubic millimetre (you will recall the normal figure is about 5,000–6,000). The spleen is much enlarged and the patient, commonly a man between twenty-five and forty years, suffers from weakness, swelling of the legs, and bleeding from the nose.

(2) *Chronic Lymphatic Leukaemia* is a similar state of affairs in which the number of red cells is reduced, although less so than in the first case. The spleen is also not so much enlarged, but the lymph glands are, and the number of lymphocytes in the blood is enormously increased. In this disease the patient is usually over middle age, but otherwise the symptoms are much the same as in chronic myeloid leukæmia.

Both diseases are treated by X-rays, and although the ultimate outlook is not good, the patient may have many years of reasonably fair health to look forward to.

Acute Leukaemia is found in younger people, and is usually due to increase—very rapid in this case—in the number of the leucocytes. It is quickly fatal.

A similar condition, in which the *red* blood cells increase in number, is *polycythaemia*. The increase may be from the normal 5 million per cubic millimetre to something like 8 million. The patient has an enlarged liver and spleen, looks blue and congested, and his fingers may become clubbed at the tips. He can lead a fairly normal life for many years with the help of drugs which reduce the production of red cells. However, thrombosis (clotting) may happen at any time, or the bone-marrow may suddenly give out through overwork, so that death is caused by aplastic anæmia.

All these diseases have this in common, that the blood cells of one type or another are produced in excess, they are, in effect, a form of cancer of the blood. Their recent increase may bear some relation to increased radioactivity.

Hodgkin's Disease is another curious condition, very similar in appearance to chronic lymphatic leukæmia. Here, however, most cases appear in young people, and, although the lymph glands enlarge, there is relatively little change in the blood. There is, too, likely to be an intermittent temperature which goes up and down at intervals of about ten days. Finally, all the glands of the body (within the chest and abdomen, as well as in the more superficial areas) become enlarged and may interfere with eating, speaking, or breathing. In the later stages severe anæmia develops, but, as we have already seen, there is little to note in this respect to begin with. Hodgkin's disease is, in fact, a disease of the lymph glands rather than of the blood. The outlook is always serious, but X-rays and certain drugs are helpful in slowing down the process.

Purpura is one of quite a number of conditions in which there are hæmorrhages under the skin, usually resembling small purple spots. Often such spots are not a disease in themselves, but simply the result of some other condition. For example, many of the ordinary fevers, septic conditions, leukæmia, jaundice, and the later stages of cancer or kidney disease may bring about this type of purpura, known as secondary because of the reason given above. Purpura may also occur after epileptic fits or bouts of whooping cough due to the strain of the spasms, and following the use of certain drugs.

Primary purpura, which is the genuine article, includes a group of diseases, some serious, others mild, and the main members of this group are:

Purpura Simplex, a mild condition in children associated with small hæmorrhages into the skin of the shins, sometimes diarrhœa, fever, general "run-down" feeling, and muscle pains. It may sometimes be connected with deficiency of vitamin P, but clears up in two to three weeks.

Purpura Haemorrhagica or Thrombocytopenic Purpura is much more serious, although in some respects its symptoms are merely an exaggeration of the above. It is found in children and young women, the hæmorrhages are severe and occur not only under the skin but also from the gums, nose, and bowels, so that anæmia soon develops. There is high fever, often with delirium. Unlike purpura simplex, in which the blood is unchanged, this disease is caused by some defect in the spleen which continues to destroy the blood platelets which play a part in clotting. Blood transfusions are given, but if the condition becomes serious the spleen may have to be removed.

Henoch's Purpura: this is a disease usually associated with infants and children. Blood and mucus are secreted into the intestine, there is colic, vomiting and diarrhœa containing blood. The main importance of this disease is that it so closely resembles a number of abdominal conditions for which surgery is necessary that it may be referred to a surgeon. The fact that it is a form of purpura becomes evident when the tell-tale spots appear on the skin. An attack clears up in about two days, but may recur and become dangerous.

Haemophilia—Bleeding and Clotting. As is well known, there are some people whose blood fails to clot in the normal time when a wound occurs. When this is so, even a small wound may cause the patient to bleed to death—a tooth extraction, a slight cut, a bruise, all become major emergencies. Since these minor injuries are happening to most of us many times each year, the life of a hæmophiliac is a risky one. Many hæmophiliacs, indeed, in their early twenties, have been given as many as two hundred blood transfusions to save their lives in injuries which would have been unimportant to anyone else.

Hæmophilia is hereditary, and is passed on to the male members of a family by the mother who is not a "bleeder," but whose father was. The mother is the carrier who hands on the disease to her sons. Perhaps the most famous example was Queen Victoria, who had four sons and five daughters, one son (Prince Leopold) died of the disease, and two daughters (Princess Alice and Princess Beatrice) became carriers. Princess Beatrice married and produced two sons with hæmophilia and one carrier daughter—a daughter who married King Alfonso of Spain, and out of four sons two had hæmophilia. Prince Alice married Prince Louis of Hesse, and had one son, who died of bleeding in his fourth year, and two carrier daughters, one of whom became the Czarina of Russia. Her only son was the unfortunate little boy who, by reason of his hæmophilia, was the main reason for the introduction of the self-styled "healer" Rasputin into the family and the source of his malign influence over the royal house.

Hæmophilia is only one disease in which there is a tendency to bleed, in this case caused by delayed clotting. But a similar tendency may be caused by inadequate clotting, when the clot formed over a wound is soft, jelly-like, and fails to harden, or, as in the case of some types of purpura, when the capillaries are so fragile that they are easily broken by a relatively slight injury. What

are the factors which bring about clotting? When bleeding occurs, the platelets in the blood-stream move to the area, disintegrate, and release a substance known as thromboplastin, which, together with two other substances in the blood—calcium and prothrombin—form thrombin. (The prothrombin is manufactured in the liver, and vitamin K is an essential in its formation.) Thrombin, however, is not the final product, for it interacts with something else in the blood, known as fibrinogen, to form *fibrin*, the actual clot, and, as we have seen, the fibrin forms long, thread-like fibres which fill in the gap and ultimately draw the edges of the wound together. Clearly, then, the tendency to bleeding may result from lack of any one of these substances, most often from lack of prothrombin (due to liver disease, blocking of the bile-duct, or lack of vitamin K) and very rarely from calcium deficiency. Almost equally rare is deficiency of fibrinogen, so the remaining types are caused by lack of thromboplastin, either because the number of platelets is reduced, the amount of thromboplastin in the platelets is insufficient, or, most commonly, because the platelets are so tough that they fail to break up at the site of the bleeding.

There are many different treatments used in bleeding diseases, and obviously the treatment will depend on what specifically is missing. But, in any case, the outlook is much better than it once was.

BLOOD TRANSFUSION.

When, in the early seventeenth century, William Harvey discovered the fact of the circulation of the blood, he became the predecessor of many great men in the England of his time. England was in the process of a scientific renaissance, one expression of which was the formation of the Royal Society under the patronage of Charles II—a society with such members as Sir Christopher Wren, Robert Hooke, the greatest microscopist of his time, Boyle the physicist, Sir Isaac Newton, Pepys, and others. All these men had an insatiable curiosity which extended far beyond the bounds of their particular subject, and thus it was Wren the architect who first suggested the possibility of intravenous injection of drugs (*i.e.*, injecting them directly through a syringe into a vein), and who carried out with other members the first experiments on blood transfusion. They transfused blood from one dog to another, from a sheep to a man, and from a young man to an old man—the fact that no human fatalities seem to have occurred points more to luck than good guidance, since, as we now know, there are four well-defined types of human blood, and some types are so incompatible that mixing will cause acute distress and possibly death. Before transfusion, therefore, it is necessary to know that the blood types of both donor and recipient are compatible.

Blood transfusion is much more frequently used now than formerly, as knowledge of the technique has increased. Whereas it was at one time regarded almost as a last resort, it is now used before, during, and after surgical operations if necessary. Blood transfusion, in fact, has become the most important weapon in the prevention and treatment of shock and has saved millions of lives. The blood taken from donors is stored in "banks" according to type, but when whole blood is not available plasma (usually in the form of dried powder which, like powdered soups, can be "reconstituted" with sterile water) or intravenous saline is also useful.

DISEASES OF THE HEART AND BLOOD-VESSELS

DISEASES OF THE HEART.

The heart lies in the centre of the chest and slightly to the left side between the lungs. Its shape is familiar from the hearts seen in butcher's shops, or, if you are a vegetarian, from the hearts on playing-cards (which are, however, a somewhat idealised version). There are four chambers in the heart, the right and left auricles and the right and left ventricles, the auricles being the ones at the upper part, the ventricles the ones below. The chambers are separated by valves which permit only a one-way flow of blood.

Circulation of the blood is, of course, continuous, and does not begin anywhere, but for purposes of description we may conveniently begin at the left ventricle, which pumps the blood through the aortic valve into the aorta, the largest artery in the body, and thence throughout all the other arteries. After passing to the arterioles (the smallest arteries), and to the capillaries, where the blood does its work of supplying oxygen and food to the tissues, it passes into the small veins or venules and then to larger and larger veins until, having given up its oxygen and food and absorbed waste products such as carbon dioxide (breathed out in the lungs) and soluble food wastes which are filtered out by the kidneys, it passes into the largest vein, the *vena cava*. The *vena cava* enters the right auricle, which pumps the blood through the tricuspid valve into the right ventricle, from which it passes through the lungs to get rid of its carbon dioxide and take in more oxygen. From the lungs, the blood goes to the left auricle, and thence, through the mitral valve, to the left ventricle to begin the cycle once more. The tricuspid valve, as the name implies, has three cusps or flaps, the mitral valve, shaped like a bishop's mitre, has only two.

Like other internal organs, the heart is covered in a thin, double, transparent covering or sac, rather like the plastic bags in which food is sold, and this contains a layer of fluid to prevent friction as the pumping motion is carried on. It is known as the pericardium.

There are three different tissues in the heart: the pericardium, which has just been described, the myocardium, or muscle, which forms the main bulk, and the endocardium or lining of the chambers, including the valves. Any one of these tissues may be attacked by disease, as also may the small blood-vessels, known as the coronary vessels, which supply blood to the heart muscle (for the heart, no less than any other part of the body, has to have a blood supply).

In general, heart disease belongs to one or other of three types: *congenital*, due to defects of the heart at birth, *infective*, due either to actual infection or its after-effects, *degenerative*, due to the changes of old age—which come on at different ages, depending on the individual. Now, strictly speaking, heart diseases are not curable in the sense that in most cases we cannot say that the heart has returned to its previous condition. What we can say is that the heart has a great ability to compensate for its defects, both by natural processes and with the aid of modern medicine and surgery. Only a score of years ago people were turned down for Life Insurance because they had a "murmur" in the heart (*i.e.*, the sound a doctor hears with his stethoscope if a valve is defective). But today judgement is based on much wider information, for it is realised that what is heard through a stethoscope is not in itself justification for making a hard-and-fast diagnosis. We must consider also the results given by electrocardiograms and, above all, by the individual patient's performance and symptoms.

The electrocardiograph is an instrument which measures the electrical currents passing through the heart muscle as it beats and shows them up on a chart. It gives in this way a pretty accurate estimate of the heart's efficiency. But, important as these results are, we are much more interested in the actual observation of what the heart can *do*, how it in fact *works*.

The following story—which is true—gives an indication of the modern medical attitude towards heart disease. A wealthy patient, who believed something to be wrong with his heart, made an appointment with a famous heart specialist. On reaching the hospital, he found that the doctor's office was on the third floor, and that the lift was not working. He was therefore compelled to walk up three flights of stairs, and finally knocked on the door of the specialist's office. When the door was opened the doctor looked at him and asked: "You walked up the stairs because the lift is broken?" "Yes," replied the patient. "Then your heart is perfectly normal. Good afternoon!" said the doctor.

What this story illustrates is that, generally speaking, the basic criterion of the heart's efficiency is whether it works satisfactorily. It is rarely possible to have heart disease in the presence of the ability to lead a normal life, except in the case of such conditions as coronary thrombosis or angina pectoris, which may remain undiscovered even by the most refined methods of investigation until they are upon us. In conclusion, it should be noted that symptoms related to the heart in an obvious manner, such as pain, discomfort, or palpitation, are rarely signs of heart disease, and are more likely to be nervous in origin or due to indigestion, fibrositis, pleurisy, or other causes.

Pericarditis is to the heart what pleurisy is to the lungs—an inflammation of the covering layer. The vast majority of cases result from acute rheumatism, but they can also be associated with other fevers, septicaemia, and generalised tuberculosis. Pericarditis may be an extension from local disease, such as pneumonia, pleurisy, or chest wounds.

When this happens inflammation develops between the two layers of the pericardium, so that instead of moving smoothly against each other when the heart beats they "scrape." If acute rheumatism is already present the temperature increases, there is pain over the heart, difficulty in breathing and restlessness, and the pulse rate goes up. This condition is known as "dry" pericarditis, but may develop into pericarditis with effusion in which fluid is secreted between the layers; when this happens, the pain disappears but breathlessness increases. The treatment of both types is that of the condition causing them (e.g., rheumatic or scarlet fever), rest, and, if fluid is formed, it may have to be drawn off. Ordinarily the outlook is good, but adhesions between the pericardium and surrounding structures may occasionally give trouble.

Myocarditis, or disease of the heart muscle, results from a number of causes: first of all there is the great enemy rheumatic fever, and in a lesser degree diphtheria, typhoid, and chronic syphilis—all these infections poison and weaken the heart in varying degrees. Or the muscle may degenerate in pernicious anaemia, hyperthyroidism, poisoning from phosphorus and other substances, or when the blood supply is affected, as in coronary thrombosis. In some cases of myocarditis damage is slight and gradual in onset, in others—such as after coronary thrombosis—it may be sudden and severe. The result in mild cases will be *compensation* when the heart is able to overcome its defects, but in severe cases *heart failure* may develop. This applies, too, to the later results of valvular disease of the heart, in which, again, there may be compensation or failure.

The condition of the heart muscle is the main factor in determining the ability of the heart to overcome any sort of damage, for it is the muscle which does the compensating. Thus, when one of the valves becomes narrowed by disease the muscle in the chamber below increases in size and thickness to force the blood through, but when the myocardium itself is degenerated this cannot take place, and sooner or later heart failure of varying degrees occurs. By and large, the symptoms of heart failure are those of most heart diseases: breathlessness (at first on mild exertion, later even when lying down), occasional coughing up of small amounts of blood, swelling of the feet (which in the later stages may extend upwards), and cyanosis—blueness of the skin. Obviously, the treatment is a matter for the doctor, who will prescribe drugs suitable to the exact condition, rest in bed, and other measures.

One of the main causes of myocarditis, as we have seen, is coronary artery thrombosis—that is to say, clotting of blood in one of the small arteries supplying the heart muscle.

Coronary Thrombosis is interesting in that: (*a*) it occurs mostly in men over forty-five, (*b*) it is more frequent in industrialised countries, and (*c*) it is more frequent in the wealthier classes. These facts have been used to support two separate theories as to its cause: first, that it is due to long periods of emotional stress in the ambitious, striving type of personality, and secondly, that it is due to over-indulgence in animal fats (not vegetable or fish oils), which causes the laying down of a substance known as cholesterol in the coronary vessels and their ultimate closure. Coronary thrombosis, then, is regarded according to one's viewpoint as an emotional or a dietary problem, but both schools of thought realise that some predisposition lies behind whatever the immediate cause may happen to be.

There is certainly some support for the view that animal fats, including milk, may play some part in predisposed individuals in bringing about coronary thrombosis. For example, the incidence of the disease went down during the War in Norway when meat was rationed, it is uncommon amongst fish-eating people, such as the Eskimos, or those who eat little meat—because they cannot afford it—such as the peasants of Southern Italy. But, of course, the "stress" school of thought can point out that these peoples are not, on the whole, subjected to the strains of a highly competitive society. High living and a tense emotional life often (if not always) tend to go together, and it is quite possible that both theories of the causation of coronary thrombosis are true: that emotional stress is the predisposing factor which disturbs the workings of the body and makes animal fats dangerous to the individual.

Thrombosis occurs when the building-up of cholesterol derived from such fats suddenly leads to clotting in one or other of the coronary arteries so that the blood cannot get through. The result is immediate and severe pain over the heart, which lasts for several days; there is breathlessness and shock, sweating, rapid and weak pulse, and later low fever. In about half the number of cases death occurs immediately, but in those who recover from the attack the outlook is reasonably good. The treatment is, naturally, a matter for the doctor, but will include rest in bed for six to eight weeks, a gradual resumption of work, depending on the state of the heart, reducing if overweight, and possibly dietary restrictions. Drugs are used to strengthen the heart.

Thrombosis in other parts of the body will be discussed later, but here it may be of interest to mention the anti-coagulant drugs which have the effect of preventing clotting. They are chemicals which have been known in Nature for a long time. Thus a leech, in order to liquefy the blood it sucks from its victim, secretes "hirudin," which prevents clotting, and the livers of dogs and oxen contain "heparin," which has a similar effect. But the greatest advance in this field came from the study of a bleeding disease in cattle, often ending fatally, which had long been familiar to veterinary surgeons. In 1921 Schofield of Canada found that the cause of this disease was the eating of spoiled sweet-clover, and in 1941 the chemical responsible for the bleeding was isolated from clover by Link in America. It is found in sweet-clover which has been spoiled by storage as hay, and is known as "dicoumarin." If given in large amounts dicoumarin produces symptoms identical with those of the bleeding diseases: purpuric spots and haemorrhage from the gums and internal organs. It is obviously the ideal drug for dealing with diseases in which clotting takes place too readily—coronary thrombosis, phlebitis, and pulmonary embolism. Dicoumarin, however, has to be used with care and under medical supervision.

Angina Pectoris. A disease which is in many respects similar to coronary thrombosis is *angina pectoris*, but here, although the arteries may be narrowed, the immediate cause of an attack is spasm of the blood-vessels, which are therefore only temporarily closed. The symptoms are the same as in coronary disease except that the pain over the heart (which frequently passes up the neck or down the inner side of the left arm) is: (*a*) brought on by exercise, whereas thrombosis can occur whilst resting, and (*b*) wears off in a comparatively short time—usually after the exertion ceases. Death may occur during an attack, but medical care can do a great deal when the condition is discovered in time. Drugs are given which prevent spasm (usually nitro-glycerine, known in a more sinister sphere as a high explosive). During an attack, relief is obtained from amyl nitrite, which is inhaled

from a capsule. Otherwise, the treatment is as for coronary thrombosis.

Valvular Disease of the Heart, or endocarditis, has a rather frightening sound which is not always justified in view of the heart's ability to compensate. The main enemy of the heart is acute rheumatism and streptococcal infections generally (scarlet fever, tonsillitis), and other conditions predisposing to endocarditis have been mentioned. Curiously enough, rheumatic fever is now a rather rare disease, although this may not be so strange when we consider the statement in a pre-war text-book that it is "relatively an uncommon disease amongst the well-to-do, and evidence is being brought forward that overcrowding in damp houses is the biggest factor of all." Higher standards of living and the much-abused Welfare State have, there can be little doubt, brought about this result.

The valves of the heart are the pulmonary, the tricuspid, the mitral, and the aortic, and each valve may be damaged in one of two ways—by narrowing, so that the blood cannot easily be forced through, or by leaking, so that the blood pumped through slips back again. The first is known as stenosis, the second as regurgitation, and when one or more of the valves are damaged in either way the heart, as we have seen, first tries to compensate. For example, in incompetence of the aortic valve between the left ventricle and the aorta, the blood is pumped out, but since the valve cannot close properly, some of it slips back into the ventricle In order to deal with this problem, the ventricle becomes greatly enlarged, but, if this action fails, the increased pressure in a chamber which is unable to empty itself completely is passed back through the rest of the circulation. The left auricle overfills, the lungs become congested, and finally the right side of the heart is affected, ultimately leading to varying degrees of heart failure

Since rheumatic fever is no longer so common as it once was, and diphtheria and chronic syphilis are equally rare, the most usual sequence of events today is as follows. a child or young adult develops a streptococcal sore throat, which may simply clear up without more ado, as it does in the vast majority of cases But sometimes the infection is followed within about ten days by pains moving from one joint to another, and this, too, clears up shortly. A similar episode may follow at a later date, and, still later, it may be found that these apparently unimportant events have damaged the heart; the damage may be discovered accidentally at a routine medical examination or because the patient complains of breathlessness or some other symptom

This, rather than the more dramatic form which was once so common, is the way that, in these times, rheumatic disease manifests itself. It has long been known that rheumatic fever was associated with streptococcal sore throat, but it is now clear that acute rheumatism is not a simple infection, for streptococci are never found in the heart or in the joints. Apparently, it is a condition in which the individual has become allergic to the toxins of the streptococcus, which then damage the joints, the heart muscle, and the valves.

Irregularities of the Heart-beat.

Like other muscles in the body, the heart cannot move without messages being passed to it from the nerves, but the nerves supplying it belong to the automatic nervous system The vagus nerve, belonging to the parasympathetic system, slows the beats, and the sympathetic nerves quicken them. Both these groups of nerves meet at the point where the great veins enter the heart at the right auricle, and this point is known as the pacemaker; from there, they send impulses around the auricles and meet again at the auriculo-ventricular bundle at the junction of auricles and ventricles; lastly, they pass down between the ventricles, dividing into two bundles to supply both sides. Obviously, any sort of irregularity can arise: (*a*) in the lower centres of the brain, where the impulses originate, (*b*) at the pacemaker; (*c*) at the junction of auricles and ventricles.

Tachycardia means that the heart beats too rapidly, and this it does in many circumstances: after exercise, when emotionally excited, in fever when the temperature is raised, in chronic infections, or in anæmia. Rapid heart beat is also found in thyroid disease. However, there can be little doubt that attacks of palpitation, as contrasted with prolonged rapid pulse, are nearly always due to emotional causes. Palpitation *can* be a symptom of heart disease, but most usually it is a sign of "nerves"; in the absence of other signs of heart disease such attacks can be assumed to be due to over-stimulation of the nervous centres in the brain which are concerned both with the emotions and control of the heart. An example of emotionally caused illness in a normal enough heart is what used to be called "*D.A H*" (*i e.*, "disordered action of the heart") during the First World War and "*Effort syndrome*" during the Second. The commonest symptoms are breathlessness, palpitation, nervousness, dizziness, and pain over the heart—all the symptoms that would suggest heart disease to the layman. It is, in fact, a neurosis, pure and simple, and the abnormal impulses which cause the symptoms arise in the lower centres of the brain as the result of emotional tension.

When the irregularity arises at the pacemaker or in the auricles there may occur the not uncommon phenomenon of feeling the heart stop for a moment which is described medically as an *extra-systole* They are commonly associated with disease of the myocardium in middle age, or, less frequently, in young adults, when they are (rather dubiously) asserted to be due to over-smoking. However, the most serious disease of this type is *auricular fibrillation*, in which so many impulses pass down through the auricles that they beat rapidly and irregularly and the ventricles respond to the shower of messages as best they may. Auricular fibrillation is usually a sequel to mitral stenosis, but can also result from hyperthyroidism and myocarditis There is palpitation, rapid and completely irregular pulse (140–180 to the minute), and, ultimately, signs of heart failure The treatment is with such drugs as digitalis and its derivatives or quinidine, which is a derivative of quinine *Digitalis* is a drug, known for many years, obtained from the purple foxglove when the leaves are dried and powdered; it has the double effect of slowing the heart beat by acting on the brain centres, and strengthening the contraction of the muscle by direct action. *Stropanthin* acts in a similar way. Although digitalis and stropanthin are the main drugs used in heart disease, doctors are nowadays much more selective in using them, for it is evident that they are not helpful in all heart conditions. In fact, their main use is in auricular fibillation and congestive heart failure— in other conditions they do little good.

In *heart block* the trouble arises at the junction of the auricles and ventricles because the nerves which pass on the impulse have been damaged by one or other of the conditions described under the heading of myocarditis When the block is complete the ventricles beat entirely independently of the auricles at a rate of about 30–40, and occasionally there are attacks in which the ventricles either cease beating for a few seconds or beat very slowly. This may be associated with attacks somewhat resembling epilepsy, known as the Stokes–Adams' syndrome. In partial heart block the ventricle misses a beat entirely—often every third or fourth beat The treatment for both conditions is a matter for the specialist. digitalis is *not* used.

The Blood-pressure.

There are two types of raised blood-pressure, the type known as secondary hypertension (hyperpiesis), which is due to a number of diseases such as kidney disease and diseases of the glands, blood disorders such as polycythæmia, and hardening of the arteries, and the type known as primary or essential hypertension (hyperplesia), which is not the result of illness elsewhere. In the treatment of secondary hypertension the doctor's attention will naturally be directed to the disease causing the raised

pressure, but essential hypertension, although it is extremely common, is not so easily dealt with. Its immediate cause appears to be a spasm of the arterioles, or small arteries, throughout the body. At first this is periodic, but later becomes permanent, with the result that the pressure remains raised. At one time it was supposed that such factors as septic areas in the body, tobacco, and a too rich diet played some part, but now it is fairly clear that essential hypertension is the result of two main factors: heredity and stress. What part each of the factors plays is unknown; for, although it is often found that relatives of the patient have suffered from the condition, this by no means proves that heredity is the cause. Obviously, someone brought up in a certain kind of mental environment will tend to adopt similar attitudes to those of his relatives, heredity or no heredity. Stress, then, is the most important factor in the sort of high blood-pressure which is not the result of another disease, but "stress" does not simply mean anxiety or fear (which, after all, have been common to most human beings throughout the centuries), and if anxiety in itself had the power to cause illness we should be in an even worse state than we are now. It seems that what matters is "bottled-up" emotional tension—worrying inwardly, which is quite consistent with not being at all consciously upset. In short, heredity may supply the sort of temperament which is prone to worry, but events cause the worry itself. The treatment of essential hypertension depends on its severity; in some cases drugs will help (for example, rauwolfia or "Serpasil" and some more powerful agents), but in others an operation which divides the nerves causing the spasm is necessary. Sedatives may also be used, but there is little evidence that dietary or other factors play any important part in essential hypertension.

Most people seem to believe that certain symptoms almost infallibly suggest the existence of high-blood pressure, but in point of fact there is no reason to suppose that any of these symptoms—headaches, giddiness, noises in the ears, lack of concentration or poor memory—indicate any specific condition, least of all high blood-pressure. Nor is it true that patients tend to be the broad, muscular, red-faced type they are so often imagined to be. By and large, hypertension is discovered largely by accident, and the sufferers are just as likely to be small, thin, and pale, as large, fat, and ruby-complexioned.

Low blood-pressure is not a disease at all, although like normal or high blood-pressure it may be found in association with other diseases. No treatment for low blood-pressure in itself is necessary.

DISEASES OF THE BLOOD-VESSELS.

Arteriosclerosis or "hardening of the arteries" is one of the commonest diseases. The aorta and the main blood-vessels become narrowed by the deposition of cholesterin, and the result is most evident in the coronary arteries supplying the heart muscle or in the arteries supplying the brain. The first may lead to degeneration of the heart muscle, the second to such symptoms as forgetfulness, confusion, and dizziness. Arteriosclerosis, like coronary thrombosis, may be due to stress, or, more probably, to a diet over-rich in cholesterol in those already predisposed by heredity. Arteriosclerotic changes happen to most people as they grow older, but not necessarily to a degree that makes them noticeable. The treatment is to regulate the diet, and lead a quiet, steady life.

Thromboangeitis Obliterans, or Bürger's disease, is a rather uncommon disease in which there is spasm of the blood-vessels and perhaps clotting which may lead to gangrene. It begins with cramp in the legs brought on by exercise, ceasing when the legs are rested, but afterwards there develops redness and a shiny appearance of the feet as the vessels become entirely blocked. The pain becomes severe and continuous, and may prevent sleep.

The disease appears to be due to an allergy to tobacco, and the patients are always heavy cigarette smokers. Treatment is rest in bed, and smoking should be given up; in severe cases it may be necessary to operate on the nerves causing the spasm, or, if gangrene has supervened, to amputate the affected part.

Extreme cold, as we have seen, can affect the tissues in the form of frostbite. But some people are particularly sensitive to even mild degrees of cold and suffer in winter from *chilblains*, which, although often described under the heading of skin diseases, are really connected with the circulation. People with chilblains should take plenty of nourishing food and wear woollen socks and woollen gloves in cold weather. Sometimes vitamin K, "Pernivite," or nicotinic acid have proved helpful.

In *Raynaud's disease* the response to cold is more dramatic, and the hands or feet become dead white during attacks. In a severe case the fingers, particularly, may later become blue or black, with severe pain or even gangrene. Occasionally the ears and nose are affected. Drugs may help, or it may be necessary, as in thromboangeitis obliterans, to cut the nerves producing the spasm. Persistent exposure to cold and damp leads to circulatory trouble in anyone, and *trench foot* was common during the First World War, its counterpart in the Second World War was "*immersion foot*" in men who had been drifting for weeks in open boats with their feet in bilge-water. Frostbite, trench foot, and immersion foot are more or less normal reactions to extreme cold, chilblains and Raynaud's disease occur only in those who are specially sensitive to cold, whose blood-vessels under its influence readily go into spasm.

Aneurism happens when the muscular lining of an artery becomes weakened and then the outer lining "blows out" like a balloon, forming a large swelling on the side of the vessel. This may be caused by injury, or strain, or arteriosclerosis, but in 95 per cent. of cases is due to syphilitic disease. Aneurism used to be very common, but is now rather unusual. It is treated by drugs or by operation.

Embolism and Thrombosis are closely associated with each other, for a thrombosis occurs when the blood in a vessel clots, and, if the clot is set free to pass through the system until it finally blocks some part of it, it is described as an embolus. This clotting ordinarily occurs when the blood flows over injured tissues, but may also occur when the inside lining of the blood-vessels have degenerated, or after an operation when the patient is lying in bed for a long period and the circulation is abnormally slow. It can also occur in cases of infection in a vein, which is known as *phlebitis*. If the clot stays in the original position, the blood-vessel is closed, and in the limbs there will be swelling due to the pressure in the vein beyond (obviously the degree of upset will depend upon the size and importance of the blocked vein—in the brain it may have serious effects in even quite a small vessel, in the leg, the blocking of a small vessel might not cause much trouble). However, if the blood clots in one of the large veins of the leg after an operation the result may be a *pulmonary embolism*, when the clot separates itself and passes through the blood-stream to the right auricle, and thence to the pulmonary artery, which it blocks, causing sudden death in someone who appeared to be getting on quite well. Nowadays this danger is much reduced by getting patients out of bed as soon as possible after a major operation.

When you think about it, you will realise that, although the heart can fairly easily pump blood down to the legs, it is not so simple for the blood to return. Having passed through the capillaries it is not just pushed back up the veins by the pressure from the heart—on the contrary, it has to be *massaged* upwards by the leg muscles during exercise. To avoid the blood falling back, the veins are provided with valves somewhat like those in the heart, which prevent the backward flow. Now, especially in people who have jobs involving long hours of standing or in women who have had a number of pregnancies, the congestion produced makes it even more difficult for the valves to operate effectively, especially if they are already not too competent, and *varicose veins* may develop.

In the early stages an elastic bandage or stocking may help, but, later, injections to produce clotting in the superficial veins, or an operation involving tying the main superficial vein at the inside of the thigh, may be necessary. *Varicose ulcer* is prone to develop just above the ankle because of the failure of the tissues to get a proper blood-supply. Apart from the measures already mentioned, it is important that people with varicose veins should stand as little as possible and should rest with their feet raised; this is much more important than ointments and bandages.

HEART SURGERY.

Only about sixty years ago an eminent British surgeon stated that "surgery of the heart has probably reached the limits set by Nature to all surgery, no new method and no new discovery can overcome the natural difficulties that attend a wound of the heart." He was, however, wrong, for new methods have made it possible to operate even within the chambers of the heart. Here it is only possible to describe briefly some of the processes which can be carried out. In stenosis, or narrowing of a valve, the heart can be opened and the valve stretched, or, if the valve is leaky, it can be replaced by an additional valve, a plastic ball covered with silicone rubber which stops the back-flow when the heart relaxes. Coronary thrombosis, too, can be dealt with either by scraping out the diseased lining of the arteries or by restoring the blood-flow from somewhere else by attaching to the heart a piece of tissue from the chest wall.

Of course, some of these operations are only in the experimental state, but they are perhaps of greatest interest in the case of blue babies—those children, born with heart defects which, because the blood does not get properly oxygenated, cause them to appear blue or cyanosed, as a doctor would say. Such a child may be born with the main blood-vessels turned the wrong way round, with a hole connecting the two auricles or the two ventricles, with a narrowed pulmonary valve, or with other defects which greatly shorten the expectation of life. It is in such disease that surgery has proved most successful.

Some operations can be done without opening up the heart itself, but if this becomes necessary a serious problem arises, for if the circulation is interfered with for more than four minutes the brain (which is the most delicate organ of the body) suffers irreparable damage. The problem was partially solved by C. H. Bailey in the United States, when, knowing that if the body temperature is lowered the tissues need less blood, he conceived the idea of freezing the patient in a bath packed with ice. In this way the normal body temperature of 98.4° was reduced to 75°, which gave him exactly double the time—eight minutes—to carry out his operation. But eight minutes is not enough for all heart surgery, and other techniques have had to be devised to solve the problem of how to make the blood circulate whilst the heart is not working.

One method used with blue babies was the rather dangerous method of connecting the child's circulatory system with that of someone else (usually the father), so that whilst the child's heart was out of action the donor's heart and lungs took over. But such solutions are no longer necessary because, largely in America, machines have been devised which draw the blood from the heart, pass it through an artificial lung so that it becomes oxygenated, and return it to the body whilst an operation on the heart is carried out. The difficulty of devising such a machine was primarily that the blood must be oxygenated without any bubbles getting into it, for if this occurs one of the bubbles may get into the circulation and, passing to the brain, act as an embolus causing death or paralysis in the same way as a blood-clot. So the earliest type of machine drew the blood from the heart and passed it over a series of thin plates in chambers containing oxygen, but it has since been found that oxygen can be bubbled through the blood in the machine, the mixture allowed to settle, and any excess bubbles removed by passing through a reservoir coated with a substance long used by brewers for removing froth in the manufacture of beer.

Here is a summary of some facts people may wish to know about heart surgery.

The operations are dangerous, but new methods are making them safer. They are not carried out unless the existing condition creates more risk than the operation, and the death-rates of the more important operations are as follows: blue-baby operations, 20–25 per cent.; coronary artery disease, 10–15 per cent.; narrowing of valve, 5–10 per cent.

Needless to say, only a small number of patients with heart disease ever need surgical treatment, and in fact there are not many people of over forty who do not have "heart trouble" in some degree or another. Those who are operated on successfully are improved to a considerable extent, but this does not mean to say that they can afterwards lead a perfectly normal life, they will live longer if they take reasonable precautions. Operations on blue babies are ordinarily carried out because the patient would not survive without the operation, but surgical treatment of coronary disease, and valvular stenosis or incompetence, is still in the experimental stage, it is only carried out in fairly exceptional cases.

DISEASES OF THE RESPIRATORY SYSTEM

INTRODUCTION.

The respiratory system is concerned with taking into the body the oxygen which is necessary to life and getting rid of the carbon dioxide which is a waste product. It begins at the nose, which is intended (although not always used, since there are many mouth-breathers) as a filter and air-conditioner. The hairs in the nose keep—or are intended to keep—dust particles from the throat, and its sticky lining, warmed by the blood-vessels in which it is so rich, has the double function of removing the finer dust and germs and warming the air taken in.

After this process, the air passes down from the back of the nose to the space behind the mouth and then down the windpipe or trachea into the lungs. On the way it goes through the larynx or voice-box (above the trachea), which makes speech possible with its mechanism of vocal cords, the vocal cords separate during breathing in order to let the air through. Lastly, in the chest the windpipe divides to right and left and goes into the lungs, these main divisions are the bronchi, and within the lungs they subdivide, rather like the arterial system, into smaller and smaller tubes, known as bronchioles, which end up by entering the air-spaces of the lung tissue. There, in the thin, spongy spaces lined with blood-vessels, the breathed-in air gives up its oxygen to the blood.

The two lungs, right and left, lie within the chest attached to the bronchial tubes and the large blood-vessels. These are their "roots." They are, like the heart, covered with a double layer of thin, plastic-like material, the pleura (the part which is affected in pleurisy), and they contract and expand with the movements of breathing. But breathing is not carried out by the lungs themselves—it happens when the muscles between the ribs draw the ribs up and so expand the space within the chest that air is sucked in. Normally the pressure within the chest is less than that of the air outside, so that if the chest is punctured the lung collapses. This is important both in chest surgery and in certain conditions where, as we shall see later, it is desirable to collapse the lung in order to rest it. The left lung is divided into two portions or lobes, the right into three.

When one thinks of the nose, certainly if one thinks of it in medical terms, the first disease that comes to mind is the *common cold*, about which we know so much and yet so little. Colds are a virus infection which, even if trivial, cause considerable discomfort and much wasted time; but research seems to show that a great deal depends upon the type of person in whom the virus arrives. Thus people sent out in thin sports clothes to run for long distances in the rain and then made to rest in their wet apparel showed no special liability to catch cold, but it seems possible

that sudden changes of temperature may have some effect. For example, in America, where central heating in some areas is very hot and the weather outside may be very cold, nose infections are common.

Even more perplexing, however, is the fact that, like the judges we read of in the daily papers, we often have to ask: "What *is* a cold?" Everyone who has a running nose or even a temperature is not necessarily suffering from coryza, the scientific name for the common cold, they may have *allergic rhinitis*, similar to hay fever, which has no connection at all with infection. In this case the symptoms are produced by dust, pollen, or some other material to which the person is sensitive. Nasal discharge and temperature may also be brought about by *sinusitis*—that is to say, an infection of the spaces within the bone of the skull which communicate by small openings with the inside of the nose. These are the frontal sinuses just behind the eyebrows, the maxillary sinuses below the eyes, the ethmoid sinuses in the corner of the eyes on either side of the nose, and the more deep-seated sphenoid sinus right at the back of the nose. When these cavities are infected pus forms and naturally discharges into the nose, but if the lining of the nose swells up (as it does, for example, in a hot room) the openings into the nose may be blocked, the pus accumulates, and there is severe pain over the site of the sinus. Sinusitis may respond to the sulpha drugs or to antibiotics, but it is sometimes necessary to make a new opening into the nose and wash them out or to operate.

Whenever anything goes wrong with the nose, whether it be a virus infection an allergic irritation, or discharge from the sinuses, there is always a secondary invasion by germs which are the result rather than the cause of the trouble, the thick pus which comes from the nose in the later stages of a "cold" is largely due to them. There are no injections or inoculations against colds, but conceivably *some* of the many available may prevent colds getting worse by dealing with the secondary invaders, they certainly do not deal with the original cause, the virus. Capsules taken by mouth are, there is every reason to think, completely valueless, and, so far, the treatment of a cold is simply the treatment of the symptoms: aspirin relieves pain when it exists, it reduces the fever, and it does nothing else. Nor has whisky any special effect, although it is so often prescribed as a cure, but it probably has some effect on devotees in making a cold more bearable.

Hay Fever is an allergic condition due to hypersensitiveness to the pollens of certain grasses. Its symptoms have already been described so far as the nose is concerned (see allergic rhinitis), but there may be other signs of allergy, such as redness of the eyes and itching of the skin. Hay fever is helped by desensitisation with increasing strengths of the substance responsible, since cases occur mainly in May or June, the course of injections should be given early in the year. It usually has to be repeated each year. An alternative is the use of one of the antihistamine drugs, which seem to afford relief—but not cure—to many people.

Epistaxis. Another condition which is not really a disease in itself but may be a symptom of one is *epistaxis* or nose-bleeding. Bleeding may be caused by injury, by nose-picking in children (who frequently put beads or other small objects in their noses), by polypi (similar to varicose veins), and by a number of general illnesses, such as high blood-pressure, blood diseases, and fevers. It sometimes occurs in women during their periods and in people at high altitudes, flying or mountaineering. Usually no special treatment is necessary, but if the bleeding becomes troublesome a doctor will probably pack the nostrils with gauze soaked in adrenalin. In ordinary cases cold compresses and lying down should suffice.

Tonsils and Adenoids. The commonest operation in the whole field of surgery is the removal of tonsils and adenoids. Indeed, in some places, and notably in America, it was formerly almost a routine to advocate the operation when children reached the age of three to five. The tonsils, one on each side, lie at the back of the throat, and are easily visible when the mouth is opened wide, the adenoids cannot be seen, since they lie at the back of the throat behind the nose. *Acute tonsillitis* is usually, but not always, caused by the streptococcus, and it results in sore throat, high fever, and difficulty in swallowing. But, as we saw elsewhere, its main danger is that it may become chronic and cause damage to the heart and other organs. Tonsillitis responds to antibiotics and the sulpha drugs. Adenoids, when they become infected, swell to an extent which may cause difficulty in breathing and block the air passage between the nose and throat—the Eustachian tube—leading to ear infection or loss of hearing. This produces a typical facial expression, the child looks dull and listless, breathes through its mouth, which is therefore constantly open, and talks in the manner of someone with a cold. It must be remembered that this occurs only in severe cases, that most children have some trouble with their tonsils and adenoids in early life, and that after the tenth year the tissues tend to shrink, so that difficulties after that time are much less frequent.

Although the operation is still common, it is probably true to say that it is less commonly advocated than before. In part this is due to the new drugs, which can nip infection in the bud, but it is also due to the realisation that the tonsils and adenoids are there for a purpose, that they act as a barrier to infection from germs entering the nose and throat. However, when they are badly infected there can be no useful purpose in keeping them and many good reasons why one should not.

Laryngitis, Pharyngitis, and Bronchitis. One of the difficulties created by infections in the upper part of the respiratory tract—the nose and throat—is that they can extend downwards, causing laryngitis, pharyngitis, or bronchitis. In laryngitis the voice-box is infected, there is a tickling cough and difficulty in speaking, the vocal cords are swollen and red. (It should be added that the same symptoms may also be due to too much talking, to neurosis, and, so non-smokers say, to too much smoking.) In simple cases it may help to inhale the vapour of Friar's Balsam, a half teaspoonful to a pint of water, but in more persistent cases a doctor should be called. Chronic laryngitis is a matter for an ear, nose, and throat specialist.

In pharyngitis there is pain on swallowing, the lymph glands in the neck may be swollen, and there is a rise in temperature, ordinary cases will respond to aspirin and gargles.

Bronchitis, however, is another matter, although it is perhaps less common than is often supposed. Every cough does not signify bronchitis, for it may be laryngitis, *tracheitis* (*i.e.*, inflammation of the windpipe), or the result of what is popularly known as "catarrh," when discharge from the back of the nose trickles down the throat. Some coughs may even have nothing to do with the breathing system at all, for example, wax in the ear may stimulate the coughing centre in the brain and produce a cough which is stopped when the wax is washed out. Bronchitis is ordinarily found only in the very young, the very old, or as a complication of other diseases, such as measles and influenza. It is not caused by any one germ, and the bacteria found may be streptococci, staphylococci, and others—or more usually a mixture. Acute bronchitis is rarely dangerous in itself, but it can spread (if you recall the anatomy of the respiratory system) down the larger tubes into the smaller ones, and thence into the lungs, causing *broncho-pneumonia*. In broncho-pneumonia the parts of the lungs affected are those near the ends of the bronchi, so there are patches of infection scattered throughout the lungs, and this is quite unlike *lobar pneumonia*, which: (*a*) is caused by one kind of germ, the pneumococcus; (*b*) affects a whole lobe of a lung at one time, and (*c*) can happen to anyone, of any age, at any time. In any kind of pneumonia there is fever, breathlessness, and ordinarily the disease responds to penicillin or the sulpha drugs. Lobar pneumonia, when untreated by the new drugs, used to show a "crisis" in seven to ten days—the temperature suddenly went down; in broncho-pneumonia

there is no crisis, but it is equally responsive to the new drugs.

Chronic Bronchitis is typically a disease of the old, or at any rate of those in later life. It is something which is always "there," but becomes worse in winter, in cities where there are fogs, in children with adenoids, and in older people who work in occupations where they are exposed to dust. Chronic bronchitis develops gradually as the result of many previous attacks and, since the lung tissues sooner or later become involved, are no longer elastic, and show *emphysema* or degeneration of the spongy substances which absorb oxygen, it would be wrong to pretend that there is any cure. People with chronic bronchitis may be helped by certain drugs, but they are not cured when irreversible changes have occurred. In this case, a large part will be played by cough mixtures, and it is important to realise that these are of two types: sedative and expectorant. A sedative mixture is intended to stop irritation which is useless, and does not perform the function of a cough in bringing up secretion. For instance, in laryngitis there is an irritating cough which is simply caused by stimulation of the tissues when there is no secretion to get rid of, and in this case it would be reasonable to give medicine which stops the cough, but when secretion is present it has to be removed, and here one has to take some drug which will make one cough more effectively. A stimulant mixture is one designed to liquefy the sputum and help to get it out of the system. (Incidentally, one of the best—even in these days of "wonder drugs"—is the solution of common salt used in Brompton Chest Hospital.) There are numerous good means of suppressing coughs, but probably very few good expectorants, although each patient swears by his own special mixture, and he may be right.

If lung or bronchial disease has been present for some time there may develop certain degenerative changes, such as *bronchiectasis* or *emphysema*. In bronchiectasis the bronchial tubes become dilated, first of all in a single lobe of one lung and then elsewhere, with the result that the stagnant and infected secretions are retained very largely within the chest, damage further the bronchial linings and the lung tissue, and end up in a vicious circle: pus accumulating, bronchitis, more pus, and more bronchitis. All the signs of chronic bronchitis are present, but what is typical is the large amounts of foul-smelling pus which are brought up. Bronchiectasis is a serious disease, but the antibiotics and the sulpha drugs have improved the outlook, and lung surgery (lobectomy or removal of a lobe and pneumothorax or collapsing of the lung) is also used in suitable cases. In emphysema the deterioration takes place in the lung tissue, and if you recall that the lung is the place where the oxygen of the air taken in meets the blood within the internal surfaces, you will see that the amount of surface available is of great importance. In fact, the normal lung internal surfaces are about the size—if they were spread out—of a tennis-court. But in emphysema the elastic tissue between the cells begins to give way, the surface available for oxygenising becomes smaller, and, as the walls of the cells collapse, so do the number of capillaries. In order to get the same amount of oxygen into the blood, the heart has to work much harder. So emphysema, like most chronic lung disease, leads to heart trouble—the heart has to work harder to get the blood through.

LUNG SURGERY.

Like heart surgery, lung surgery has greatly developed in recent years and is used in four main categories of disease: infections, cysts, tumours, and in wounds. Infection is mainly due to bronchiectasis and tuberculosis—although other infections may arise; cysts are not very common, and need not necessarily give trouble unless they become infected; tumours, if malignant, obviously have to be removed; and how a wound is treated depends on its severity. Generally speaking, the operations performed are: (1) drainage, (2) removal of part of the lung, or (3) collapse of the lung. *Drainage* is carried out when—as in the case of an abscess or infected cyst—there is an area containing pus, and the purpose of the procedure is to let the pus out. *Removal of part of the lung*, or in some cases a whole lung, is carried out where there exists bronchiectasis or tuberculosis or cancer limited to a particular area; clearly such an operation is serious, but the results today are good, although, of course, this depends in part upon the initial condition from which the patient was suffering. *Lung collapse* is carried out when infection is present, but it is thought that recovery might occur after a "rest", for collapse means that the affected lung is put out of action and is not used for breathing. Collapse is carried out in various ways. In *pneumothorax* air is injected into the chest by a simple procedure, causing collapse; in *pneumoperitoneum* air is injected into the abdomen, with the same result, since by pushing up the diaphragm it causes collapse; in *phrenic nerve crush* the nerve supplying the diaphragm is crushed under a local anæsthetic where it passes through the neck. In more serious cases *thoracoplasty*—the removal of all or portions of the upper ribs—may be performed under a general anæsthetic.

Lung Cancer is one of the most obvious reasons for surgery, and as most people know by now, it has been established that there is some connection between lung cancer and tobacco-smoking. The facts, as known, are complicated, but some of the more important are these:

(*a*) Between the ages of fifty and sixty-four those who smoke more than twenty cigarettes a day have a death-rate more than twice as high as non-smokers (although not necessarily from lung cancer).

(*b*) Five moderate smokers die of lung cancer to every one non-smoker and fifteen or sixteen heavy smokers.

(*c*) It seems certain that other factors are important. For example, the death-rate from lung cancer is very much higher in cities than in the country, the incidence is higher amongst cigarette smokers than amongst pipe or cigar smokers. Diesel fumes and smog probably play a quite important part, and the considerable increase in cancer (which is, however, commoner in men than in women) runs parallel both with increased cigarette smoking and increased fumes from car exhausts—particularly Diesel fumes.

(*d*) As in the case of coronary thrombosis, we can see that it is not easy to analyse out the real cause of the trouble in lung cancer. We have to consider the soil—the person affected. Is there, perhaps, something within the individual which predisposes him to cancer, and that smoking merely determines *where* he will get it? We do not know, but it is a possibility.

There are few early symptoms and the condition is usually discovered by accident at a mass X-ray centre. Pain in the chest, loss of weight, and coughing blood are late symptoms. The only treatment, if the disease is found in time, is removal of the whole or part of the affected lung.

Asthma is a chest disease which we will discuss at this point, since it will serve to introduce the general problem of *allergy*, although other allergic diseases will be mentioned elsewhere according to the part of the body affected. The causes of asthma are mainly three: allergy, chronic bronchitis, and emotional disturbances, although in varying degrees they go together in any one person, there is a likelihood that allergy and emotional sensitivity are related and that in cases with bronchitis the patient may be allergic to his own germs. People may be allergic to all sorts of things: to pollens, feathers, and numerous particles present in the form of dust in any house or any city street, to foods such as shellfish, to penicillin, to injections given them at the doctor's, and a case was even reported from America in which a man got a divorce because he was allergic to his wife and developed a skin-rash whenever she embraced him! Asthma is simply one form of allergy, in this case affecting the bronchi, which go into spasm when the person comes into contact with the stuff to which he is sensitive. But allergy can affect the nose and eyes, as in hay fever, the

skin, as in dermatitis, the joints, and the bowels. In an asthma attack the patient finds it more and more difficult to breathe, his chest is widely expanded, and the main trouble is in breathing out. Such attacks often come on at night, and may occur almost daily, or as infrequently as one every few months. Although asthma is an allergic disease, the attacks are very often set off by emotional crises of rage or resentment. In some cases the emotional element is even more obvious, as when a woman allergic to roses developed an attack when shown into a room in which there was a bunch of roses on the table, which were, in fact, artificial! The immediate treatment for an attack is to give something which will relax the tubes, usually adrenalin injections or ephedrene taken as tablets by mouth The long-term treatment is directed towards finding the substance to which the patient is sensitive and by a course of injections attempting to desensitise him Unfortunately this does not always work, but in some cases antihistamine drugs may help However, the trouble with asthma, as with other chronic lung diseases, is that when it has existed for some time changes occur which are irreversible, such as chronic bronchitis or emphysema When this stage is reached the best that can be done (and it is a great deal) is nevertheless palliation

Allergy is to be understood as a perversion of the normal body reactions towards certain substances—mainly, but not always, proteins Such substances act, just as do the toxins of germs, as antigens that is to say they cause the formation of counter-substances designed to neutralise their influence, and these counter-substances are known as antibodies Normally, this takes place successfully within the blood, and when a second dose of the foreign protein gets into the body its effect is neutralised But when, due to some unknown cause, this does not happen, the antigen, or foreign substance, gets into the body cells and causes the liberation of a poisonous chemical known as histamine It is this which causes the symptoms in allergic diseases, and which is sometimes countered by the antihistamine drugs In extreme and rather rare cases a person with this sort of disability may get an injection, and if there has not been sufficient time for antibodies to form, a second injection of a completely harmless stuff, such as a serum, may lead to sudden death This is known as *anaphylactic shock*

Allergy, then, is due to an inability to produce antibodies, and this, in turn, is the result of (*a*) heredity—for such diseases run in families, (*b*) to the person's physical condition at the time, and (*c*) to emotional causes which can interfere with antibody formation.

DISEASES OF THE DIGESTIVE TRACT

INTRODUCTION.

The digestive tract begins at the mouth and ends at the rectum, where the waste products are excreted The food taken in at the mouth is moistened with saliva secreted by the salivary glands, of which the largest are the parotid glands —they are the ones which become swollen in mumps. The smaller glands are the submaxillary (under the jaw) and the sublingual (under the tongue) The act of chewing breaks the food down and helps to mix it with the saliva Saliva contains an enzyme called ptyalin, which starts the digestion of starchy foods, and the food thus reduced to a pulp passes down the œsophagus, a tube about 2 ft. long leading through the chest down to the stomach, where the main part of digestion begins. The gastric juice, as everyone knows, contains hydrochloric acid, which in concentrated form is a dangerous caustic and will burn holes in carpets or anything else if allowed to —as certain advertisers at one time were not slow to point out. Advertisements used to show the dreadful effect of the acid on a carpet, and invite the gullible to consider what would be the effect on the much more delicate stomach, the effect could, of course, be neutralised by "Biffo" or whatever was the name of the stomach powder This, needless to say, is a piece of nonsense hydrochloric acid in the stomach is important for digestion (although some seem to manage without it), and it exists in such a diluted state that it could not burn a hole in a piece of tissue paper. However, the details of this will be discussed later when we are talking about ulcers. Suffice it to say that the acid is intended to be there, and causes harm only when something else has gone wrong with the stomach

Also in the juices secreted by glands in the stomach lining are the substances known as enzymes, which are found not only there but play a large part in all body processes By bringing about chemical changes they make life possible, and we have already mentioned one, ptyalin, which functions in the saliva to break down starch into sugar The word enzyme is derived from two Greek words meaning "in yeast," because the first enzyme known to Man was the one in yeast which breaks down starchy foods into sugar and, given time, as brewers and some less-respectable gentlemen know, into alcohol. In the stomach the main enzymes are pepsin, which further digests starches into sugar, and rennin, which curdles milk (essence of rennet obtained from the cow's stomach is the stuff used to make curds and whey) In the small intestine the food comes under the influence of the alkaline juices, secreted partly by the intestine itself and partly by the pancreas, the most important enzymes here are trypsin, which breaks down proteins, amylase, which continues the work of breaking down starches, and lipase, which breaks down fats

The end result is that by the time it reaches the end of the small intestine all the food we have eaten, however varied, is broken down into very simple chemicals the proteins into substances known as amino-acids, the fats into glycerine and fatty acids, and the starches and sugars into glucose The fact that glucose does not have to be digested, and that carbohydrates generally are the fuel of the body give rise to the quaint notion that glucose makes you energetic (hence all the tablets, drinks, and so on containing glucose which, from the remarks made about them by advertisers, one might suppose to be the elixir of life) Unfortunately, although glucose is useful as a temporary food in those who cannot—as after an operation—absorb anything else, there are very few people who need any extra Most of us don't need more energy, we need more brains to make use of what energy we have A spoonful of glucose is no better and no worse than a couple of lumps of ordinary sugar or a slice of bread so far as giving energy is concerned, for the simple reason that all end up in the same way, as glucose

After being thus broken down, the fatty acids and glycerine enter the lymph channels passing from the intestinal walls and so get into the blood and thence to the areas under the skin which give some ladies their "vital statistics" and many men and women their "middle-aged spread," but the amino-acids and glucose pass through a special system of veins, the portal system, to the liver to be stored until they are needed

The small intestine includes the duodenum, which joins the stomach at the lower end, where there is a sort of valve known as the pylorus. The duodenum is about a foot long and continues into the jejunum and ileum, which together are about 23 ft long. At the end of the ileum the small intestine joins the large intestine or colon, and this, at the right-hand lower corner of the abdomen, is the site of the appendix Finally, the 5-ft -long large intestine passes to the rectum, which is only 6 in. long and leads to the anus, the band of muscle which ends the digestive tract.

Later on we shall deal with problems of diet and nutrition, but at present it is more convenient to wend our way down the length of the alimentary canal and discuss the various diseases which can affect it Little need be said about the teeth, since most people know about the principles of dental care, although they do not always carry them out with any degree of completeness. Briefly these are, brushing the teeth at least twice a day, but preferably after every meal, avoiding too much sweet food, and especially the kind of nauseous confections which stick to the teeth, and going to the dentist every six months A *gumboil* is an abscess at the root of a tooth which causes the all-too-familiar swelling of the face.

The only first-aid treatment for this is the old one of heat applied outside, aspirin for pain, and hot mouth-washes. Sooner or later the dentist will have to be consulted.

Elsewhere we have mentioned *tonsillitis* and *pharyngitis*, and so far as this region is concerned the other "ituses" are *stomatitis*, a general infection of the mouth, and *glossitis*, an infection of the tongue. Stomatitis can be due to many causes to a fungus infection common in babies whose mothers take insufficient care in the hygiene of feeding (this is known as "thrush"), to various other sorts of infection often predisposed to by malnutrition, and to certain drugs, such as mercury.

In thrush, white patches form within the mouth, but the condition can easily be treated by a doctor. The other types are usually characterised by a bad taste in the mouth, bad breath, excessive salivation, and sometimes by a burning sensation. Their treatment depends upon the cause, and they should therefore be referred to the G.P. Glossitis, too, may be the end result of many influences, and shows itself by some unusual appearance of the tongue: redness, soreness, white or black patches, or ulcers. Sometimes the patches are in a form resembling a map, which doctors with their irrepressible sense of humour—not always shared by their patients—describe as "geographical tongue." Sometimes, and paradoxically, the cause may be the use of penicillin, which, by killing some germs, encourages the growth of others, sometimes it is the result of oral sepsis. But all these conditions, if they last any length of time, should be referred to a doctor, especially in older people, and especially if ulcers are present. *Ulcers of the tongue, although they are often of little significance, may be serious, and it is not worth while taking risks.* The œsophagus, too, may be affected by a number of diseases usually characterised by pain or difficulty in swallowing. This is known as *œsophagitis*, and may be due to the passage of burning, hot, or caustic liquids. Or there may be paralysis of the nerves supplying the muscle, which also leads to difficulty in swallowing. But the most important disease which can affect this area is *cancer of the œsophagus*. It is estimated that about 1 per cent. of all cancer deaths are due to this cause, that it affects men more often than women, and ordinarily men between fifty and seventy. The symptoms are difficulty in swallowing and loss of weight. Until recently, the outlook in the condition was absolutely hopeless, and doctors and relatives had to stand helplessly by whilst the patient virtually starved before their eyes. But now advances in chest surgery make it possible for an operation to be carried out in which the diseased area is cut out, the stomach brought up into the chest, and stitched to the remaining part of the œsophagus. Still more recently, almost the whole œsophagus has been removed and replaced with a plastic tube. Of course, this can be done only when the disease is caught in time.

Often difficulty in swallowing or a sensation of choking is due to solely emotional causes. This is known as *globus hystericus*, and requires to be treated psychologically. Lastly, there sometimes develops in the œsophagus what is described as a *diverticulum*, which is to this area what an aneurism is to an artery: *i.e.*, it is a bulging out of the wall which creates a sac. A diverticulum does not necessarily cause trouble, but the larger ones do in three ways: (1) they collect food which every now and then comes back into the mouth, (2) they may become large enough to cause obstruction; and (3) they are likely when their contents become infected to cause lung disease. If they are at this stage the only treatment is surgery, in which the "ballooning" part is tied off at the base. The operation is obviously a major one, but recovery is almost invariable.

Peptic Ulcer is a name covering two separate conditions—*gastric ulcer*, which is an ulcer in the stomach, and *duodenal ulcer* in the duodenum. The immediate cause of ulceration is that the digestive juices have, for some reason or another, digested away a part of the wall of the tract. It appears that ordinarily, although the stomach can digest protein from outside, it does not digest itself, because there are chemicals in the lining—known tentatively as "anti-enzymes"—which neutralise the effect of the hydrochloric acid and the enzymes. Why does this protection break down?

This is an important disease because it is so common, and perhaps we had better have some facts:

(*a*) About 10 per cent. of all adults have had at one time or another an ulcer of the stomach or duodenum.

(*b*) Nearly 90 per cent. of these ulcers clear up by purely medical attention, without surgery.

(*c*) When people say they have "an ulcer in the stomach" they usually mean an ulcer in the duodenum. Only one out of twelve ulcers are in the stomach.

(*d*) The indications for operation are, in general (1) when the ulcer is chronic and medical treatment has failed, (2) when there is severe bleeding caused by the ulcer eating into a blood-vessel; (3) when, as sometimes happens, the ulcer forms scar tissue which contracts and obstructs the passage of food, (4) when an ulcer perforates.

A perforated ulcer is one which has eaten right through the stomach wall, and in these circumstances an emergency operation is necessary, for the stomach contents pass into the abdominal cavity, causing *peritonitis*—*i.e.*, a septic infection of the peritoneum, the delicate lining which covers the abdominal organs as the pericardium covers the heart and the pleura the lungs.

Typically, ulcer pain is in the upper abdomen, comes on about half an hour to two hours (depending upon its site) after meals, and is relieved to a greater or lesser extent by alkalis or taking more food. The medical treatment consists in dieting on easily digested foods taken "little and often" so that the stomach is never empty but never full. Alkaline powders are usually prescribed by the doctor, and sometimes muscle relaxants such as atropine are used to relieve the spasm which is the immediate cause of pain. It cannot be too strongly emphasised that symptoms such as those described above if they persist for any length of time should be referred to a doctor. Self-treatment is very risky.

Operative treatment is designed to reduce the hyperacidity which causes the trouble. The two main operations performed are *gastrojejunostomy*, in which part of the jejunum is stitched to the stomach so that the alkaline juices of the small intestine can enter the stomach and partially neutralise the excess acid, and, much more frequent nowadays, *partial gastrectomy*. In this operation the part of the stomach which contains the acid-secreting glands—the lower three-quarters—is removed, the duodenum is closed, and the remaining quarter of the stomach is stitched to the small intestine. This operation is very successful, and only about 1 per cent. of cases have any further symptoms. Finally, *vagotomy* is sometimes performed—*i.e.*, cutting of the vagus nerve, which passes down from the brain through the neck and chest to the stomach, for it is the impulses passing down this nerve which are responsible for the over-secretion of acid.

Why is peptic ulcer becoming so common? Most doctors would agree that it is one of the diseases caused by stress and the problems facing us in an age of anxiety. It is more common in industrial communities than in peasant ones and in people whose work is a source of worry—who are continually tense. There is no reason at all to suppose that irregular meals and the other dietary reasons often given have any influence in producing an ulcer, although one must, naturally, be careful about these when an ulcer is present. Duodenal ulcer is common in the fairly young and fit, stomach ulcer in the old and poorly. For some reason, although duodenal ulcers almost never become malignant, about 10 per cent. of stomach ulcers do so, even although there may have been no previous history of dyspepsia.

Cancer of the Stomach is found most frequently in men between forty-five and sixty. The pain of cancer tends to be constant rather than periodic, and there is increasing loss of weight and

anæmia. Operation is necessary, but the outlook is good if the condition is discovered in time. There would be much less risk of cancer getting beyond the stage where operation can help if people with "indigestion" lasting any length of time would put themselves immediately under medical care with periodic check-ups. A curious feature of cancer of the stomach is that hydrochloric acid is completely absent.

Gastritis means inflammation of the stomach lining. It may be acute or chronic. In acute gastritis eating too much food or eating unsuitable food in a person with a sensitive stomach may lead to symptoms, but the most frequent cause is too much alcohol. The symptoms, in general, are those of a "hangover": headache, depression, loss of appetite, and, as P. G. Wodehouse puts it, "a feeling that you're going to die in about five minutes." In more severe cases there may be a raised temperature and diarrhœa. The treatment is to avoid irritating the stomach further, to eat only as much bland food as one feels inclined to, and to take some alkaline medicine—"fizzy" salts are suitable for this. Since "gastritis," strictly speaking, refers to any form of irritation of the stomach lining, it can also be applied to serious conditions, as when poisons such as strong acids or other corrosives are swallowed, intentionally or otherwise. Here we are discussing only the condition which is ordinarily understood when the word is used.

Chronic gastritis, although it may be associated with kidney, lung, heart, or blood diseases, and with diabetes, is usually the sequel to frequent attacks of acute gastritis. Here, again, the appetite is poor, there is depression and a feeling of discomfort rather than pain after taking food. Headache, flatulence, and vomiting or nausea in the morning are common features. Although one is inclined to picture the case of chronic gastritis as typically a retired colonel from India or some other tropical spot who has subsisted for years on curries and alcohol, there is no reason to suppose that curries have anything to do with it. Even alcohol can be taken in large amounts without doing any harm (except to one's pocket!) provided it is taken diluted and with meals. In fact, many elderly ladies of irreproachable character suffer from chronic gastritis, and it is well to remember that strong tea taken too frequently causes red noses more frequently than strong drink. Chronic gastritis requires special medical attention.

Nervous or Functional Dyspepsia is a term used by doctors which means, first, that the condition is basically a sign of general neurosis and, as such, needs a psychological rather than a physical approach, and secondly, that no signs of organic disease of the stomach have been found on examination. This, of course, does not make the discomfort any easier to bear from the point of view of the patient. The symptoms tend to be different from the more or less cut-and-dried ones of ulcer: for example, flatulence and nervous vomiting are frequent. *Flatulence* is a gastric neurosis due to the habit of swallowing air, for no "gas" is formed in the stomach, and all that is brought up has previously been unconsciously swallowed. Trying to "bring it up" as many people do to the distress of those near by, only results in more air being swallowed, so the desire should be resisted. *Anorexia nervosa* is another gastric neurosis in which the patient refuses to take food or vomits it up when it has been taken. In some cases even death may result from self-imposed starvation of this type, for which psychological treatment is necessary.

The end of the stomach where it joins the duodenum is known as the pylorus, a ring of muscle which acts as a valve and allows the partially digested food to pass from the stomach only when it is ready for further digestion by the intestinal juices. In newly born babies the pylorus muscle may be too thick or it may tend to go into spasm easily, with the result that food cannot get out of the stomach and is vomited up. This is known as *pyloric stenosis*, and is quite common in babies of two or three weeks of age—three times more frequently in boys than in girls. Without treatment the continued vomiting, which is very forceful in character, would lead to death through malnutrition and lack of fluids, but fortunately treatment is relatively simple. In some cases, injections of a drug to relax the spasm is sufficient, but more often an operation is necessary. A small incision is made under an anæsthetic, and the pylorus muscle is slit down its entire length (of course, only the muscle fibres are cut, not the inner lining of the stomach). The operation is very safe, and the wound heals within about a week, after which the infant has no further trouble.

The small intestine can be affected by a number of diseases, although much less frequently than the stomach and duodenum. Here we shall mention only two of the more common conditions: regional ileitis and intestinal obstruction.

Regional Ileitis is an inflammation of the small intestine frequently found in young men and women. The cause is unknown, but it leads to ulceration and small perforations which cause adhesions between the affected area and other parts of the small intestine. Such a condition requires surgical treatment, which usually takes the form of short-circuiting the diseased area and joining together the healthy ends of the loop. Sometimes the diseased area is cut away altogether and the healthy end joined to the large intestine. By this means the vast majority of cases can be cured.

Intestinal Obstruction can be caused by a tumour, by a loop of intestine becoming twisted on itself (volvulus), by the bowel being caught in a hernial sac, or by the contraction of old adhesions. Here, too, the surgeon will either by-pass the area or if the intestine has become damaged and gangrene has set in he will remove the whole of the affected part. Acute (*i.e.*, sudden) obstruction is a surgical emergency, and if an operation is not performed death will occur in a few days. The symptoms are severe colic, profuse vomiting, distended abdomen, and collapse; no bowel motions are passed. Chronic obstruction, in which the blockage is gradual, is usually due to a tumour; the symptoms are periodic attacks of vomiting, constipation alternating with diarrhœa, and loss of weight.

In children, *intussusception* is not uncommon, especially in boys under the age of two. Here one part of bowel becomes telescoped into another, leading to colic and the passage of motions consisting of blood and mucus. Later there will be vomiting and collapse. Operation, of course, is necessary.

Constipation. Here, perhaps, we had better mention the question of constipation, about which so many people hold such pronounced views. They believe that constipation is the root of all evil, that it causes a mysterious condition known to them (although, alas, not to doctors) as "auto-intoxication." Sedulously fostered by the manufacturers of patent medicines, their beliefs range from the notion that headaches, spotty skin, muddy skin, and tiredness are caused by constipation, to the more extreme idea that the whole system is being poisoned and that, if the bowels do not work, the individual will shortly die. Of course, all this is the merest rubbish, for, as Professor Samson Wright, whose *Applied Physiology* is one of the most famous of medical text-books, has pointed out, there is no such thing as absorption of poisonous products from the bowel. There is no such thing as "auto-intoxication." "The symptoms of constipation," he writes, "are largely due to distension and mechanical irritation of the rectum." It has been shown that an enema removes these symptoms *immediately*, which would not be the case if they were due to poisons in the blood, and exactly the same symptoms can be produced by packing the rectum with cotton-wool. Wright mentions the case of a man who went for just over a year without a bowel motion, and at the end of that time, although his abdomen was distended and he felt some discomfort, he was not noticeably ill. Needless to say, telling these facts to the purgative addict will only make him annoyed, but it is as well to note that if no known diseases are due to constipation (although constipation may be a symptom of another disease), the regular use of purgatives *can* cause disease.

Constipation should be treated first by diet

containing plenty of roughage—bran and oatmeal are excellent—plenty of stewed and fresh fruits, and at least three pints of fluid should be taken daily. Failing that, one of the best things to take is "Senokot," a proprietary product prepared from senna pods. Never to be taken regularly are liquid paraffin, since there is some evidence that it may cause cancer, castor oil, preparations of aloes, Epsom salts, and all the other dreadful stuff that people swill down.

An extreme form of constipation is *Hirschsprung's disease*, which is found in children, usually males, and leads to constipation over long periods, so that motions may occur only every few months. The condition is probably due to spasm in the intestine, and can be relieved by an operation in which the nerves producing the spasm are divided.

Diarrhœa has already been discussed under the heading of infectious diseases, and the types due to infection will be found there. However, diarrhœa can be the result of other influences: food that "hasn't agreed" with one, certain poisons, such as mercury, arsenic, and purgatives, and to nervous tension. The treatment depends on the cause, but in mild cases a single large dose of castor oil is a good idea. This gets rid of whatever is causing the trouble (provided that it is not a serious infection or nervous diarrhœa we are dealing with), and it has a slightly constipating after-effect. Other mixtures given by doctors are chalk and opium or kaolin and morphia—the opium and morphia are in very small quantities.

DISEASES OF THE LARGE INTESTINE.

The large intestine consists of the colon and the rectum. If you put your hand down in the right-hand lower part of the abdomen, then you are covering the area where the small intestine meets the colon, and also where the appendix, a small, blind tube about 2 in. long, hangs from the beginning of the colon. Now move your hand upwards to the margin of the ribs, then straight across the abdomen at the level of the stomach and down the other side to the corresponding place on the left side from where you began. The path you will have mapped out is that of the colon, which, as the name implies, is much wider than the small intestine.

The colon is just as subject to disease as the stomach. In fact, Dr. Clark Kennedy says that most so-called indigestion "is not due to duodenal or gastric ulceration . . . but to disorder of the mechanics of the large bowel aggravated by introspection and *again and again by the misuse of aperients*" (the writer's italics). Irritation of the colon is known as colitis, and there are two types: ulcerative colitis and mucous colitis. As in the case of stomach and duodenal ulcers, mental factors play a large part, but, since not everyone with anxiety or who is under stress develops colitis, we have to assume that this condition, and indeed the other stress diseases, are caused by an interplay between hereditary disposition, certain physical factors not yet completely understood, and stress.

Ulcerative Colitis is a serious disease in which there is not only inflammation of the intestinal wall but also ulceration. The patient, usually an adult between twenty and forty, and most commonly a woman, develops diarrhœa, with passage of blood, pus, and mucus, there is an irregular fever, although no germs have ever been conclusively found to account for this. Sometimes the disease begins abruptly and ends in quite a short time in death, but more often it runs a course of many months in a milder form. Medical treatment, such as washing out the colon, may be used, and various drugs have been tried, and in about 75 per cent. of cases these prove adequate. But in the remaining 25 per cent. of cases operation is necessary. The operation performed is *ileostomy*, in which the end of the small intestine is brought out on the abdominal wall so that the motions pass out there, the colon is thus put out of action and can be rested. In about 10 per cent. of cases the ulceration heals and the small and large intestines can be joined up again by closing the opening on the abdomen, but more often the opening must be permanent. If, in spite of this, the bleeding and diarrhœa persist, the only possibility is to perform a *colectomy*—*i.e.*, to remove the whole of the colon. Although this is a large-scale operation, the recovery rate is well over 90 per cent.

Mucous Colitis is a less serious disease which appears to be almost entirely nervous in origin. As in the other type, there are attacks of diarrhœa, in which quantities of mucus and membranous material—actually parts of the lining of the bowel—are passed. There is no blood, and the treatment is medical, with sedatives and antispasmodics, drugs which relax the spasm in the colon.

Appendicitis is a disease which mysteriously became popular towards the beginning of this century. Appendicitis begins with pain over the stomach (*i.e.*, in the *upper* part of the abdomen, and not over the site of the appendix). The pain remains there for some hours and then moves to the right lower part of the abdomen, there is usually fever and sometimes vomiting. It is important to realise that in any case of abdominal pain purges should never on any account be given, in appendicitis particularly purges may lead to death from peritonitis. The treatment of appendicitis is nearly always surgical, but in a few cases antibiotics may be used.

Bleeding from the Rectum is a common symptom which may be due to a number of causes: hæmorrhoids, dysentery, typhoid, some blood diseases such as purpura, and tumours. Bleeding from a gastric or duodenal ulcer leads to black motions or *melæna*. The blood in this case is black because it has been changed in its passage through the digestive tract, and although black motions may result from harmless causes—*e.g.*, when iron-containing medicines are being taken—it should always be referred to a doctor. In fact, any bleeding from the rectum should be investigated.

Visceroptosis occurs when the bands of tissue holding up any of the abdominal organs begin to sag so that the organs sink downwards. The symptoms are vague: dyspeptic tendencies, constipation, and a general feeling of being unwell. Although it often occurs in young women who have had too many pregnancies too quickly, there is a large neurotic element involved. Treatment is directed towards the neurotic condition accompanied by exercises and perhaps the use of an abdominal belt to support the sagging muscles.

Cœliac Disease. Some children are born with an innate difficulty in absorbing fats from the small intestine. They suffer from diarrhœa, in which large quantities of partly digested fats are passed from the body. The passage of fats in this way is known as *steatorrhœa*, and the disease is described as *cœliac disease* (Gee's disease), or, if it occurs in the tropics, *tropical sprue*. Adults, too, may suffer from the disease, but in children the important factor is that the disease is also associated with defective absorption of iron and calcium, so they tend to become anæmic and may develop rickets. It is necessary to give a fat-free diet, vitamins and calcium, and plenty of protein. "Sprulac," which is a dried defatted milk powder, is frequently given. The condition may go on for years, but the outlook is quite good. Tropical sprue is not caused by living in the tropics, but tropical conditions may bring out a latent tendency to steatorrhœa.

Diverticulitis. In diverticulitis an inborn weakness of the large intestine leads to weakness of the muscular wall of the large intestine, and through the weakened areas the mucous membrane or lining of the bowel pushes through. Probably at least 5–10 per cent. of all people have some diverticulæ, but they give trouble only when they become inflamed through some of the fæcal contents of the intestine getting trapped within them. There is pain, usually in the left lower part of the abdomen, slight fever, and general abdominal tenderness. Diverticulitis can usually

be treated by dieting, rest, and antibiotics or sulpha drugs. The vast majority of cases can be dealt with in this way; but if they do not respond, it may be necessary to remove the affected area.

Cancer of the Large Intestine The large intestine is one of the commonest sites for cancer The symptoms, which usually occur from forty to sixty, are twice as common in men as in women, and, in general (although this depends upon the part of the colon affected), they are passing of blood from the rectum, loss of weight, anaemia, and increasing constipation. Pain occurs as the obstruction increases, and finally the signs of acute obstruction already described make their appearance. Fortunately, symptoms usually appear early in the disease, so it can frequently be caught in time. Surgery is the only remedy, and in early cases may be done in one stage by removal of the affected part, but if obstruction has begun it is necessary to perform an operation—*colostomy*—in which a part of the intestine, as in ileostomy, is brought out on to the abdominal wall, so that the fæces discharge from the side of the abdomen instead of through the rectum This operation is followed a few weeks later by removal of the part containing the tumour

Hernia The body, unfortunately, is supplied with many weak areas in the abdominal wall and elsewhere through which structures such as the intestines can thrust their way to where they are not supposed to be This condition is known as hernia There are numerous different types of hernias, for example, they may occur in the canal below the groin through which the large blood-vessels pass back and forth between the legs and abdomen or in the larger inguinal canal just above They are also found at the umbilicus, a weak area through which before birth the child was supplied with all its needs from its mother's circulation, or right in the middle of the abdomen below the umbilicus, where the two bands of muscle which form the abdominal wall come together but often leave a weakness in between There may also be hernias internally, or in the diaphragm, or over the site of an operation scar In the groin we speak of *inguinal hernia*, in the area where the vessels pass between abdomen and legs slightly below the groin we speak of *femoral hernia*, at the umbilicur, *umbilical hernia*, and between the two abdominal muscles, *ventral hernia* A *diaphragmatic hernia* is one in which the stomach pushes its way into the chest through a weak part of the diaphragm.

Hernias may occur at any age, and indeed many children are born with them In later life they are generally caused by a combination of developmental weaknesses in the area concerned, flabby muscles, and sudden strains, such as lifting heavy weights The main danger from a hernia, apart from its inconvenience, is that it may become *strangulated* -that is, a part of the intestine may become caught in the hernial sac, and becoming filled with intestinal contents, swell up and be unable to escape This causes all the symptoms of intestinal obstruction and has to be treated as an emergency, or else gangrene of the part which is caught and possibly peritonitis will occur

Although many people, fearing surgery, wear a truss—that is a belt which by pressing on the part keeps the weak area compressed—there is no doubt that hernias, except in the old and infirm, should be operated on No matter how comfortable the truss may be, it is a continual nuisance and interferes with many activities, such as swimming, nor are trusses always adequate in performing their function. The operation involves replacing the herniated organs back into the abdominal cavity, removing the sac of peritoneum (*i e*, the thin lining of the abdomen which has been pushed out by the organ), and then repairing the muscle wall where it was weakened. The main sign that a hernia exists (at least so far as femoral, inguinal, umbilical, ventral, or scar hernias are concerned) is a soft swelling over the place where the weakness exists Unless strangulation occurs, there need be no other symptoms. But any bulge in the groin or upper thigh or, indeed, anywhere, should be immediately referred to a doctor.

Cancer of the Rectum. The rectum and anus are afflicted by two common diseases: cancer of the rectum and hæmorrhoids. In cancer of the rectum the symptoms are similar to those described under cancer of the large intestine. Operation is imperative as soon as possible, and it is usual to remove the anus, rectum, and the lower part of the colon, subsequently creating a permanent colostomy.

The anus, the last inch of the intestinal canal, is a sphincter, a band of muscle which controls the exit of fæces from the bowels. In addition to hæmorrhoids, the anus may be the site of fissures (*i e*., ulcers of the lining), fistulas (abnormal tracts leading from the lower rectum to the skin), and polyps (non-malignant growths). *Fissures* are elongated ulcers rather like a crack in the mucous lining which cause pain every time the bowels are moved They tend, if untreated, to get deeper and more inflamed Treatment is surgical, by cutting the sphincter muscle to allow relaxing and healing. A *fistula*, as has been mentioned, is an abnormal channel between the lower rectum and the skin — *e*., it comes out somewhere around the anus Nearly always it is the result of a previous infection, such as a boil or abscess, in the region of the anus The treatment is surgical, as a fistula rarely clears up by itself. The channel is opened and cleared out, then packing is put in to enable it to heal from the bottom up. *Polyps* may vary in size from a pea to a golf ball, and the first sign may be fairly severe hæmorrhage from the rectum. Sometimes there is no bleeding, but the polyp suddenly appears protruding from the anus after a bowel movement It is painless, and not in itself serious, but should nevertheless always be removed (this can often be done by cauterising without an anæsthetic), since some authorities believe that such growths may become cancerous

Hæmorrhoids are simply varicose veins in the rectal and anal regions They are very common, and are caused probably in about equal degrees by inherited weakness of the veins, strain such as heavy lifting, and constipation (this is one of the very few conditions in which constipation may do some damage, due to the mechanical pressure of hardened fæces in the rectum on the veins). Pregnant women are liable to develop hæmorrhoids or "*piles*," as they are commonly called, owing to the pressure of the baby's head in the pelvis Hæmorrhoids may be external or internal, the former being in the anal region below the sphincter, the latter in the rectum, the two usually go together. There may be no symptoms, but the veins are liable to bleed, to get thrombosed (*i e*, a clot forms within) or to become infected When clotting or infection occurs the piles enlarge and tend to be pushed out through the anus during defæcation, when they form extremely painful external swellings Treatment in simple cases may be by the use of suppositories—cones of a firm grease containing suitable medicaments which are inserted in the rectum—in other cases the veins may be injected, as with varicose veins of the leg, in order to close them, but when there is much bleeding, thrombosis, infection, or interference with bowel movements they should be removed surgically

DISEASES OF THE LIVER AND GALL-BLADDER.

The functions and site of the liver have been described elsewhere, so no more need be said about these. Presumably the most common associations of the layman in relation to the liver would be the two words "liverish" and "jaundice" Feeling *liverish*, one gathers, produces a sort of sensation like a hangover (which it frequently is), but there is no medical term corresponding to the word, nor is there any reason at all to suppose that it has anything whatever to do with the liver. Most likely it is an attack of mild gastritis, and should be treated as such.

Jaundice is easily recognised by the yellowish skin, the degree of colouring depending upon the severity of the case. In mild cases it may only be

noticeable in the whites of the eyes. Less well-known symptoms of jaundice are itching of the skin, dark-coloured urine and pale motions, depression, loss of appetite, and tiredness. Jaundice, however, is not in itself a disease, rather it is a symptom of many diseases, amongst which some of the commonest are

(1) Blockage of the bile ducts, which normally carry the bile and its pigments into the intestines (it is the pigments which produce the yellow coloration). The blockage may be caused by gall-stones, parasites, tumours, or in the liver itself when cirrhosis is present. The bile pigments, unable to get through the duct into the intestine - hence the pale motions--pass backwards into the blood-stream and are filtered into the urine, which therefore becomes stained, and into the skin. This is known as *obstructive jaundice*.

(2) *Infective jaundice*, on the other hand, results from various types of organism such as spirochætes and viruses. Examples are infective hepatitis, spirochætal jaundice, yellow fever, malaria, and some cases of syphilis. Certain poisons, such as chloroform, arsenic, phosphorus, and snake venom, can also cause jaundice, which in this case is due to damage to the liver.

(3) *Haemolytic jaundice* is found is some blood diseases, such as pernicious anæmia, acholuric jaundice, and blackwater fever. Its immediate cause is breaking down of the red cells at a rate too rapid for the liver to absorb the products.

The treatment of jaundice depends entirely upon its cause. The infective and hæmolytic types have already been dealt with under infectious diseases and diseases of the blood respectively, so it only remains to deal with obstructive jaundice, and this leads us to the subject of the gall-bladder and *gall-stones*. Doctors in their perverse way refer to inflammation of the gall-bladder as *cholecystitis* and to the condition of having gall-stones as *cholelithiasis* (just as Americans refer to typists as "stenographers" and lifts as "elevators").

The gall-bladder is pear-shaped and lies below the liver. It ends, at the "stalk" of the pear, in a tube called the cystic duct, which enters the main bile duct passing from the liver into the beginning of the duodenum. Bile is essential to the digestion of fats, and when a meal is eaten a supply of dilute bile moves down the main duct from the liver, whilst more concentrated bile is squeezed into the same duct from the gall-bladder. The bile, both dilute and concentrated, then enters the duodenum to do its work. In cholecystitis, which may be acute or chronic, the walls of the gall-bladder become infected, usually by streptococci or the bacillus coli, and severe pain develops over the liver area, typically spreading back to the right shoulder-blade. If the infection becomes worse and pus is formed there may be a high fever. Gall-stones may, as some physicians believe, be the aftermath of such an infection, although others think that they are formed because of some defect in the ability of the body to deal with fat and cholesterol. In any case, gall-stones are formed in the gall-bladder, and may number anything from one or two to several hundred; their size varies from that of a grain of corn to that of a golf ball. Stones may be present without causing any trouble at all, but usually sooner or later the following symptoms develop: indigestion after eating fatty foods, heartburn, nausea, and attacks of pain. The pain of gall-bladder disease, whether in the case of simple infection or gall-stones, is more or less the same—over the gall-bladder area and passing to the right shoulder-blade. Such pain signifies either infection, which, of course, may occur without stones, or else that a stone formerly lying quietly within the gall-bladder has passed into the bile duct and got stuck.

Typically, gall bladder disease is found in men and women in middle age, but it is three times commoner in women. As an aid to examinations, students are told (or used to be told) that the typical case is a woman who is "fat, fair, forty, and fertile," for there can be little doubt that pregnancy plays some part in upsetting the secretion of bile in some people. But it is also entirely possible for thin men to develop the disease, so there is no general rule.

When the stone blocks the cystic duct (*i.e.*, the one leading from the gall-bladder to the main duct) there is pain, which may be relieved when the stone either moves back into the bladder or passes into the main duct. The next problem is whether it can negotiate the opening of the main duct into the intestine; for if this duct is blocked *none* of the bile can escape and, passing back into the blood-stream, it produces jaundice.

Operation is necessary when acute inflammation is present, when there are frequent attacks of severe colic and other symptoms causing discomfort, or when jaundice is present. Drugs can cause only temporary relief when a gall-bladder becomes troublesome. There is no such thing as a drug which dissolves gall-stones.

The liver may be the site of cancer, but this is nearly always secondary to cancer elsewhere. Primary cancer, that is cancer originating in the liver, is not common. So, too, the liver may become enlarged, sometimes very considerably so, as a result of events elsewhere in the body: heart failure, leukæmia and other blood diseases, and even rickets can cause enlargement. In the liver itself enlargement may be due to cancer, cirrhosis, abscesses, and cysts (the former usually caused by amœbic dysentery, the latter by parasitic worms; both of which are described elsewhere). Abscesses are usually aspirated—which means that a needle attached to a syringe is passed in and the pus drawn off—cysts have to be surgically removed.

Cirrhosis of the Liver is a condition in which more and more of the liver cells become replaced by fibrous tissue. Now, as we have seen, the whole portal system which carries away the end-products of digestion passes into the liver, so when the liver becomes fibrosed there is serious obstruction to the portal circulation, leading to back-pressure in the veins, and therefore the liquid part of the blood, the plasma, oozes out through the walls into the abdominal cavity. This is known as *ascites*, and it is also found in some cases of heart failure, kidney disease, and chronic peritonitis. Usually the fluid is removed by tapping the abdominal cavity in the same way that one removes pus from a liver abscess.

Cirrhosis is always a serious disease, for, although Nature is so generous as to give us 80 per cent more liver than we need to preserve life, the common type of cirrhosis extends right through the liver, and the secondary effect of portal obstruction with ascites complicates the matter. The disease is generally associated with alcoholism, especially in those who drink large quantities of spirits (there are other rare types of cirrhosis which need not be mentioned here), but the problem is more complicated than might appear, for everyone who drinks to excess does not develop cirrhosis. In fact, cirrhosis is not at all common, and some seem more liable to it than others. It is believed that another unknown factor is involved and the disease is not due solely to alcohol as such.

Symptoms are chronic gastritis, morning sickness, constipation. Later, when the portal system has been seriously obstructed, large veins are seen on the abdominal wall, especially around the umbilicus. These develop in an attempt to compensate for the blocked portal circulation. Ascites and slight jaundice are later symptoms. Treatment is a matter for the specialist, but obviously alcohol should be banned. Recently, an operation has been devised in which the portal vein, instead of going to the liver, is sutured to the *vena cava*—the largest vein in the body, which passes up the centre of the abdomen just in front of the backbone on its way to the heart. This operation is known as *porta-caval shunt*. Not infrequently the first sign of cirrhosis is serious hæmorrhage from the mouth due to the rupture of "varices" (*i.e.* varicose veins) at the end of the œsophagus.

The Pancreas.

This is a soft, elongated gland lying behind the stomach; it is about 5 in. long and 2 in. wide

Within its tissues lies the duct, which, when it leaves the pancreas, passes into the duodenum near the point of entry of the bile-duct. This duct transmits the juices containing enzymes which aid in the digestion in the small intestine. The pancreas, however, has two main functions: not only does it manufacture these important digestive juices, but in certain specialised areas, known as the islets of Langerhans, it manufactures insulin. The functions of insulin will be discussed shortly when we are dealing with diabetes.

Like the liver, the pancreas may be the site of cysts or tumours. The only other condition which need be mentioned is *acute pancreatitis*. This is a not very common disease which is caused by a small gall-stone becoming stuck in the opening of the duct. When this occurs, bacteria come in to infect the pancreas, and the blocking of the duct prevents the digestive juices from leaving, with the result that the organ is digested by its own enzymes. There are all the signs of an acute abdominal disturbance: sudden severe pain, vomiting, and fever. Pancreatitis is difficult, even for the expert, to diagnose, and formerly was always treated surgically, but today it is often possible to clear it up with medical treatment and the use of penicillin or other antibiotics.

Diabetes. Although we know so much about diabetes, we still have not the faintest notion as to what causes it. Its immediate cause is a failure in varying degrees of the pancreas to produce insulin, but examination of the pancreas rarely reveals any significant changes. The disease is commonest between thirty and sixty years, but may occur even in children. Now insulin is the substance which makes it possible for the body to make use of sugar—the glucose which is the end-product of carbohydrate digestion. So in its absence the glucose, although there to be used, is useless to the body and accumulates in the blood, finally passing out in the urine. (The fundamental test for diabetes is the discovery of sugar in the urine by the use of certain simple procedures.) The diabetic, then, is being starved of sugar no matter how much he takes in, and the excess sugar in the blood which cannot be used acts as a poison, which, in extreme cases, sends the patient into coma and may—indeed, in former times, usually did—result in death. The symptoms of diabetes vary, of course, with its severity, but in the main they are: increasing appetite in an attempt on the part of the body to supply the sugar which is there but so tantalisingly unavailable, great thirst, because this useless sugar has to be excreted, and the production of urine demands water, frequency in passing urine, and increasing loss of weight in spite of all that is taken in. In severe and untreated cases boils, itching of the skin, gangrene of the limbs, and finally coma and death may occur.

Although mild cases of diabetes could, and still can, be treated by dieting alone, by reducing the intake of carbohydrate, the diagnosis of diabetes prior to 1922 amounted almost to a death-warrant. In that year, however, the Canadian physicians Banting and Best separated out the secretion of the islets of Langerhans and named it "insulin"; they showed that insulin taken from the pancreas of animals and injected into the diabetic patient was just as effective as the home-made article.

Since a diabetic regime has to be decided on by the doctor according to the severity of the disease, no useful purpose would be served by discussing the details of diet or dosage of insulin, which vary from one person to another. On the whole, diabetes is more severe in young people than in the elderly, but with correct treatment it is possible for all cases to lead a perfectly normal life except in so far as dietary restrictions and insulin injections are concerned. Many famous people are, or have been, diabetics—for example, H. G. Wells—and have lived to a ripe old age. Recently, a drug has been discovered which has the great benefit that, unlike insulin, it can be taken by mouth.

Whereas the type of diabetes we have been describing, the disease ordinarily known by that name, is properly known as *diabetes mellitus*, there is another disease known as *diabetes insipidus*, which, in fact, has no real relation to the other at all. In this disease there is no sugar in the urine, nor has it anything to do with the pancreas. Diabetes insipidus is a rare disease characterised by the passage of large amounts of dilute urine and appears to be due to deficiency of the secretion of the posterior part of the pituitary gland at the base of the brain. It can be partially controlled by the use of pituitrin.

Peritonitis is an infection of the peritoneum, the thin, transparent lining which covers all the abdominal organs. Acute peritonitis may occur at the end of serious chronic diseases, but more commonly it arises from perforation of some part of the intestines or stomach which allows septic material to flow into the abdominal cavity, or from extension of infection from the Fallopian tubes (the tubes passing between ovaries and womb in women). Wounds of the abdomen are also a possible cause. There is severe pain, vomiting, constipation, fever, and the abdomen is distended. The coils of intestine become matted together by infected lymph, produced by the germs which, while harmless within the intestine, are dangerous to life outside them. Treatment may be by antibiotics or surgery or both.

Chronic peritonitis is usually tuberculous in origin, and is commonest in young children. It is usually caused by the bovine type of bacillus, and usually there is ascites (i.e., free fluid in the abdomen), with slight fever. Matting together of the intestines may threaten to produce obstruction. Unlike acute peritonitis, in which death will occur within two or three days without treatment, chronic peritonitis is a long-drawn-out disease which is usually treated medically.

DIET.

Food is, like alcohol, tobacco, and constipation, on of those subjects which people tend to have a "thing" about. In point of fact, what we know at present about this subject may be summarised as follows. Any diet to be adequate must first of all provide enough energy, and energy is measured in terms of Calories (for definition of a Calorie see **Gen. Inf.**). Thus a ten-stone man leading a moderately active life will require about 3,000 Calories daily, that is the amount of energy he requires in order to carry out his work and avoid living on himself, on his stored-up food. The amount of Calories required varies with age, size, and the amount of work done, from 1,500 Calories for the light-weight sedentary worker to three or more times this amount for the heavy manual worker.

Now, in theory, the adequate amount of Calories could be supplied from carbohydrate and fats alone, since, as we have seen, Calories are merely a measure of energy and can be supplied by any food. But in this case the individual would not live long, because he needs for body maintenance certain kinds of food in adequate proportions. Just as you cannot run a car for long simply by putting in petrol and ignoring lubricating oil and maintenance of the engine, so you cannot run your body simply by taking in enough Calories. There must be adequate proportions of the three basic foodstuffs: carbohydrates (the fuel), fats (for insulation and other purposes), and proteins (for body-building purposes). Proteins are necessary to replace the parts of the body, which is largely a protein structure, when they become run-down. Fats and sugars can be transformed into each other within the body—this, of course, is why too many sweets make one fat—but proteins cannot be manufactured from these two foodstuffs, since proteins contain nitrogen and the others do not. One could even live on a diet of nothing but protein, but not on a diet of fat or sugar, proteins are a biological necessity. It is generally agreed that a well-balanced diet should provide 25 per cent of its energy from fats, 10–15 per cent from proteins, and the remainder, 60–65 per cent, from carbohydrates.

Here are some foods classified according to the predominating basic foodstuff they contain:

(1) *Carbohydrates:* bread, sugar, and all starchy foods or sweet things such as confectionery, puddings, and cakes.

(2) *Fats:* animal fats, such as dripping, fat meat, fried foods, butter, margarine, and

vegetable oils, such as olive oil, or fish oils, which are found more in some fish than others—*e.g.*, herring.

(3) *Proteins*: lean meat, cheese, non-fatty fish, nuts, oatmeal

In addition to these basic foods, the body must also have adequate supplies of vitamins (P42, 61) and certain minerals, such as iron, manganese, calcium, copper, sodium, potassium, iodine, and phosphate.

Obesity. Many people worry because they are overweight, and statistics show that the expectation of life is shorter in fat people than in thin ones. This, however, is a statistical view, and need not apply to any single person. Thus a famous French gourmet who weighed twenty stone died recently at the age of eighty-two—through falling out of a window. When one sees people who are constantly worrying about their health and diet one recalls the statement attributed to Winston Churchill as a recipe for a long life: drink too much, smoke too much, and work hard. He might have added ". . . and stop worrying." There are few people more pathetic than those who, by rigidly adhering to the so-called rules of health, seek to eke out a life which, if it does not actually last longer than that of the more care-free individual, will certainly seem much longer.

Being overweight is due to one cause—eating too much, and especially eating too much of the wrong kinds of food. There are, obviously, some people who can eat to their heart's content without becoming fat, perhaps because their bodies burn up the food more quickly. Their *basal metabolic rate*, which is the measure of the speed at which their body cells work, is higher than normal, and the basal metabolic rate is largely dependent on the functioning of the glands—in particular, the thyroid. Nevertheless, being overweight means that you are eating too much for you, that your intake of Calories is greater than your output.

Reducing is not difficult, but it does require an effort of will. Basically it depends on (*a*) taking less food, and (*b*) taking food which is not fat-producing. In practice, this means taking a high-protein diet, little fat, and no sugars or starches. Such a diet would be somewhat as follows: coffee or tea with milk, but *no sugar* for breakfast, and if desired some form of crispbread, whether of rye or wheat, but *no white or brown bread*. A small amount of butter or jam may be taken with the crispbread. At lunch, grilled lean steak or an egg dish and salad, followed by jellies or fruit or crispbread and cheese—but *no potatoes*. The evening meal may consist of grilled or steamed fish, clear soup, cheese, fruit, but there must be no fried foods and no sweets at any time. This diet is merely to give an indication of general principles, more interesting ones will be found in the pages of most women's magazines or from time to time in the daily papers. The basic principles are obvious: plenty of lean meat, non-fatty fish, eggs, cheese, fruit, crispbread (or those starch-free rolls which one can buy in some shops), but no fried foods, fat meat or fish, bread, potatoes, sweets, or cakes. However, small amounts of butter and quite a lot of milk are permissible.

Obesity may have a psychological basis, and excessive eating is often a substitute for affection in individuals who have been spoilt as children. But, however this may be, most people find it as difficult to stick to a reducing diet as they do to give up smoking. For such people there are certain drugs which may help. Thyroid tablets, once generally used for reducing, are little used now, and should be used only when the thyroid gland is underactive, otherwise they simply increase appetite, and although they speed up the combustion in the body (the basal metabolic rate), the effect is cancelled out by the increased appetite. Dexedrene, one of the derivatives of benzedrene or amphetamine, acts by reducing the appetite, but in some people of a nervous disposition it may have the effect of causing a feeling of tenseness, and they may even have difficulty in sleeping. Finally, there is a substance obtainable at chemists' shops without prescription either in the form of granules or biscuits which does not exercise any chemical effect on the body; what it does is to swell up into a gelatinous mass within the stomach under the influence of water, which is drunk later, and this gives the impression of a "full stomach" and allays the pangs of hunger.

There are, as has already been mentioned, many fads about food, although one is treading on dangerous ground when one mentions them, for every faddist is a fanatic, and every argument one may put before him is seen as an attack on himself. For example, there was the "Hay diet" now, it appears, largely forgotten, then the "Gaylord Hauser diet" much favoured by Americans, which seems to be based largely on large quantities of molasses and brewer's yeast; and there was not so long ago a gentleman who lived on grass freshly clipped each morning from Hyde Park—it would be interesting to know whether he has survived his self-imposed ordeal. However, few doctors would deny that, although diet in some cases is an adjunct to the cure of disease (for example, peptic ulcer, diabetes, sprue), it is not a cure for disease, and those who make such claims are claiming a great deal too much. It must be repeated that, so long as a diet contains adequate amounts of the basic foodstuffs, adequate amounts of vitamins and the necessary minerals, and so long as it supplies adequate Calories for the build of the individual and the amount of work he does, it matters very little how these needs are supplied.

Vegetarianism.

This can hardly be called a fad, although it cannot be denied that many of its adherents are faddists. It apparently has two main sources. There are those who abstain from animal food for moral reasons because they believe that killing is wrong, even for food; and there are others who believe that vegetable food is more healthy than animal food. Some vegetarians live almost entirely on vegetables and fruits, whilst others allow themselves milk, eggs, and cheese. The moral issue cannot be argued here, although it must be admitted that few people who have visited a slaughter-house for the first time have as much appetite for their steak the day after, so we shall only discuss the health aspects of vegetarianism. On the negative side, it must be said that, in general, vegetable foods are much less rich in protein than animal foods, so one has to eat a great deal more in order to get an adequate amount. If, however, one includes in a vegetarian diet cheese, milk, and nuts or eggs this difficulty is largely obviated. Cows and other animals living on grass or vegetable matter have to spend practically their whole lives eating, precisely because they would not otherwise get sufficient protein. On the positive side we have the recent discoveries that, in predisposed people over forty, excess of animal fats can lead to cholesterol being deposited in the blood-vessels, notably the coronary vessels in the heart, and thus to coronary thrombosis. Vegetable and fish oils do not seem to have this effect, hence the infrequency of thrombosis amongst those peasants in Europe who are too poor to afford much meat and amongst the Eskimos who eat fish. From the point of view of evolution it would seem that Man is designed to be both carnivorous and vegetarian; for he has sharp, cutting teeth in the front for tearing meat and flat, grinding teeth at the back for dealing with grains. We must conclude that those who are vegetarians for moral reasons should have all our respect, for killing is not a pleasant thing, and we have already too much of it. From the merely medical point of view vegetarianism has both advantages and disadvantages. Nobody will suffer from being vegetarian, but, apart from the exceptions mentioned, there is little reason to suppose that their health will be any better than that of meat-eaters. We are less able to influence our fates than we often suppose, since longevity and good health are much more a matter of heredity than is ordinarily believed.

THE DEFICIENCY AND METABOLIC DISEASES

INTRODUCTION.

If you have read earlier parts of this section you will know that there can be two types of malnutrition, the first, of course, is the type we ordinarily think of when the word is mentioned, and in this case the individual is simply not getting enough food or enough of the right kind of food. The second type might well not be regarded by most people as malnutrition, for here we are referring to diseases such as diabetes and sprue, in which, although there is adequate supply of certain foods, the body, owing to some deficiency, is unable to make use of them. The patient with diabetes cannot make use of sugar, the patient with sprue of fat—they are starving in the midst of plenty, as is shown by the fact that in both cases one of the prominent symptoms is wasting.

We shall deal first with the ordinary type of malnutrition and later with the second. Since diabetes and sprue have already been mentioned, we shall be looking at some other conditions in which something or other is missing or is present in the wrong amounts, as in the diseases of the endocrine glands.

Two-thirds of the population of the entire world are undernourished, and particularly in Asia famines are common, famines like the one in Bengal in 1943, in which 3 million people died of starvation. In Europe such conditions exist only when war dislocates food supplies, but nevertheless individual cases of malnutrition can occur. For example, the lazy or ignorant mother of a large family may feed them largely on bread and margarine, with no fresh fruit or vegetables and only tinned meat because she "can't be bothered" cooking. Or the self-sacrificing mother of a large family may give all the meat and protein food to her working husband (somehow or other many men fail to notice that a housewife works!) and her children. Then old people or people living alone are liable to neglect their food, either because they have lost heart, because they are too frail, or because they cannot afford to buy enough good food. Lastly, those who are addicted to alcohol neglect their food and, drinking on an empty stomach, soon get such a degree of gastritis that they find it difficult to eat even when they need to.

A human being can live about six weeks without food, and a much shorter time—a week or ten days—without water. Naturally, human nature being as it is, there have been many claims to longer periods of starvation, and some of the more enthusiastic claim not to eat at all! Thus, in the sixteenth century Eve Flegen of Brabant appears to have lived for fourteen years solely on the smell of a rose, and, coming nearer our own time, Mollie Fancher of Brooklyn, who died in 1916, similarly lived for fourteen years without eating, and in 1864 even stopped breathing. However, presumably becoming bored with this, she resumed her respirations after only fourteen weeks.

These people, needless to say, were humbugs, as is revealed by the grim case of Sarah Jacob "the Welsh Fasting Girl," who towards the end of last century allegedly took no nourishment whatever for two years, two months, and one week. The one week, at any rate, is certain, for, at the invitation of the local vicar, who was convinced of her genuineness, a number of doctors from London came to observe her. They put relays of nurses to sit by her bed day and night to note whether she ate, but in a few days she began to decline so alarmingly that the doctors begged the parents to feed her. This they refused to do, and Sarah would not ask for food. She died within a week on December 17th. The most famous non-eater of today is Theresa Neumann, who lives in Bavaria and claims that nothing but the wafer, the Eucharist, at Holy Communion has passed her lips since 1927. The Roman Catholic Church, however, has been careful never officially to recognise her claims as true. So we shall still assert that six weeks, more or less, is the longest period a human being can go without eating.

DEFICIENCY DISEASES

The materials which are necessary to the body have been mentioned elsewhere, and we can now look at some of the diseases (other than those already discussed) which result from their lack.

Lack of iron leads to anæmia, but less well known is the type of deficiency caused by lack of iodine. Iodine is found in large amounts in seaweed, which obtains it from the sea surrounding it and concentrates it in its fronds. But ordinary water contains enough for our needs. In some districts, however, especially where the main rock is limestone—Derbyshire and some valleys in Switzerland and the Himalayas—the water contains very little iodine, and there the inhabitants are prone to develop goitre. There are several types of goitre, but this type is caused by lack of the iodine which is necessary to build up thyroxin, the secretion of the thyroid gland. It is a deficiency goitre known in adults as myxœdema, but in those parts where iodine is lacking in the water supplies the disease develops in childhood and the children become, although perfectly normal when born, dull, gross, and stupid—they become idiots or, as they are more correctly described, cretins. This is one of the commonest types of mental deficiency in children, and, if noted in time, they can become completely normal by the use of thyroxin or thyroid tablets. But prevention is better than cure, and this terrible disease has now been almost eliminated in the districts where it used to be prevalent by adding iodine to the water supply of towns and villages, by giving iodised chocolate at schools, or otherwise supplying the missing element.

In this country cretinism and myxœdema are found in individual cases for reasons other than lack of iodine: in children, cretinism may be due to congenital lack of the thyroid gland or early failure, in adults myxœdema may occur when the gland, usually in the middle period of life, runs down. Both conditions can be treated by thyroid tablets, which, like insulin, have to be taken for the rest of the patient's life.

Lack of calcium is less common in this country than it once was. Calcium is necessary for building the bones: it is calcium, in fact, that makes the bones hard. Actual lack of calcium in the diet is very rare, because calcium is one of the commonest elements in Nature, and what usually happens is that lack of vitamin D or calciferol, without which calcium cannot be utilised or absorbed, causes the deficiency.

The two main diseases caused by calcium, or rather vitamin D, deficiency are rickets and osteomalacia. Vitamin D is found in fats—but only animal fats such as are found in meat, fish, and milk, it is not found in vegetables, plants, or fruit. A second source of the vitamin is sunshine or ultra-violet light, which manufactures it in the skin, hence, in spite of inferior diet, rickets and osteomalacia are perhaps less common in sunny countries. In *rickets*, a child during the period when its bones are developing does not get enough vitamin D and cannot make use of the calcium taken in. Its bones become soft and are liable to bend, producing defects such as bow legs, curvature of the spine, and deformities of the chest (pigeon chest, funnel chest). In bad cases the skull is deformed and assumes a square shape. Rickets is rare today, at least in Britain, it is prevented by taking vitamin-D-rich oils, such as cod- or halibut-liver oil, or the vitamin can be taken in a more or less pure form in capsules.

In these days when diets are adequate, when children get cod-liver oil at home or school, and when they are much more often in the sunshine than used to be the case, it is not always realised that *overdosage* of vitamins, especially vitamin D, is possible. In its extreme form this is a rare condition, but children have died from overdoses which caused calcium to be laid down where it did not belong—in the kidneys and elsewhere. It is possible to have too much of anything.

Rickets is uncommon in adult life because the demand for calcium is less than in the growing child. But in pregnancy the demand increases, and especially in Eastern lands, where famine is frequent and where, although there is plenty of sunshine, the women are veiled from any of the sun's rays, there may occur the disease of *osteomalacia*. In this disease the bones soften and deformities occur which are particularly important in the case of women, in whom the pelvis becomes deformed, with resultant difficulties in child-birth. Osteo-

malacia is a main cause of the high maternal and infant mortality in such countries as India.

In old people who do not get enough food, lack of vitamin D causes no deformity, but leads to the condition known as *osteoporosis*, in which the bones, through lack of available calcium, become brittle and break easily.

Scurvy is another once-common deficiency disease which is now rare except under such unusual conditions (or perhaps not so unusual in these days) as life in concentration camps or amongst prisoners-of-war. It is due to lack of vitamin C, which is found in fruits and vegetables, particularly in lemons, oranges, tomatoes, and turnips. In scurvy the gums swell and bleed, there is increasing anæmia, and spontaneous bruises, due to hæmorrhage under the skin, occur. In former times the disease was the bugbear of sailors and travellers, because on long journeys or voyages before means of preserving food were known other than drying or salting no fresh fruit was available. It was no less a personality than Captain Cook who on his long voyages found that the simple use of lemons or limes would prevent the disease. Hence the almost international description of Englishmen as "Limeys"—a name which is not always used flatteringly, but of which we have every reason to be proud. Minor degrees of scurvy may occur in British children even today through faulty diet, but this is much less common since orange, blackcurrant, or rose-hips syrups became available to all.

We now come to the B group of vitamins. There are, regrettably, many members of the vitamin B family, but we shall mainly deal with vitamins B1 and B2.

Beri-beri is caused by lack of vitamin B1, which is found in most grains, principally in the embryo and the outer covering. Now, since many people are snobs, who prefer white bread to wholemeal and polished rice to the crude article, it has become the habit to remove the precious outer covering of the grain and its embryo which contain the vitamin: white bread and polished rice *look* so much better. Thus, in those parts of Asia where rice is the staple diet, it was frequently machine-milled, with loss of the vitamin, and the result was the serious form of neuritis known as beri-beri. Just as Captain Cook eradicated scurvy from his men by the use of citrus fruits so, in 1882, Takaki eliminated beri-beri from the Japanese Navy by giving a good mixed diet. This led two Dutchmen, Eijkman and Grijns, to study the disease experimentally. They found that fowls fed on polished rice developed the disease, whereas those fed on rice with the husk did not. In this country we are still in the rather foolish position of carefully removing the vitamin by "refining" the flour and then replacing it chemically. However, although whole-meal bread is probably better, there is really little risk of any European diet lacking vitamin B1.

The symptoms of beri-beri are neuritis (*i.e.* degeneration of the nerves), which leads to weakness of the muscles, wasting, and sensations of "pins and needles", the heart muscle is also affected and œdema—swelling of the limbs—or ascities (fluid in the abdomen) occurs.

Pellagra. Vitamin B2, or rather the vitamins of the B2 group, of which the main ones are riboflavin and nicotinic acid, is another substance deficiency of which in this case leads to pellagra. Pellagra is found in those parts of the world where maize is a staple diet, that is in parts of America and the Far East and round the Mediterranean. Maize does not contain the vitamin which, like vitamin B1, is found in most other grains and vegetables, but, since vitamin B2 is also normally produced by the action of bacteria in the human colon, it would appear that there is some other factor than the mere absence of the substance from the diet. Probably maize contains a substance which prevents the absorption of the vitamin from the colon.

In pellagra there is wasting, soreness of the mouth, diarrhœa, skin rashes on the hands, forearms, face, and neck. In severe cases insanity may occur. The disease does not occur in this country in its full-blown form, but minor degrees may develop with the use of certain antibiotics, such as chloramphenicol and aureomycin, which kill the "good" vitamin-producing bacteria in the intestine as well as the disease-producing ones.

Vitamins.

Whereas vitamins B and C are found mainly in vegetables and fruits, vitamins A and D are found in oils and fats. Vitamin A is, indeed, found in the form of carotene in all green vegetables, but it is not much use to us until it has become concentrated in the fat and milk of the animals who eat the vegetables. Lack of the vitamin leads to *night-blindness*, to difficulty in seeing in the dusk. This is because the retina, the "mirror" at the back of the eye, requires adequate amounts of a substance known as visual purple for its full efficiency, and visual purple is manufactured from vitamin A. (It must be noted, however, that not all cases of night-blindness are due to lack of vitamin A—there is often a very large neurotic element, and it was frequently found during the War that men who on this account pleaded their inability to carry out sentry duties at night might show a very considerable talent for seeing their girl-friend at the camp gate even in pitch darkness.) Vitamin A is also connected with the health of the skin and the ability of the body to resist diseases of the respiratory tract, such as bronchitis. Like vitamin D, it is most easily obtained from fish oils, such as halibut-liver oil.

Lesser-known vitamins are vitamins E and K. The former, found in wheat-germ oil, influences fertility, the latter influences the clotting power of the blood and the healing of wounds. Most vitamins can now be produced in the laboratory synthetically, in the case of vitamin B1 from coal-tar.

It is important to realise that vitamins, although necessary to health, are not cure-alls. There are few sights more ridiculous than the fad of over-fed individuals taking vitamin pills as a tonic to keep themselves up to scratch. Any vitamins taken in excess of requirements may either cause damage—as in the case of vitamin D—or else are simply excreted from the body. Extra vitamins are not a tonic, those who take them in excess are simply wasting their money, and if one eats a good mixed diet they are totally unnecessary.

GLANDULAR DISEASES.

The Endocrine Glands.

The workings of the body are regulated in all sorts of different ways—by the nervous system, the circulation, and by the endocrine glands or ductless glands, as they are sometimes called. We have already seen that there are glands, such as the liver (the largest gland in the body) and the pancreas, which manufacture substances and pass them through a duct or tube to their destination. But the ductless glands, as their name implies, have no duct and pass their secretion directly into the blood, the pancreas, for example, discharges the pancreatic fluid down a duct, but it also produces insulin, which is secreted directly into the blood. It is thus partly an endocrine gland and partly an ordinary one. The other endocrine glands are particularly important in that they produce hormones (the word means "chemical messenger"), which have a great deal to do with personality and health.

Myxœdema, we saw, is due to lack of thyroid hormone either because the gland, which is situated at the base of the neck astride the windpipe, has failed or because it has insufficient iodine to manufacture its product. The opposite effect occurs when the gland becomes overactive, and then we get a quite different state of affairs: instead of being dull, slow-witted, and flabby-looking, the patient with an overactive gland—*exophthalmic goitre* or *thyrotoxicosis* is excitable, nervous, flushed, and thin. The eyes become prominent and bulge forward, giving a staring,

scared look. The disease is commonest in young adults, mostly women, and there can be little doubt that what usually sets it off is an emotional shock. Thyrotoxicosis is not primarily a disorder of the thyroid gland, and it is believed that the sequence of events is: emotional shock, which influences the nerves supplying the pituitary gland at the base of the brain, overactivity of the pituitary with overproduction of the hormones, which in turn affect the thyroid. (The pituitary is the main endocrine gland in the body and gives off hormones which control all the other glands—it has been called the "conductor of the endocrine orchestra") All the body processes the basal metabolism—are speeded up in this disease, which, however, cannot be treated at its roots in the pituitary. Sometimes it can be treated medically by the drug thiouracil, which damps down the activity of the thyroid, but more usually an operation is necessary to remove part of the gland. It is also possible in suitable cases to give the patient radioactive iodine—a radioisotope which is carried, as all iodine is, to the gland, where it destroys some of the overactive tissues. The results of these procedures are good, but any exophthalmos, the prominence of the eyes, which may be present always remains.

A similar condition, appearing in middle age, may result, not from shock or from an overall enlargement of the gland, but from a *toxic adenoma*, which is a simple, non-malignant tumour. In this case exopthalmos does not occur, but the tumour should be removed.

The Parathyroid Glands.

We have already discussed the importance of calcium in the body and seen how vitamin D is necessary for its utilisation. But the calcium content of the body is controlled by another factor, the parathyroid glands—two pairs of small glands lying behind the thyroid. Now, calcium, in addition to building the hard structure of bones, has another function in that it acts as a kind of sedative, damping down the nerves and preventing overexcitability. When the parathyroid glands do not work properly, or when they have been partially removed during a thyroid operation, *tetany* (not to be confused with tetanus) arises. The hands and feet go into spasm and there may be generalised convulsions. Tetany can be produced in a number of other ways which influence the amount of calcium in the blood: for example, alkalosis when people have taken too much alkali for stomach disease, or when they have lost acid through persistent vomiting, or even by overbreathing—*i.e.*, persistent deep and rapid breathing, which causes the body to lose carbon dioxide—a condition which may occur in hysterical or neurotic patients. The treatment is to give large amounts of calcium and vitamin D.

Overactivity of the parathyroid glands, usually due to a tumour, causes the reverse effects. The blood calcium is high, but this calcium has been withdrawn from the bones, and a disease known as *generalised osteitis fibrosa* arises, in which the bones become soft and there is pain, fractures, and deformities. Sometimes cysts form in the bones. The treatment is operative removal of the tumour.

Salt is very important in the running of our bodies. Indeed, our blood has been described as an "inner sea", for, whereas primitive creatures in the ocean, such as sea-anemones and sponges, get their sustenance from the sea surrounding them and do not need a blood-stream within, in the course of evolution the situation gradually changed. As sea-animals grew bigger, the water outside did not suffice, and they had to develop some sort of circulation within, even more so, when they developed into land animals they had to carry their sea about with them. Loss of the salt in this inner ocean is occurring all the time, both through the urine and through sweating. Workers who do heavy jobs in a hot atmosphere lose a great deal of salt through sweating, and if afterwards they drink a great deal of water the remaining salt in the body becomes even more diluted, with the result that they will get painful cramps. Similarly, diarrhœa or prolonged vomiting can bring about the same result through loss of salt from the body. After long periods of exercise it is much more refreshing to take water with added salt than to take pure water, which will increase rather than diminish our fatigue.

Suprarenal Glands.

A glandular disease which influences the balance of salt in the body is *Addison's disease*, named after the famous English physician who first described it. This disease is characterised by great weakness of the muscles, tiredness, loss of weight, low blood-pressure, and a brown pigmentation of the skin. Until recently it was always fatal. Addison's disease is caused by damage to the suprarenal glands, two small glands which sit one on top of each kidney like little cocked hats. These glands produce a number of hormones, one of which controls the excretion of salt from the body; if it is lacking, too much salt escapes, with the results described above. The disease is now treatable by the use of cortisone, one of the suprarenal hormones.

These glands consist of an inner part or medulla which secretes a hormone known as adrenalin—the substance which, when released into the blood, prepares us for states of emergency. It reinforces states of anger or fear, and aids in the process of fighting back or running away. The cortex (the word means "bark of a tree"), on the other hand, secretes a number of hormones, one of which, as we have seen, is connected with the salt content of the body and another which plays some part in sexual development. Thus a tumour of this area may bring about a state of *hyperadrenia*, in which excessive secretion leads to premature or excessive development of masculine sexual traits. Boys show precocious sexual development, their voice breaks, and their muscular development increases. Girls assume male characteristics. This is known as the *adreno-genital syndrome*.

The Pituitary Gland.

The pituitary gland, lying at the base of the brain, is only about the size of a small cherry, yet it not only regulates the behaviour of all the other glands but is responsible for sexual development and growth. It consists of two parts, the anterior (which does all the interesting things), and the posterior, which secretes a hormone known as pituitrin, thus raising the blood-pressure and causing the muscle of the uterus to contract. Many conditions are described in which the anterior part of the gland either produces too much or too little of its hormones. For example when this part overacts in early life the result is a giant—*i.e.*, anyone over 6 ft 8 in. In later life, when the bones are set, the result of overaction is *acromegaly*, in which the face is elongated, the hands are relatively huge, as also are the feet. The head, too, is large, and the patient gives a somewhat gorilla-like impression.

When the anterior part of the pituitary underacts there are many unpleasant possibilities: the individual may develop into a fat boy, like the one in *Pickwick Papers*, sleepy, greedy, and monstrously fat, or into a human skeleton who appears to have hardly any flesh at all, or there may develop painful masses of fat in the wrong places, a condition described as *adiposis dolorosa*, or again, dwarfism may result and the individual retain the appearance and size of a child with normal adult mentality. These conditions are known by the various names of *Frölich's syndrome* in the fat-boy type, *Simmond's disease* in the human skeleton, *Dercum's disease* in the case of adiposis dolorosa, and *Lorrain's disease* in the case of dwarfism.

The Sex Glands.

In women these are the ovaries, and in man the testes. The ovaries produce two hormones, one of which, œstrin, brings about, under the influence of the pituitary, the normal sex changes at puberty, controls the release of the ovum from the ovary, and, in animals, produces sexual excitement. The other, also controlled by the pituitary, is progesterone, which in general has a sedative

effect: it prepares the uterus for pregnancy, and, when a pregnancy exists, maintains it.

The internal secretion of the male sex glands is testesterone, and it, like œstrin, produces the sex changes at puberty. The problems of sex, however, will be discussed later.

DISEASES OF THE URINARY SYSTEM.

Everyone knows what kidneys look like—in fact, the term "kidney-shaped" is used to describe other objects. Within the kidneys the blood-vessels carrying waste materials subdivide and finally end up in little coils or glomeruli through which waste products are filtered into the other system, the system of tubes which, beginning as tiny cups around the glomeruli, become larger and larger until they join the ureter passing out at the root of the kidney, the hilum, a point at which both the veins and tubes enter and leave. The kidneys, of course, lie one on each side in the loins, so that if one puts one's hands on the hips and then slides them farther back they will cover the area over the left and right kidney. The ureters pass down on each side to the bladder, which is the storage tank of the products excreted by the kidneys, and lies in the mid-line low down in the abdomen, it is somewhat pear-shaped, and at its base in men there lies the prostate gland—a gland which apparently has few functions but can be a nuisance. Its only known function is that it adds something to the semen from the testes without which the semen would be sterile. Then, from the base of the bladder a single tube, the urethra, passes to the outside One can, in fact, visualise the urinary system as a capital Y, in which the two upper limbs are the ureters, the place where they meet is the bladder, and the single limb at the foot is the urethra. Clearly, then, there may be diseases of the kidneys, of the ureters, of the bladder, of the prostate gland, or of the urethra.

The amount of urine may be increased or diminished. It is *increased* in the following conditions: after drinking excess of fluids, after taking drugs (known as *diuretics*) which are given to increase the flow, in diabetes of both types—mellitus and insipidus, in some types of chronic kidney disease, and finally, in emotional states of excitement. It is *decreased* in the following conditions acute nephritis, any disease in which fluid is being lost in other ways, such as diarrhœa or sweating in fevers, when the fluid intake is small, and when both ureters are blocked by stones. Passing a great deal of urine is known as *polyuria*, passing very little as *oliguria*, passing frequent small amounts is simply called *frequency*. Normally, the urine is acid, but in infections of the bladder it may become alkaline owing to decomposition by bacteria. Abnormal substances, or normal substances in abnormal quantities, may occur in the urine and give the doctor an indication of what is wrong. In fact, urine analysis is a very important part of medical diagnosis. Thus urea is a normal content of urine which is increased in fevers, wasting diseases, or diabetes, the amount of urea is to some extent a measure of the degree of tissue breakdown Uric acid is found in small quantities in normal urine, but the amount is increased in fevers and after an attack of gout (uric acid plays some part in the causation of gout, but has nothing at all to do with rheumatism in general, so one may disregard the advertisements in the popular Press showing unpleasant pictures of joints with sharp crystals of uric acid which are alleged to cause the pain of rheumatic disease). Oxalates are not ordinarily found in urine, but, since they occur in such foods as rhubarb and strawberries, and some people are unable to deal with them, such individuals may develop stones or have pain on passing urine after eating oxalate-containing fruits.

Two very important substances which ought not to be in normal urine are albumen and sugar Albumen is a protein, and its presence in the urine indicates that the filters of the kidney are leaking—they are allowing protein to pass out which ought to remain in the body. Albumen is easily tested for, and its presence may indicate kidney disease or nephritis as it is usually called by doctors. On the other hand, small amounts of albumen occur in fevers and in nervous conditions—*functional albuminuria*. Sugar, too, should not be present, but its presence does not necessarily indicate diabetes; for small amounts may occur in nervous conditions or in some people after taking large quantities of carbohydrate.

Blood in the urine may give it an appearance which varies from bright red to a dark, smoky colour. It is found in many diseases, acute nephritis, stone, tumours, poisoning by certain drugs, infections such as bilharzia or malaria, papilloma (*i.e.*, non-malignant tumour of the bladder), after injury, in high blood-pressure, scurvy, and blood diseases. Sometimes it occurs for no known reason at all.

It will be remembered (or if it is not, you can look it up on p. 28 (1)) that streptococcal infection of the throat may cause in some people disease of the valves in the heart or endocarditis In such cases, although the germ is found in the throat, it is not found in the heart or indeed anywhere else in the body. *Acute nephritis* occurs in the same circumstances, with the sole difference that the kidneys instead of the heart are affected. The disease appears to be an allergic reaction to the toxins of the streptococcus The patient, often a child, has a sore throat (and even this may be absent or fail to be noticed) or sometimes the infection may arise in other sites after scarlet fever, erysipelas, burns, and disease of the ear A few days later there is headache, vomiting, pain in the loins, slight rise in temperature, and especially typical is *dropsy* or œdema This begins in the face, first around the eyelids, and then affects the ankles, later it may become more general and affect the rest of the body Blood and albumen are found in the urine, and the blood-pressure is slightly raised. The outlook is usually good if the kidneys are rested by reducing the amount of protein taken in and also the amounts of salt and water. When this is done, the inflammation soon goes and no permanent harm results In other cases, however, if treatment is inadequate or the condition severe, the symptoms may go, but the albumen found in the urine persists This means that permanent damage has been done, and although there may be nothing else to show for many years, *chronic nephritis* develops In this case, the blood-pressure continues to rise, and since the filters of the kidneys no longer work efficiently, urea, the principal waste-product of the body to be excreted in the urine, is retained in the blood and only small amounts escape from the system Hence chronic nephritis sooner or later leads to heart failure or hæmorrhage in the brain from the rising blood-pressure, or to the form of poisoning known as *uræmia* which results from the retention of urea in the blood. Uræmia may come on suddenly or gradually, but ends in progressive coma, drowsiness, and unconsciousness There may be convulsions similar to those of epilepsy, high fever, and difficulty in breathing to complicate the picture

Another type of nephritis which seems to have nothing at all to do with streptococcal infections, and the cause of which is completely unknown, is *nephrosis*. Developing in early adult life, its onset is insidious, and the patient first shows signs of œdema in his white and puffy face and the swelling of his legs (It should be said here that if you have swelling of the ankles or elsewhere, you would be foolish to jump to conclusions, for such swelling is common in many diseases—in heart disease, in allergic conditions, in neurotic illness, and even just from hot weather) When the urine is examined in a case of nephrosis it is found to be full of albumen and, as in chronic nephritis, the blood urea starts to rise. Ultimately, the end-results of nephrosis are the same as those of chronic nephritis, so the outlook is not good Of course, all these diseases must be treated by a doctor, but it must be realised that damage done to the kidneys is irreversible.

Pyelitis is an infection of the pelvis of the kidney, that is to say, of the part where the ureter leaves the kidney. It is usually caused by the bacillus coli, which is normally present in the body, or by the streptococcus. These germs may reach the ureter through the blood-stream or may

pass upwards from the bladder. Obstruction anywhere in the urinary tract which causes the urine to stagnate is liable to cause pyelitis. Symptoms come on suddenly, with high fever, pain in the loin (the infection is usually on one side only, and is commoner in women), and pain in the abdomen. When urine is passed there is a burning sensation, and it is passed frequently and in small amounts. On examination, the urine is found to be highly acid and full of bacillus coli or whatever the causative germ may be. Pyelitis is fairly readily treated by the antibiotics or sulpha drugs. Plenty of fluids should be given and the urine made alkaline by administration of alkalis.

Cystitis means inflammation of the bladder, either acute or chronic, and its causes are much the same as in the case of pyelitis. There is pain over the lower abdomen, frequency, and sometimes slight fever. The treatment is as for pyelitis. *Urethritis* is an inflammation of the urethra, with burning pain on passing water and frequency. The most serious cause (although it can usually be easily dealt with now) is gonorrhœa. But non-specific urethritis is common, and in this case various germs or none may bring about pain and frequency, there is often a large neurotic element. Urethritis should be regarded as probably due to gonorrhœa, which has already been discussed elsewhere, when there is a thick, creamy discharge from the penis or discharge in women following sexual intercourse with an infected person.

Kidney stones or Renal calculi sometimes form, and, as in the case of gall-stones, what causes them is not certain. They may be caused by disorders of metabolism—that is, in the inability of the body to deal with calcium, proteins, uric acid, and other products, or by vitamin deficiency, obstruction in the urinary tract, and urinary infections. But when a stone or stones are formed various events may occur: thus it may remain in the kidney and cause no symptoms, or it may cause repeated attacks of pain, infection, and blood in the urine (hæmaturia), or it may completely block the passage of urine from the kidney to such a degree that it degenerates and becomes useless, or, lastly, it may pass into the ureter, and when this occurs very severe pain, known as *renal colic*, will occur. A stone passing down the ureter into the bladder may become stuck in the urethra, although this is uncommon, since a stone small enough to get down the ureters is likely to be capable of manœuvring through the rest of the tract. In fact, about 80–90 per cent of stones are passed spontaneously. Stones not passed spontaneously may have to be removed by operation, but whether this is undertaken or not depends on various factors, such as the general health of the patient, the amount of trouble caused by the stone, and the health of the other kidney—for it is dangerous to operate on one kidney unless one is sure that the other is functioning efficiently.

If a stone blocks the passage of urine on one side for any length of time *hydronephrosis* may result, in which the part where the ureter enters the kidney swells with the retained urine. Ultimately much of the kidney may be destroyed by the back-pressure. The same effect may be produced by kinking of the ureter or anything else which causes obstruction. Sometimes children are born with hydronephrosis, and when the dilation is due to kinking of the tube the condition may be intermittent, with attacks of renal colic during which only small amounts of urine are passed, this is followed with relief and the passage of large quantities.

Tumours and Cysts. The kidney may also be the site of tumours and cysts which produce pain in the loins, sometimes a lump over the kidney which can be felt, and blood in the urine. Cancer of the bladder is a serious condition in which the bladder may have to be removed, so the urinary flow has then to be directed elsewhere. Either the ureters are brought out on to the skin surface, a procedure known as *cutaneous ureterostomy*, or they are implanted in the large bowel, so that the urine flows out with the fæces. This is described as *uretero-colostomy*.

There may also be benign tumours of the bladder or *papillomas*, which are soft and bleed easily; a great deal of blood is passed, but there is usually little or no pain. In this, and similar, diseases of the bladder examination of the inside of the organ is carried out by means of a cystoscope, a thin tube which is passed up the urethra and has a small electric light at the end which enables the surgeon to see what is going on. Instruments may also be passed through the tube, and simple papillomas can be cauterised. Similar instruments are used in the examination of the stomach (gastroscope) and the bronchial tubes (bronchoscope). When some obstruction in the outlet of the bladder or in the urethra occurs the bladder, of course, fills with urine, which cannot be passed, and very painful dilation occurs. In this case an attempt may be made to pass a catheter, a thin rubber tube, into the bladder to relieve the tension, or if this fails a *suprapubic cystomy* is performed—an incision is made in the abdomen over the bladder and a tube inserted into it, through which the urine escapes. This is ordinarily a temporary expedient, and later when the patient's health has improved an attempt will be made to remove the cause of obstruction. The most common cause of such obstruction is *enlargement of the prostate gland* at the base of the bladder, which surrounds this area and the beginning of the ureter. About 40 per cent of men over sixty have some degree of obstruction due to this cause, and about 20 per cent of these require operation. The gland is about the size of a walnut, and, as we have seen, its function is to supply part of the fluid which makes up the semen, the male sex secretion. Enlargement of the prostate may be benign or malignant, and, although nobody knows just why, such benign enlargement tends to occur in most men in later life. There may be no symptoms, but characteristically there is frequency during the day and the need to get up at night to pass water. The flow of urine being impeded by constriction of the urethra, the passage is less forceful than normal, and there is a tendency for dribbling to occur. If the obstruction is severe and not relieved the back-pressure may be transmitted to the ureters and kidneys, resulting finally in kidney failure and uræmia. The prostate, except in cases of very mild enlargement, has to be removed either through the abdomen or through the perineum (the part of the body lying between the sex organs and the anus). Sometimes, in less serious cases, it is possible without an incision to cut away the obstructing part by an electrocautery inserted, as is a cystoscope, through the urethra. Prostatectomy was once a serious operation, all the more so because the patient was usually elderly and not in good condition, but new techniques and the use of antibiotics have greatly improved the outlook.

Cancer of the Prostate is always serious, but if discovered in time it can be operated on successfully. The gland, of course, has to be completely removed. In inoperable cases, or in patients unfit to stand operation, the tumour may be treated by means of female sex hormones, which cause it to shrink and may prolong life by some years.

DISEASES OF THE NERVOUS SYSTEM.

The brain and nervous system are like a telephone exchange which sends out and receives messages from the rest of the body. Essentially it consists of two levels, the lower centres, where primitive emotions are felt, the viscera controlled, and simple actions initiated, and the true brain, which holds the lower centres under control. When, for example, one is pricked with a pin, a message is passed up the nerves (the sensory nerves or nerves of feeling) through the spinal cord to the lower centres, which return a message through the motor nerves (the nerves dealing with movement), causing the hand to jerk away. All this takes place without any conscious interference, and can, in fact, happen even when the true brain has been removed. It is, of course, possible for the movement which jerks the hand away to be inhibited, because in this case the brain intervenes, all mental life is a constant interaction between the lower and higher centres

When we become angry, for instance, the anger originates in the lower centres, but may be inhibited by the higher ones. To some extent, the former correspond to what a psychologist would describe as the unconscious mind, the latter to the conscious mind.

The nervous system is made up of nerve cells which are smaller than the head of a pin but end in a long, thin fibre, which may be several feet long. These fibres form the nerves of the body, and they end in the motor nerves, which bring about muscular movement, or in the skin, where there are separate nerve-endings dealing with pressure, heat, cold, pain, and so on. It used to be supposed that there were areas in the brain dealing with such mental faculties as acquisitiveness, conscientiousness, and other abilities, but this is known to be quite untrue There are, indeed, areas dealing with movement, sight, hearing, speech, feeling, and thought, but certainly none dealing specifically with the more complex mental faculties. Nor is it correct to suppose that each nerve cell carries some particular thought or feeling, for it appears that thinking and feeling are represented by nervous circuits in the brain and are not isolated in any special area Thus large parts of the brain can be removed without interfering with mental activity

The most primitive part of the nervous system is the autonomic nervous system, which has its "brain" in the hypothalamus at the base of the true brain. It is divided into two parts the sympathetic nervous system, which supplies the viscera with impulses which prepare the body for flight or fight (causing the heart to beat faster, the muscles to become congested with blood, the skin to become pale, and the blood-sugar to rise whilst the intestines become less active), and the parasympathetic nervous system, which, in general, produces relaxation. When the parasympathetic system acts, the heart beats more slowly, the skin becomes flushed, the intestines digest food, and the body is prepared for rest Since, as we have seen, the lower centres are the centres controlling both emotion and the internal organs, it is clear that emotional states will influence the action of the body This is the basis of psychosomatic medicine.

The brain and the spinal cord, which passes down the bony canal within the spine, are covered with the thin layer of tissue known as the meninges and surrounded with cerebro-spinal fluid, which is also found in the cavities of the brain known as ventricles. A specimen of cerebro-spinal fluid, or C S.F., may be removed by pushing a hollow needle between the vertebræ in the lumbar region, and such specimens can give a great deal of information about what is going on in the nervous system.

The diseases of the nervous system can be divided into various groups. there are those due to injuries, such as fractures of the skull or divided nerves, the infectious diseases, most of which have been discussed already, the diseases due to hæmorrhage or embolism; tumours, and, perhaps the biggest group, the degenerative diseases

The blood-vessels of the brain are one of the common sites of *aneurisms*, bulges like small berries, often at the base of the brain, caused by weakness of the vessel wall This is sometimes the result of arteriosclerosis, syphilitic infection, or injury, but perhaps most often the aneurisms are congenital—*i e*, the individual is born with them. There are usually no symptoms, although if the aneurism is large enough it may press upon other structures and cause symptoms recognisable by the specialist. In most cases the diagnosis is apparent only when the aneurism, as may occur, ruptures When this happens the symptoms are those of brain hæmorrhage. There is severe headache, vomiting, and loss of consciousness, the patient breathes heavily, and when the doctor does a lumbar puncture the C.S F. is stained with blood. Such an event is very serious, and ordinarily all that can be done is to rest the patient; nevertheless, over 60 per cent. of cases are fatal.

When, in the few cases in which symptoms occur *before* hæmorrhage, the presence of an aneurism is suspected, this may be confirmed by X-ray. Since soft tissues are not seen in X-ray pictures, it is necessary (for example in the gall-bladder, the kidneys, the bronchi, or the blood-vessels of the brain) to inject some radio-opaque substance which outlines them. In the brain this is known as arteriography, and when by this means aneurisms or other abnormalities are found surgery is sometimes possible. Hæmorrhage into the brain substance produces what is generally known as a *stroke* The artery affected is usually the middle cerebral, when in later adult life it has been strained and weakened by high blood-pressure or arteroselerosis. It can, however, be caused by bleeding into a tumour, or in children by birth injuries Hæmorrhages may also result in the small veins from the strain of coughing in whooping cough.

A stroke comes on suddenly, and the patient is flushed with a bluish tinge. He breathes heavily and, as he breathes, the cheek on the affected side may be blown in and out. Since the left side of the brain supplies the right side of the body, and *vice versa*, the side of the body on the opposite side from the hæmorrhage is paralysed. The limbs and face right down the affected area are flaccid and useless, but if the patient survives they will at a later stage become spastic. There are, therefore, two types of paralysis: flaccid and spastic. In the first, the limb is incapable of movement, and when lifted it falls back like a dead weight, there are no reflexes, so that when the knee-cap is tapped to elicit the knee-jerk there is no response Flaccid paralysis is typical of injury to the lower parts of the nervous system, and it means that no impulses are getting through Spastic paralysis, on the contrary, is characterised by rigidity of the limb, overactive reflexes, and even when movement is possible it is out of control This, in fact, is what has occurred, for spastic paralysis indicates that, although the lower nerves are undamaged, the controlling centre in the brain has been affected.

If the patient survives, there may be varying degrees of improvement in the paralysis, which is always at its greatest in the beginning.

When such an emergency occurs it is best to leave the patient where he is, keep him warm, take out his dentures if any, call the doctor, and on no account to give him any fluids or alcohol No patient in coma should ever have fluids poured down his throat Other causes of coma are diabetes, alcohol, uræmia, acute hypertensive (high blood-pressure) attacks, and thrombosis or embolism

In thrombosis and embolism a similar picture to that of hæmorrhage occurs Embolism comes on suddenly like a hæmorrhage, but in thrombosis or clotting the onset may be more gradual, with premonitory symptoms of headache, giddiness, and numbness or pins and needles in the limbs There may be difficulty in speaking

Tumours and Abscesses The brain is soft, greyish white in colour, and from the upper surface closely resembles a huge walnut in that it has two sides joined across the middle by a smaller part known, in the brain, as the corpus callosum It resembles a walnut, too, in that its surface is crumpled up into convolutions Investigation of the brain has become more and more refined in recent years, the following being some of the techniques employed:

(1) Straight X-rays

(2) Arteriograms, which have already been described

(3) Encephalograms or ventriculograms, in which some of the fluid, the C S F surrounding the brain or in the cavities known as ventricles within the brain substance, is removed and replaced by gas. The gas may be helium or oxygen, and it has the effect in an X-ray picture of outlining the brain and ventricles so that any distortion of shape due to a tumour or abscess is outlined.

(4) Electroencephalograms are pictures made of the electrical brain waves produced by the brain, just as the electrocardiograph takes pictures of the similar waves produced by the heart Electrodes attached to the scalp may show abnormal waves over the site of a tumour or abscess.

(5) Still more recently, radioisotopes have been used to locate tumours, since radio-

active substances become concentrated in the area of the abnormal tissues.

The main symptoms of brain tumour are severe headache, vomiting, and disturbances of vision, such symptoms must be referred to a doctor at once. The pulse-rate is usually slow. All these symptoms are caused by increasing pressure within the brain because of the space taken up by the tumour

The popular belief that a brain tumour is tantamount to a death warrant is simply untrue, for at least 80–90 per cent of cases recover. The main types of tumour are meningiomas (*i e*, tumours of the brain coverings or meninges), tumours of the nerve fibres within the brain or neurofibromas, tumours of the pituitary gland, and gliomas, which are tumours of the brain substance The outlook for all of these is good, except in the case of the glioma, which is a type of tumour which tends to infiltrate into the substance of the brain fairly rapidly. It is not localised, and therefore complete removal is not always possible.

Brain abscesses may be spread from the blood-stream in people with bronchiectasis, osteomyelitis, infected sinuses, or chronic ear disease The symptoms are similar to those of tumour, but there is also fever and drowsiness

Aphasia is a disturbance of the ability to speak, write, or to understand spoken or written words It is usually due to a tumour, abscess, thrombosis, or embolism of the speech area in the brain In motor aphasia the muscles of speech are normal, but the patient is unable to speak intelligibly In nominal aphasia the patient cannot name objects, which he nevertheless is able to recognise In agraphia the patient cannot write, although his muscles are normal In word-blindness and word-deafness the patient cannot understand written or spoken words respectively Treatment depends upon the cause, but in hopeful cases re-education is sometimes possible

Headaches This seems a convenient point to say something about headache, which must surely be one of the commonest symptoms suffered by the human race We shall begin by noting that at least 90 per cent of all headaches are nervous in origin or the result of such other minor troubles as gastric upset It is doubtful whether headache is as frequently brought about by eye-strain as is often supposed, but there is certainly no harm in having one's eyes tested if frequent headaches are present

A doctor will first try to distinguish between headaches due to mental causes and those due to organic or physical ones When the cause is physical the headache is often very severe, usually located sharply in one area (for example, on one side of the head), and it is likely to be accompanied by other symptoms, such as vomiting and eye-disturbances The person with this type of pain often tries to minimise the pain he suffers, but his behaviour—for example, his obvious fear of moving his head—belies him The neurotic person, on the other hand, suffers from headaches which are "terrible," "awful," "unbearable," vague in their location (they are "all over"), and, if they are accompanied by other nervous symptoms, the diagnosis is clear Apart from the neurotic type, headaches are caused by migraine, increased pressure within the skull, as in brain tumour or abscess, sinus disease, and eye diseases Treatment obviously depends on the cause, and the sensible thing to do is to go to a doctor, believe what he says, and take his advice Neurotic headaches may be dealt with by investigation of the sources of worry, frustration, and so on which cause the pain, or by taking aspirin or other pain-relieving drugs. (Pain, in fact, is one of the very few things aspirin is good for, and as has already been said elsewhere, those who believe that it is good for "nerves," insomnia, and all the various conditions which make aspirin an almost universal cure in the minds of many, are deluding themselves)

Migraine is a disorder which many claim to possess and not so many really do, if all the people who claim this dubious honour—often those who have little better to do than be bored with themselves—if all these were put end to end, or even stood upright in a line, they would surely encircle the Earth True migraine, however, is a very clear-cut disease, and happens in a very definite type of person. The owner of the migraine tends to be a highly intelligent and conscientious—even over-conscientious—individual (not at all like Mrs Jones, who says she suffers from it and could by no stretch of the imagination be described either as intelligent or over-conscientious) The headaches are severe, usually on one side of the head only, occur in periodic attacks, and are not, like the headaches suffered by Mrs. Jones, "there all the time" Vision is affected so that there may be hemianopia (*i e.*, half-vision), flashes of light before the eyes, and the so-called fortification spectra (*i e*, zig-zag patterns in the field of vision). The pain is often prostrating, and is usually followed by attacks of vomiting. Migraine is a mystery disease which apparently has something to do with the personality, with emotional stresses, and conceivably in some cases with allergy, the actual pain appears to be caused by spasm of the blood-vessels in the brain The usual treatment is with tablets of ergotamine (Femergin), but other remedies are also helpful in different cases

There are a number of other nervous diseases the cause of which remains a mystery, and of these we shall mention epilepsy, chorea, and pink disease

Epilepsy is a disease which has troubled many famous men—it has been attributed to St Paul, Julius Cæsar, Napoleon, and (with more justice, perhaps) to Dostoevsky Epilepsy manifests itself in various ways, the common type being *grand mal* seizures, in which the patient falls down unconscious, his muscles become tense, his jaw clenched so that he is in danger of biting his tongue, and his body is rigid all over This is known as the tonic phase, and it is followed by the clonic phase, when, within a minute or so, the limbs begin to contract rhythmically As this phase passes away the patient lies limp and gradually recovers consciousness Often he does not know what has happened Sometimes he is confused, forgets where he is, and wanders away in an attack of loss of memory (amnesia or epileptic fugue) In *petit mal*—the name means the little sickness—the attack may be hardly noticeable The patient is perhaps talking or doing something, when without any warning he simply stops, looks dazed or confused for a brief period, and then carries on again Occasionally there may be localised twitchings of the arm or leg. In temporal epilepsy, in which the condition arises in the lobe under the temples, there is no obvious interruption of consciousness, but the patient suddenly stops what he is doing and proceeds to do something else. For example, a man whilst at work may stop what he is doing and for no apparent reason at all proceed to go through his pocket-book, examining its contents with great care, and then puts it back in his pocket without afterwards knowing what he has done Rarely, criminal acts may be carried out whilst the individual is in this state

Epilepsy tends to run in families, and it varies greatly in severity from the case where an isolated fit occurs once in a lifetime to the case where fits are frequent and violent, and there may finally be some degree of mental deterioration Some cases, although not many, pass into a state in which one fit succeeds another until death results. This is known as status epilepticus Fits may have many causes hypoglycaemia (*i e*, lack of sugar in the blood produced by an overdose of insulin), lack of oxygen, uraemia, injury to the brain from an accident, brain tumours, and meningitis But true epilepsy shows no such antecedents—it just happens, and although it is apparently the result of something wrong with the chemistry of the brain, what this something is, is not known

It is important not to jump to the conclusion that because someone has a fit they therefore have epilepsy, and all such cases should be carefully investigated Children, in particular, may have convulsions during a fever when the temperature is high without necessarily having epilepsy. The treatment of idiopathic epilepsy, that is, the type due to no known primary cause, is to give sedatives which damp down the brain activity. In former

times bromides were used for this, and later phenobarbitone, which, indeed, is still used, but more recently the tendency has been to use such drugs as Epanutin with or without phenobarbitone, as this drug makes the patient less drowsy and is, in some cases, more effective.

Epileptics often find it difficult to get work because of the reluctance of employers to take on someone who may be more prone to accidents and whose fits may distress other workers. Obviously there are some jobs which epileptics should not do because of the danger involved, and they should not drive a car, a few cases are so severe that work is almost impossible. But employers have a duty, whenever possible, to employ these people, whose mental health may suffer greatly if they are made to feel outcasts and who ordinarily are as efficient, or even more so, as the next man. If some of the famous men who have suffered from this disease had had to rely on the charity of some employers today the world would have been much the poorer, although possibly we could have managed without the generals.

Chorea, or St. Vitus' Dance, is connected in some way with rheumatism, especially with rheumatic fever. It is much less common than formerly, and is also known as Sydenham's chorea, after the English physician who first described it and to distinguish it from Huntington's chorea, a serious hereditary and incurable degenerative disease which leads to progressive mental deterioration. Fortunately, Huntington's chorea is rather rare. The patient with Sydenham's chorea is a child, most often a girl, and one who has been rather delicate and nervous. She shows an inability to keep still and makes purposeless movements, such as writhing and twitching of the limbs and grimaces of the face. The speech may be affected, and the muscular inco-ordination may be so pronounced that dishes or other objects fall from the hands when lifted. The treatment for chorea is that for acute rheumatism with the addition of sedatives. The heart may be affected.

Pink Disease is a disease of young children between the ages of six months and three years. Why it should be included here is not certain, for its cause is unknown, and the theories to explain its origin range from the supposition that it is a vitamin-deficiency disorder, an infection, or the result of poisoning by mercury in teething powders, to the more probable theory that it is a vasomotor disorder like chilblains brought about by the nerves which control the diameter of the arteries. (Here it should be said that "teething powders," whether or not they play any part in causing this disease, should never be used, anyhow, since in the first place—doubtless to the great indignation of mothers who, of course, always know best—one must say that it is extremely uncertain whether the many disturbances allegedly due to teething have anything to do with teeth at all, and secondly, that whether or not teething causes anything, it is certain that the numerous powders available in the shops can do nothing about it.) Pink disease was first described in Australia in 1914, and the general picture is that of a child in acute misery with itching or burning of the hands and feet, which are swollen and pink in appearance. Sometimes the face, ears, and nose are affected, there is loss of appetite, sweating, insomnia, and thirst. The treatment of the condition, which may last many months but with an ultimately good outlook, is injection of the B vitamins, especially B12, rest, and sedatives.

Angio-neurotic œdema. Another mysterious disease, common to both children and adults, and mentioned here because it, too, seems to be caused by malfunctioning of the nerves controlling the blood-vessels, is angio-neurotic œdema in which attacks of œdema (swelling) occur in various parts of the body, but are most apparent in the face. Undoubtedly allergy to various foodstuffs can play some part, but emotional factors are at least equally important. Very frequently, without any warning at all—but often after an emotional outburst—the face within a short time swells so that the patient is almost literally unrecognisable. Sometimes the swelling is so severe that breathing is endangered by œdema of the glottis, the entry to the windpipe. An immediate injection of adrenalin usually starts to clear up the condition, and for later use the antihistamine drugs have proved helpful.

THE DEGENERATIVE DISEASES.

There are very many conditions coming into this category, and they are given different names according to the parts of the nervous system affected. However, they all have this in common, that they are the result of a degeneration of groups of nerve cells, usually for no known reason, and, since nerve cells once destroyed can never regenerate, the diseases are usually irreversible and progressive. In a few cases, however, they can be arrested.

It would be impossible to deal even briefly with all these diseases, so here only a few of the more common ones will be discussed. The ones we shall mention are muscular atrophy, amyotrophic lateral sclerosis, disseminated sclerosis, syringomyelia, and subacute combined degeneration.

Muscular atrophy is, in fact, a whole group of diseases in which there is some damage to the lower parts of the nervous system, usually in the nerve cells at the point where they leave the spinal cord. The common type, *progressive muscular atrophy*, occurs in middle age or over, and the patient begins to note wasting of the muscles in first one hand and then the other. Ultimately, the hand becomes claw-shaped, and some wasting may spread up the forearm. It may finally spread up to the base of the brain, with fatal results. There is no known cure. In children a similar condition is *peroneal muscular atrophy*, in which degeneration of the nerve cells in the spinal cord leads to wasting both of the hands and legs. In this case, however, the disease may stop of itself after several years.

Amyotrophic lateral sclerosis affects both the lower and higher nerve cells. There is wasting of the hands and arms, with increasing weakness, and the legs show a spastic type of paralysis, *i.e.*, they do not waste, but the muscles are in varying degrees of spasm and the knee-jerk and other reflexes are increased. The disease has been treated with concentrated vitamin E, but the results are uncertain. It should be noted that to say that a disease is incurable is not at all the same thing as saying that the patient is going to die from it. Some of these diseases progress very slowly, or may stop of themselves, and any disease process tends to go slower as one gets older. For example, many old people with cancer die of old age long before they are in danger of dying from the disease.

Disseminated sclerosis—sclerosis means hardening of the affected parts of the nervous system—is a progressive condition which goes on with periodic intermissions of improvement. Often the first symptom is double vision or sudden weakness in a limb, but the later symptoms are largely those resulting from loss of muscular co-ordination, thus, when the patient is asked to shut the eyes, stretch out the arm at right-angles to the body and then touch the tip of his nose, he manages the first part of the movement fairly adequately, but as the finger nears the nose it starts to wobble and fails to reach its goal. There is thus some loss of sense of position and difficulty in carrying out such actions as drinking tea from a cup. Another typical symptom is nystagmus, in which, when he is asked to look to one side, the patient's eyes jerk back and forth (this condition is, of course, also a feature of so-called "miner's nystagmus," which appears to have a large psychological element and certainly has nothing to do with disseminated sclerosis). In later stages the spinal cord becomes affected and there are varying degrees of paralysis in the lower half of the body so that the legs are useless and there is loss of control of bladder and bowels. Thus, although disseminated sclerosis is not by itself a fatal disease, it does result in the long run in the patient becoming increasingly bed-ridden. Ex-

amination of the nervous system reveals that the covering of the nerve fibres—which have a sort of insulating layer much the same as in the case of electric wires—has been damaged and the underlying fibres have degenerated themselves. Where this damage occurs, and this appears to be completely fortuitous, determines the nature of the symptoms and where they occur. Many treatments have been tried, but their number only emphasises how little we know. The disease may be the result of inborn weakness in the fibres, of allergy, or of a virus infection with a so far undiscovered virus, but since it occurs in young adults in the prime of their life it is a particularly tragic disorder. Strangely enough, it is confined almost entirely to Europeans, and is rare elsewhere in the world.

Syringomyelia, another degenerative disease, is caused by the formation of small cavities in the upper parts of the spinal cord in the neck and chest regions. These cavities become surrounded with scar tissue, and hence interfere with nerve impulses passing down the areas where they occur. The patient may be any age between ten and thirty, and suffers from both sensory and motor symptoms. There is wasting of the muscles of the hand, and sometimes of the arm and shoulder, and specially typical is loss of the sense of pain with retention of the sense of touch. Because of this, the patient may burn or cut his fingers without noticing anything. The disease is slowly progressive over a long period of time, and there is no known effective treatment.

One of the few degenerative diseases which can be treated is *subacute combined degeneration*, which is invariably associated with pernicious anæmia. A middle-aged patient notices numbness, pins and needles, and so-called lightning pains in the fingers and toes and later in the limbs. The muscles are weak, and the tongue is smooth and glossy. On examination, the symptoms of pernicious anæmia are found. Treatment for the anæmia puts a stop to the disease, although damage already done may remain.

INFLAMMATORY DISEASES.

These are those, such as shingles or neuritis, which may be due, as is shingles, to virus infection, or to various causes, as is neuritis. The virus causing *shingles* is apparently the same as that causing chickenpox. Shingles, or to give it its proper title *herpes zoster* (it must not be confused with *herpes labialis* or cold sore of the lips, with which it has no connection whatever), shows itself in the form of a band of pain surrounding the upper abdomen or chest, which is then followed by an eruption with blisters in the affected area. There is no specific treatment, aspirin may be given for the pain and the eruption painted with collodion or "New Skin." Ordinarily the condition clears up fairly quickly, but the pain may persist for a long time. Injections of vitamin B12 are sometimes helpful.

The word "neuritis," meaning inflammation of a nerve, covers many different types of illness: polyneuritis, simple neuritis, neuralgia, sciatica, prolapsed vertebral disc, and other conditions. All they have in common is nerve pain, for, as in the case of "colds," one cannot assume that because a condition has one name it represents one disease or has even one cause.

Multiple, peripheral, or polyneuritis is, as the name indicates, a condition in which numerous of the peripheral nerves, mainly in the limbs, are affected. The symptoms will vary according to whether motor or sensory nerves are attacked. The causes are various: poisons, such as lead, arsenic, or alcohol; bacterial poisons, such as those of diphtheria, typhoid, or gonorrhœa, vitamin deficiencies, as in beri-beri; and, finally, diseases of metabolism, such as diabetes. Rarely, an infection known as acute infective polyneuritis causes the symptoms. The parts affected depend to some extent on the cause. Thus alcohol brings about, when taken in excess, pain in the calves and foot-drop (*i.e.*, the foot hangs down and cannot be raised to its normal position), neuritis due to diabetes and arsenic shows similar symptoms, whereas in lead poisoning not only the foot but also the wrist may be affected. Diphtheria tends to attack the palate and the eyes, causing difficulty in swallowing and in vision.

The ordinary type of neuritis, however, is localised—and here it should be said that many pains described as neuritic are nothing of the sort, being probably caused by fibrositis or muscle and joint disorders. Typical of localised neuritis is *Bell's palsy*, neuritis of the facial nerve, in which one side of the face is paralysed so that the eye on the affected side will not shut, and the mouth droops down. Asked to whistle or blow out his cheeks, the patient with facial paralysis is unable to do so. The usual cause of Bell's palsy is cold—for example, it is common to find that the patient has been driving with the car window open in cold weather. But facial paralysis may also be caused by infection in the middle ear. Most cases clear up in a fairly short time, but in a few instances the palsy is permanent. There is very little evidence that the treatments usually employed, such as electrical stimulation, have any effect, but injections of concentrated vitamins B may be useful.

Other familiar types of neuritis are *sciatica* and neuritis in the arm. They can be caused by fractures, or pressure from tumours, or the callus (excess bone) in badly healed fractures, cold, too, is said to be a factor, and then there is always "idiopathic neuritis"—which, in everyday language, means that one does not know the cause. Most cases, regrettably, are idiopathic. In sciatica, we have a condition which is not a disease but rather a symptom. The familiar pain down the back of the leg may be caused by alcohol, rheumatism, diabetes, tumour, fibrositis, "slipped disc," arthritis of the hip joint, infection from local areas in the body, such as tonsillitis, and so on. Treatment depends on the cause, which frequently is never found.

Prolapsed Intervertebral disc is a popular disease in these days. It causes a sciatica-like type of pain, and is brought about by the bulging of an intervertebral disc (the shock-absorbers, which lie between the vertebræ of the spinal column) into the area where it can press upon the nerve root. Treatment is first by rest and pain-relieving drugs, if this is not enough laminectomy is performed and the protruding part of the disc removed.

Paralysis agitans or Parkinson's disease may result in young adults following an attack of encephalitis, or in older people, in whom the part of the brain concerned simply deteriorates. The face becomes expressionless, the movements stiff and slow, the gait shows a shuffling tendency, in which the patient bends forward and seems to be running to catch up with himself. There is tremor of the fingers and the so-called "pill-rolling" movements, in which the thumb and fingers are constantly moving against each other. Treatment is by drugs, such as hyoscine or more modern proprietary ones, in some cases surgical operation has been used with varying degrees of success. The disease is also known as "shaking palsy."

MENTAL DISEASES.

Psychosis.

Mental diseases are divided into psychoses (*i.e.*, insanity) and neuroses (*i.e.*, what is ordinarily known as "nerves"). Psychoses, in their turn, are divided into organic and functional—those due to physical disease and those in which no physical cause has been discovered. In point of fact, the distinction into organic and functional is rather meaningless, for if we accept the modern view of psychosomatic medicine which regards the body

and mind as a single unit it is clear that organic disease brings out psychological defects which were already there and that functional disease must, in the final analysis, be the result of physico-chemical causes, even if this is brought about by mental stress.

Organic disease results from poisoning of the nervous system by such poisons as alcohol, carbon monoxide, or lead, vitamin deficiencies, as in pellagra, infections such as syphilis; and degeneration of the brain, either primary or as a result of poor blood supply. In all cases its main symptoms are confusion, signs of other disease, and loss of memory. Alcohol leads to various conditions: in *delirium tremens* heavy bouts of drinking end in delirium ("D T s"), confusion, hallucinations—although not necessarily of pink elephants or rats. It is a serious disease, but the outlook is much improved since it was discovered that injections of concentrated vitamins B and C in the form of "Parentrovite" can help. In more chronic cases *Korsakov's syndrome* manifests itself in the form of mental deterioration and memory defects. There can be little doubt that previously existing mental instability is a predisposing factor in these conditions. The same may be said of *general paralysis of the insane* or G.P.I., and in this case the immediate cause is syphilitic infection of the nervous system. Nevertheless, of all the patients with chronic syphilis, only a small number get syphilis of the nervous system. G.P.I. is typically associated with the usual symptoms of organic disease and delusions of grandeur, for example, a man with this disease may go out and buy several expensive cars in one day. However, it is not uncommon to find G P I. associated with severe depression—again the picture depends on the previous personality. At one time G.P.I. was considered hopeless, but treatment by malaria (that is, deliberate injection of malarial germs) was found to be helpful Today, although in some places the treatment is still used, penicillin is found to be adequate. The association of the above symptoms with a positive Wasserman test—which proves the presence of the spirochæte in the blood—indicates neurosyphilis. When the lower centres of the nervous system are affected the disease is known as *tabes dorsalis*, in which there is difficulty in passing urine, limb pains, inability to stand when the eyes are closed, and finally difficulty in walking The patient becomes paralysed and ultimately bedridden. Treatment is with penicillin.

People age at varying rates, so that some are hale and hearty at eighty or ninety whereas others are old at sixty or seventy They present the typical picture of old age "second childishness and mere oblivion, sans eyes, sans teeth, sans everything." When this condition, which is caused by degenerative changes in the brain or by defective blood-supply resulting from arteriosclerosis, is pronounced we speak of *senile psychosis*. There is mental confusion, forgetfulness, and delusions, in which the previous personality defects which we all have are accentuated Such patients may have to be put under special care, but the process is largely irreversible.

The functional psychoses are two in number schizophrenia and manic-depressive insanity In *schizophrenia*, which, when it occurs in early adult life, is known (or used to be known) as *dementia præcox*, the symptoms are bizarre. There are delusions and hallucinations, so that the patient often believes himself to be persecuted and hears voices which say objectionable things to him. Sometimes the schizophrenic is wildly excited, and in other cases he goes into a state of stupor which is described as a catatonic state. Although the disease is described as functional, recent discoveries seem to suggest that there is some derangement of the blood chemistry. Treatment by insulin and the new tranquillising drugs has revolutionised the outlook in this admittedly serious disease. Indeed, some cases of psychosis are more easily treated than neurotic patients, since the former respond to physical methods, whereas the latter may require fairly prolonged psychotherapy (psychological treatment).

In cases which do not respond to other methods, the brain operation known as *leucotomy* may be performed. Leucotomy is also performed to alleviate intractable pain, as in incurable cancer, but some of the ataraxic drugs (tranquillisers) are probably equally useful for this purpose. Leucotomy involves the severing of the connecting nerve fibres between certain areas of the brain, and the results are most favourable, but in fact the operation should be performed only in cases where the outlook is otherwise very poor, chronic severe neuroses, frequent attacks of manic depressive psychosis, severe chronic depression, and schizophrenia which has not responded to other forms of treatment. The operation reduces anxiety, fear, aggressiveness, and agitation, but may result in the less-desirable symptoms of apathy, impaired judgment, lack of self-control, and loss of initiative.

Schizophrenia developing in later life is likely to be less dramatic in origin, and the delusions tend to be more systematised—that is, they take a persistent form, which does not change from day to day. This type of the disease is known as *paraphrenia*. In those beyond middle age the rare but dangerous condition described as *paranoia* may develop in which there are no hallucinations and the only symptom is a completely systematised collection of persecutory delusions, which on recital may sound entirely convincing even to the ordinary doctor Such people are dangerous precisely because they are so plausible, and they fill the ranks of the litigious, the trouble-makers, and the political and religious eccentrics One such patient known to the writer spent his life in a mental hospital from which he had parole, employing this to form a society propagating highly eccentric sexual and political beliefs. It says little for the intelligence of the general population that his meetings were invariably crowded out (although, of course, when one reads of the people who apparently believe that the various fictitious families on radio or television—the Groves, the Archers, and the like—really exist, one need not be surprised at such examples of communal dottiness, even if one may despair of democracy).

Manic-depressive insanity is characterised by mood swings in which the emotions alternate between wild elation without obvious cause and equally causeless depression However, the picture is not quite as simple as this, for phases of mania or excitement may occur without depression obviously following, or there may be a single attack of depression with no manic phases The disease may be absolutely incapacitating, or there may be periods of relative normality, typically, then, manic-depressive insanity is a disease of alternating moods The depression responds to electroconvulsive therapy or E.C T., but mania is less responsive to treatment However, it ordinarily remits of itself. Sometimes in middle age *involutional depression* occurs, and this in the vast majority of cases is cured by E C.T.

Neurosis.

The main neuroses are anxiety neurosis, hysteria, and obsessional neurosis. *Anxiety neurosis* is an illness in which the main symptom (as the name implies) is anxiety. There is fear which rationally the patient knows to be groundless, there may be anxiety attacks, in which the heart pounds, the patient feels he is going mad, is unable to sleep, and worries "for no reason at all." In hysteria, anxiety is largely absent, but there may be apparently physical symptoms ranging from paralysis of the limbs to blindness, deafness, inability to write, and lapses of memory (the so-called hysterical fugues or loss of memory). Typical of *hysteria* is the fact that the patient is less worried by his symptoms than would be expected from their apparent seriousness; this is what the early psychiatrists described as "la belle indifference" The reason for the indifference is simple—it is that the paralysed individual *wants* to be paralysed, the blind *want*

to be blind, the deaf to be deaf (there are none so blind—or deaf—as those who don't want to see, or hear), and the person who doesn't want to write conveniently finds that he cannot.

•

Generally speaking, neurotic people are suffering from a failure to face up to reality. They are not physically ill and are largely the end result of a faulty upbringing. It is wrong to suppose that the only bad families are those in which the children are ill-treated, much the worst ones are those in which children are spoilt, the parents possessive, and the wrong kind of love is dispensed. Neuroses are the result of a conflict between primitive desires and what the individual has been brought up to believe he should be. For example, before an examination a student may develop a nervous breakdown because he fears failure when he has been brought up to expect success. The excuse, of course, is "overwork"—an entirely non-existent condition. With his breakdown he solves his problem, he avoids the fear of failing and preserves his self-respect: he has been ill. Similarly, the soldier with "shell shock" (another non-existent condition) has a conflict between his sense of duty and his fear of death, which again is solved by becoming ill. Or, to take a final example, a woman feels the duty to look after her ageing mother. But she also wants to get married. So she unconsciously develops a neurosis which says, in effect, "I should like to do my duty in looking after my mother, but unfortunately I am unable to." There is an unconscious rebellion on the part of the mind.

Neurosis, in effect, is not a disease—it is a self-inflicted injury, a form of maladaptation to life. The neurotic, no matter how much he suffers, does not want to get well, he has found some way of getting along, even if a foolish way, and he intends to keep it. Often his symptoms are the sort of excuse that say: "If only I wasn't ill what wouldn't I be able to do!" The neurotic is a person who is different and is afraid to be himself, his problem is a conflict between being "ordinary," "like other people," and being what he was supposed to be. You will find some other suggestions about neurosis in the section dealing with Family Affairs.

Obsessional Neurosis is a more severe type of neurotic illness, for although in anxiety neurosis we find such symptoms as phobias, irrational fears of open spaces, closed spaces, animals, and so on—obsessional states are characterised by compulsive feelings that certain acts must be performed or certain thoughts thought. In a mild form we all have obsessions: we feel that we must walk on the spaces between paving-stones, that we must touch lamp-posts, and so on. But when this type of compulsion gets to the stage when we must go back several times to make sure the lights have been put out, when we feel the need to wash our hands every few minutes, become obsessed with numbers on cars or dates on coins, then it becomes a nuisance and requires treatment. Usually the treatment is psychotherapy—whether psychoanalysis according to the method of Freud or shorter methods—and, in serious cases, physical methods such as L.S.D. (lysergic acid) or leucotomy. The obsessional neurotic is a person who feels that life must be controlled, he is "a creature who moves in predestinate grooves—he's not even a bus but a tram." His symptoms are an attempt to devise self-imposed rules which will control the unconscious desires of which he is so afraid.

Neurasthenia is an entirely imaginary condition allegedly due to exhaustion of the nervous system. Since no such condition exists, we need not bother with it. Neuroses cannot be treated by feeding the nerves (which are perfectly normal). They can be helped by such things as sedatives, but not cured. *Neurosis has nothing at all to do with disease of the physical nerves, so nerve tonics do not exist, and anyone who asserts that they do is a humbug.* Glycerophosphates and the usual contents of tonics are excreted almost as soon as they are taken in, and tonic wines are one of the best ways of becoming an alcoholic. The one reason for not taking alcohol is when one craves it, and many a "respectable" old lady has required several dust-carts to carry away the store of empty bottles left behind when she died.

Psychopathic Personality is the term given to anyone who has different standards of behaviour from those generally accepted by society. Some of these unfortunates may be *inadequate*, that is to say, although perfectly intelligent, unable to earn their own living. Others are the *creative* people, who, as in the case of Van Gogh, did many eccentric things but also many productive things—Van Gogh was gifted, or cursed, with an intense sensitivity. Lastly, there are those who have what others regard as peculiar sexual habits. Of the first two classes nothing more need be said, and all that is necessary is to mention certain of the so-called sexual perversions. (When we say so called the implication is not that none of these forms of behaviour is perverse but that some of them are carried out by otherwise quite ordinary people.) *Sadism* and *Masochism* refer to, in the first place, pleasure in inflicting pain and, in the second, to receiving pain. The pleasure is sexual, and it is incorrect to talk of cruelty in itself as sadism. Sadism is named after the Marquis de Sade, who suffered from this perversion, although he certainly did much less harm in his small way than numerous politicians or generals of our time, and masochism is named after the Austrian novelist Sacher-Masoch, who wrote books which, although unpleasant, were not notably more so than certain Sunday newspapers of today.

Masturbation is sexual self-stimulation. • Needless to say, it produces no more *physical* harm than ordinary sexual intercourse—that is to say, none at all, although some people have the strange belief that every act of intercourse weakens the body and it has even been believed that each act shortens life by a specific length of time. This is rather illogical in view of the fact that most of the famous rakes have been noted for their longevity! Masturbation is almost universal in infancy, adolescence, or even in later life when other outlets are not available. It need only be a matter of concern (*a*) when it is chosen in preference to normal sexual activity, or (*b*) when it is compulsive and excessive, since then it is a sign, not of sexual desire, but of severe underlying anxiety.

Homosexuality is, as presumably most people now know, an attraction between individuals of the same sex. Feminine homosexuality is not illegal in Britain, but male homosexuality is. The Wolfenden Report of 1957 takes a much more tolerant view of the problem than has been hitherto current, recommending, in effect, that homosexual acts between consenting adults should be legalised. Homosexuality is, so far as is known, not inherited, and is the result of psychological difficulties in early development, occasionally it can be treated by psychotherapy, but it is doubtful whether those "cured" in this way were ever genuine homosexuals. To any humane person it must seem that the Wolfenden Report gives a sensible solution to the problem, for it is difficult to see why the homosexual should be treated differently from the heterosexual offender. That is to say, what adults do (with consent) together is their own business, but the male homosexual who seduces a boy under age should be treated in no way differently from the man who seduces an under-age girl.

All that remains to be said is that many of these conditions are treatable or, if not treatable so far as cure is concerned, they can at least be relieved. The world is full of people who are "different", there are those who are different in the right way, who should take satisfaction from their achievements, and those who are different in the wrong way, who should seek expert advice. Since psychological treatment is time-consuming, it is not very easy to obtain it within the National Health Service, although group treatment has simplified the problem. However, any person

with such difficulties would probably benefit from a discussion with his family doctor

DISEASES OF THE SKIN.

The skin in the course of development before birth is particularly closely associated with the nervous system. It is therefore not surprising that so many skin diseases are influenced by emotional states. Other causes of skin disease are infections, glandular disorders, vitamin deficiencies, and the numerous conditions for which no cause has been discovered, but which presumably are due to metabolic disorders.

One of the commonest of skin symptoms is *itching or pruritis*, as it is more properly described. This may be caused by parasites, such as the *scabies* mite or *lice*. The scabies mite is very small, and since it burrows under the skin surface, is even less likely to be seen; it is the cause of itching most commonly between the fingers and on the front of the wrists. The itching is worse when the body becomes heated, as when one goes to bed. Treatment is hot bathing, followed by inunction with sulphur ointment, although there are now more pleasant preparations available. Scabies, of course, is contracted through close personal contact with an infested person. Lice are specialists, one type of which affects the scalp, another the body, and a third the genital area. There are various preparations which can destroy head lice, from lethane, a relatively pleasant treatment, to the traditional mixture of equal parts of olive oil and paraffin, which, needless to say, is as unpleasant as it sounds. The head must be covered with this mixture for about two hours and then washed. Body lice are best dealt with by D.D.T. powder, and genital lice by shaving off hair and washing. Obviously, the clothes, especially in the case of body lice, should be disinfested, either by the use of D.D.T. or, if this is not available, by using a hot iron over the seams, which lice (for some inexplicable reason) seem to favour. Apart from the discomfort they cause, lice are dangerous as potential carriers of typhus fever.

Itching may also result from other causes, and is especially common around the anus and genital organs. In these areas it may be caused by worms, by irritating vaginal discharge, by acid urine or —as in diabetes—by sugar in the urine. General diseases in which itching may occur are diabetes, jaundice, gout, and leukæmia. Lastly, and perhaps most commonly, pruritis may occur during the change of life in women, in old age, or in nervous conditions. Itching during the menopause is sometimes helped by sedatives and sex hormones, and there are ointments which may help, in very severe cases X-ray treatment may be necessary.

Baldness, or Alopecia, is a very common condition, as is manifested by the extraordinary number of preparations advertised as curing it. When many preparations are offered for the treatment of one condition it is a fair judgment to assume that none of them is likely to be effective. There are, in fact, two types of baldness, one, which is much the commoner, is hereditary, and cannot be influenced in the slightest by any treatment, the other, *alopecia areata*, is caused by nervous stress, and would recover in most cases by itself, whether one used a solution of soot and water or the most expensive "hair food." There is no such thing as a hair food, any more than there is such a thing as a nerve food, and although it is probable that hair hygiene may delay baldness, it certainly cannot prevent it. All hair tonics and "foods" are useless, and their uselessness is only equalled by their costliness. Those who have lost their hair and find it growing again after using some alleged tonic are people who have had *alopecia areata* and whose hair would have grown back anyhow.

Seborrhœa is a condition in which there is overactivity of the sebaceous glands, with subsequent infection. The most usual form it takes is *dandruff*. However, it takes other forms, and those who have dandruff may also have rashes on the face, shoulders, and chest. In these areas there is a patchy, greasy, and often itchy, rash which does not clear up until the primary condition in the scalp is dealt with. The scalp should be washed with one of the modern sulphur-containing shampoos at least twice a week, and the affected parts on the face and chest should be dealt with by the use of sulphocalamine lotion (*not* on any account by greasy ointments). Seborrhœa is not in itself difficult to treat, but, since the condition depends on over-secretion of sebum, the skin lubricant, treatment may have to be persisted in during the years of early adulthood, when it is most active.

Erythema Intertrigo is, quite simply, the sort of irritation which occurs usually from excessive sweating under the armpits, between the legs, and under the breasts in women. All that need be done is to wash frequently and to dust the affected areas after washing with powder. This is the condition which, in the tropics, is known as "prickly heat" and elsewhere as a "sweat rash." In some people *hyperidrosis* or *excessive sweating* is a problem, especially when the sweating is accompanied with body odour—the sort of thing that, according to the advertisements, "even your best friends won't tell you." There is little need for anyone in these days to suffer in this way, for the cosmetic firms have produced many highly efficient deodorants which not only control odour but also control the amount of sweating. Chlorophyll, which has been much advertised as removing odours, is, there can be little doubt, effective when applied directly to surfaces which give off an unpleasant smell. It is effective, for example, in septic wounds, and probably in the mouth. What is much more doubtful is whether, when taken by mouth, it prevents body odours. One is reminded of the fact that goats are (*a*) noted for their strong odour, and (*b*) live on chlorophyll in the vegetation which they ordinarily eat.

"The goat that reeks on yonder hill,
Has fed all day on chlorophyll."

But, say the manufacturers, the chlorophyll we prepare is different, it is not sufficient simply to take chlorophyll as it comes from grass or any other type of green vegetation. And they may be right—who knows? In any case, one way or another, there is no reason why, in these days, one's best friend should have anything to tell at all.

Erysipelas is an infection of the skin caused by the hæmolytic streptococcus. It begins as a red, raised area anywhere on the body where the germs have been able to enter through a small crack or cut in the skin. The red area advances and spreads over the body until the disease is got under control. Erysipelas is very infectious, and those who look after the patient should wash their hands throughly after contact. At one time the disease used to spread as an epidemic throughout the hospital wards, but this is very rare nowadays. Treatment is, of course, a matter for the doctor. The sulphonamide drugs are used.

Chilblains are extremely common in cold weather, especially in those with poor circulation. Ordinarily they occur in the toes and fingers, but may appear on the nose and ears. The part affected becomes swollen, dusky, and there is pain and itching, sometimes leading to ulceration. Treatment is to give plenty of nourishing food and to stimulate the circulation. Vitamins A and D are useful, in the form of Adexolin or capsules of halibut-liver oil, and either nicotinic acid or "Pernivite" may be used. It is best to wear woollen socks and gloves during the cold weather. A skin affection caused by heat is rather grandiloseły described as *erythema ab igne*, and is frequently seen on the legs of ladies addicted to roasting their legs before the fire. It takes the form of red patches on the front of the legs, and can be removed only by avoiding the cause.

Dermatitis means "inflammation of the skin," and therefore the word could be, strictly speaking, applied to any skin disease. It certainly does not

warrant the terror it usually seems to inspire when, as is often the case in industry, the worker, on being given the diagnosis, says: "You don't mean *dermatitis*, do you?" For some reason or other, the word is now ordinarily used to describe skin diseases caused by substances which harm the skin either because the individual is sensitised to them or because they are in themselves dangerous. When the injury is the result of a substance such as strong acids or alkalis which would be harmful to anyone, the condition is known as "primary dermatitis," and it is typical of such injuries that when the harmful material is removed the dermatitis goes. When, on the other hand, the disease is caused by allergy to an otherwise harmless substance—vegetables, detergents, soap, fruit, and even cosmetics—it may persist for a long time, even after the patient is no longer in contact with the material. At least 95 per cent of cases come into this category, which has been described by an eminent skin specialist as "a disease of the personality," and only the remaining 5 per cent. are dermatitis caused by genuine irritants. As regards these cases, no problem exists, they clear up rapidly with conventional treatment. But the other 95 per cent are a serious problem, such cases may respond to the antihistamine drugs, sedatives, and psychological treatment. In the most real sense they are suffering from a self-inflicted injury due to their problems, their resentment, or anxiety, and it is noteworthy that most cases of this type of dermatitis occur in departments where morale is low.

Impetigo is an infectious skin disease caused primarily by the streptococcus, but later often infected with staphylococci. It usually occurs on the face, and takes the form of blisters filled with pus on a red base, when the blisters burst their place is taken by yellow crusts. Impetigo is very infectious and easily spread by the fingers, dirty towels, or cloths, therefore, one of the first necessities is to prevent infection of others or reinfection of oneself by avoiding scratching and using a different towel each day, which must on no account be used by anyone else. Treatment is simple, with sulphonamide powder or penicillin, so the main issue is prevention of contamination. If care is not taken on this point, no treatment is of the slightest use.

Sycosis or "Barber's Rash" occurs in men, and is similarly treated.

Urticaria, or Nettlerash, is a familiar skin disease in which blisters appear on the skin for no obvious reason. It is not infectious, and is caused by allergy to some foodstuff (such as shellfish, mushrooms, or fish of any type which is "a bit off"), certain drugs, and nervous stress. The blisters are itchy, and in those who are specially susceptible it may even be possible to write on the skin with the finger-nail the "writing" appearing in the form of weals. This is known as "dermographia." The immediate treatment is an injection of adrenalin, afterwards the antihistamine drugs may prove useful.

Acne, or "Blackheads," is a condition found on the face and shoulders, its appearance is so familiar that no description is necessary. Acne is one of those conditions which is the end result of many factors. There is, first, a greasy skin, the result of glandular upset (which is why the disease usually occurs in adolescence), secondly, there is infection of the skin, and thirdly, there is blockage of the sebaceous ducts, which ordinarily allow the grease from the skin to pass out on to the surface. Since the condition starts with excess secretion of grease, ointments should never be used, and probably the best application is sulphocalamine lotion. The face should be frequently washed, and it is possible now to obtain detergent solutions which are both antiseptic and prevent grease formation. In severe cases X ray treatment may be necessary.

Rosacea. As has already been implied elsewhere, although the wages of sin may be extremely unpleasant, the wages of extreme virtue may be no less troublesome. Thus *rosacea*, in which the nose and cheeks become red and greasy and the skin coarsened, occurs alike in chronic alcoholics and elderly ladies with no vices other than a preference for strong tea. Both cases are associated with indigestion, since, regrettable as it may seem, strong tea and alcohol are about equally liable to cause the gastritis which is invariably at the root of this complaint. Treatment consists in the careful attention to diet and temperance in all things—especially tea.

Lichen Planus is one of the numerous skin diseases which seem to be due to nervous states of tension. It may occur on any part of the body, but is most common on the front of the forearms and legs. The rash takes the form of blisters which are lilac in colour and have a dent on the top, when these disappear a stain is left behind. There is severe itching. Treatment is a matter for a specialist, as it also is in the case of *psoriasis*, a very common disease of largely unknown origin, which is extremely resistant to treatment. It takes the form of slightly raised papules, usually on the elbows and knees, typically the papules are covered with dry, silvery-looking scales. Apart from the rash, the patient is usually in perfectly good health and there is no itching. Many drugs have been used in psoriasis, notably chrysarobin, and while it is not difficult to cause the rash (which may occur anywhere on the body) to disappear in one area or even in all areas for a time it has a strong tendency to return.

Warts, or Verrucae are familiar enough. They are caused by a virus, and are, theoretically at least, contagious (although having removed many warts, the writer has never found them contagious). Most frequently they are found on the hands, but may occur elsewhere. Treatment is best carried out by a doctor, who will use a cautery, a caustic stick, or in severe cases X-rays. A curious feature of the common wart is that it can sometimes be caused to disappear by suggestion, which is presumably why so many old wives charms are not necessarily without effect. Different altogether from the common wart is the *plantar wart*, which occurs on the soles of the feet and often causes a good deal of discomfort. It is best dealt with by a chiropodist or in bad cases by a skin specialist.

Icthyosis. A condition with which some unfortunate people are sometimes born is *icthyosis*, in which there is absence of secretion from the oil and sweat-producing glands, rendering the skin dry and scaly like the skin of a fish. It is, however, possible to help the condition, which does not affect the general health, by frequent alkaline baths to wash off the scales, and the subsequent use of lanolin to replace the lacking oil. Large doses of vitamin A seem to help in some cases, and there have been reports in the medical Press of cases being helped by hypnosis; this, however, is very much a matter of opinion.

Cancer, Rodent Ulcer, and Cysts. Cancer of the skin occurs mostly in old people, and takes the form of what is described as an *epithelioma*. It is most common on the face or hands, and usually appears as a nodule which breaks down and produces an ulcer. The glands may later be affected, but such cancers can almost invariably be cured unless a considerable time has elapsed during which they have been neglected. *Rodent ulcer* is a form of ulcer which appears on the inner corner of the eye or the side of the nose in old people. It does not spread over the body, but acts by eating into the tissues in the area where it has started. X-ray or operation is necessary, but the outlook is good. *Cysts* on the skin are due to blockage of the sebaceous glands. They may become very large, and should always be removed, as they may become infected. They do not turn into cancer, and there is no such thing as "male" and "female" cysts. It does sometimes happen that *moles*, especially of the bluish-black type, may become malignant, so it is perhaps best to have them removed surgically

when they exist. *All moles which change in appearance or size should be at once referred to a doctor.*

Skin Grafts.

These are a very complex subject which can be only briefly discussed here They are used basically for a number of conditions in which large areas of skin have been removed from the body, as in burns or serious accidents. In other cases, as in plastic surgery, grafts may be used to make a new nose, eyelids, and so on. The following are the main types:

Pinch Grafts are small, circular pieces of skin cut from some other part of the body. (The former method of using grafts from another person has been given up almost completely, since such grafts—except in the case of identical twins—never "take.") The small pieces are laid on the area without skin and gradually grow together. *Split-thickness grafts* are grafts removed from another part of the body by an instrument known as a dermatome, which cuts sections about 4 in. by 8 in. containing part of the deep layers of the skin.

In *Full-thickness Grafts*, on the other hand, the whole thickness of the skin is removed from elsewhere and applied to an area which has to bear friction or heavy weights, such as the hand or the foot. Lastly, and this is largely used in plastic surgery, there is the *Pedicle graft*, which, unfortunately, although it is certainly the most exciting type, is rather difficult to describe. Briefly, if one, for example, wants to make a new nose, one cuts an area of skin and underlying fat about 2 in. wide and 5 or 6 in long in the abdomen. One end, however, remains attached so that it gets adequate blood-supply. The problem is how to get this tissue to the nose, and this is done by a complicated process of leap-frog First, the free end of the graft is attached to the forearm, whilst its "root" remains in the original site, and when it begins to grow and get its blood-supply from the arm, the original "root" is cut So we now have a "sausage" of tissue attached to the arm. The arm is then lifted to the face and kept firmly in position there until the new free part becomes attached It is then detached from the arm, modelled to the correct shape, and grows where the nose used to be!

THE RHEUMATIC DISEASES.

The main rheumatic diseases (or so they are described, although they seem to have little relationship one with the other), are *rheumatic fever*, the acute form, which has already been dealt with; *chorea*, or rheumatism of the nervous system, also mentioned, *rheumatoid arthritis*; *osteoarthritis*; *gout*, and *fibrositis*. The only thing these diseases seem to have in common is that most seem to be associated with the muscles or joints—this, of course, with the single exception of chorea. Apart from this, there is very little similarity.

Rheumatoid arthritis often starts without evident cause in early adult life, and affects the small joints of the fingers and toes, causing swelling and pain. No infective process has been discovered, yet the disease goes on and on, sometimes better, sometimes worse It is (and this is all one can say) a disease commoner in women, commoner in temperate climates, commoner following emotional stress. Although, as we have seen, rheumatoid arthritis is a disease characterised by frequent remissions, it takes a considerable time to burn itself out. The most likely explanation for its occurrence is that stress reactions act on the suprarenal glands and the secretion of cortisone is inadequate to play its usual part in preventing the body from responding too severely to injury. However, the injection of cortisone has proved, on the whole, less useful than might have been expected, and there is little reason to suppose that in most cases it is any better than aspirin.

Osteoarthritis is essentially a degenerative disease of old people. The bones affected are ordinarily the larger joints: the shoulders, the hips, or the spine There is no disease in the ordinary sense, and essentially what has happened is that these joints have got "old" and the bone has overgrown so that movement is less simple than it once was Osteoarthritis is not curable, but can be relieved by drugs and physiotherapy.

Gout, so far as one knows, has nothing at all to do with rheumatism. It is a metabolic disease caused by the inability of the body to deal with certain protein breakdown substances, such as uric acid. Typically, the pain develops in the big toe, and the foods concerned are such luscious products as wines, spirits, liver, sweetbreads. Although drugs such as cinchophen can help, the plain fact is that those liable to gout cannot have sweetbreads and wine, liver and spirits, without having gout as well Most people, perhaps, would prefer the food and wine, but those who dislike gout must abstain.

Fibrositis. All diseases are annoying to the patient, but fibrositis is just about equally annoying to the doctor Fibrositis, in fact, is a condition in which people come along (and how often they do so!) with muscular pain which may be caused by anything from falling down the stairs to quarrelling with their mother-in-law Although at one time, and perhaps even now, it used to be said that those with fibrositis could be diagnosed by the presence of "nodules" in their muscles, it is almost certain (*a*) that there are no such nodules, and (*b*) that muscular pain may be due to many causes and very largely to psychological ones.

DISEASES OF THE EYE AND EAR.

The Eye.

The eye is frequently compared to a camera, and in a general sort of way there is some resemblance. The eyeball consists of 3 coats within which are contained the refracting media (1) The outermost layer, the main support of the eyeball, comprising the sclera (opaque) and the cornea (transparent, covering the front of the eyeball) The conjunctiva (the part which gets inflamed when you get germs or dust on the surface of the eye) is a thin protective membrane covering the sclera and doubles back to line the inside of the upper and lower lids It stops at the junction of the sclera and cornea (2) The middle layer containing many blood vessels which forms the choroid and, in front, the iris (the coloured part of the eye) The muscle in the iris enables its central aperture, the pupil, to contract in bright light, and to dilate in dim light. (3) The innermost layer of nervous tissue, the retina The retina contains the expanded termination of the optic nerve which is part of the brain Behind the iris is the lens, which is controlled by a series of muscles which increase or diminish its curvature, and thus produce, according to the nearness or distance of the object, a clear picture on the retina Some of these parts may, of course, be affected by disease. Here we shall deal only with a few of the more common diseases

Blepharitis is an infection of the eyelids which is easily recognisable from the red, sore appearance at the margins, the formation of crusts, and the falling-out of the eyelashes. If it has just developed, an attempt may be made to treat it at home with hot bathing and the so-called Golden Eye Ointment, but *blepharitis* is liable to become a chronic disease, and it is wiser to see a doctor. Penicillin cream or ointment can cure the disease, but must *never* be used save under medical advice, allergy to penicillin is commoner in the eyes than anywhere else, and in some cases patients have lost their sight through its use in this way.

Conjunctivitis is the result of infection of the conjunctiva, and the symptoms are the familiar

ones of a feeling as if some grit had got into the eye, running from the eye, and frequently gummed-together eyelids in the morning. In some cases it can be treated by hot bathing and eye-baths with one of the proprietary lotions on the market, but it is much wiser to see your doctor, who can supply much more effective remedies and may save you a lot of unnecessary discomfort.

Other Eye Diseases. We can only mention briefly *keratitis*, inflammation of the cornea, *iritis*, inflammation of the iris; and *glaucoma*. These are all potentially serious diseases, and should not be diagnosed or treated by the layman. Glaucoma, in particular, may lead to blindness if help is not sought in time. If there is redness and congestion over the eye, dimness of vision, *severe* pain (as contrasted with the irritation caused by conjunctivitis), and perhaps even vomiting, the doctor must be called immediately.

The main disease of the lens is *cataract*, in which the lens becomes opaque and varying degrees of blindness result. Ordinarily, cataract is a condition found in people after middle age, but sometimes it is found in children at birth. The treatment is by operation—one which has been carried out for centuries—in which the opaque lens is removed. The patient thereafter has to wear glasses, but the vast majority of patients obtain good vision.

In *retinitis*, however, where the "screen" at the back of the eye is affected, the general outlook is more serious. This is because, whereas cataract is a localised disease, retinitis often signifies some bodily illness: infection, hardening of the arteries leading to haemorrhage, diabetes, or kidney disorders. Sometimes the retina becomes detached, leading to blindness. As has been suggested above, except in very minor conditions, such as styes (a localised infection treated in the same way as blepharitis), or conjunctivitis, the doctor should always be consulted. He should be consulted, too, when a foreign body gets into the eye unless it can be removed by very gentle manipulation with a handkerchief, for it must be remembered that such "poking about" on the surface of the eye may do much more harm than the original condition. So, if a couple of minutes fail to remove the grit, give up, and go to the surgery.

The Ear.

This is not merely the outer portion which is visible to all of us—this part of the ear performs the sole function of collecting the sounds and leading them into a tube which consists of three parts: the outer part (which is the part in which the main troubles are collections of wax, small boils, and sometimes skin irritation), the middle ear, which is separated from the outer ear by a membrane, the ear-drum, and the main disorder of which is otitis media, due to infection, lastly, the inner ear, where the sound impulses, transmitted by a chain of tiny bones through the middle ear, reach the nerve which passes them to the brain.

Wax, or Cerumen, is naturally secreted in the ear, but in most cases will dry up and fall out. Some unfortunate people, however, tend to accumulate it, so that after varying periods of time the ear is completely blocked and deafness occurs. Then they have to go to the doctor to have it syringed. There is no cure for this tendency except periodic syringing, although there is an oil on the market which allegedly softens the wax and makes it come away of itself. *Boils* in this part of the ear are small but rather painful; they should be entrusted to the doctor, who will give something to relieve the pain. However, once the boil has started, it is unlikely to regress, and will probably come to a head and burst, with consequent relief to the patient. Whilst we are dealing with the outer ear it should be said that, like the eyes, it should not be interfered with except by someone who knows something about it. Mothers should not poke the corners of towels into the ear in an attempt to clean it, nor if, as frequently happens, a child puts a bead or a pea into the ear should they try to dig it out. This should be left to the doctor.

Otitis Media, or infection of the middle ear, is another cause of earache, and, since the middle ear is shut off by the ear-drum from contact with the outside world, the ordinary source of infection is from the throat by way of the Eustachian tube, a narrow tube which passes between the back of the throat and the middle ear. Its normal function is to equalise pressure between the middle ear and the atmosphere—that is why, for example, when a large gun is being fired, soldiers are told to keep their mouths open, otherwise their ear-drums might be burst. But not only air but germs can pass up the tube, and when infection exists in the throat (such as adenoids or tonsillitis) it may move up to the middle ear and start disease. When this happens, pus begins to form and accumulates until it presses against the ear-drum, which causes severe pain. Without treatment one of two things may then happen, either the ear-drum bursts or the infection may spread backwards into the mastoid area—an area of spongy bone immediately behind the ear. This is known as *mastoiditis*, and together with otitis media, can be dealt with only by a skilled doctor. Sometimes antibiotics are adequate, but in other cases operation is necessary.

Tinnitus is the medical term for noises in the ears, which is one of the commonest conditions met with in the doctor's surgery. There are numerous physical causes, but there can be little doubt that very many of the cases seen are neurotic and show no physical disorder at all. Some of these unfortunate people, who undoubtedly suffer a great deal, go around from one doctor to another seeking relief and failing to find it, because the trouble is so often in their minds rather than their ears. One of the physical causes of tinnitus is *otosclerosis*, a disease of the inner ear in which the tissues become hardened and increasing deafness results. The treatment has not been, on the whole, very successful, but the fairly recent operation of fenestration sometimes gives good results.

DISEASES OF WOMEN.

The internal sexual organs of women, like the urinary system, can best be described as shaped like a capital Y. At the tips of the letter are the ovaries, the female sex glands, the two limbs running downwards are the Fallopian tubes, the point where they meet is the uterus or womb; and the single leg at the foot is the vagina. The ovaries have already been mentioned. They give out two hormones which control the sexual life: oestrin, which, in a very general way, may be said to be stimulating, and progesterone, which, during pregnancy, has a sedative effect on the womb. These two hormones also control the menstrual cycle: (*a*) by producing an ovum each month which passes down the Fallopian tube to the womb ready to be fertilised (this happens about the fourteenth day—half-way between two periods), and (*b*) when fertilisation does not occur, bringing about the removal of the lining of the womb—which is the meaning of menstruation—and then proceeding to build it up again.

The breasts, too, are secondary sexual organs, and are also under the influence of the ovarian hormones. One of the commonest and most trivial complaints encountered by the doctor is that they are either too small or too large. However, small breasts cannot be made larger, and are just as efficient for feeding babies as large ones, which are not always so effective as they appear. If breasts become too large they can be dealt with by plastic surgery. Two more serious conditions are *mastitis* and ***cancer of the breast***, both of which are characterised by lumps within the breast tissue. It is not proposed here to discuss these two conditions in detail except to say that mastitis may be uncomfortable but is not necessarily dangerous, and can usually be treated medically, whereas cancer is obviously extremely grave. The reason nothing more is being said is that any woman with a lump in her breast must go *at once* to a doctor—reading about it is useless.

and, although nothing serious may be wrong, there can be no doubt that, if there is, every day wasted lessens the chance of prolonging life.

Abscesses also occur in the breast, nearly always during the time when the mother is feeding her child. Here again a lump appears, but in this case it is accompanied by redness over the area and fever. Treatment is surgical.

Oophoritis and Salpingitis. The former means inflammation of the ovary, which is ordinarily not due to infection but to some internal defect. The symptoms are usually low back pain (which is a very common gynæcological symptom) and heavy loss during the periods Treatment is entirely a matter for the gynæcologist. The latter disease is an infection of the Fallopian tubes, often following abortion, but sometimes conveyed by the blood from another septic source in the body. There is high temperature, pain in the lower abdomen, and frequently vaginal discharge Since the disease can become chronic and is likely to lead to sterility, immediate attention should be sought. *Ovarian cysts* are of different types and of varying degrees of severity, before the era of effective surgery it was not uncommon for certain types of cyst to become larger than the patient. But needless to say, this does not occur now.

The womb, or uterus, is subject to many diseases, but here we shall only mention *fibroids*, a non-malignant tumour, which, however, may necessitate major surgery. The main symptom of fibroids is severe menstrual loss.

Cancer of the Womb is of two types, cancer of the body or of the cervix. The womb is pear-shaped, and the body is the main part, whereas the cervix is the narrow part which projects into the vagina. Cancer of the cervix usually occurs in middle-aged women with a large family, whereas cancer of the body of the uterus occurs slightly later in life (fifty to sixty) and most commonly in those who are childless The symptoms will not be described in detail, but any woman who, after the menopause, has slight bleeding, especially after intercourse, and fairly constant watery discharge, *must* see her doctor at once The treatment of cancer depends upon circumstances. Operation is nearly always necessary, but in certain cases radium will be used. Finally, the uterus may have an infected lining, *endometritis*, another cause of discharge and low back pain, or its ligaments which ordinarily support it in the pelvis may sag with age or frequent childbirth, and *prolapse* may occur In prolapse, the womb sags down into the vagina, and the cervix may even appear outside. The usual symptoms, apart from visible evidence, are low back pain and a heavy, dragging feeling in the lower abdomen.

Discharge, or Leucorrhœa (strictly speaking, leucorrhœa refers to white discharge), may be, as we have seen, due to many causes—in fact, to infection of any part of the genital tract. In the upper part, the womb and the Fallopian tubes, the most common cause of infection is following a childbirth in which all the products have not been removed or after abortion, but discharge is also common when the vagina has been infected with various types of germs and fungi. Generally, it is advisable for a patient who has discharge which is (*a*) too copious, (*b*) blood-stained, (*c*) offensive, or (*d*) irritating, to see a doctor as soon as possible. On the other hand, there is a perfectly normal discharge, more plentiful in some women than others, which may become offensive if personal hygiene is inadequate. This need not be the subject of concern, but women would be well advised to adopt here the continental habit of douching—not with antiseptic, but with ordinary warm water.

Dysmenorrhœa, or pain with the periods, is very common, and occurs in many different conditions. However, in those who have not had children, and especially in young girls, it is likely that there is a large psychological element involved. In a symptom which has so many varying causes the sensible thing to do, if the pain is troublesome, is to see the doctor.

Many women are very troubled at the prospect of the change of life or *menopause* This, in itself, is not unnatural, for nobody likes growing older. But this quite natural fear is overlaid with all sorts of additional ones based on sheer nonsense. women often talk to each other as if the change of life means the end of being a woman, as if it must be accompanied by all sorts of painful and uncomfortable symptoms, such as "hot flushes," depression, severe losses of blood, and so on. Now the menopause has no influence whatever upon the sexual life (although naturally it has upon fertility). desire is not affected, and indeed it is recounted that a famous courtesan, at the age of eighty, on being asked by Voltaire when women ceased to feel desire, replied: "I don't know—I haven t lived long enough." The "hot flushes" appear to be a disease of civilisations, since they are rarely found amongst simpler peoples. In any case, they can be treated by hormones and clear up fairly readily The same applies to heavy losses of blood. There is no reason at all why women should suffer during the menopause

Abortion is a word which, to the doctor, does not have the unpleasant connotation which it apparently has to those who perhaps too avidly read some of the Sunday newspapers. It does not necessarily signify any criminal act, and its simple definition is "Expulsion of the uterine contents before the viability of the fœtus (*i.e.*, the twenty-eighth week)" This means that an abortion or miscarriage is the termination of any pregnancy prior to the time when the fœtus is able to survive The two main symptoms of abortion are (*a*) bleeding, and (*b*) abdominal pain. The bleeding may be slight initially, but obviously any bleeding during pregnancy ought to be reported at once. Pain is in the lower abdomen and spasmodic in character, like colic it works up to a height and then temporarily passes off. Any pregnant woman with pain and bleeding should at once go to bed and send for the doctor *Criminal abortion* is brought about deliberately, either by the use of drugs or by injecting substances into the womb Both these practices, although very common, are extremely dangerous, there are no drugs taken by mouth which can produce abortion without also endangering life, and injecting water or anything else into the womb is liable to lead to sepsis and death The frequency of abortion in general is about one in every five pregnancies

Amenorrhœa means stopping of the periods It may signify either pregnancy, glandular disease, or can be purely psychological

Contraception.

This is another subject which will be only briefly dealt with, since if one does intend to practise birth control one should either go to the local Birth Control Clinic or to a gynæcologist The matter of whether or not a baby is born is too important to leave to chance, so any method used should be effective. Basically, there are four methods of contraception: (1) chemical, whether with tablets, douches, or jellies, this is increasingly reliable, but certainly not 100 per cent. effective: (2) The use of appliances, such as the sheath in men or the cap which fits over the opening of the womb in women (these, properly fitted, and combined with a chemical contraceptive jelly, are almost 100 per cent effective): (3) The type of method which is "physiological"—that is, which makes no use of any artificial appliance or chemical, one such method is simply to cease intercourse before emission takes place—to say the least of it this method is unreliable. The other is the use of the "safe period," which is recognised by the Roman Catholic Church and based on the fact that ovulation occurs at some time in the mid-period, usually about the fourteenth day. Intercourse outside this period is unlikely to lead to pregnancy, since, in effect, there are only about four days in the month when this could occur. The only problem is: which four days? It is possible to find this out by daily readings of the vaginal temperature carried out over some months, but it must be repeated that advice about birth control should be accepted from nobody but a thoroughly qualified specialist.

BABY CARE

THE HEALTH OF THE MOTHER.

The health of a baby during its early years of life is so bound up with the health of the mother that the two must be considered together. Indeed the intimate relationship which exists between the two before birth is, in normal circumstances, continued after birth and throughout the whole of the first year. It is therefore necessary to consider first the health of the mother before the birth of the child.

It has now been established beyond doubt that the health of the expectant and nursing mother affects profoundly the health and well-being of her infant. It is not merely a question of good bodily health. Mental contentment and freedom from anxiety are also important. It is necessary, therefore, to encourage a placid state of mind from the outset. This can best be done by making the arrangements for adequate care and supervision as early as possible. As soon, therefore, as pregnancy is suspected the mother should seek the advice of her family doctor.

When the pregnancy is confirmed the question whether to have the baby at home or in hospital must be decided. Much will depend on the opinion of the doctor, who may consider confinement in hospital advisable on medical grounds. Other considerations will also enter into this decision, such as the suitability of home conditions, the care of other children in the family, the availability of domestic help and so on. If it is decided to have the baby at home, arrangements must be made for securing the services of a midwife. The sooner these arrangements are made, and other matters such as the provision of home help and care for the other children decided, the sooner will the mother be able to settle contentedly to prepare for the baby. Subject to the advice given by the doctor and midwife the more natural the life the expectant mother lives the better.

Experience in a number of countries, including Great Britain, in the Second World War, confirmed the view that the nutrition of the expectant mother is of vital importance, both to her own health and to that of the baby. That is so throughout pregnancy, and especially in the earlier months. From the moment that pregnancy is diagnosed, therefore, it is essential that the mother should have a good and varied diet, with plenty of fruit, salads, and vegetables, in addition to fresh meat and fish, milk, butter, eggs, and cheese, for it is from these materials that the essential proteins, the fats, carbohydrates, and mineral salts required by the developing infant are drawn. Adequate supplies of vitamins are also required, especially when the baby is growing rapidly in the later months of pregnancy, and these are usually supplied in the form of cod-liver oil or halibut-liver oil which contains vitamins A and D, and fresh orange or tomato juice or concentrated orange juice, rose-hip syrup, blackcurrant syrup, etc., which contain vitamin C. Multi-vitamin preparations containing a number of vitamins may be taken on the recommendation of the doctor or welfare centre.

Mineral salts, and especially calcium and iron, are essential for both the mother and the child, especially during lactation. Calcium is supplied naturally by means of milk, cheese, and vegetables, and iron by way of green vegetables, egg yolk, liver, peas, beans and lentils, oatmeal, and wholemeal flour.

The old tradition that the expectant mother should attempt to eat enough for two people is, of course, a fallacy. A good, well-nourishing diet taken at regular meal-times is all that is required. Similarly, the other elementary principles of healthy living should be followed, with adequate fresh air, exercise and sleep, and a rest during the day. Before attempting anything exceptional, such as hard exercise or swimming, medical advice should be taken.

MEDICAL SERVICES.

It is no part of these notes to describe the arrangements for the confinement, but it is obvious that this will be made much easier if adequate preparation has been made. The expectant mother should therefore make sure that she is getting all the help which the health and welfare services can give. These services are now very extensive, and they are available to everyone. Under the National Health Service, for example, the help and advice of a doctor and midwife are freely available, and so also are the welfare clinics of the local authority and the expert care of the hospitals.

The Local Health Authorities now provide a free ambulance service for those who may need it, and also a home help service whereby a helper experienced in the running of a home can come to assist the family during the time of confinement, and also if necessary during the nursing period. Local Health Authorities may make a charge for this home-help service.

If there are other young children in the family it may be possible to make use of day or residential nurseries where these are provided by the Local Health Authority, and old people in the house may be encouraged to go to an old people's club during the day or be found temporary residential accommodation elsewhere. In making these arrangements the advice of the health visitor will be valuable. Local Health Authorities are empowered, under the National Health Service Act, to provide nursing equipment and additional comforts in the home. These may take the form of bedding and blankets, and nursing equipment may include such items as bed-pans, macintosh sheeting, air-rings, and bed cradles. Local authorities can make a charge for lending this equipment. Another helpful provision is that of a recuperative holiday after confinement.

It goes without saying that regular examinations of the expectant mother's health should be made, and these ante-natal examinations may be carried out by the general practitioner, at the welfare centre, or at hospital. Similarly, an examination to detect that no minor disability remains as a result of the confinement is also essential to prevent subsequent ill-health. This post-natal examination, which is usually made about six weeks after the confinement, may be undertaken by the family doctor or at the welfare clinic or the hospital.

GENERAL PREPARATION:

Two of the important things to prepare in advance are the baby's clothing, and equipment and furniture.

Clothes have undergone revolutionary changes in the past thirty years. Whereas it was formerly the fashion to provide elaborate sets of clothing, often in three or four layers, the objective to-day is to provide the simplest and lightest clothes which will keep the baby warm and comfortable and at the same time allow free movement and exercise. It is essential to remember when buying or making baby's clothes, and also later on when washing them, that a baby's skin is very sensitive and liable to chafe easily. The under-garments must be of soft and fine material that will wash and wear well, and the layer next to the baby's skin should be the same in summer and in winter and night as well as day. A common mistake is to put too many clothes on the body. A baby loses heat quickly from the whole skin, including the legs, and in cold weather the legs should be covered. The old tradition of wearing bonnets is now nearly dead. Provided that the baby is not directly exposed to draughts and keen winds, there is no need to wear any head covering except in very cold weather, when a woollen bonnet which covers the ears should be worn out of doors.

Vests should be of soft, fine wool, silk or silk merino, and long enough in the body to ensure that there is no gap between vest and napkin. A wide piece of tape can be sewn to the bottom of the front of the vest so that the napkin can be pinned to the vest without tearing it. The neck of the vest should be wide enough to go over the baby's head without force.

Napkins are usually of two kinds: soft muslin squares to be worn next to the skin, and turkish towelling worn over these as an added protection. The various ways of putting on and changing napkins are best learnt by demonstration by the midwife or at the clinic.

In cold weather the baby will need, in addition to vest and napkin, a woollen jersey and knickers and good woollen socks long enough to reach almost to the knee. As woollen socks are easily kicked off they should be drawn in by a ribbon and tied above the ankle. In really cold weather a long-sleeved double-breasted matinee coat of wool should be worn.

In hot weather the baby may need only vest and napkin, but care must be taken to add clothes as soon as it turns cooler. Incidentally it is wiser not to speak of summer and winter clothes when dealing with young children. In the British Isles, at any rate, a winter day can be warm, and cold spells occur in the summer. If the system is adopted of adding warm garments to the foundation of vest and napkin according to the temperature indoors or outdoors, the child will be most comfortable. In this, as in all other matters relating to the care of the baby, common sense plays a very large part.

Bibs are needed to save the clothes when the child dribbles or regurgitates its food after feeding. They should be of soft, absorbent material, such as drill or cotton, with tapes to tie round the neck and the waist. Bibs made of plastic material are not recommended, as they may cover the child's face if he falls asleep, and a young baby was stifled in this manner not long ago.

Binders are *not* necessary after the first ten days of the baby's life. Once the stump of the umbilical cord has separated and the scar at the navel has healed the binder should be discarded.

The equipment and furniture required are simple and will vary with the type of home and financial circumstances, but the underlying principles are the same for all homes. The first essential is cleanliness. This means not only provision for bathing the baby, but also facilities for washing the baby's clothes and napkins, and for the clean preparation of the baby's food and clean surroundings generally. It is essential also that the mother should be able to see to her own cleanliness and in particular the care of her clothes and hands.

A low chair on which the mother can sit to nurse and bath the baby is useful, and this can be improvised by cutting down an ordinary wooden chair. It can be painted a bright colour and it should be scrubbed at regular intervals—for example, once a month.

The cot for the young baby can, if necessary, be improvised from such things as a wicker basket. During the late war, cots were even improvised from orange boxes! It is, however, worth while to buy a wicker cradle and later a large dropside cot, as this will last well into infancy. A point to be remembered about cots and also about play-pens is that the bars should not be more than 3 inches apart, so that the baby cannot get his head through. Also there should be no collapsible parts which can suddenly give way and trap the fingers.

Bedding for the cot will include a blanket to go under the mattress. Next comes the under-blanket on top of the mattress. Over this comes the macintosh or other waterproof material with the flannelette drawsheet over it. The baby is wrapped in a shawl or soft blanket and covered with a top blanket. An extra blanket may be needed in cold weather. Many leading authorities on baby care recommend that a pillow should never be used, and certainly not a soft pillow, for babies have been known to be suffocated by these. When discussing later on the preparation of food, the washing of the baby and the washing of baby's clothes, reference will be made to some other items of equipment required.

With quiet and orderly preparation for the coming of the baby, pregnancy can be a very happy time. Indeed, that is what Nature intended it to be, and most women are never so well as during the months of pregnancy.

THE HEALTH OF THE BABY.

So far these notes have dealt primarily with the health of the mother. Independent life begins for the baby from the moment he is born. The stimulus of the external air makes him draw his first breath, and immediately his own circulation replaces that of the mother on which he has been dependent for the past nine months. But a new association begins. It is the baby's birth-right that he should be nursed and fed by his mother, and the intimate relations which exist between mother and baby render them, in effect, one person for nearly the whole of the first year of life. The more the mother knows about babies in general, and her own baby in particular, the better.

Care of the Newly Born Baby.

This is, of course, the province of the midwife, who, in addition to cleaning the eyes and freeing the mouth from mucus, will bath the baby and wrap up carefully to prevent chilling. After weighing, the baby is put into his cot while the midwife looks after the mother.

The Cord. Before birth the baby gets his nourishment from the mother through a cord which enters his body at the navel and at the other end is fixed to a large sponge-like structure (the placenta) attached to the inner wall of the mother's womb. Although the bloods of mother and baby do not intermingle, oxygen and nutritive substances in the mother's blood pass via the placenta into the baby's circulation and waste products are transferred from the fœtus to the mother's blood. The baby is part of the mother. That is one reason why the expectant mother should not over-indulge in tobacco or alcohol!

Directly after birth the midwife or doctor ties off the cord and the stump falls off in about seven days. The scar at the navel heals about the tenth day. If strict cleanliness is not observed in handling the baby during that time the cord stump may become septic and the baby's life be endangered. The directions of the doctor and midwife must therefore be followed carefully.

Weight and Length. The weight at birth varies usually between 6½ and 8 lb. It is sometimes as high as 10 lb. or as low as 5 lb. Boys usually weigh more than girls. The length of a baby at birth is usually 19 to 20 in.

The premature baby is not necessarily one which is born before the end of the normal pregnancy, and often babies born three weeks before they are expected are normal in size and do not require special care. The newly born baby weighing less than 5½ lb. is usually regarded as premature and treated accordingly. Premature babies have not got the natural resistance of the normal baby and require special care. For example, the results of a cold or influenza, or any septic infection, are more serious in these babies, and it is therefore necessary to exercise strict watch over them and keep them apart from other children and adults. Again the body temperature of these babies is often low and requires to be kept up to normal by artificial means, such as hot bottles and extra clothing or electric blankets. Some babies are so small and delicate that they have to be nursed in an incubator. Premature babies are difficult to feed and they do not suck so vigorously as a normal infant. On the other hand, it is even more important that they should be breast-fed, if possible, than with normal infants. Extra care is therefore necessary with the premature infant, and many Local Health Authorities have arrangements for nursing these babies either at hospital or at home with a specially experienced nurse. It is important to remember that premature babies need special attention throughout the first year of life, for if neglected they are especially liable to bronchitis and pneumonia. The care taken by health and hospital authorities to save such babies is well worth while, for once they pass the critical early months they develop fully, both in mind and body, into normal healthy people.

The Skin. At birth the skin of a baby is red and covered with a protective fatty substance which comes off with the first bath; the redness persists for a few days. The skin of a baby is extremely delicate and needs very careful attention. This will be emphasised later when the question of washing and bathing is considered.

The Head of the new-born baby may look a little out of shape. This is because of the pressure during birth and it rapidly becomes normal. The bones of the skull are separated from each other in the new-born baby, and on the middle of the top of the head there are two diamond-shaped soft spaces where the skull bones meet. The space towards the front of the top of the head is known as the anterior fontanelle, and the doctor and midwife often gain useful information on the child's condition from the bulging or depression of this area. The other opening towards the back

of the skull is smaller and is known as the posterior fontanelle. This closes in six or eight weeks, but the anterior fontanelle remains open for about eleven to eighteen months.

Chest and Abdomen No special comment is needed concerning the chest of the baby, but the abdomen is normally more prominent than in older children. This is due partly to the very large liver of the young baby and also to the fact that the stomach stretches to take in as much as 3 or 4 oz. of milk at one feed

Nervous system Even a newly born baby can grasp an object and hold it It can also suck and swallow from birth, but the special senses are not well developed Loud noises will startle the baby, but he cannot at first recognise where a particular noise comes from Babies are particularly sensitive to bright lights, but for some time cannot properly control the movements of the eyes and head so as to be able to gaze steadily at anything The sense of smell and taste develop in a few days. Movements of arms and legs are not co-ordinated at first, but at the end of the third or fourth month of life the child can usually hold up his head. At the end of five or six months the baby makes an attempt to sit up, although this may be delayed until the seventh or eighth month By the ninth month the child begins to crawl and can usually stand at the end of ten months At twelve or fourteen months he walks The young baby is very sensitive to his surroundings. If these are unfamiliar he may, for example, refuse to feed Also if the mother or a relative is nervous in handling him he will immediately become frightened It is therefore very important to learn how to handle a baby properly and firmly so as to gain and hold the child's confidence

Speech Sounds are made a few weeks after birth, but single words are only said towards the end of the first year Real talk does not occur until about twenty months or two years

The Teeth One of the reasons why it is important to ensure the adequate nutrition of the mother during pregnancy is that the infant's first, or milk teeth, are developing at this time, so that they are already present within the gums at birth They appear through the gums in the following order —

Lower central incisors	5th to 6th month
Upper central and outer incisors . . .	7th to 8th month
Lower outer incisors	10th to 12th month
First molars .	14th to 16th month
Canine teeth (eye teeth) .	17th to 18th month
Second molars . .	24th to 30th month

Although there are wide variations in the time of appearance of teeth, eight teeth should be present by the end of the first year, and all twenty of the milk teeth by the end of the second year

The prevention of dental decay depends, therefore, partly on the good nutrition of the mother, but also on freedom from illness of the infant, especially one which affects the intake of food for any length of time The preservation of the teeth depends on the presence of an adequate supply of mineral salts, and especially calcium and also of vitamin D. Exercise for the jaws by the gnawing of hard crusts, or rusks, is also necessary

GENERAL MANAGEMENT

It is important to have a clear idea of the needs of the young baby in order that a regular routine may be worked out which will place the least strain on the mother and give the baby the maximum degree of comfort and security. It is also necessary to know where to turn for guidance and advice in a difficulty The family doctor is, of course, the stand-by in emergency and if illness is suspected He is, however, a very busy man, and the young mother may not want to worry him with enquiries which, although important to her, are relatively trivial to him. The midwife, the health visitor, the home nurse, and the Welfare Centre are all available to advise. When in doubt do not hesitate to ask for advice The mere sharing of an anxiety with another is helpful.

The baby's material requirements are simple. They are food, cleanliness, warmth, and sleep and, above all, an orderly routine.

The Daily Routine.

Opinion varies as to the frequency of baths for the newly-born infants, but it is now a common practice to bath the baby immediately after birth, and then to leave him until the stump of the cord has separated, at the seventh to the tenth day, the skin being cleaned, when necessary, with olive oil.

After this time the baby will take a bath each day

A baby's skin is very sensitive and will quickly chafe and get sore if roughly handled. It is therefore necessary to exercise the greatest care in the choice of materials used for washing and in the handling and drying of the skin. Great care should be taken to select the finest soap and the softest of washing flannels or sponges. Towels must be soft, dry, and clean, so that the skin can be dried thoroughly by gentle rubbing Gentle handling is particularly necessary for the creases of the skin and behind the ears Some experts say that powder is unnecessary after bathing, but there is little doubt that a good dusting powder helps to preserve and soothe the baby's skin and to keep it dry

If the skin becomes inflamed and sore expert advice should be sought, as the baby is very susceptible to septic infections which can enter through small abrasions or cracks in the skin.

Sun and Air.

Many skin conditions in infancy, and indeed other illnesses, are predisposed to either by neglect or excessive care Leaving the baby to lie in wet and dirty napkins is one example, and at the other extreme is the failure to allow free access of air and sunlight to the skin by over clothing The human skin has many important functions, including the maintenance of the temperature of the body, and it is also concerned with the manufacture of vitamin D by the action of sunlight on the skin It is therefore essential that the body should obtain a reasonable amount of fresh air and sunlight

Sore Buttocks The best way to prevent a baby from developing soreness of the skin of the buttocks is early training in clean habits, as in many instances the inflammation of the skin is due to irritation set up by the child's urine or motions Obviously a clean dry napkin will not cause this soreness, and the well-trained child soon learns to keep clean and dry Accidents will, of course, happen and some little upset in the diet may cause frequent stools It is therefore essential to change the napkins regularly and to clean the buttocks thoroughly after a motion All faecal matter should be removed with cotton wool swabs (which are put immediately into the "dirty" bucket), and the buttocks are then cleaned gently with warm water, dried and powdered If the skin is red and sore, olive oil may be used for cleaning instead of water, and zinc and castor oil ointment or cold cream instead of powder If the soreness is marked the daily bath can be stopped for a day or two, but expert advice should be sought if it does not clear up quickly

CARE OF THE CLOTHES.

Apart from the fact that every mother likes her baby to look clean and neat it is essential to keep the clothes clean because of the sensitiveness of the young infant to infection of all kinds. Cracks or abrasions of the skin may turn septic if dirt comes in contact with them and dirty clothes or towels are particularly liable to cause infections of this kind. Apart from this, badly washed clothes may also set up inflammation of the skin by being hard, and thereby chafing the skin, or because irritating fatty acids from the wrong kind of soap have not been completely rinsed out The first essential is therefore to wash all articles which may come into contact with the baby regularly and frequently

The mother must see that her own clothes and body are clean and in particular that her hands are washed thoroughly before the baby is handled Her aprons and overalls should be washed frequently and discarded at once if soiled This is particularly important if soiling takes place when the baby's napkins are changed.

Towels must be clean, soft, and thoroughly dry, before they are used.

Flannels and sponges should be washed frequently in hot water and thoroughly rinsed free of soap. Face flannels should be boiled once a week.

Napkins require special care They should

first be sluiced under running water to wash out all solid matter, and then left in a bucket of cold water until ready for washing. Washing should be done in warm water with a good soap lather with thorough rubbing, and rinsed in several lots of water until all the soap is rinsed out. After wringing they are hung up to dry. Drying should not take place too quickly, as the napkins will then be hard. For this reason it is best to dry them out of doors. Mangling will help to make the napkins soft after drying.

Baby's Clothes. Different materials require different methods of washing, but the principles set out above hold good for all clothes. The washing must be thorough, in water which is hot enough to enable dirt to be removed but not so hot that the clothes cannot be well cleaned by hand. It is particularly necessary to see that neck and cuffs are cleaned properly, and the same comment applies to the lower edge of the vest which may be soiled from the napkin.

Bibs should be boiled at regular intervals, as they are liable to get smelly from regurgitated milk.

SLEEP.

If a baby is warm and comfortable and well fed its natural reaction is to sleep. The newborn infant sleeps for eighteen to twenty hours each day, waking only to be fed, and even at twelve months he will require fourteen or fifteen hours sleep each day. Sound sleep is essential to good health, and bad management of the young baby may result in faulty habits which last throughout life. Thus undue excitement before being put down to sleep, or irregular hours, may sow the seeds of insomnia. Ideally the baby should be made so comfortable that he will sleep from ten o'clock at night until six o'clock the next morning, but hunger may prevent this, and feeds may require to be re-arranged accordingly.

Restless sleep, with sudden nervous starts, is not a normal condition, and expert advice should be sought if this persists. A common cause is some digestive upset, such as colic or constipation, and coughs and colds also disturb the normal sleep rhythm, especially if there is a rise of temperature. It may then take a few days for the normal sleep habit to return.

CRYING.

It is normal for the young baby to cry, and a lusty yell is a good way to expand the lungs. Attacks of crying and screaming do not always signify pain or colic. Although it is a mistake to pick up a baby every time he cries, it is necessary to exclude sources of discomfort, such as hunger, a wet napkin, colic, constipation, and pain. Apart from these, the child may quite easily get into the habit of crying, or the baby, even the very young baby, may realise that he can readily attract attention by a display of tears or temper and thus be spoilt. It is advisable to seek expert advice if the fits of crying persist without apparent cause.

CARE OF THE MOUTH, NOSE, AND EARS.

Common sense applies in the cleanliness of the mouth, nose, and ears, just as in all other matters relating to the care of the baby. The lining of the mouth is very delicate and easily scratched. It should not, therefore, be cleaned. Indeed, any attempt to clean the mouth may result in an infection which will result in difficulty in feeding and fretfulness. As mentioned earlier, the nostrils must be cleaned regularly, but this only means the entrance to the nostrils. Sneezing and discomfort are caused if the cotton wool is pushed up too far. The cotton wool swabs used to clean the nose should be moistened in warm water and twisted to a point. The ears may also be cleaned gently in the same manner as the nostrils, but no attempt to remove dirt or wax with a solid instrument, like a match-stick or hair-pin, must be made. Permanent injury to the ear-drum and hearing may easily result.

BREAST-FEEDING.

Every baby has the right to expect that his mother will feed him herself. That is the natural way and has advantages to both mother and baby. The baby gets the best possible food without any of the risks of contamination that may occur with the preparation of artificial food. The temperature of breast milk is that of the infant's body and it contains various protective substances which help to shield the baby from infection.

The mother, for her part, has the satisfaction of knowing that she is "mothering" her baby in the fullest sense. Incidentally, breast-feeding costs nothing, whereas artificial feeding can be quite an expensive matter. There are certain medical conditions where a mother should not feed her baby herself, but they are very few in number.

As in everything else in life confidence arises from the knowledge of the right way to do a thing. Breast-feeding is no exception to this rule, but it is particularly important that the mother should have full confidence in her ability to feed the baby, as any nervousness and anxiety on her part are soon transmitted to the child. This is one of the reasons why regular visits should be made during pregnancy to the doctor or clinic, in order that the mother's general health may be investigated and such important details as the care of the nipples attended to. The midwife will see that a regular routine is taught during the first fortnight of the baby's life, so that by the time the mother assumes full responsibility for the baby she will have had quite a lot of experience.

The general rules are, of course, quite simple. A regular routine is desirable both for the sake of mother and baby. The latter must be able to have his food at the same times each day, and the regular routine helps the mother to lead her normal life. The mother will already have had instruction on the care of the breasts, and in particular the preparation of the nipples so that they will not become tender when the baby starts feeding. The next essential is, of course, cleanliness. The nipples must be carefully washed before and after feeding and particular care should be taken in drying after feeding, as a little crack or fissure in the skin of the nipple, in addition to causing pain and discomfort, may let organisms enter to cause a breast abscess.

The third essential is to persevere. Many young mothers get discouraged at what proves to be in fact only a temporary upset. For example the baby with a cold in the nose has difficulty in breathing and feeding at the same time, but a little patience will soon ensure that he does not suffer, by taking a little longer at each feed.

The last great requisite is calmness. Breast-feeding is a natural process, and countless millions of women have successfully fed their babies since the world began. It is not therefore a matter for nervous speculation and anticipation. Any nervousness or sense of strain on the part of the mother is quickly felt by the infant, who will in turn be restless and irritable. A comfortable position in quiet surroundings, and a regular routine, will ensure that the baby can give his entire attention to feeding, and the supply of milk almost invariably keeps pace with the demand. If any little anxiety or doubt arises in the mother's mind she should seek competent advice and not listen to "old wives' tales." The doctor, midwife, or health visitor, are the best people to advise.

WEANING.

No sensible grown-up person would contemplate changing suddenly from a normal diet to one entirely different. In the same way, weaning should be a gradual process. Between the sixth and twelfth month of life the baby will be changing from four-hourly feeds to the "three good meals a day" routine which he will hope to continue for the rest of his life. To begin with, therefore, it will be natural to change his diet by altering *one* of his feeds, for example that at 10 a.m. This may be at first one of the recognised proprietary milk foods, and later such items as milk pudding, potato and gravy, and green vegetables, may be given. From the sixth month onwards, the baby will want to nibble a rusk or hard-baked crust, which may be smeared with butter, egg, honey, etc. It is not necessary to continue breast-feeding beyond the ninth month and many mothers stop earlier. Much depends on the health and energy of the mother. Generally speaking she should try and continue breast-feeding during the hot weather and not wean until the autumn. By this means the anxiety of protecting the baby's food from contamination during the summer months is avoided. It is also inadvisable to wean if the baby is suffering from illness. It is much better to continue with breast-feeding until he is well. It

is sometimes necessary suddenly to wean a baby. For example, the illness of the mother may make this imperative. In that event expert advice should be taken, as the sudden transfer to an unsuitable food may upset the baby's digestion. Again, the amounts of food taken by different babies vary very much, and one may take several ounces more than another in the course of twenty-four hours. It may therefore be necessary to try different kinds and amounts of artificial food before the right one is found, and expert advice on this is most helpful.

ARTIFICIAL FEEDING.

It would be unwise in these notes to attempt to describe the various kinds of artificial food for a baby. Babies vary in their likes and dislikes from one to another just as grown up people do. The basis of artificial food is cow's milk modified in various ways. Very few infants will tolerate whole cow's milk as the amounts and nature of the fat, sugar, and protein, are different from human milk. Expert advice should be sought on the best type of artificial food for the baby, but there are certain fundamental rules which must be followed in all cases. In addition to the essentials already set out for breast-feeding, namely, a regular routine, quiet surroundings, and personal care all the time the baby is being fed, particular attention must be paid to cleanliness. It is very easy to contaminate the baby's food in the course of artificial feeding and infections caused in this way may prove to be serious.

First, the mother must make sure that her own hands are clean by scrubbing with soap and water and drying on a clean towel before each feed is prepared. This precaution is particularly necessary if the mother or one of the other members of the family has an intestinal upset, such as diarrhœa. Next, the room in which the food is prepared must be scrupulously clean and free from dust and dirt. The outside of tins and containers must be cleaned before they are opened and so must the table or tray on which the food is kept. Much time is saved by neat and methodical preparation. If everything required is kept always in the same place, and used articles are cleaned and replaced immediately, the risk of contamination by constant handling of unnecessary articles is thereby reduced. Saucepans and bowls and basins must also be absolutely clean, but the most frequent source of infection is in the feeding-bottles and teats. If these are not cleaned properly after each feed the film of milk left behind makes an ideal breeding-ground for bacteria. Feeding-bottles should be washed after each feed, rinsed, and kept in cold boiled water until required again. They should also be boiled for five or ten minutes every twenty-four hours. Teats should be turned inside out and cleaned thoroughly after each feed, and boiled once a day in water to which a little salt has been added: the salt helps to preserve the rubber. Between feeds they also should be kept in cold boiled water.

It is advisable to boil all milk for babies, especially in hot weather. Indeed, where there are no proper facilities for keeping fresh milk, it may be wiser to use dried milk in very hot weather. It is also essential to see that jugs and bottles containing milk are securely covered to keep out dust and flies.

The actual feeding of the infant should follow the same routine as for breast-feeding. The baby feeds best when he is quiet and comfortable, and the napkin should therefore be changed before feeding. In no circumstances must the baby be given a bottle and left to his own devices. The mother should stay during the whole feed and hold the bottle herself. Only by this means can the little encouragement and attention which mean so much to the health of the infant be given.

Vitamins

Milk, fruit, and vegetables make the basis of the baby's diet, but by the age of nine months he is able to digest tender and finely divided meat, and also fish. At this age all fruits can be eaten, but fruit with pips and skins, *e.g.*, black and red currants and gooseberries, require to be strained and given in the form of gooseberry fool, etc.

Similarly, all vegetables can be taken, provided that they are young and tender and well cooked, and small amounts of lettuce, carrot, and other salads can be given, provided that they are finely divided.

It is essential to ensure that the infant receives an adequate supply of vitamins, especially in the winter. This may be done by adding fresh or concentrated orange juice or rose-hip syrup, and cod-liver oil or halibut-liver oil, to the diet, or by means of vitamin concentrates. It is advisable to take expert advice on the most suitable way of supplementing the vitamin content of the diet especially following an infection, for coughs, colds, and other infections, tend rapidly to lower the reserves of vitamins in the body.

Foods containing iron include green vegetables, and bone and vegetable broths. Calcium, so important for bone formation, is supplied with the milk in the diet.

THE SYMPTOMS AND SIGNS OF ILL-HEALTH

It is, of course, essential to seek advice immediately illness is suspected. The signs and symptoms of illness in the baby are not so clearly defined as in grown-ups, nor can the baby tell where he has pain or discomfort. Again, anxiety or doubt in the mother's mind is best shared with an expert as soon as possible. The following notes may, however, serve as a guide in interpreting some early departures from the normal.

Temperature. A young child will often develop a rise of temperature for no apparent reason, as the mechanism for controlling the heat of the body is not so well regulated as in older people. A slight temporary rise in temperature may not therefore be so significant as in older children, but if at the same time the child is restless, irritable and "off his food," it should not be neglected. The thermometer should be placed under the arm pit with the arm held closely to the side, or in the fold of the groin with the legs held closely together. As the skin temperature is a little lower than the body temperature it should be kept in position for five minutes before reading the result. The normal temperature is 98.4° F.

General Appearance. The mother will be able to tell when a child is ailing, as she sees the baby constantly. Restlessness, irritability, pallor or undue flush, sweating, crying and unusual movements or positions, may all give an indication that the child is unwell. Colic, or vomiting and diarrhœa or constipation, may also help to show abnormalities.

Restlessness and disturbed sleep in a baby who had previously been sleeping and eating well are obviously indications that there is something not quite right. This is especially the case if at the same time there are other symptoms, such as sweating and a rise in temperature. Lying in an abnormal position, or the development of rigidity in the back or neck, should be enough to seek expert advice at once.

The Air Passages. The common cold may be quite a serious matter in the young baby. In addition to making him feverish and fretful it interferes with his feeding because the nose is stuffed up. A cold in the head should not be treated lightly and every effort should be made to keep away people who have a cold so that the baby does not catch it. When nursing a child with a simple cold make sure that he has plenty of fresh air. A stuffy atmosphere delays recovery, and the child will come to no harm if he is warmly clad. Patience in feeding is required, as he will need frequent rests to get his breath. Plenty of warm, sweetened, boiled water will help to relieve thirst. The nostrils should be kept clean and soreness prevented by lightly rubbing vaseline round the nose and upper lip.

Cough and Shortness of Breath. If the baby develops cough, and shortness of breath, expert advice should be sought at once. There is, of course no need to assume that the child has some serious condition such as pneumonia. Probably he has some simple condition which will get better in a few days with expert treatment. On the other hand, it would be sheer stupidity not to take advice, as even a simple bronchitis can cause the baby distress and interfere considerably with his feeding.

Refusal of Food. A young child refuses food either because he does not want it, or he is "full up," or because he is not feeling well, or because he is feeling cantankerous and is "playing up" in consequence. The first and last reasons are soon

cured by hunger, but the onset of illness, and especially the early stages of infection, are not easy to detect, and it is inadvisable to delay too long before seeking advice

Vomiting and Diarrhœa occurring together should lead the mother to seek advice at once, particularly if this happens during the hot weather and other cases are known to have occurred in the neighbourhood.

Vomiting without Diarrhœa It is normal for the child to regurgitate a little food after feeding particularly if he has had too much Again he may bring up a little milk with the wind, but the vomiting of sour curdled milk is not a normal event. Persistent vomiting, particularly if "explosive," or not related to food, will need expert advice, as it may be the first symptom of illness.

Diarrhœa Slight changes from the normal, righting themselves in a few hours, are only to be expected from time to time. If diarrhœa persists, and particularly if the child is also out of sorts, expert advice must be taken. A change of colour of the motions from orange-yellow to a green slimy stool is an indication for seeking advice at once. In any attack of diarrhœa, however slight, particular attention should be paid to the skin of the buttocks, as this readily becomes inflamed and sore The treatment for sore buttocks is described earlier in this article

Constipation is not a cause for anxiety unless it is persistent, or the child is ill in other respects In fact many babies tend to be constipated Drastic measures are not called for. It is, of course, essential to persevere with the regular routine each day in order that regular habits may be acquired The first essential in treatment is to see that the baby is getting enough food, and adequate exercise, together with plenty of sweetened water, or fruit juice and water to drink Constipation is more frequent in the older infant who is taking mixed or artificial food, and he can be given such simple (and usually effective) remedies as a teaspoonful of prune juice or a teaspoonful of honey in warm water. Persistent constipation requires expert advice, and remedies such as glycerin suppositories or enemas should not be given without that advice

Feeding Troubles In addition to the above indications of ill-health there are other signs and symptoms which help to show when the baby is not feeding properly Distention and discomfort may be indications that all is not normal Some distention after a feed is not abnormal, but it should subside before the next feed Persistent distention, especially if it is increasing, should lead the mother to seek expert advice

Discomfort after feeding is not normal It may vary from mild restlessness and fretfulness to attacks of colic with screaming and the legs drawn up. Examination of the motions may show that they are loose and green or contain white undigested lumps, in which case expert advice should be sought

Failure to Gain Weight and Wasting It is essential to remember that babies are not machine made Therefore they vary from one to another One may be big and sturdy with a loud cry and a lusty appetite. Another may be small and quiet with only slow gain in weight Too much attention must not be paid, therefore, to the weighing machine. If the baby is placid, healthy, and sleeping well, the fact that he is not gaining rapidly in weight does not matter If, on the other hand, the child looks tired and thin with sunken eyes and the fontanelle on top of the head drawn in, expert advice must be sought. If he also has diarrhœa and is irritable or apathetic, then expert advice should be sought immediately

Teething There is no doubt that teething causes temporary disturbances in most babies, but it is important that illness due to other causes should not be dismissed as teething trouble It is safer, therefore, to assume that any illness is not due to teething and to seek advice The kinds of disturbance that may occur in teething are local and general The local symptoms are pain in the mouth with sore and inflamed gums The child resents any attempt to see the teeth There may also be dribbling, and enlargement of the glands in the neck. The general symptoms may include a tendency to eczema, and bronchitis, and nervous symptoms, such as fretfulness, irritability, sleeplessness and convulsions. Expert advice should be sought for such conditions as eczema, bronchitis or convulsions. Beyond this no treatment is required except patience and watchful care. Common sense will show the wisdom of studying the child's needs for soft and easily digested food, and avoiding hard crusts and rusks until the tooth is through

Convulsions. The occurrence of convulsions is a danger signal indicating the need for immediate medical advice. In many instances the cause and the remedy are simple, such as faulty feeding with insufficient vitamins in the diet. On the other hand, they may be an indication of the onset of an acute infection, or some other condition requiring careful investigation. Fortunately convulsions are rarely fatal, and the first-aid treatment is to put the baby in his cot in a quiet corner of the room and send at once for the doctor

Head Injuries. Babies and young children can fall in the most alarming manner without sustaining anything more serious than a bruise If, however, following a head injury, the baby is pale and drowsy with vomiting, then expert advice must be sought immediately

PREVENTION OF ACCIDENTS.

Each year about 6,000 people die, in England and Wales alone, as the result of accidents in the home More than one-quarter of these are children under the age of fifteen, and between the ages of one and five years a fatal accident in the home is the third most frequent cause of death Many of these are either due to accidental suffocation or to burns and scalds

Down pillows for small babies were formerly a common cause of suffocation Burns and scalds may result from an unguarded fire, or one in which the fire-guard is faulty Electric flex with worn insulation is a particular danger to the toddler, for he may fall over it, or get an electric shock if he plays with it. A saucepan handle put within easy reach of the child, or an over-hanging table-cloth with a tea-pot on the edge of the table, may result in a bad scald if the child can reach to pull it down

Medicines or garden chemicals, etc left lying about may tempt the child to eat them, and in this connection it should be remembered that young children are more susceptible to poisons than adults

Finally, a very young child, like an old person, falls readily, and care should be taken not to put obstacles in its path, such as a loose mat on a slippery floor, or a worn carpet with loose strands

The young baby should be so well protected that accidents do not happen, but they do sometimes occur, even in the best regulated families! The first essential is, of course, prevention, and the wise parent will look carefully round the rooms in which the baby lives to see that all fires are protected by guards, electric light and power flexes and switches are not exposed, and that hot kettles and taps are out of reach The table must be so laid that sharp knives cannot be touched and table-cloths cannot be pulled, and tea-pots, and other vessels containing hot liquids, thereby spilled over the infant See also S38

Protection against Smallpox, Diphtheria, Whooping Cough, and Poliomyelitis

Smallpox is now rare in the British Isles because of the care taken at the sea and airports to keep it out of the country, and because vaccination prevents it from spreading if it is introduced It is a very serious disease with a high mortality, particularly in young children

Although compulsory vaccination has been abolished it is still essential that every baby should be vaccinated This can be done either by the family doctor or at the Welfare Centre

Diphtheria, Whooping Cough, and Poliomyelitis. During the late war the diphtheria immunisation campaign was so successful that the number of cases and the deaths from diphtheria were reduced beyond all expectation. Diphtheria remains, however, a very serious disease and the baby must be protected against it Immunisation is a simple procedure and does not leave any after-effects It can be done by the family doctor or at the Welfare Centre. It is now possible to immunise also against whooping cough, and poliomyelitis, and it is a wise precaution to take medical advice on protection against these serious diseases

HEALTH EDUCATION

Definition of Health.

Research and the organisation of medical services would be quite useless if the people to be helped remained in ignorance of what is expected of them. So great has been the burden of disease until recently in western countries, as indeed it still is in many under-developed communities, that all efforts were bent on cure. The medical student rarely left the walls of his teaching hospital and never saw the homes or working conditions of the patients until he embarked on practice for himself. If a person was not "sick" he must be "well," so that good health was thought to be synonymous with freedom from disease.

It was not until recently, after the Second World War, that health was defined in the Constitution of the World Health Organisation as "a state of complete physical, mental and social well-being and not merely the absence of disease or infirmity" This definition was regarded as quite revolutionary when it appeared in 1948, as indeed it was, but it is slowly becoming recognised that it is not impossible of attainment, provided that all those concerned, governments, health workers, and the people, play their part, and it is the purpose of health education to ensure that they can do so The teaching of medical students in the future, for example, will be very different from that of the past, with increasing emphasis on the prevention of disease and instruction in the principles of healthy living Already the concept of the "Health Centre" is widely accepted throughout the world as a primary health unit where the prevention and cure of disease may be practised under one roof, and from which medical care may extend into the homes of the people Similarly, all governments now recognise that many factors play a part in improving the health of their countries, better housing with the abatement of over crowding, the supervision of the health and welfare of workers in industry, and higher nutritional and economic standards, being among the more important measures, together with general education to raise the standard of literacy

Maintenance of Health.

Even in the most advanced countries, however, the final and decisive measures to maintain health rest with the individual A person who habitually over-eats, who takes no exercise, and who persistently taxes his mental and emotional powers beyond their capacity cannot complain if he suffers as a result Quite apart from this extreme example, there are many thousands of people who are genuinely ignorant of the elementary principles of health or of the measures available for their help, people to whom the reasons for personal hygiene and cleanliness are unknown and, more important, a very large group, including the elderly, who do not know where to look for the help which is available to them. In a well-organised and literate society health education begins with the mother and continues during the school years It can be reinforced by all modern methods of propaganda, through the press, radio, and television, as well as by personal instruction and formal lectures by doctors and health workers. Even so, the amount of ignorance still displayed as to the causes and prevention of disease is alarming

When one turns to the under-developed countries the problem becomes one of the first magnitude, and health education has to begin at the "grass roots" For millions of people the use of soap is still unknown, even if they could afford to buy it, water is drawn from shallow and polluted wells, and all the ordinary habits of life are governed by ancient tradition and superstition. Very few can read or write, especially among the women, and the influence of the elders is great To teach such people to be healthy is fraught with many difficulties, for sickness is a part of their lives, to be accepted with all other hazards, such as flood, drought, or disasters affecting their animals and crops To expect people to change their insanitary habits because of the danger of spread of bacteria or parasites which they cannot see is asking a great deal, even of the most intelligent villagers Any health measures introduced must also be within their limited capacity to pay for them, or be paid for by government or international agencies Health education here begins with the women, and calls for people who can think as they do and speak their language Making contact with the villagers requires great patience, but it is ultimately most rewarding, provided always that the people are not so poor and under-nourished that they can no longer help themselves Simple health education in the village schools is also of value, but it is commonly found that very few girls attend these schools, and the influence on the boys is limited, for their work lies in the fields and not in the home Another profitable line of approach is through the head man of the village, and an appeal to his pride, his superior intelligence, and his desire to improve the health of his villagers may produce quite unexpected results

The fact remains, that in countries where the vast mass of the population live on the land and where the *per capita* income is very low the people can do little to help themselves Even with the help of the great international agencies progress is bound to be slow Fortunately such peoples usually have strong religious and family ties, so that while physical well-being is an ideal for the distant future, they enjoy a peace of mind denied to the more sophisticated Care must be taken not to be too hasty in breaking down ancient social and caste traditions, for they represent a secure way of life for people who are at the mercy of perils that they cannot contend with Health education may thus consist essentially of working at a very humble level, in the instruction of simple people in the elementary principles of healthy living. With the growth of health services the health workers begin to assume also the role of health educators. The midwife, the nurse, and the health visitor gave, and still give, valuable instruction to mothers on the care of themselves, their babies, and older children Public health inspectors teach practical health measures during the course of their daily work, and health education forms an important part of the duties of the medical officer of health

Health Educators.

In certain countries, and notably the United States of America, the modern techniques of communication have led to the creation of professional health educators, people who combine the necessary technical knowledge with special training in the arts of teaching people, influencing public opinion, and publicising the value of health services. To do this requires experience of the mass methods of communication by the press, television, and radio, in addition to working with the people by means of group discussions, audio-visual aids, and formal lectures Courses are now available in this subject at certain universities, and in Britain the Central Council for Health Education engages in teaching and training especially for health workers. The one thing in common between the highly trained professional health educators of western countries and the health worker sitting with the women in an over-crowded mud house in an eastern country is that both must carry conviction with what they say.

PART III. INDEX AND GLOSSARY

Cancer of the lung, 32 (2).
Cancor of the œsophagus, 34 (1), 5 (1).
Cancer of the rectum, 37 (2).
Cancer of the stomach, 34 (2).
Carbohydrates. The scientific name for sugars, starches, and cellulose, 39 (2).
Carbuncle. A large boil.
Cardiac neurosis, 28 (2).
Carrier. A person who harbours disease germs without suffering from the disease himself, 13(1).
Cataract, 55 (1).
Chadwick, Sir Edwin (1800–90) English social reformer, 5–6.
Chancroid, 16 (1).
Change of life, 56 (2).
Changes in atmospheric pressure, effects of, 21 (1)
Chickenpox, 10 (1).
Chilblains, 52 (2), 29 (2).
Chill. This is not a proper medical word, but refers to the symptoms that occur when one first becomes infected with any germs which cause fever When such germs enter the body, all the defending processes are mobilised and speeded up The white cells in the blood increase in number, and the amount of energy used is greater than normal, causing the temperature to rise. This rise in temperature increases the ability of the body to fight back, and, in order to retain heat within the body, the blood-vessels in the skin contract so that less heat is lost by radiation This makes the skin cold and pale What is ordinarily called a chill is merely an infection by the germs causing cold and influenza But a chill may be the preliminary to almost any infectious disease, such as measles, mumps, scarlet fever, pneumonia, and so on. The best treatment when the temperature is raised is to go to bed with as much warmth as possible Hot drinks and hot-water bottles are helpful *See* 10 (2)
Cholecystitis, 38 (1)
Cholelithiasis, 38 (1).
Cholera, 15 (1)
Cholesterol, 27 (2), 38 (1), 40 (2)
Chorea (St. Vitus' Dance), 48 (1).
Chromidrosis, 52 (2).
Chronic. A chronic disease is one which is prolonged and relatively mild, as opposed to an acute one, which is short and severe
Chronic bronchitis, 32 (1)
Chronic nephritis, 44 (2)
Circulatory system, 24 (1), 26.
Cirrhosis of the liver, 38 (2)
Claustrophobia. A psychological symptom, which causes the individual to be afraid of enclosed spaces *See under* **Obsessional neurosis,** 51 (1)
Coccyx. The end of the spinal column
Cœliac disease, 36 (2)
Cold sore. *See* **Herpes labialis,** 49 (1).
Colds, 10 (2), 30 31.
Colitis, 36.
Collodion. A drug which, when painted on the skin, forms a thin transparent protective film. It is also known by the proprietary name of New Skin, 49 (1).
Concussion, 20 (2).
Conjunctivitis, 54 (2).
Constipation, 35 (2)
Contraception, 56 (2).
Coronary thrombosis, 27.
Cortisone. A hormone produced by the suprarenal glands, 4 (2), 43 (2), 51 (1)
Cough. *See under* **Chronic bronchitis,** 32 (1).
Cretinism, 41 (2), 4 (2)
C.S.F. (*i.e.*, **cerebro-spinal fluid),** 46.
Cutaneous ureterostomy, 45 (1).
Cystitis, 45 (1)
Cystoscopy. Internal examination of the bladder *See under* **Urinary diseases,** 45 (2)

D.A.H. (*i.e.*, **disordered action of the heart),** 28 (2)
Dandruff. *See* **Seborrhea,** 52 (2).
Deafness, 55.
Decompression sickness (**Caisson disease),** 21 (1).
Deficiency diseases, 41 42.
Degenerative diseases, 48 49.
Delirium tremens, 50 (1).
Dengue, 12 (1).
Dercum's disease, 43 (2).
Dermatitis, 52–53
Dhobie itch, 8 (1), 15 (2)
Diabetes, 39 (1).
Diarrhœa, 13 (2), 36 (1)
Diarrhœa and vomiting, 13 (2).
Diet, 39–40, 4 (1), 42 (2),
Digestive tract, diseases of the, 33–36.
Digitalis, 28 (2).
Dipsomania. *See* **Alcoholism,** 23 (1).
Diphtheria, 12 (2).
Disseminated sclerosis, 48 (2)
Diverticulitis, 36 (2), 34 (1)
Dropsy, 44 (2).
Drugs, addiction to, 22–23
Drugs, use of the new, 4–5
Duodenal ulcer, 34
Dysentery, 13 (2)
Dysmenorrhœa, 56 (1)
Dyspepsia, 35.

Ear, diseases of the, 55.
Earache, 55
E.C.T. The abbreviated form of the name for a modern type of treatment for certain psychiatric disorders—electro-convulsive therapy *See under* **Psychosis,** 50 (2)
Ehrlich, Paul (1854–1915) German bacteriologist, 4 (2), 5 (2), 16 (1)
Electrocardiograph, 26 (2)
Elephantiasis, 19 (1)
Embolism, 29 (2)
Emphysema, 32 (1)
Empyema. A collection of pus in the lung, usually a complication of other diseases
Encephalitis, 11 (1), 49 (2)
Encephalogram, 46 (2)
Endemic. Referring to a disease, etc. as prevalent in a particular area
Endocarditis. Disease of the valves of the heart, 28 (1)
Endocrine glands, 42 (2)
Enzymes, 33 (2)
Epidemic. Of a disease widely prevalent among people at a special time and produced by some special causes not generally present in the affected locality *See under* **Influenza,** 10 (2), *and also* 17 (1)
Epidemic jaundice, 16 (2).
Epilepsy, 47 (2)
Epitaxis (nose bleeding), 31 (1)
Epithelioma (cancer of the skin), 53 (2).
Erysipelas, 52 (2)
Erythema intertrigo, 52 (2)
Essential hypertension, 28 (2)
Exercise. *See* **New Views about Health, 4.**
Exophthalmic goitre, 42 (2).
Eye, disease of the, 54–55

Farcy, 15 (1)
Fevers, general treatment of, 9
Fibroids, 56 (1)
Fibrositis, 54 (2)
Flatulence, 35 (1).
Fleming, Sir Alexander (1881–1955) Scottish bacteriologist, discoverer of penicillin, 4 (2)
Food poisoning diseases, 13–15
Fractures, 20
Frölich's syndrome, 43 (2)
Frostbite, 21.
Fungi, 8 (1). **Fungi, diseases caused by,** 15 (2)

Gall-bladder, 38 (1).
Gallstones, 38.
Ganglion. A small cystic swelling, usually on the wrist, which can be dealt with by simple surgical treatment

Family Affairs

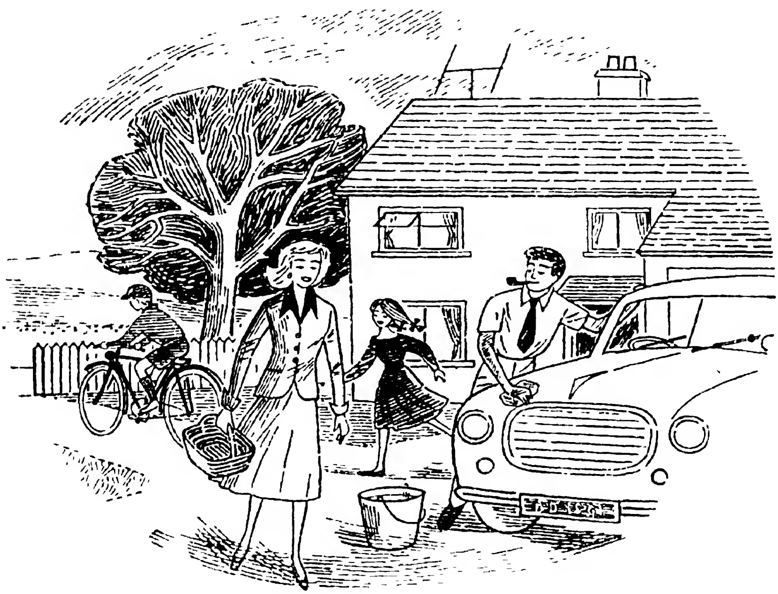


TABLE OF CONTENTS

Family Affairs

This section has an entirely practical purpose for it deals with the problem of how to be happy and make the most of our opportunities in this exciting, but often perplexing world in which we live Of course, personal and social problems cannot be solved merely by reading about them but it may help to see them through the eyes of a doctor who is a psychiatrist and social psychologist The section attempts two things: first, to give understanding—the first step in solving any problem—and, second, to suggest where to go for more personal and detailed advice
In addition there are suggestions for those who are thinking of buying a house, especially young people founding a home. The subject of insurance is dealt with and there are notes on consumer protection.

I. HUMAN RELATIONS

By a Doctor

Scientific knowledge has made possible greater material well-being, yet it is doubtful whether our capacity for happiness has correspondingly increased. There is an old saying, "happiness is with people," which means that satisfaction in living springs from good relationship with our fellows This is something which wealth, health, and good education cannot guarantee, no matter how important these things are in themselves.

Causes of Unhappiness.—There seem to be three immediate causes of unhappiness. ignorance, environmental problems, and psychological problems. Most unhappy people are suffering from a mixture of all three

By *ignorance* I mean that many people are discontented or troubled either because they do not know where to turn for help when it is needed or because they have got into difficulties through not knowing the rules of living

By *environmental problems* I mean not getting on with the people one has to associate with, being in a job which one finds unsatisfying and all the other everyday situations which arise from clashes between the individual and his surroundings.

Psychological problems are difficult to define, but, generally speaking, I shall speak of "environmental problems" when I mean that the trouble lies mainly in the person's surroundings and circumstances, and of "psychological problems" when I mean that the trouble lies mainly within the individual himself If, for example, a man is unhappy in a particular job, leaves it, and later finds a job in which he is quite satisfied, we should suppose that it was originally a case of "right man, wrong job", but if he goes from one job to another, never finding the "right" one, then there is surely something wrong with the man Similarly, it is quite possible for a girl to meet the wrong man once, or even twice, but if all her attachments end unhappily, it is likely there is something wrong within herself.

The Meaning of Happiness.—Many people confuse two quite different things—pleasure and happiness. *Pleasure* is always temporary and usually physical in origin, and is associated with those things which one usually (depending, of course, upon one's tastes) considers "fun" to do Such things have this in common: (1) they all come through the senses of sight, feeling, hearing, and tasting or smelling, (2) they are always temporary, (3) they are all "pleasant" in the sense that they are, quite simply, enjoyable in the most obvious way. But *happiness* is something quite different; for while it is true that all people enjoying pleasure are, for the time being, happy, the reverse is not true. One can be happy when quite unpleasant things are happening. "Happiness," said a famous psychologist, "is a state of going somewhere." It is no coincidence that the suicide rate always drops in war-time; for war, in spite of all its horrors, supplies the three emotional needs felt by all normal people—the need to be appreciated—to "belong" as the Americans say, the need to be useful; the need to have an aim in life There is a dramatic relationship between human misery and loneliness or lack of an aim in life.

Aims for Happiness.—In order to be happy one needs a goal to strive for, the love of a few, and the respect of those who share our views The opinions of others need not matter Therefore one is unhappy.—

(1) If one has no goal.

(2) If one is prevented by circumstances from attaining reasonable goals

(3) If one has chosen unreasonable goals which cannot be attained

(4) If one is compelled by circumstances to mix with the kind of people one finds uncongenial

(5) If one is prevented by one's own personal defects (shyness for example) from mixing with those who are congenial

There may be three causes of all these five ignorance, environmental maladjustment, and psychological maladjustment, as has been explained above The second and fourth, for example, are likely to be due to environment, the other three are more likely to be psychological in origin

Every Personal Problem is also a Social Problem—This means that most of our problems, no matter how personal they may seem, are connected with the type of society in which we live How to bring up children, what to do with old people, whether a married woman should go to work or stay at home, problems of loneliness, of the unmarried woman, of sex, and even of religion, are problems of people living in a particular society at a particular time and place If you are living in present-day Britain, some of these matters are bound to affect you But if you are living as a small farmer in the South of France or Italy or Greece—or even in the West of Ireland or the North of Scotland—they may hardly have begun to affect you at all. In Central Africa, parts of Asia, or of South America, you could not even conceive of them.

Peasant Communities.—The rural areas of France, Britain, Italy, Greece, and much of Asia, Africa, and South America—which we choose to think of as relatively "backward"—are, in fact, leading the sort of life which was the rule almost the whole world over prior to about 1750. That is to say, they are areas where people make a living on the land, dwell in villages or small towns, and are guided in their conduct by tradition Peasants living this sort of life have large families, and you would probably find numerous children,

the parents, and the grandparents living under the one roof. There are no financial problems relating to children and grandparents, because both are economic assets from a very early age the children can work with their parents in the fields, and the grandparents stay at home and look after the very young ones. Nor do problems of how to bring up children arise, because tradition ensures that all children are brought up (rightly or wrongly) in the same way. For the same reason, there are few difficulties about sex or religion or moral conduct generally, most people have the same religion (in Southern Europe, the Roman Catholic Church) and the same rules are accepted by everyone. Women work in the fields or at home, and no question of the type—career or family?—can arise, because the choice does not even exist.

PROBLEMS OF MODERN LIFE.

(1) **The Town.**—But in time we find ourselves living in a different community—a community in which there are big towns where most of us work in shops or factories. Even if we still work on the land, it is more often for somebody else.

The functions of the family are increasingly taken over by the State. Children under school age go to kindergarten while their mothers go out to work; family squabbles are more often dealt with by social workers than by the parson, medicine is socialised, with many good results and some not so good, there is hardly any aspect of family life which does not have some external body to deal with it. In themselves, these changes are neither "right" nor "wrong", we have to find out how best to use them, not how to turn the clock back.

(2) **Mass Communications.**—Other important changes have been due to mass methods of communication—to the popular magazines, radio, and television. Two main results have followed from these. The first is that, although we learn more, we understand less. Our minds, instead of being filled with one self-consistent belief, which, whether right or wrong, did make some sense about morals and the nature of things, are now filled with all sorts of garbled theories which, no matter how true some may be, collectively mean little to the ordinary individual.

The second result of mass methods of communication has been the influence of advertising, which sometimes makes us regard as necessities things which are not necessary at all. We become more competitive and spend our time trying to "keep up with the Joneses"—they have a washing-machine (or a television or a car), so why shouldn't we? There is a perfectly harmless side to this too, but, as a famous psychologist has said: "It is much easier to create wants than to supply the means of satisfying them. To widen the gap between what people want and what they actually have or can reasonably expect to have is to make for widespread discontent and nervousness." We are always hearing that people are "frustrated," but it is important to remember that they are frustrated in terms of what they *think* they should have (and don't) rather than in terms of what they actually need.

(3) **The New Position of Women in Modern Life.**—Two world wars have accustomed women to taking their place in industry, and once they acquired the taste they were less easily satisfied with life at home. This is the fundamental cause of woman's new attitude to work and family. But there are other causes which maintain the situation. One we have already mentioned is "keeping up with the Joneses"; for when people have raised their standard of living they are reluctant to reduce it, and obviously another breadwinner in the family raises its standard of living. Another reason is quite simply the social one. Many single girls work in a factory and, for the time being, the one important thing in their lives is to get married. But when they are married they dislike being left alone, as they often are, in a small flat, and return to work in order to be back with their friends.

Economically, women are less dependent on their husbands, so if things are not going well at home they see divorce as the obvious solution. It is this, rather than an increase in "immorality," which has caused the number of divorces to go up. (Incidentally, anyone who thinks that people are more "immoral" than they used to be must know very little about social history—even in the most conventional sense everyday behaviour is more moral than at any previous time.) But when many women are working, a new problem is bound to arise, the problem of career or family. The new situation means that the married woman in her less happy moments is likely to look back and say: "What might I not have been if I had continued in business?" Whereas the unmarried business woman may wonder: "How happy might I have been had I been married with a family?"

(4) **Loneliness in Modern Life.**—In the large city there are more lonely people than in simpler societies. This loneliness is often greatest in well-to-do-suburbs. One obvious reason for the increase in loneliness is that, whereas in the small village everybody knows everybody else, their virtues and vices—especially the latter—in the large town there are too many people. Again, whereas only about fifty years ago there were millions of people who had never been farther from their homes than twenty miles or so, today there is a great deal of shifting about. Students come to the big city to study, or workers to get jobs, and all of them are anonymous to each other. Many are afraid or suspicious of each other just because of this. So the individual who is shy or unsure keeps clear of strangers no matter how lonely he may be.

It is, of course, true, that there is a higher proportion of emotionally unbalanced people in towns than elsewhere, for it is to the towns that not only the successes but the failures gravitate. A few are running away from practical difficulties, some from their families, and some just from themselves. Perhaps most fall into the two latter categories, and these, together with the merely shy and reticent or timid, form the bulk of the lonely. They are literally starving for companionship in the midst of plenty.

(5) **Boredom in Modern Life.**—If there are many lonely people in the modern city, there are others who are suffering from problems which may be classified under the head of "boredom." Indeed, this group may be much larger than the other. Some, surrounded by large families in small flats may wish they had more loneliness and privacy. Such people, even if they have some hobby or interest, have neither the space, peace, nor freedom from interruption to practise it. Then there are those with jobs which are either dull in themselves or associated with such emotional tension that they have little inclination to interest themselves in anything else when they get home. Here the question of stimulation by mass media comes in. Modern man is constantly under some sort of stimulation, and when the radio or television is turned off he feels at a loss. His amusements increasingly tend to be passive. Of this type of man the saying of a great French writer, Blaise Pascal, is relevant: "I have discovered that all the unhappiness of men arises from one single fact, that they cannot stay quietly in their own chamber, men only seek conversation and entertaining games because they cannot remain with pleasure at home." Hence those great preservers of the state of matrimony, the pub, the radio, work, and football. Thus there is the man who can boast that he has "never said a cross word to his family," for the very good reason that he never has a chance to—the radio is turned on from the moment he gets back from work until the moment he goes to bed, and nobody is able to talk. This is equally true of the manager who "always has to work late" or of his employee, who, having eaten his supper, rushes off immediately to the local. Family life presents few difficulties, since it does not exist—at least for the husband. There are therefore two problems involved: (1) education for leisure and how to use it to the best advantage, (2) how to supply adequate accommodation, time

and other facilities to allow those with the interest or ability to make the best use of their leisure.

There is nothing priggish in suggesting that one should make the best use of one's leisure. Nor is there anything wrong in going to pubs or football matches. But there is something undeveloped and childish about anyone who spends all his spare time in pubs, or in talking about or watching football. He is just like the man who listens uncritically to the radio: talks, music, variety are all the same to him so long as there is a background noise. If a hobby is to be anything better than a means of drugging the mind and preventing thought it has to be chosen and tested —not an activity which just happens to be ready to hand, but one which has been selected.

How much pleasure and talent is wasted can be seen any day in a hospital, where, when left with nothing to do, many patients find for the first time the happiness they can get from books, painting, or modelling. In order to avoid boredom one has to plan one's leisure as well as more serious activities *See* Section R.

Conclusions.—We have tried to sketch the main problems of modern life, and since the main pattern of the new way of living cannot be altered, we must adapt ourselves to it. (This does *not* mean that adaptation is the one and only solution—in fact, many psychologists have overdone this theme—but it does mean that, living as most of us do, we can't pretend we are living on a desert island.) We have seen, too, that we can respond to the difficulties of modern life in three mistaken ways: by not knowing how to handle them (ignorance), by being faced with practical problems which arise from our surroundings but remain problems even when we understand what they are (environmental), and, lastly, and perhaps most uncomfortable of all, by having the sort of attitude to life which causes us to create our own problems (psychological) Let us deal with these one at a time.

IGNORANCE.

I said above that one of the main difficulties facing us today is the question of knowing what is true and what is not. We are being told so many things, and our heads are stuffed with so much information—much of it contradictory—that we really are in a much more unsatisfactory situation than more primitive people, who, even if they are wrong, can feel that they know what is what. When I first played golf I was given a small booklet setting out the rules of the club—what you could or couldn't do The booklet said nothing at all about the rules of golf, which you were supposed to know, but only how you were expected to behave But today we are often in the position of being on the course not only without knowing the rules of the club but without even knowing the rules of the game The papers we read or the broadcasts we listen to are full of snippets of information which taken together can be more puzzling than informative cigarettes are dangerous, cigarettes are not, milk is good for you, milk after forty makes you more liable to heart attacks; radioactive fall-out from bomb explosions is dangerous to the future of mankind, radioactive fall-out is practically harmless; fat people are jolly, fat people are likely to have shorter lives So we don't know the rules of the game (and we can have a pretty shrewd suspicion that the experts don't always know either) But worse than this, we don't even know the club rules—that is, how to behave to other people, we know what our parents' attitude would have been about a teenage son or daughter having boy- or girl-friends, what our parents thought about telling the "facts of life," about "getting on," about colour or race problems in their personal aspects, about going to church and so on But we know only that opinions have changed and ask ourselves whether we should change with them or not. Here is the most general problem about ignorance, and the first thing to understand is that for a new way of life one needs a new approach —an approach which does not reject new information, but is critical about it, which does not wholly believe but does not utterly disbelieve—in short, an approach which is logical, slightly sceptical, and prepared on some subjects to keep an open mind

Choosing Advice.—So, first, about the things that matter, you should choose the advice of someone you can trust and act on it If you are dissatisfied, say so (although you would be well-advised to consider first the possibility that you yourself may be wrong, consciously or unconsciously seeking advice which you wish to hear rather than unpleasant truths which are difficult to accept) Second, about the things that don't matter, you should keep an open mind Thus, all the medical advice about diet, milk, being fat, and so on, in my opinion is irrelevant to those who are healthy; for, if you took every precaution to live longer you would never do anything at all Nothing good ever came from those who are always taking care On the other hand, the hydrogen bomb is not just a medical problem but a moral one which concerns not only our own lives but those of other people. This is not one of the problems which do not matter, and since it concerns everyone, it should be thought out seriously by all responsible individuals

Although there are fundamental rules of behaviour, the more superficial ones are changing all the time So you cannot apply the rules your parents applied to you directly to your own children All one can say is that if you have brought up your children sincerely and with a genuine concern for their own interest (which is easier said than done), then you need have no reason to worry for them later But to start worrying about them when they are in their 'teens is to start worrying too late In another part of the section we shall have something to say about this matter

Most problems, then, have their logical, moral, and personal aspects, all of which must be taken into account in making a decision Here are some examples of the sort of things that bother people.

(1) **Unnecessary Fears** can be about anything, but are most often about medical, legal, or financial matters, and when I say "unnecessary," I do not mean that they are not real (although, of course, some are not) All that is meant is that, assuming them to be real, either something can be done about them or it cannot If the first, we have to do what is necessary, if the second, worry is useless.

When such fears exist it is essential to let nothing stand in the way of getting expert advice Thus if you think you have cancer or any other disease go at once to a doctor—for you will feel pretty silly if, after months of worrying, you find there is nothing wrong, and if something *is* wrong, the sooner you have it dealt with the better A disease won't go away just because you shut your eyes to it If you think, as often happens, that what you have to disclose is embarrassing or shameful, go just the same, doctors, lawyers, psychologists, or any other experts used to dealing with these problems are quite unshockable The expert is there to supply the information—that is what he is paid for—and your morals are not the slightest concern of his except in so far as they are going to influence his advice A lawyer is there, too, to give advice, and if you really think that your misdeeds or marital quarrels or financial mistakes are surprising to him you are utterly mistaken (*See* Q10 for the names of some organisations which may help you)

Once you have got the advice, what you do will be influenced by your moral, religious, or other personal views. Thus, whether an unmarried mother decides to get married, keep the child, have it adopted, send it to a home, or (if she is physically unfit) agrees to have her pregnancy terminated will depend on her religious and moral views, and in the light of these she can discuss what to do with the doctor Similarly, in a legal matter concerned with money the client has to consider both what, legally, he *has* to do and what morally he feels he *should* do.

Irrational Fears differ from unnecessary fears in that they do not even appear to be sensible,

Fears of open spaces, of leaving the house and walking outdoors, of being shut up in a small space (for example, in a railway carriage), of animals, of dirt or sharp objects, are perhaps natural enough in their way. They are abnormal to the extent that they trouble you and keep you from leading a normal life, thus, it is reasonable to dislike dirt, but it is not reasonable to do so to such an extent that you have to wash your hands every five minutes These are what a psychologist would describe as "phobias," and all that need be said about them is that nearly everyone has some phobia, and whether it requires to be dealt with by a doctor depends, as has already been said, upon how much it upsets you Phobias are uncomfortable, but have no serious significance.

(2) **Unnecessary Frustration.**—I mentioned the importance of having an aim in life. We saw that, in matters of belief, it is necessary to make a delicate compromise between believing everything and believing nothing, and in the same way with goals you must compromise between what you want and what you reasonably can expect to have If, for example, you are unhappy at your place of work the one thing *not* to do is just carry on and grumble, since this hurts nobody but yourself. You must either put up with what you have or pull up your roots and go elsewhere But before you do either be careful to consider whether it is the job or yourself that is to blame—would you really be happier elsewhere? If you have always been somewhat of a misfit it would be better to see a psychologist than to go through the futility of getting another job no better than the one before

Of course, it is only fair to say that many great men and women were profound misfits throughout a large part of their lives Bernard Shaw produced little of value until he was nearly forty, and Elizabeth Barrett Browning suffered from an entirely imaginary illness until she met Robert Browning at the age of thirty nine But, since few of us are geniuses, there is little use in departing from the general rule that the more "unsatisfactory" jobs you have had, the more it is likely to be something wrong with you rather than with the job

What I have said about jobs applies equally to that very much overdone passion, romantic love What matters in your choice of a mate is whether or not you can get on together, and romantic love is certainly no guarantee of this In fact, there is good reason to believe that Bernard Shaw was not far wrong when he said that there would be just as many happy marriages if each of us married the first person he met on walking out of his house But, whether you believe this or not, there can be little doubt that more "disappointments in love" are due to hurt pride than to genuine care for the loved one. For, if you really care for someone, you are concerned about their interests rather than your own.

(3) **Unnecessary Loneliness.**—This, on the face of it, appears to be mainly an environmental problem. Nevertheless, the personal side is just as important, for, although the normal person may feel at sea for a few weeks or so when he first arrives in a new area, he sooner or later finds his roots and makes friends After all, even the most "unfriendly" town is full of churches, youth clubs, hobby clubs, and all sorts of societies where the stranger is welcome. My own experience is that most people are lonely because they are shy or timid, which is really just another way of saying that they don't like themselves But behind this timidity there lurks a good deal of conceit, and the real attitude behind the embarrassment of a shy person entering the company of others is, "What are they going to think of me?" To which, fortunately or otherwise, the most common answer would be: "Nothing at all." The fact is that you are much too anxious to create an impression, whereas the normal attitude should be, "I am what I am—take me or leave me."

To make friends, the great advantages are not beauty, good looks, charm, or knowledge, but tolerance, being genuinely fond of others, and being able to forget yourself.

ENVIRONMENTAL PROBLEMS.

Difference between Problems of Environment and of Psychology.—We have seen that the difference between environmental and psychological problems lies in the fact that in the first the person's surroundings or circumstances really are difficult, whereas in the second he has largely created the problems for himself by the way he looks at his surroundings and responds to them

No Problem is Entirely Environmental.—Although the distinction we have made is a useful one, no problem is entirely environmental, for the result always depends upon how the individual sees his situation, and what he does about it It is "natural" to be unhappy in prison, but some people have been happy there, it is "natural" to be unhappy when one suffers from incurable disease, but, in fact, a large number of people with incurable disease find happiness and more peace of mind than those who are not sick Strictly speaking, there are no purely environmental problems—all your troubles are confined in a small area—your head However, it is useful to make the distinction for practical reasons, for if you are trying to help an unhappy person, the first practical question to ask is "Can I help him by getting him a new job, a new home, or new friends, or would he be miserable almost anywhere?" Of course, many people in trouble want to believe it is all the fault of others, or circumstances, or fate (in fact, the more it is their own fault, the more they like to believe otherwise) Some women, for example, assert that all their problems are due to the kind of house they live in, and five or six houses later they are still miserable Some men are never able to find a "good" job, even after trying dozens There are men and women who are always complaining of ill-health but who would be desolate if some doctor were cruel enough to remove their only hobby--their real or imaginary illness and their absorbing interest in it Although we may agree that all troubles are in the mind, it is necessary to distinguish between those that can be cured by a change of surroundings and those which require a change of oneself The two overlap quite considerably So, under the heading of "environmental problems," I am going to discuss such everyday matters as bringing up children, marriage, the problems of old people, and some general rules for leading a happy and useful life You will have to decide for yourself where your own problem lies, are you an ordinary person in unhappy circumstances, or an unhappy person in ordinary circumstances? If you are seriously troubled, it would be a good idea to go to one of the bodies listed at the end of this section Misery is not conducive to clear thinking, and it is always advisable to get the advice of others, particularly when they are experts in such problems

Childhood.—Psychologists believe (and most sensible people have known for centuries) that the really significant time in life from the point of view of character building is the first five years That is why it is so important for a child to have a proper start, as reflected in its early training. Some parents fuss and worry over their children in the late teens, when the fact is that if a child is not able to look after itself by that age, the parents must have made a sorry mess of their job Detailed rules cannot be given about a subject such as this It would almost be true to say "It's not *what* you do—*it's the way that you do it.*" The only fundamental rule—and, of course, I am talking here about the child's character, not its bodily health—is complete, unconditional, and unpossessive love on the part of the parent. If you cannot give this, then all the rules in textbooks are of no avail

The Spoilt Child and the Neglected Child.—The job of a father and mother, then, is to look after the child when it is unable to look after itself and bit by bit to give it as much freedom as it is fit to take.

When the first rule is ignored and the child is not looked after or is regarded as a nuisance

we speak of a neglected child; when the second rule is ignored and there is no freedom we speak of a spoilt child. Both types are unfortunate, because the first grows up to regard itself as unlovable and the world as a hostile place, and the second grows up always depending on others and unable to make its own decisions. In neither case has wealth or social position much to do with whether a child is spoilt or neglected, and the popular notion that the spoilt individual usually comes from a wealthy home, the neglected one from a poor home is quite absurd. It makes not the slightest difference to a child whether it is neglected because its mother goes out to work or because it is brought up by a "nanny" and its mother is always abroad or attending social events.

Possessiveness and spoiling are usually due to anxiety on the part of the parent—sometimes the mother who has lost her husband or is separated from him lavishes all her affection on her son and, not unnaturally, wants to hold on to him. Sometimes the child is made a pawn in the conflict between husband and wife, and in yet another type of case the parent who has felt neglected in childhood tries to ensure that the same will not happen to her own family. But in each case the result is the same: the development of a suffocating, possessive, and unhealthy love. This is much less likely to happen in a large family, since the children are less dependent on their parents and more on each other. They have their edges rubbed off by having to learn to give and take; that is why, in the case of a single child or of a small family, it is a good idea to make use of a kindergarten or arrange associations with the children next door.

Children Learn by What You Do.—Many parents have the pathetic belief that their disagreements pass unnoticed within the family. Unfortunately, they don't. Children, like other people who live more at the emotional than the intellectual level, know very well what is going on, and if there is some sort of conflict between father and mother they cannot but suffer thereby. How little some ostensibly affectionate parents really care can be seen by the numerous cases one reads of in the papers in which, following a divorce, the child is torn between one and the other quite regardless of its real interests.

Like all sensible people, children are much more impressed by what you do than by what you say. A young boy I knew who was crippled with infantile paralysis hated his mother, who although poor, had spent much of her money on cures. He hated her because he knew that the real reason for her behaviour was that she was ashamed of his being a cripple, and he was quite right. Another mother was unhappy with her first husband and divorced him, they had one child, who, during the time of her unhappiness, was spoilt. She then married again, and, for reasons which seemed perfectly good to herself, sent the boy to a boarding school. Her second husband wanted to be alone with her, and she was getting somewhat scared of the amount of affection and possessiveness she had stirred up in her son. Now, in his twenties, the son is resentful of his mother, and although gifted, he finds it impossible to achieve anything, all he thinks about is having been "let down."

These are not unusual cases. To the statement that children have a pretty shrewd idea of what is going on we must add that what seems to a child to be a betrayal remains a betrayal no matter how good the *logical* reasons for it may appear to its parents. Children don't think—they feel.

Unconditional Love and Consistency.—Two things are necessary in order to rear happy children: unconditional love and consistency. Unconditional love means that, whether the child does right or wrong, it can feel that the parent's love is always there, that however much one dislikes the deed, one never ceases to love the child. Consistency means that there should not be too many rules, but the rules, once made, should in all circumstances be maintained. If you make too many rules, the child will lack character, since it is never free to choose and make its own mistakes; if there are too few, the child feels insecure because it never knows "what's what." In short, children should be as free as they are fit to be at any given age. The whole aim of a good upbringing is not that the father and mother should try to coerce their offspring according to their own parental ideals, but rather that father and mother should protect the children while they are growing into their true selves. After all, few people are such big successes in life that they are entitled to force their children into their own mould.

Mental Cruelty.—Most people in this country are, quite rightly, sensitive to the problem of cruelty to children—that is to say, obvious physical cruelty. But I doubt whether they are equally sensitive to the problem of mental cruelty. Take the example of the little girl or boy of three or four years old who is allowed to feel neglected upon the arrival of a new baby. Previously he has been in the centre of the picture, yet now he is suddenly left out of it, and assuredly his future happiness will not be helped thereby. Or the mother who would be shocked by the idea of hitting her child, but punishes it by saying: "Mother doesn't love you any more." "All right, go away, *we* don't care." Or the mother who said that she could always bring her little boy to heel by taking away his best-loved toy when he misbehaved. What do children feel when the two people upon whom their whole security depends quarrel violently in front of them, or when they are always being left under the care of others while the parents go out? Cruelty is not always physical. The most devastating type of cruelty in its effect upon the child is the type of mental cruelty we have just been describing.

Child Guidance Clinics.—The infant is primitive, born without morals and only gradually comes to share the grown-up's views on sex, cleanliness, and affection. If you get worried at such things as dirtiness or absence of shame you are revealing more about your own lack of emotional balance than about the child's naughtiness. There is a very true saying, "There are no problem children, only problem parents," so if your child is a problem, ask first what mistakes you have made and remember that all psychological difficulties in childhood are due to lack of emotional security. When you notice such signs, take the child to a doctor and ask him to arrange an appointment at the local Child Guidance Clinic. Fortunately, the problems of children are much more easily dealt with than those of adult life. Danger signals which indicate that something should be done are: when the child is more noisy, aggressive, or destructive than the ordinary child; when it is too silent and unwilling to associate with other children; thumbsucking, bedwetting, nightmares or crying or screaming at night, frequent complaints of pain or sickness when your family doctor can find nothing organically wrong. Remember, the Child Guidance Clinics are there for the purpose of helping you, so there is no need to be hesitant in asking for their aid.

Marriage.—Most people nowadays seem to suppose that the only basis of a happy marriage is romantic love. Till fairly recent times marriage was as much to do with parents as with the bride and bridegroom and was regarded as a career for the woman—a career to be carefully prepared for by sex-instruction, and a training in cookery, child-management, and the running of a house. Today many girls rush into marriage from their work in a factory or office knowing considerably less about running a home, mending, or cooking than the man they marry, who may have been looking after himself for some years. Both men and women frequently share the most childish "romantic" notions. They seem to suppose that pleasure, rather than happiness, is the aim of life, that romantic love must last for ever, that marriage is the goal of life (whereas it is only the beginning of learning to adapt to a new way of

life); that children are nice but a nuisance, that one's wife, or husband, should remain beautiful or handsome. And, of course, when one is disappointed, there is the final delusion that divorce is always a solution.

Some General Points about Marriage.—Reading about problems is useful because it can show what is wrong and can give some degree of understanding. But full understanding comes only from experience and personal contact with others. So the points I want to make about marriage must be made quite briefly. First, many of the difficulties experienced by husband and wife are related to social problems peculiar to our times. Second, frustration is *in terms of what one expects and does not get*, not at all in terms of objective reality. If you expect too much, or if you expect different things from what you are going to get, you are bound to be disappointed no matter how "lucky" you appear to other people. It is not always life or "fate" that is to blame for human misery, very often it is the way the individual looks at life and his unrealistic demands upon it that cause the trouble. This point is so important, and so little understood, that it is worth while saying something more about it. Although every personal problem is also a social problem created by the society in which we live, the way we deal with the problems is very largely our own responsibility.

Divorce is sometimes the only solution to a marriage which has failed, but there are two dangerous things about divorce which should be taken into consideration. First, the fact that divorce is possible makes people think of it as the obvious answer when trouble arises instead of trying to do something when a marriage could still be saved. Second, because failure in marriage is always due to the personal defects of both people, unless these defects are remedied the second marriages will be no better than the first.

Steps to Happy Marriage.—I could have occupied some space in this section telling you about the sort of behaviour which leads to a happy marriage: a spirit of give and take, tolerance, and so on. But, unfortunately, people either have these qualities or they do not, and you certainly cannot obtain them by reading about them. So, if your marriage is in serious difficulties, the proper thing to do is to go to a Marriage Guidance Clinic for help. However, here are some aspects which you can do something about, and most doctors and psychologists would agree with the following points:—

(1) Before marriage a woman should learn something about running a house, cooking, and bringing up children.

(2) Reflect upon the meaning of love. Although "love" is a word which is often talked about rather glibly, it can have a number of different meanings. *Romantic love* is based upon sentiment (often upon sentimentality), and its essential feature is an idealisation of the other person, so that one all too often sees in the beloved qualities which are not there. That may be a good thing, but it is certainly no guarantee in itself of a happy marriage, as the divorce courts make it painfully clear. Reflect carefully upon the nature of *possessive love*, based upon a desire to possess the other person regardless of his or her own best interests. One thinks here of the mother or father who unwittingly prevents children who have grown up from leading their own lives, or of the jealous wife or husband who will not let his or her partner in marriage go out or meet other people. Possessive love is not really love at all. True love is based upon mutual respect and a deep desire to further the other person's best interests whatever sacrifice one has to make oneself.

(3) Keep your good appearance. Both husband and wife should keep up appearances after marriage just as they did before; they should not lose their good manners, or dress carelessly, with the implied attitude that it no longer matters what the other partner thinks. In this sense marriage should be an eternal courtship in which one always goes on trying to please the other. True, this will not save a basically impossible situation, but lack of the observance of this rule may break up a marriage which well might have been saved.

(4) Lastly, two observations about children. First, a couple should never have a child with the sole intention of trying to prevent a marriage from going on the rocks. It is unfair to the child, and if a marriage is in such a bad way having a child is unlikely to have the desired effect. Second (and this may be an unpopular statement), *every child needs the full care of its mother in the first five years of its life*. One of the reasons for the increase in juvenile delinquency in recent years is the failure of mothers to give the child full attention. The family has been called "the character factory of society," and character is formed in the first five years of life, without the mother the factory cannot work properly.

Sex.—It is often said that more marriages break down because of sexual difficulties than for any other single reason. As it stands, this statement is not true. Sexual difficulties come into two categories: those due purely to ignorance, and those basically due to *personality* problems between the two partners. The first kind are a straightforward medical matter, which can be solved by a family doctor, by a Marriage Guidance Clinic, or even by reading a good book on sex technique. The other kind are an entirely different matter, for here the sexual difficulty does not cause the trouble in the everyday relationship between husband and wife, but their unsatisfactory everyday relationship causes the sexual difficulty. For example, if the wife suspects infidelity on the part of her husband, if she has had an unhappy home life with her parents which leads her to suspect men or fear sex or marriage, if she is afraid of having more children, or if she feels a latent resentment towards her husband over some matter quite unrelated to sex, these feelings may make her sexually frigid. With women, as contrasted with men, sexual happiness is impossible unless the total personal relationship between the partners is satisfactory. A list of books about sex is given on a later page, but where the problem lies in the sphere of personal relationships the help of a psychiatrist or the Marriage Guidance Clinic must be sought. We must, therefore, reverse the statement that sexual difficulties (except those due to ignorance) cause marriage difficulties, the truth is that difficulties in the everyday relationships between the partners cause sex difficulties.

PSYCHOLOGICAL PROBLEMS.

We have seen that a psychological problem is one which is caused less by your surroundings than by the way you look at them. You should suspect that your problems are primarily psychological (1) if the same situation in life keeps cropping up—love affairs always ending unhappily, jobs always being lost or given up, and so on, (2) if you have difficulty in getting on with your fellows, (3) if you are depressed, anxious, or unhappy without obvious reason, (4) if you have nervous symptoms, *e.g.*, irrational fears (of closed spaces, open spaces, or disease), sudden attacks of panic or anxiety, or pains for which the doctor can find no adequate explanation. These conditions, whether they masquerade as personal problems or as "nerves," have this in common, they are caused by a faulty attitude to life, and, in particular, to other people, originating in early training. *"Nerves," neurosis, and psychological problems in general are not diseases in the ordinary sense, and are always caused by fundamental misunderstandings in the sphere of human relationships.*

Many people have troubles of this sort, and doctors say that 60–70 per cent of all their patients come into the category of people who are suffering from the "bad" emotions of hate, anger, resentment, fear, and anxiety—people who are ruining their own lives because of the past.

Some of them create their own problems in everyday life, others suffer from "nerves," and yet others develop those physical illnesses due to prolonged worry and emotional stress, stomach ulcer, "fibrositis," high blood-pressure, heart trouble of certain types, headaches, some kinds of skin disease, and so on.

Most of us have such problems from time to time, and sooner or later they pass, but when such problems are persistent it is necessary to consult a psychiatrist. True, in most cases such states are not dangerous—men and women with "nerves" do not (as so many of them fear) go insane But they suffer a lot of needless misery If you are suffering from any of the problems mentioned above it would be a good idea to ask for expert advice at one of the bodies mentioned on a later page.

WELFARE OF OLD PEOPLE

We live in a society which has the highest proportion of old people anywhere in the world, and the proportion will go on increasing Old age is, of course, associated with a decline in physical and mental powers, but social and medical factors may hasten or slow down this decline For example, the person who has led an active life often rapidly deteriorates when he has to retire or when he lives by himself and is thus cut off from human society, he loses interest, becomes untidy, and does not look after himself properly. He has, in fact, nothing to live for and shows it in his behaviour In cases like this there is often a dramatic improvement when the old person goes to a Residential Home where he gets proper food and, above all, company and things to do. *A great deal of the appearance of deterioration in old age has to do, not with physical, but psychological factors*, lack of a goal, a feeling of being unwanted, loneliness, and all the things we have already seen to be so important for psychological health and happiness at all ages. The grumpiness, the interfering, the selfishness often associated with old age are largely due to circumstances rather than natural "cussedness", they are the reactions of anyone who feels unwanted or useless, and many of the so-called problems of the aged would be removed if they were allowed to continue work under suitable conditions

Attitude to the Old.—*Where* the aged are cared for depends primarily, upon medical factors, which should be discussed with the family doctor Obviously, a sick person cannot stay by himself at home, but, on the other hand, a healthy person cannot be sent to the geriatric unit of a hospital One must think of the other members of the family, and here the moral problems begin should one look after one's aged relatives even if they are troublesome and a wholetime problem, or should there be a limit set to one's responsibilities in this respect? The answer must be personal, and one suggestion is that the old (and, in particular, our parents) are entitled to expect some attention from their children. But, on the other hand, nobody is entitled to expect another person to give up his whole life to this end A parent must not demand the sacrifice of marriage, career, or happiness. If an unmarried daughter genuinely wishes to look after her father or mother, giving up all hope of any other career, she may, of course, do so, but to give up her whole life *unwillingly* to this end is not being self-sacrificing, but wrong. We have a duty to others, and particularly to our parents, but we also have a duty to ourselves. Such problems should be solved by considering the best interests of all those involved—the greatest happiness of the greatest number—and the younger the individuals concerned, the more consideration they are entitled to One should help one's parents or parents-in-law, even at considerable sacrifice, but not to the extent of sacrificing the whole of one's life, the happiness of one's marriage or children.

The Sacred Rule of Non-interference.—No situation is more liable to cause trouble than the interference of one generation in the affairs of another. In particular, the older generation should never give unasked advice to the younger—especially concerning the upbringing of grandchildren. If your children are not capable of reasonable behaviour once they are adults, they are certainly not likely to be changed by unwanted advice. Nor should parents interfere in the quarrels of their married children. if any interference is called for, it should come from those who are less emotionally involved

Services for Old People.—There are various types of help for old people, the principal ones being concerned with

National Insurance	Education
Pensions.	Health
National Assistance	Welfare Services for Aged and Handicapped Persons
Housing.	
Employment	

The National Insurance Scheme covers, of course, persons of all ages The following are the salient points about services which offer special benefits for old people

Retirement Pension.—An insured person who

(*a*) has reached pensionable age (65 for a man, 60 for a woman),

(*b*) has retired from regular employment,

(*c*) has paid the prescribed number of contributions,

will receive a retirement pension for life A pensioner's wife is generally also entitled to a pension if she is over 60 and has retired, and he can receive an allowance for her if she is under that age and is dependent on him Retirement pensioners who are widows receive the same rate of pension as single persons Anyone who has not received a letter three months before his 65th birthday (her 60th birthday) should inquire at his local Pensions and National Insurance Office You will find the address at your local Post Office, and the Pensions Officer will give you every help and advice (Pamphlets on the subject are N I. 15, N I 28, and N I 83) Valuable information about pensions and retirement is set out very simply in the National Old People's Welfare Council's leaflet, *Notes for those Nearing and Over Sixty* The Council's address is 26 Bedford Square, London, W C 1

Work and Pensions.—Many old people continue to work after they reach pensionable age, and thereby attract increased pensions for themselves when they retire. In any case the full pension is drawn by men at 70 and women at 65, whether they have retired or not Retirement pensioners under 70 (65 for women) must declare earnings over £3 10*s*. a week, so that the necessary adjustment of their pensions can be made Here again the Pensions Office will give advice

Non-contributory Old Age Pensions.—A person of 70 or over (or 40 in the case of a blind person) who is not entitled to draw retirement pension or widow's benefit (as explained above) and whose income is within certain limits may apply for a non-contributory pension This can be done on Form N.I. obtainable at any Post Office.

National Assistance.—Old people who have no income or resources except retirement pensions are generally entitled to help from the National Assistance Board, and application can be made on Form O.I, obtainable from any Post Office Many old people living in the past may, perhaps regard the Assistance Board's allowance in the same light as the Poor Law outdoor relief of their young days; and care should therefore be taken to explain why they should not feel uncomfortable in accepting the assistance to which they are entitled.

Housing.—It is important to encourage old people who are living in unsatisfactory conditions and who wish to be rehoused to put their names down on the local housing authority's waiting list

Most housing authorities have dwellings which are intended to meet the requirements of elderly persons. Some also provide small club rooms and also wardens to care for the less vigorous while they remain at home.

Employment.—Increasing importance has been attached in recent years to encouraging older people to continue at work as long as they are willing and able to do so Elderly people seeking employment will receive help from the local Ministry of Labour office. Disabled persons can obtain help from the Disablement Resettlement Officer

Education.—The education authority may be prepared to provide a teacher for a group or club with a special interest, for example, music, singing, or a craft

National Health Service.—Under this comprehensive medical service for people of all ages, a full medical and preventive health service for the aged is being built up. The following are some of the points of special interest to elderly people It is important to encourage old people who are suffering from eye trouble to see an ophthalmic medical practitioner or optician (on the recommendation of his doctor) Discourage them from buying glasses over the counter of a store A good deal of blindness of later years could have been prevented by treatment at the proper time People not receiving National Assistance can get help, if necessary, to pay the charges for dental treatment, spectacles, etc Old people should not be deterred by anxiety about the cost from obtaining any appliance which they need

Ambulance, Home Nursing, Health Visiting, Home Help.—These and other services can be of great importance to old people The Home Nurse gives nursing care and the health visitor advises on health and home management Both are free. Applications for domestic help should be made to the Home Help Organiser in the health department, and those who can afford to do so are asked to contribute towards the cost An increasing number of local authorities are organising laundry services to meet the needs of old people

Hospital and Specialist Services—Elderly patients may be admitted to the acute wards of general hospitals or, directly, to the "chronic sick" wards It has now been seen that many patients, formerly regarded as irremediable cases, could benefit from active treatment and rehabilitation Therefore, out of the chronic sick wards have grown the geriatric units Here a patient gets more concentrated attention than he might get in a general ward Whenever possible, too, they are restored to an extent to allow them to return to their own homes or to Homes provided by a local authority or a voluntary organisation

Half-way Houses and Day Hospitals.—Patients from geriatric units who are not yet sufficiently rehabilitated to allow them to return to their homes are sometimes transferred to "Half-way Houses" (where they have been founded) for further rehabilitation in a more leisurely and informal atmosphere "Day hospitals" are another new development. These are sited within the precincts of a hospital, and infirm old people spend a day or a number of days there each week, returning, by ambulance if necessary, to their homes in the evening They receive medical attention, meals, and suitable occupations

People to Contact.—The appropriate person to contact for help has been mentioned in this outline. Sometimes it is the local office of a Ministry, sometimes the local Welfare Officer, or Housing Officer, or Medical Officer. There may be a local office of the National Old People's Welfare Council or of one of the numerous voluntary organisations mentioned at the end of Section C In Scotland the Scottish Old People's Welfare Committee is the co-ordinating body and in N Ireland the N. Ireland Council of Social Service.

ADOPTION

The following are introductory pointers for those who are thinking of adopting a baby, including those who, perhaps, have been discouraged by their first inquiries

1. *Be prepared to take time, trouble, and have a lot of patience* —Adoption is for life, and the best adopters realise the need to invest a lot of thought and care at the outset

2. *There are many more would-be adopters than children* —Say ten to twelve suitable couples are waiting for every child who needs an adoptive home The number of children available is likely to decrease with better services for unmarried mothers

3 *Take advice of experienced workers* Do not accept a child whose history and background have not been studied by experienced and impartial workers, otherwise you are taking a great risk

What Sort of Child? Many more people want girls than boys Suitable baby girls are adopted so promptly that there is little chance for people who prefer to wait for an older child It is better to adopt a very young child if you can, whether boy or girl You will have a right to be given what information is available about a child's background, parentage, and health

Clarifying One's Motives.—No doubt those who wish to adopt a child are impelled by a number of motives, and it is never easy to disentangle them and be clear in one's own mind about them all It is not a good thing to adopt a child because of fear of pregnancy or to avoid the risks of child birth Adopting a child will not keep off the rocks a marriage which is drifting to shipwreck The most satisfactory natural basis for adoption is a happy marriage still incomplete because of sterility of one of the partners, and a couple with a good prospect of a reasonably long life. Give yourself a test borrow a neighbour's baby for a day, preferably a difficult one, and see how many marks you give yourself and whether you still like babies at the end of the day. There is one sound question to face: If you were a child about to be adopted and you could choose, would you choose to be adopted by you?

The First Step — You can apply to the children's department of your county or county borough, in London, to the L C C area children's officer But your own local authority may not place children and will refer you to an adoption society Adoption societies are carefully controlled by law, and all must be properly registered and run. There are over fifty societies in England and Wales, and some half dozen in Scotland. Their addresses will be found in a booklet called *Adopting a Child*—an invaluable brief guide—which can be obtained for 1s (post free) from Mr A Rampton, Gort Lodge, Petersham, Surrey. He is the Hon. Secretary of the Standing Conference of Societies Registered for Adoption. Do not expect an orphan, as few are available. The mother of a baby placed through an adoption society never knows the name and address of the adopters unless they wish her to do so.

How is Legal Adoption Brought About?—The adoption society will help you on this. Adoption can be made legal only in court, either a Juvenile Court or a County Court. An adoption order cannot be made by the Court until three months after you have officially informed your local authority—the children's department of your county or county borough—that you have the child in your care and intend to adopt him. Up to the moment that the adoption order is made by the Court, the baby is still legally the mother's responsibility, and she may have him back if she chooses. You must adopt a child from an adoption society within nine months or return it. (If you live in the British Isles, elsewhere than in England and Wales, the position may be different from that indicated.)

Telling the Child.—Should a child be told? Yes, always. Keep faith with him by telling him what he wants to know, when he wants to know it. Never avoid, never force the subject. An experienced expert on adoption has wisely said, "Build up the child all through life to meet his own history." But this aspect is so important that you will wish to read more about it in one or more of the books mentioned below.

Changes Brought about by the Children's Act 1958.—The principal changes affecting adoption relate to age of adopters, the probationary period, taking children abroad, inheritance, and health of applicants. In regard to age, one of the applicants must be at least 25 years old and the other at least 21 years. The minimum probation period remains at three months, but if the child is under six weeks when coming into the care of adopters, no time before the date when he reaches the age of six weeks will count towards the probationary period. Under the change of law a court is now required, before granting an adoption order, to have regard to the health of the applicants, that is, to be satisfied that they are likely to live long enough to look after the child until he is old enough to stand on his own feet.

WHERE TO OBTAIN HELP ON PERSONAL PROBLEMS AND ON MARRIAGE AND HOME PROBLEMS.

The following are some of the principal organisations.—

Marriage Guidance Councils.—The National Marriage Guidance Council, 58 Queen Anne Street, Grosvenor Square, London, W 1 (MAYfair 2731/2) co-ordinates nearly 100 Marriage Guidance Councils in England, Wales, Northern Ireland and the Channel Isles. This headquarters will gladly give the address of any of the local Councils. Similarly the Scottish Marriage Guidance Council, 44 Queen Street, Edinburgh 2 (Caledonian 5006) co-ordinates 8 councils in Scotland.

The local Councils offer skilled, kindly, and confidential help to those who want it before marriage and after. Particular help is given to engaged couples on all aspects of marriage and parenthood. This is done by private consultation and by informal discussions for small groups of engaged couples, as well as by sound publications on wedding etiquette, budgeting, sex, and all aspects of marriage.

Marriage counsellors—men and women volunteers most carefully selected and trained—offer help to all who seek it in any marriage difficulty. This help is given to more than 12,000 couples a year through private consultations and when necessary help is available from doctors, psychiatrists, lawyers, spiritual advisers, and other social workers.

The National Council's Bookroom issues a free list of recommended books and pamphlets available on request to 58 Queen Anne Street, London, W.1. Books are despatched by post in plain wrappers. Some of these books and pamphlets are referred to in the list given in this section.

The National Association for Mental Health, 39 Queen Anne St., London, W.1 (WELbeck 1272).—This voluntary body provides an advisory service for individual cases. It can help you to understand your children's problems; or (if you are a teacher) it can help with courses about the development of children and their intellectual capacities. If you have the care of old people it can help you to make the best arrangement for their care, and if you have a backward child it can help you about schools and special centres. The Association also has Homes for mentally handicapped children and for elderly ladies suffering from mild mental deterioration, and two Hostels for educationally subnormal school leavers. If you have a personal problem the Association can put you in touch with good advisers. It will help you to find the nearest Psychiatric Out Patients Clinic or Child Guidance Clinic. You may want to help mentally handicapped people, and if so the Association can advise you about training and can offer courses to qualify you for work with mentally handicapped children.

There are 20 voluntary Mental Health and Mental Welfare Associations under the ægis of this National Association throughout the country.

Family Planning Association (1930), 231 Tottenham Court Road, W 1 (MUSeum 9135/9).—*Objects* (*a*) to advocate and promote the provision of facilities for scientific contraception so that married people may space or limit their families, and thus promote their happiness in married life and mitigate the evils of ill-health and overcrowding. (*b*) To advocate and promote the establishment of Family Planning Centres at which, in addition to advice on scientific contraception, advice and, where necessary, treatment are given for any or all of the following—(i) involuntary sterility, (ii) difficulties connected with the marriage relationship. (*c*) To encourage the production of healthy children who are an asset to the nation, provided that their parents have the health and means to give them a reasonable chance in life. (*d*) To examine such other problems as are relevant to the above, and to take such action as may be considered advisable.

The F P A has 383 clinics throughout the country, many on local authority and hospital premises, and a sub-fertility investigation unit, and postal advice department, and pregnancy diagnosis service at its Headquarters. The Association is supported by voluntary funds. At some clinics fees are related to family income, at others there is a moderate fixed charge. No one is refused advice because of inability to pay.

Family Welfare Association, Denison House, 296 Vauxhall Bridge Rd., London, S W 1 (Victoria 7334/8). The National Assistance, National Insurance, and National Health Service Acts have assured to the citizen the satisfaction of many basic needs, but many people still require certain forms of personal service which the State does not provide. It is here that the Family Welfare Association has its place.

The Casework Service of the Association is carried out in local offices, of which a list can be obtained. Many family difficulties can be resolved by comparatively simple forms of help. In addition to providing a casework service, the Association, in its local offices, gives practical training to students in family casework.

In addition, the Association sponsors (1) the Old People's Homes Committee, which gives advice on suitable Homes for elderly people and problems of old age, and, (2) the Citizens' Advice Bureaux Service, in Central London.

The Family Discussion Bureau, 2 Beaumont Street, London, W 1 (WELbeck 5415).—The Bureau is a professional Marriage Counselling Service under the ægis of the Tavistock Institute of Human Relations serving the Greater London Area. It is staffed by a group of caseworkers with the relevant qualifications and professional experience who work in co-operation with psychiatric Consultants from the Tavistock Clinic. Interviews, which last for an hour, are arranged at weekly intervals. The period of attendance varies widely, and may extend over a considerable period. Although it is considered more advantageous if the

two partners make a joint effort, cases are accepted in which only one is willing to attend. Those wishing to consult the Bureau or to refer cases are asked to telephone or write.

Family Service Units, 207 Marylebone Road, London, N.W.1.—There are 4 Units in London and other Units in Liverpool, Sheffield, Leicester, York, Manchester, Birmingham, Bristol, Stockport, Oldham, and Bradford, as well as in parts of Lancashire, Derbyshire, Surrey, and Middlesex (For addresses apply to above address.) This organisation provides a voluntary specialised service for "problem families." For this purpose "problem families" does not mean any family in difficulties, but families where conditions have been such as to lead to neglect of children. Sometimes parents are disabled or suffering from chronic illnesses. For the families' own welfare and that of the community they need help. Family Service Units exist to meet this need.

The National Association for Maternity and Child Welfare, B.M.A. House, Tavistock Square, London, W.C.1.—Gives enquirers much useful advice on these matters.

Maternity and Child Welfare Centres.—The address of the nearest Centre can be obtained from your doctor, a hospital, or the local council offices. The Local Education Authority provides Nursery Schools for children between two and five.

National Council for the Unmarried Mother and her Child, 249 Kentish Town Rd., N.W.5, exists to give advice and help to the unmarried mother and her child—a term which includes a married woman and a baby of which her husband is not the father.

International Social Service, 70 Denison House, 296 Vauxhall Bridge Rd., London, S.W.1.

The Sexual Responsibility of Woman. Maxine Davis (Heinemann, 15s.).

II. BIRTHS, MARRIAGES AND DEATHS

BIRTHS: HOW TO REGISTER (ENGLAND AND WALES)

1. Notification of Birth to Medical Officer of Health.—Within 36 hours after the birth of a child, notice must be given to the district Medical Officer of Health by the father of the child, if he was residing on the premises where the birth took place, or by any person who was in attendance upon the mother at the time of the birth or within six hours afterwards. Generally this duty is discharged by the doctor or midwife attending the mother, but if the birth occurs at the home of the parents and the mother receives no medical attention, then the responsibility for notification rests upon the father of the child. This notification to the health authorities must not be confused with the registration of the birth, which is an entirely separate procedure.

2. Registration of a Birth.—Within forty-two days after the birth of a child in England and Wales, information for the registration must be given to the Registrar of Births and Deaths for the sub-district in which the birth occurred. The

duty of giving this information and of signing the birth register rests primarily upon the parents, or, failing them, on the occupier of the house or institution where the birth occurred, or a person present at the birth, or the person having charge of the child. As a rule the registrar will expect either the father or the mother to attend and give him the information, but in the case of an illegitimate child the father is not qualified to give information alone, but he can attend with the mother and sign the birth entry jointly with her.

The information recorded in the register includes the date and place of the birth, the name and sex of the child, the name, surname, and occupation of the father, and the name, surname, and maiden surname of the mother. However, if the child is of illegitimate birth, no particulars relating to the father will be inserted in the entry unless both he and the mother request it and both sign the register.

No fee is payable when a birth is registered within three months after its occurrence, but after three months have elapsed an informant wishing to effect the registration must do so in the presence of the superintendent registrar of the district, and must pay fees amounting to 7*s.* 6*d.*

If twelve months have passed since the birth occurred, then it can be registered only on the authority of the Registrar General, to whom applications should be addressed. If registration is authorised, a fee of 15*s.* will be payable.

Instead of giving the information directly to the registrar of the sub-district in which the birth occurred, an informant may attend before any registrar in England and Wales (or before any superintendent registrar if three months have elapsed since the birth) to make a written declaration of the particulars which have to be registered. This will be sent on to the appropriate registrar, who will then make the entry in his register. A fee of 3*s.* is payable for this service.

When a birth has not been registered within forty-two days after its occurrence, the registrar may issue a formal requisition to a qualified informant, requiring him to attend before him to discharge his statutory duty to give information for the registration of the birth and to sign the register. The failure of a parent to register the birth of a child or of any qualified informant to comply with a registrar's requisition is a punishable offence.

3. Re-registration of Birth of Legitimated Person.—If the parents of an illegitimate person marry each other subsequent to the birth, and if the father is domiciled in England or Wales at the time of the marriage, then that person is legitimated by virtue of the marriage. Further, if the legitimated person was born in England or Wales, the parents have a duty to apply to the Registrar General for the re-registration of the birth within three months after the date of the marriage. If application is made within this time, re-registration, if authorised, will be effected free of charge, but if application is made later a fee not exceeding 10*s.* may be payable. The new birth entry will be similar to that for a legitimate child.

If application is not made by *both* parents, re-registration cannot be authorised unless the original birth entry was signed jointly by both parents, or the paternity of the child was established by an affiliation order, or a declaration of legitimacy has been obtained in the High Court or in a County Court.

4. Birth Certificates.—Birth certificates relating to the child may be obtained from the registrar as soon as the birth has been registered. A full copy of the entry can be supplied at the time of registration for a fee of 3*s.* 9*d.*, but if application is made at a later date a search fee will normally be payable in addition. This will be 1*s.* 6*d.* if the applicant goes personally to the register office or to the General Register Office, Somerset House, or 6*s.* 3*d.* if he applies by post. Birth certificates required for certain statutory purposes are obtainable from the registrar of the sub-district where the birth occurred, or from the district superintendent registrar, at special fees of 6*d.* or 1*s.*

A shortened form of birth certificate is obtainable for a fee of 9*d.* This gives no information about parentage, but states only the name, sex, date and place of birth of the person concerned. Short birth certificates are now in general use throughout the country, and are acceptable on almost all occasions when a person needs to prove his age.

5. Registration of Still-births.—A still-born child is a child which has issued forth from its mother after the twenty-eighth week of pregnancy, and which did not at any time after being completely expelled from its mother breathe or show any other signs of life. As in the case of a live birth, the duty of giving information for the registration of the birth of a still-born child rests primarily on the parents or, failing them, on the occupier of the house or institution where the still-birth occurred, or a person present at the birth. There is no provision for the registration of a still-birth before any registrar other than the one for the sub-district in which the birth occurred, and he will require evidence that the birth was indeed a still-birth. This evidence should take the form of a certificate setting out the cause of death, which will have been issued by the doctor who was present at the birth or who examined the body, or if there was no such doctor, by the midwife in attendance on the mother. If such a certificate cannot be obtained then the registrar will ask the informant to make a written declaration that the child was still-born.

6. Adopted Children Register.—An adoption Order granted by a court in England and Wales under the Adoption Act, 1958, contains a direction to the Registrar General to make an entry recording the adoption in the Adopted Children Register.

When the entry has been made, a full certificate containing the name, surname, date and country of birth of the adopted child, and particulars of the adoptive parents is obtainable from the General Register Office under the same conditions and for the same fee for a birth certificate.

A short certificate at a fee of 9*d.* may also be obtained. This bears no reference to the fact of adoption, and states only the child's name and surname, sex, date and place of birth.

DEATHS: REGISTRATION AND ARRANGEMENTS FOR BURIAL OR CREMATION (ENGLAND AND WALES).

1. Registration of a Death.—Every death taking place in England and Wales must be registered by the registrar of the sub-district in which the death occurred. Except in a case where a coroner's inquest has been held, information for the registration must be given personally to the registrar by a qualified informant within five days, or within fourteen days if an informant has sent a written notification of the death to the registrar. Qualified informants include relatives, any person present at the death, the occupier or inmate of the house or institution where the death occurred, or the person responsible for the arrangements for burial or cremation.

If the deceased person was attended during his last illness by a registered medical practitioner, then it is the duty of that doctor to sign and send to the registrar a medical certificate of the cause of death, and at the same time to give to a qualified informant of the death a notice that he has signed the certificate. This notice should be handed to the registrar by the informant when he attends to register the death.

If the death has been referred to the coroner, it cannot be registered until he has completed his investigations. When an inquest is held the registrar will register the death without the attendance of any informant on the authority of a document issued to him by the coroner.

The information recorded in the register includes the date and place of the death, the name, sex, age, and occupation of the deceased, and the cause of death.

2. Arrangements for Burial.—The body of a deceased person may not be buried until an authority for the burial has been issued by the

coroner or the registrar. A registrar will normally issue his authority after the death has been registered, but a certificate for burial can be obtained from the registrar *before* the registration of the death provided that he has received written notice of the death and a medical certificate of cause of death. If a death is being investigated by a coroner, a registrar cannot issue any authority for burial until those investigations have been completed.

3. Arrangements for Cremation.—The body of a deceased person may not be cremated until an authority for cremation has been issued by the coroner or the registrar. The coroner may issue his certificate for cremation or, after the death has been registered, the registrar may issue his authority, but neither of these documents in itself is sufficient authority to allow a cremation to proceed. Final authority for cremation must be given by a medical referee at the crematorium.

Cremation may not take place if the deceased has left written directions forbidding that form of disposal.

4. Removal of Bodies out of England and Wales.—Any person wishing to remove the body of a deceased person out of England and Wales must give notice to that effect to the coroner for the area within which the body is lying. The body may then be removed after the expiration of four clear days from the day on which the notice was received by the coroner, or earlier if the coroner states in his acknowledgment of the notice that no further enquiries by him are necessary. Forms for the purpose of giving notice to the coroner may be obtained from any Registrar of Births and Deaths.

5. Death Certificates.—Death certificates may be obtained from the registrar as soon as the death has been registered. A certificate can be supplied at the time of registration for a fee of 3s. 9*d*., but if application is made at a later date a search fee will normally be payable in addition. This will be 1*s*. 6*d*. if the applicant goes personally to the register office or to the General Register Office, Somerset House, for the certificate, or 6*s*. 3*d*. if he applies by post. Death certificates required for certain statutory purposes are obtainable from the registrar of the sub-district where the death occurred, or from the district superintendent registrar, at a special fee of 1*s*.

MARRIAGES: PRELIMINARY FORMALITIES (ENGLAND AND WALES)

1. General.—In England and Wales, marriage may be celebrated between persons aged sixteen or over according to the rites and ceremonies of the Church of England after appropriate preliminaries, or according to any other rites or before a superintendent registrar after the appropriate civil preliminaries have been observed. A marriage may be solemnised at any time between 8 a.m. and 6 p.m.

2. Marriage According to the Rites of the Church of England.—The preliminaries to a Church of England marriage may be the publication of banns, the issue of a common licence, the issue of a special licence, or the issue of a superintendent registrar's certificate (see "Civil Preliminaries" below).

(a) *Banns.*—Application for the publication of banns should be made to the clergyman of the parish in which each party resides. The banns must be published on three Sundays preceding the solemnisation of the marriage, which should take place within three months after the completion of the publication of the banns.

(b) *Common Licence.*—Application for a common licence dispensing with the necessity for banns should be made to the Diocesan Registrar or any Surrogate for granting Marriage Licences in the Diocese, or a Surrogate of the Vicar General or of the Master of the Faculties. A common licence is void if the marriage is not solemnised within three months of its issue.

(c) *Special Licence.*—A special licence granted by or on behalf of the Archbishop of Canterbury enables a marriage to be solemnised according to the rites of the Church of England at any time and place. Such a licence is issued only in grave emergencies or very exceptional circumstances.

(d) *Superintendent Registrar's Certificate.*—A marriage according to the rites of the Church of England may be solemnised with the consent of the clergyman of the church on the authority of a certificate of a superintendent registrar instead of after the publication of banns (see "Civil Preliminaries" below).

If any further information is required concerning marriage according to the rites of the Church of England, application should be made to the clergyman of the church in which it is desired that the marriage shall take place.

3. Civil Preliminaries.—Marriage after civil preliminaries may be on the authority of a superintendent registrar's certificate without licence, or of his certificate and licence, and may be solemnised in a register office, in a registered building (*i.e.*, a place of worship which has been registered for the solemnisation of marriages), or according to the usages of the Jews or Quakers. A summary of the legal requirements before notice of marriage can be given is set out below. More detailed information can be obtained from the superintendent registrar of the district in which either party resides.

(a) *Superintendent Registrar's Certificate without Licence.*—When both parties reside in the same registration district each party must have had his or her usual place of residence within that district during the seven days immediately preceding the giving of the notice to the superintendent registrar. The notice may be given by either party.

If the parties reside in different districts, notice must be given to the superintendent registrar of each district. Each party may give notice in his or her district, or either party may give both notices, but notice cannot be given until the seven days' residential qualification has been completed.

Generally speaking, the building in which the marriage is to take place must be in the district of residence of the parties or of one of them, but there are certain exceptions to this.

On the request of the party who gave the notice, the superintendent registrar may issue his certificate, provided that a period of twenty-one days has elapsed since he entered the notice in his marriage notice book. The marriage may then take place in the building specified in the notice at any time within three months from the day on which the notice was entered in the book.

(b) *Superintendent Registrar's Certificate and Licence.*—Only one notice is required, whether the parties reside in the same or in different registration districts, and the notice may be given by either party, but both parties must be in England or Wales on the day notice is given. One of the parties must have resided in the registration district in which notice is given for fifteen days immediately preceding the giving of the notice, and the marriage must (with certain exceptions) take place in that district. If both parties have resided for fifteen days in different districts, the notice may be given to the superintendent registrar of either district, but the marriage must (with certain exceptions) take place in the district in which the notice was given.

On the request of the party who gave the notice, the superintendent registrar may issue his certificate and licence, provided that one clear day (excluding a Sunday, Good Friday or Christmas Day) has elapsed since he entered the notice in his marriage notice book. The marriage may then take place in the building specified in the notice at any time within three months from the day on which the notice was entered in the book.

4. Registration of Marriages.—A marriage in a church of the Church of England is registered by the clergyman solemnising the marriage. A marriage in a Nonconformist church may be solemnised in the presence of an authorised person (*i.e.*, a person authorised by the trustees or governing body to be present at the solemnisation of marriages in that building), in which case the marriage is registered by that person, or in the presence of a registrar of marriages, who will register the marriage. A marriage according to the usages of the Society of Friends (Quakers) is registered by a registering officer of that Society. In the case of a Jewish marriage, registration is effected by the secretary (for marriages) of the synagogue to which the husband belongs. A marriage in a register office is registered by the registrar of marriages.

The particulars recorded include the date and place of the marriage, the names, ages, marital condition, and occupations of the parties, and the names and occupations of their respective fathers. The entry is signed by both parties to the marriage and two witnesses.

5. Marriage Fees.—(a) *Marriage According to the Rites of the Church of England.*—Generally, fees for a marriage after banns amount to £1 2s. if the parties live in the same parish or £1 12s. 6d. if in different parishes. Fees for a marriage on a superintendent registrar's certificate amount to £1 13s. if the parties live in the same registration district and £1 16s. if they live in different districts. Fees for a marriage by ecclesiastical licence amount to between £3 and £4. The fee payable for a special licence is £20.

(b) *After Civil Preliminaries.*—The following fees are payable in respect of the civil preliminaries to a marriage:—

	Superintendent Registrar's certificate.		Superintendent Registrar's certificate and licence
	Notice in one district	Notice in two districts	
	s. d.	s. d.	£ s. d.
Entry of notice .	1 6	3 0	1 6
Superintendent Registrar's certificate	1 6	3 0	1 6
Superintendent Registrar's licence	—	—	2 5 0
Attendance of registrar of marriages (if required by law)	7 6	7 6	15 0
Total . . .	10 6	13 6	£3 3 0

In the case of a marriage in a registered building, however, further fees may be found to be payable to the Minister or the authorities of the building in regard to the solemnisation of the marriage. An additional fee will be payable if a marriage certificate is required.

6. Marriage Certificates.—Marriage certificates may be obtained from the person registering the marriage immediately after the ceremony for a fee of 3s. 9d. If application is made at a later date to the person having the custody of the register, a search fee will normally be payable in addition. Marriage certificates required for certain statutory purposes are obtainable from the person having the custody of the register at a special fee of 1s.

III. HOUSE PURCHASE

INTRODUCTION.

The following guide has been compiled to help those who want to buy a house, especially young people founding a home. For many of us the need to buy a house comes but once in a lifetime, or, at any rate, so seldom that we have little experience to guide us. Many people, therefore, pick up such knowledge as they can at the last moment as they go along. That they tumble unawares into pitfalls is not therefore surprising. It is to save the house-seeker from those mistakes, which can be so costly and worrying to him, that the following guide is offered.

The guide has two main parts: first, how to make sure that the purchase is a sound one, and second, how to obtain the necessary funds. In addition, there is an explanation of the rates and income tax on a house and what reliefs can be obtained.

The advice may well seem more complicated, at first sight, than the newcomer to the problem expected. But when he reads it the main points will be found to be simple and clear, and the advice will repay careful study.

In addition to an explanation of how to select a house and get the money for it, information is offered on important subsidiary matters, such as how the purchaser may assure his family if he dies before a mortgage is paid in full. It is also explained how grants can be obtained for conversions and improvements.

The figures quoted in this section are those ruling at the time of going to press.

THE ESSENTIAL QUESTIONS TO ASK.

The Nature of the Property.—There are certain preliminary points which you need to get clear before entering into any commitments. You should think most carefully over the general position of the site; the nature of the soil; handiness to shops; what daily transport is available and what schools there are in the neighbourhood. You should ascertain the exact nature of what is being sold. Is the land leasehold or freehold? If it is leasehold, your ownership will be only for a stipulated number of years, often ninety-nine, sometimes more and sometimes much less, rent will be payable, and there are likely to be restrictions on its use. Though freehold usually means outright ownership of the land, freehold may also carry restrictions, such as debarment on use for business purposes or conversion into flats, or there may be limitations on the type of structure or size of house which can be built.

The Nature of the Neighbourhood.—Next comes essential information about the neighbourhood as a whole. Is it already zoned, or likely to be zoned, for industrial or other non-residential development? Are developments in hand, or possible, near enough to be inconvenient or liable to affect the amenities or value? The local Planning Authority (whose address you can find from the local council office) can usually give guidance on all these points. Equally essential is to find out if the land is subject to any rights of way, or other "easements" as they are legally termed.

Services and Roads.—Handiness to main drainage and gas, electricity and water supplies must be considered. Installation may be costly, if any or all of these services have to be carried some distance. If roads have not been made up or adopted by the council, it should be found out when they will be built or adopted, where they will run, and the probable liability in road charges.

Local Bye-laws and Planning Clearance.—Assuming a clear bill up to this stage, local bye-laws and planning rules must be taken into account if a new house is to be built. Not any kind of building can be put up. It must conform to local standards of construction and safety. Its outward appearance and the facing materials used must also be approved by the local Planning Authority. An architect is the best adviser on these points. Once bought or built, owners can-

not do anything they wish with houses. In addition to any restrictions going with the land, as mentioned above, the local Council and Planning Authority may have a definite say in all proposals. For example, their approval is necessary before a house can be converted to flats or for business purposes, or put to any other use

The Need for a Surveyor and a Solicitor.—A qualified surveyor should be called in to report on the condition and value of an existing house in which you are seriously interested. You will thereby know exactly what it is you are thinking of buying, and you will know within limits what you ought to pay. Various legal points must also be considered, and a solicitor should be consulted at the earliest stage of negotiation, to look after matters such as the title to the property, restrictions on use, conveyance and, a complicated matter calling for expert advice, the likelihood of the land being lost by compulsory purchase. On written application to the local council it must state whether, so far as it knows, the land is liable to compulsory purchase within five years

The Golden Rule, is therefore: Obtain professional advice at the earliest stage—from a surveyor and a solicitor acting for you and independent of another party to the transaction. Where necessary, as, for example, when building a house, you should also consult an architect. The safe rule is not to enter into any commitment off your own bat. But if you do make any undertaking make sure that you introduce into your undertaking the words "subject to contract". Thus if you pay a deposit to a house agent as stakeholder state, in writing, that the payment is "subject to contract".

ON HAVING A HOME BUILT.

Here are some points worth considering if you are thinking of having a house built for you.

1. Consult an architect before buying land for building the house. He will advise you whether it is suitable for the kind of house you want and find out if the local authority will allow you to build. The Royal Institute of British Architects, 66 Portland Place, London, W 1, will put you in touch with an architect in your district

2. If you deal directly with a builder make sure whether he is registered with the National House Builders Registration Council. You can obtain from them a list of registered builders covering the area you are interested in. Their address is 58 Portland Place, London, W 1.

3. Employ an architect to design the house to your wishes, draw up plans, select the best tender, and supervise the construction. There is a sliding scale, starting at 10 per cent. on the cost of the work and dropping to 6 per cent. The fee is a good investment. But if you cannot afford to have an architect-designed house, the Royal Institute of British Architects have a special scheme under which an architect will quote for preparing and supervising through to the state of obtaining planning consent, but does not supervise erection. The fee is £45 for a house not exceeding 1,000 square feet

4. Consider the allocation of the ground-floor space. Do you really want two rooms of equal size—lounge and dining-room—or one good sized room? If you must economise on space, would you be content with a dining alcove, in the lounge or perhaps in the kitchen?

5. Give high place to the claims of the kitchen.

6. Decide upon your heating and lighting installations early enough to incorporate requirements in the original plans

7. If you are not already in possession of your furniture, consider how far built-in furniture will solve the problem of restricted space

8. Study the plans carefully. If you find it difficult to visualise, you could have a model made for a few guineas.

9. You may find useful the notes below on certain troubles which may occur in houses, namely, woodworm, and dry rot.

HOW TO BUDGET.

Stamps and Fees.—Sufficient money must be available to cover every need. You will, of course, remember that expenditure does not stop at the cost of the property itself. You will need to have money for stamp duties, legal charges, and expenses on the conveyance (or transfer) of the house if it is being bought, or on the land only if it is being built to plans, stamp duties, legal and inspection fees, and expenses in connection with the mortgage if money is being borrowed; and a fee for the surveyor who examines before purchase. All are payable by the purchaser. The actual amounts depend on the purchase price of the property or land and the amount of any mortgage advance. Stamp duty, payable to the Inland Revenue, as from August 1, 1963, is nil up to £4,500, ½ per cent. up to £6,000, thereafter the full 1 per cent. Legal charges are at a set scale related to the purchase price. For example, if the land is unregistered the scale is 2½ per cent. on the first £1,000, 1½ per cent. on the next £2,000, and ½ per cent. on the next £7,000. If the land is registered at H M Land Registry, fees are less, rates being 1½ per cent. on the first £1,000, 1 per cent. on the next £2,000, ½ per cent. on the following £1,000, and so on, but Land Registry fees will be payable at the rate of £3 15*s* for the first £1,500 and 2*s* 6*d* for each extra £50 or part of £50

Total Expense for the Conveyance.—A reasonable estimate of the maximum total expenses for *conveyance*, including incidental expenses and stamp duties, is, therefore, say, 2-2½ per cent. on the purchase price—less, of course, if the land is registered. Further, though smaller, sums will be payable if a mortgage has to be arranged. The whole set of expenses can add as much as 3-3½ per cent. to the outlay

Other Monetary Needs may include: removal expenses, cost of fittings, curtains, and new carpets, structural alterations, decorating, etc., new or additional furniture, and laying out a garden, including the cost of tools. The total will depend on circumstances and particularly whether you are moving to a new house or setting up home for the first time. The total amount can be substantial, and it is important that before entering into any commitments, you should draw up a budget of what capital you need, and if insufficient capital is available you should ascertain the amount which can be borrowed on mortgage. How to obtain a mortgage is explained in the next paragraphs.

HOW TO RAISE A MORTGAGE.

Who Lends Money?—Building Societies, Insurance Offices, and Local Authorities all lend money to enable people to own their homes. Banks also lend money and, subject to membership conditions, Trade Unions and Friendly Societies. While details may vary, some broad general rules apply to most methods. They are: (1) The property must be freehold or, if leasehold, must have a life of 20-30 years more than the repayment period of the mortgage. (2) The property must, in many instances, be constructed of brick, stone, or concrete—timber-built or half-timbered houses will not be entertained by some lenders. (3) The loan will be calculated on the value as decided by the lender's surveyor or the purchase price, whichever is the lower. (4) Normally, only a proportion of the price or value will be advanced, the amount usually depending on: (*a*) the age, condition, size, and situation of the house, (*b*) the lending policy of the mortgagee; and (*c*) the age, financial position, prospects, and family circumstances of the borrower. **A useful** general guide to (*c*) is that, in order to avoid **taking** on financial commitments which might **become** burdensome, mortgage repayments, rates, and a fair allowance for repairs should total not more than around one-quarter of the borrower's income

How Much is Lent?—The percentage advanced varies widely, and depends partly on the method of borrowing. But a broad indication for freehold or long leasehold properties for owner-occupation costing not more than, say, £3,500–£4,500 is: new, up to 85 per cent.; reasonably modern older types, up to 80–85 per cent. On higher priced, large or pre-1918 houses the amount may be anything from 66% to 75–80 per cent. Where the price is substantially below current market value, such as may happen if a rent-controlled house is being bought at a favourable figure by a sitting tenant, most lenders will advance a larger proportion, though, on the reasonable stipulation that the owner should have some cash stake in the property, probably not more than 95 per cent of the cost Likewise, as explained in later sections, larger loans may be made when suitable guarantees or additional security can be provided

Loans for Houses Being Built.—Special considerations apply when building one's own house Loans are not normally made on bare land, but if its purchase and commencement of building are a more or less continuous operation, an advance may be made on the land if its value is (*a*) high in relation to the total cost of the completed property, and (*b*) more than the borrower will have to find himself For example, if the land costs £750, building, etc , £2,250, and a loan of 80 per cent will be made on the total of £3,000, a sum of £150 would be advanced on the land itself In every case, however, the amount lent will be based on the surveyor's valuation of the completed property This will take into account the cost of the land, building, and architect's fees, which latter are properly reflected in the value It is possible in most cases to have the advance in up to three or four instalments as various stages of building are completed Whatever the nature of the property, the borrower has to pay out of his own resources the costs of conveyance of the house or land, as mentioned earlier, plus legal and other charges in connection with the mortgage As explained before, the two sets of expenses can add up to a further 3½ per cent to the cash outlay

Three Points for the Future.—Make sure when arranging the advance that lump sums can be paid off at any time, with a proportionate reduction in the interest payable You can ask the Building Society if an extra loan will be possible should money be required at some future date to pay for additions, improvements, or heavy repairs Finally, if for any reason whatever, it is difficult to keep up repayments, discuss the problem with the lender at the earliest stage—a temporary reduction in payments will probably be made to tide over the difficult period

HOW A BUILDING SOCIETY HELPS.

The Need for Early Consultation.—Building Societies encourage prospective owners to discuss their propositions with them at the earliest moment By finding out how much you can borrow you can be saved a lot of disappointment and loss of money by way of deposits and survey fees

Surveyor's Inspection.—Inspection of the property by the society's valuer is the first step after the preliminary discussion A typical scale of fees is £2 on a purchase price up to £500, with additions of 10*s*. for every extra £250 up to £2,000 (at which level the fee is thus £5) and 4*s* per £100 thereafter up to £10,000; plus travelling expenses over a certain distance. The valuer's report is confidential to the society, and is not available to the applicant. A decision to offer an advance is made normally within a day or two of the receipt of the report. In the case of new houses built to individual design preliminary arrangements and the offer of an advance are made on the basis of architects' plans and builders' estimates.

How Much Will be Lent?—Societies, when a substantial loan is wanted, make the figure as large as possible commensurate with the security offered, the ability of the borrower to meet repayments, and their individual policy. Normal maximum amounts are 75–85 per cent on reasonably modern and new properties costing up to £3,500–£4,500 and less on more expensive ones Increased proportions may be arranged, however, if additional security is provided Up to 95 per cent may be considered if the borrower himself can provide extra security in the form of Trustee Securities, another property, or a life-assurance policy with a sufficient surrender value Up to 90–95 per cent may also be arranged if a third party of financial substance will put up good security to cover part of the loan

Guarantee Schemes.—Building Societies offer guarantee schemes in conjunction with insurance companies One special plan provides for 90–95 per cent advances to approved applicants on houses valued at not more than, say, £3,500–£4,500 A single insurance premium, which is usually added to the loan, is charged on the amount of the extra advance There is also a Government–Local Council scheme for advances of up to 95 per cent on new and *old* property

Methods of Repayment.—Optional methods of repayment are offered by most Building Societies The *Monthly Repayment* system is the most widely used and popular. Equal calendar (or lunar) monthly instalments paid throughout the term of the mortgage cover both interest and repayment of principal Typical *calendar* monthly payments on each £100 borrowed for various periods and different interest rates are

Number of Years	*Interest Rate* 6%		6½%		7%	
	s	*d*	*s*	*d*	*s*	*d*
5	39	7	40	2	40	8
10	22	8	23	3	23	9
15	17	2	17	9	18	4
20	14	7	15	2	15	9
25	13	1	13	8	14	4

While repayments can be arranged over any lesser number of years, the normal maximum is twenty to twenty-five, though some societies may arrange longer terms in particular circumstances The advantage of this system is the even spread of the outgoings In the early years the greater part of each payment represents interest, which, however, falls steadily as the loan is reduced The society usually reserves the right to increase—or reduce—the rate of interest on giving due notice Increases are applied in ways giving the minimum inconvenience to the borrower, often by extending the repayment period

SAVING MONEY IN A BUILDING SOCIETY

Before You Invest—Investigate -Make sure that the building society into which you are going to put your money is a sound one For the uninitiated there is a simple way Find out if the society belongs to The Building Societies Association. Its address is 14 Park St , London, W 1 (telephone Mayfair 0515), and it will send a little booklet free of charge called *How to Choose a Building Society*. If the society you have in mind is not a member and has total assets of £500,000 or more you should inquire whether its deposits have been designated by the Registrar of Building Societies as trustee investments But for added security it is best to deal with a member of the Building Societies Association. If after reading the booklet you have any doubt about a particular society ask your bank manager or solicitor or accountant to study its latest balance sheet with the help of the notes given in the book.

Two Classes of Investment—Shares and Deposits.—Depositors receive an agreed rate of interest, which is generally about ½ per cent. lower than the rate paid to shareholders If the society should be wound up, depositors are entitled to their money in full before any money is paid to shareholders. Shareholders are members of the society, depositors are not Some societies do not accept deposits.

HOW LOCAL COUNCILS AND BANKS HELP.

Local Authorities, including County Councils can, if they wish, advance money for home ownership under various Acts Applications for details of mortgage facilities available for the area in which the property is situated should be made to the Treasurer or Clerk of the appropriate local Council These facilities apply to property of any value and, though not always available, up to 100 per cent may be lent Interest is generally charged at ¼ per cent above the rate at which the Council itself borrows from the Public Works Loan Board, which fixes its rates in accordance with money-market conditions and the term of repayment The interest is, as a rule, fixed for the whole period of the loan, though some Councils have taken powers of variation. There is, of course, no life-insurance protection, but, as explained in the Life Assurance section, this may be arranged by taking out a reducing term, or mortgage protection, assurance

Loans can be made by Local Authorities for the conversion of buildings into houses or flats and for the alteration, enlarging, repair or improvement of dwellings (See paragraphs below on Improvement and Conversions.)

Bank Loans.—Banks are generally prepared to help within certain limits, the main considerations being that (1) the borrower is an established customer of good standing, (2) the advance can be reduced steadily and repaid entirely over a relatively short period of, say, eight to ten years at the outside, and (3) no more than two thirds to three-quarters of the value is to be lent, or additional security such as marketable investments, other property, or life assurances with surrender values can be put up A bank loan is subject to half yearly or annual renewal, and may therefore have to be repaid on due notice, though this is given only in exceptional circumstances Likewise, bank loans are subject to restrictions such as credit squeeze or Government financial policy

Private Mortgages, up to two-thirds or three-quarters of the value, may also be obtained, mostly through mortgage brokers, solicitors, and estate agents Interest may be ½ to 1 per cent. more than on building society advances Repayment may be by instalments, but is more usually in one sum at the end of an agreed term, which calls for the accumulation of funds. This private field is often the best one for raising a second mortgage when it is impossible to obtain enough in the normal way on a first charge. Second mortgages, in view of the risk involved, generally have to be repaid over a comparatively short period of, say, two to three years and the interest ranges up to 7 or 8 per cent.

Bridging between One House and Another.—It may be necessary to bridge a gap between payment for the new house and receipt of the proceeds of sale of the old. If the present house is not mortgaged and no loan, or only a relatively small one, is needed on the new property, the bank may be able to help. If the present house is mortgaged, consult the lender. Arrange the financial side well before entering into any contracts or commitments on the new transaction Established mortgage brokers and insurance brokers can be of help in the arrangement of mortgages, especially where it is desired to link the loan with endowment or mortgage protection assurance; or it is difficult to obtain the full amount required through the direct channels.

RATES.

Rates, levied by Local Authorities, are payable on all occupied house property—by the owner if he is also the occupier and often by the tenant if a house is rented The amount depends on: (*a*) the rateable value, and (*b*) the rate in the £ levied by each Council The latter varies widely Council by Council, and is liable to annual or even half-yearly change

Rateable Value.—Under a comprehensive revaluation completed in 1955 all dwellings have been reassessed on a common basis laid down in the Valuation for Rating Act, 1953 The starting point is the *Gross Value*, which is the rent at which the property might reasonably have been expected to let at end-June 1939, with (*a*) the tenant paying all usual tenant's rates and taxes (but excluding income tax), and (*b*) the owner meeting the cost of repairs and insurance. A *Repairs Allowance* is next given at fixed scales. The net figure left is the RATEABLE VALUE, and it is the one on which rates are paid The new values came into effect as from April 1st, 1956 Ratepayers may appeal for reductions in the gross value at any time during the currency of the rate This right is particularly important when a new house is first valued An appeal must first be made to the local Inland Revenue Valuer, whose address is obtainable from the town hall or council offices There is to be a rating revaluation in 1963

If the valuer's decision is unfavourable the appeal can be carried to the local Valuation Court A final appeal can be made to the local Land Tribunal, which, however, may entail certain costs A qualified rating valuer should be consulted in complicated cases

INCOME TAX

Net Annual Value—Income Tax assessments on property, made separately by the local Commissioners of Income Tax, also start with a *Gross Value*, which can be defined as the fair rental value with the tenant paying rates and the owner repairs and insurance (The income-tax figure, it should be noted, is not necessarily the same as the rating gross value) A repairs allowance (automatically given) is based on the gross annual value, as under —

G A V	*Repairs Allowance*
Up to £40	One-quarter of the G A V
£40–£50	£10
£50–£100	One-fifth of the G A V
Over £100	£20, plus one sixth of the G A V over £100

The balance, known as the *Net Annual Value*, is the amount on which Schedule A, or Property Tax, is assessed This Tax was to be abolished in 1963

Appeals.—An appeal for a reduction in the gross annual value can, as with rating valuations, be made by the owner at any time When a new house is assessed for the first time an appeal must be made within forty-two days of receipt of the notice All appeals should first be made to the local Inspector of Taxes and, if no satisfactory agreement can be reached, taken next to the local General Commissioners of Income Tax

Relief for Repairs—Rebates may be claimed for repairs when actual expenditure over specified periods exceeds the fixed allowance The normal basis for making what is called a *Maintenance (or Excess Repairs) Claim* is the *average* spent over five consecutive years, generally ending March 31st. After making the initial claim, subsequent claims are made year after year by dropping out the expenditure for the earliest year and adding that for the newest, until the five-year average drops below the fixed allowance. One useful exception to this general rule may apply where a property has been owned for less than five years and a lot of money has been spent on it. If the previous owner's expenditure is known it can be included with such outlays to arrive at the five-

year average. Alternatively, it may be possible to arrange with the Inspector of Taxes to work on actual yearly expenditure until a full five years' figures are available. All claims must be supported by receipted and detailed bills, which should always be kept. The cost of insuring the house—but not the contents—should be included. Money need not be spent each year, it is the five-year average which matters. Claims must be made *by the owner* within six years of the end of the relative tax year to the local Inspector of Taxes.

How the Owner Pays Income Tax.—When it comes to calculation of the income-tax liability on a house the net annual value is taken into account as part of the owner's income. Tax, if any, is then payable at the rate or rates applicable to the total income from all sources after deduction of personal and other allowances and reliefs. The owner obtains relief, in addition to any maintenance relief, in respect of the annual interest paid on a mortgage or loan on the security of the house. If the interest is paid to a building society, local council, certain insurance companies or a bank, relief will be given normally by setting off as much as possible against the assessment on the house and the balance, if any, against other income. But if the mortgage is the type where income tax is deducted from each interest payment such tax will have to be paid over to the tax collector and the assessment, or part of it, will remain. Though this seems to be a complicated way of doing things, the net effect is the same and full relief is given. All queries about property tax assessments should be addressed to the local Inspector of Taxes.

GRANTS FOR IMPROVEMENTS AND CONVERSIONS.

What Grants Cover.—Grants towards the cost of certain types of improvements and for conversions can be made to property owners by Local Authorities. *Improvement* for this purpose means work, other than ordinary repairs, necessary to bring a dwelling up to reasonable modern standards of convenience and comfort. Grants are now of two kinds. A *Standard* grant may be claimed *of right* to instal five amenities: bath or shower in bathroom, wash-hand basin, hot-water supply, water closet; satisfactory food storage—of up to one-half of the approved cost but subject to specified maximum payments. A *Discretionary* grant can be made for a much wider range of improvements, and for *conversions*, though qualification for assistance is decided solely by the Council and the cost of approved work must exceed £100, up to one-half may be granted, with a maximum of £400 for each dwelling. *Conversion* work includes the division of a suitable house or group of houses into flats or other self-contained dwellings.

Conditions of Grant.—To qualify for a grant council approval must be obtained *before* any work is started. The property must be brought up to certain defined standards and usable life. Fees for professional help and advice may be included in the approved cost.

PROTECTION OF DEPENDANTS AND HOME BY ASSURANCE.

Freedom from Debt in Case of Death.—Life assurance can be linked with house purchase in various ways to provide not only finance, but protection for dependants and, perhaps, a fund for meeting major expenditure some way ahead. A popular method is a loan from a life insurance office repayable by means of an endowment assurance. It is a two-way transaction. The insurance office makes a fixed loan for an agreed number of years. Simultaneously, the borrower takes out an endowment assurance for at least the same amount and the same period. Thus—which is the great merit of this method—if he dies at any time after paying the first premium the endowment pays off the mortgage and leaves the house free of debt. The maximum maturity period of the endowment assurance is normally twenty to twenty-five years or age sixty-five, whichever is the shorter term.

Home Protection Insurance.—A growingly popular and cheaper method of "insuring" reducing types of loan is, however, a reducing-term insurance, more popularly called "mortgage protection," "home protection" insurance, and so on. Though a number of variations are available, the basis is similar—the amount assured falls annually as the mortgage is reduced. Under the simplest form the insurance provides enough to repay the balance of the mortgage if death occurs before its complete repayment, but the borrower obtains no cash benefit if he lives to the end of the term. Premiums, payable for only a limited number of years, vary according to the age of the borrower and rates for younger age groups are no more than a few pounds per £1,000 original loan. The need to insure your house and contents is explained in Part IV.

HOW TO MEET CERTAIN TROUBLES IN HOUSES.

Woodworm.—Although dry rot is the most serious menace to timber in this country, there are four beetles mainly responsible for beetle infestation, which is unfortunately increasing. Therefore pay particular attention to wood in damp, dark, and out-of-the way places, and the backs and underneaths of furniture.

The most frequent cause of "worm" damage in furniture and joinery is the common furniture beetle.

It is best to study how to deal with attacks, both slight and heavy, in the Ministry of Works Advisory Leaflet No. 42 (H.M.S.O.). This pamphlet explains how damage is caused, how to prevent attack, how to identify the beetle, and the best kind of insecticides. Leaflets with further information on this subject can be obtained free on application to The Director, Forest Products Research Laboratory, Princes Risborough, Aylesbury, Bucks.

Dry Rot.—Dry Rot fungus is the worst type of fungus (of which there are several) to attack and destroy woodwork in buildings. If neglected it will spread, like an infectious disease, to uninfected buildings.

It nearly always starts in damp unventilated places and it draws moisture and strength from wood, which it leaves dry and powdery—hence the name.

Make sure that there is adequate ventilation, never paint damp or unseasoned wood and, on planning a new house, use well-seasoned wood.

The collapse of a floor board or irregularities in woodwork may be the first indication that something is wrong. Test suspicious places with a knife blade or pointed tool—it will dig in and pull out easily if the wood is rotten.

Drastic treatment is necessary. Cure the cause of dampness. Look for buried or choked air bricks or flower-beds raised against walls above the damp-proof course.

Get rid of every trace of rot, cutting away about 12–18 in. of sound wood beyond the last signs of attack, as it will probably contain some invisible strands of the fungus. Burn all infected wood immediately.

Sterilise all walls and brickwork which were near the infected timber by playing the flame of a blow-lamp on walls. When the walls are cool treat with a suitable chemical—sodium pentachlorophenate (8 oz. to the gallon of water) or buy a ready-made solution.

If there is a danger of the area remaining damp, use as little wood as possible for reinstatement and secure timber which has been pressure-impregnated with preservative.

One of the best preservatives is creosote. It will penetrate better if it is hot.

For information about dry rot and about the preservation of timber write to: **Timber Development Association Ltd., 21 College Hill, London, E.C.4.**

IV. A GUIDE TO INSURANCE

It is simple prudence to secure the benefits of insurance. You should ask yourself not whether you ought to insure but which pattern of insurance suits you best. Life assurance will give you confidence and your dependants too; and this will promote that trust which makes for happy relationship. Moreover, life assurance is a form of systematic saving against the inevitable rainy day. And there is a special word of advice for women, who are naturally especially concerned about financial security.

The figures quoted are those ruling at the time of going to press.

Life Assurance: Who may Insure.—You may insure your life and thus provide for your family in the event of your early death A husband may take out an insurance on the life of his wife, and vice versa It is a condition of the grant of a life policy that the person effecting it should have an interest in the life to be insured, known as an insurable interest Every adult person has an unlimited insurable interest in his or her own life A husband has an unlimited insurable interest in the life of his wife, and vice versa These are, however, exceptions to the general rule, which is that the interest must be pecuniary, *i e*, measurable in terms of money Relationship in itself does not constitute an insurable interest. Thus a parent as such has no insurable interest in the life of his child, nor a child in the life of its parents It is to be noted that provided the insurable interest subsists at the time the policy is effected, the interest may be reduced or disappear entirely during the term of the policy without invalidating the contract

Whole Life Assurance.—The first contract should provide life assurance for as long as it can possibly be needed, which generally means a whole of life policy The premiums may be payable throughout the lifetime of the assured, or can be limited to a fixed term of years, when, if the life assured survives beyond the fixed term, the policy continues in force without further payments of premiums. A whole-life policy under which premiums are payable throughout the life of the assured, and which does not participate in profits, is the cheapest form of permanent life assurance because it provides the maximum sum assured with the minimum premium outlay A whole-life policy, either with or without profits, and preferably with premium payments ceasing not later than retirement age, should form the backing of every well-planned scheme of life assurance At age 25 a whole-life "without profit" policy for £1,000 will cost around £13 a year subject to rebate of income tax, or, say, £15 a year if it be arranged for premiums to cease at age 65 If effected on the "with profit" plan, a whole-life policy for £1,000 with premiums payable throughout life will cost about £22 at age 25, or around £24 a year if premium payments cease at age 65

Endowment Assurance.—In its simplest form an endowment assurance secures a stipulated sum upon the survivance of the life assured to a stated date, or upon his death should that occur earlier The most important advantage of endowment assurance is provision for old age. Where adequate assurance has already been effected as a provision for dependants, a short-term endowment assurance is often the best means of making provision for school expenses or providing a child with a start in life But apart from special circumstances of that kind, the best form of endowment assurance in the great majority of cases is a policy maturing at the prospective age of retirement Many men, of course, come under a pension scheme, but the pension will by no means equal their earnings, and may die with them. Their wives may enjoy the protection of a widow's pension, but this is likely to be a modest amount and perhaps inadequate, even allowing for an amount under the National Insurance scheme There is therefore no better object for your savings than an endowment assurance maturing at 65 It provides a reasonable amount for dependants in the event of early death, while if the assured survives to 65 he receives a capital sum, which, should he so desire, can be converted into a pension for himself, or himself and his wife

"With" and "Without Profit" Assurance.—Both whole-life and endowment assurances can be obtained either with or without the right to participate in profits, termed bonuses, a larger premium being charged for participation A policy-holder's share in the profits is usually added to the sum assured It is known as a reversionary bonus, and is payable with the original sum assured at the time of claim. These bonuses may, if desired, be surrendered for immediate cash without disturbing the original assurance, but the cash value, is, of course, considerably less than its reversionary value as an addition to the sum assured. The bonus may be calculated as a "simple" bonus on the sum assured or as "compound" bonus on the sum assured and any bonuses already added

Endowments by Instalments—The proceeds of an endowment assurance may be payable by instalments over a period of, say, 5, 10, or 15 years free of income tax The person assured would, of course, have an option to take a lump-sum payment at maturity instead of payment by instalments, and his representatives could make such a choice in the event of his death during the policy term

Optional Endowments—An option to convert to an endowment assurance can always be attached to a whole-life policy, so that if at the end of, say, five or ten years an endowment would better suit the assured's needs, the change can then be made The option is with the assured, and if ill-health has overtaken him since effecting the whole-life assurance, he will no doubt prefer to retain the cheaper form of policy This freedom of choice is of great value whether the policy is intended as a complete provision in itself or whether it is to be used in combination with other policies.

"Income" for Dependants.—Experience has shown that the provision of a capital sum at death does not always solve the problem of the young widow, especially if she has a family to support The essential requirement is a guaranteed income during the years when any children will be dependent for education and general upbringing, and to cover this contingency the companies have devised plans which at a low cost provide a tax-free income for the remainder of or the whole of a specified term of years

A number of offices assure "income" independently of "capital" provision For instance, assuming a man aged 30 effects a "Family Income" policy with instalment benefits of £200 per annum (payable monthly in advance) for 20 years, the annual premium will be around £6 If the man dies at say age 40, his dependants will receive £200 a year for 10 years, making £2,000 in all The most beneficial plan however is where the income benefits form part of a whole-life or long-term endowment assurance, to which the income benefits may be added at inception or during the currency of the policy There are various varieties of this principle, and a plan to suit every need and every purse.

Financial Security for Women.—An increasing number of women are effecting policies, both as provision in the event of death as well as for old age Many insurance companies now recognise that in general, women live longer than men by offering lower rates of premium The woman following a career can provide for retirement at 55, or, at the latest 60, by an endowment assurance, or by what is known as a double-endowment assurance, or by the purchase of a deferred annuity The two former have the advantage of tax rebate not allowable on premiums under a deferred-annuity contract For a young woman the problem is "If I marry, a policy on my husband's life is important If I do not marry, a pension for myself is necessary" For this situation a number

of special assurance schemes have been devised. Under one such scheme a single woman assures her own life for a sum payable, either with or without bonus additions, at 55 or 60, and has the option, should she marry, to exchange the assurance for one on the life of her husband. By another, she has the option on marriage to take a small cash payment and, subject to her husband's not having reached 45, can exchange the policy for an assurance on her husband's life. In both cases the substituted policy remains for her absolute benefit, and is issued without medical examination of the husband or other evidence of his health.

Retirement Annuities.—A self-employed person, or an employee not in pensionable employment, may under the provisions of the 1956 Finance Act effect an "approved" deferred annuity to provide a pension commencing not later than at age 70 and not earlier than age 60, and obtain full tax relief on the annual premiums paid. The benefit, however, must be in the form of a pension and, excepting a possible return of premiums at death before retirement, no cash payment is provided. The annuity acquires no loan or surrender value, and does not of itself provide adequately for dependants. By reason of these limitations an endowment assurance as previously outlined is in many cases the more suitable choice.

Educational Assurance.—The cost of education can be met by an endowment assurance on the life of the parent or guardian. There are special assurances available with the sum assured payable at *termly* intervals over a period of years. In the event of premature death of the parent or guardian premiums cease at once, and the education fees provided for would then commence, or, alternatively, be held by the life office for payment of fees during the original period as provided in the policy. Where school fees have been, or are about to be entered upon for a given number of school terms, a special assurance plan provides that if the parent dies prior to or during the educational period the school fees and expenses are assured for the remainder of the agreed period. Assuming the first term's fees have been paid and the next payment is due at end of four months, an annual premium around £6 payable only for three years would cover £100 per term for 14 terms, i.e., £1,400 in all. While the benefits under the policy are treated as capital, not taxable, the ordinary rebate of income tax can be claimed on the premiums of these policies.

Child's Deferred Assurance.—A popular form of policy for the benefit of a child on reaching maturity is the child's deferred assurance, which becomes the property of the child on becoming 21 or 25, when a number of valuable options may be exercised. The most valuable option permits the assurance to be continued on a whole-life or endowment basis—with or without profits—at the same low premium, irrespective of the state of health of the child at that time, and without regard to occupation, travel, or foreign residence. The policy may thus be said to provide insurance against uninsurability, and this possibility is a very real one. The policy sometimes carries a special educational option at, say, 15, to meet school fees. Varying schemes of this nature are offered at comparatively small premiums, often no more than £10 per annum, or £1 per month. A small extra premium, which varies with the age of the parent, will provide that, if the parent dies, all premiums cease up to the option age. No loss can be sustained under this class of assurance, for all premiums paid are returned should the child not survive to the agreed "option age."

Life Assurance and House Purchase.—No man should buy a house on mortgage without making sure that, in the event of his death before the mortgage has been paid off, his wife and family will be free from any liability in connection therewith. The only way to safeguard one's dependants is through life assurance, and particularly by means of a life policy specially adapted to the purpose. The two principal classes of house purchase assurance are referred to and explained under the heading "Home Protection Insurance" (Q 18).

Loan, Surrender, and Paid-up Values.—Both whole-life and endowment assurances acquire a surrender value after a minimum number of annual premiums (usually two or three) have been paid. Alternatively, either type of contract can be converted into a paid-up policy, i.e., the payment of future premiums is dispensed with, but, of course, a reduction is made in the sum assured. The surrender value of a whole-life or endowment assurance increases as time passes, and provided that premiums are regularly paid, policies form good security for a loan either from the office itself or from a bank. This may prove very valuable in the event of temporary financial embarrassment. Policies acquiring a surrender value are in general subject to special conditions of considerable value to the policy-holder in the event of premiums not being paid when due. Under what are termed "non-forfeiture regulations" the accrued surrender value is applied automatically to keep the assurance in force. The non-forfeiture period lasts so long as there is a surrender value sufficient to cover the unpaid premiums.

Income-tax Allowance.—Under existing legislation relief of income tax may be claimed on the amount of the premiums paid for life assurance effected by a person on his own life or on the life of his wife subject to the following conditions:

1. The amount on which relief is allowed is not to exceed one-sixth of the total income.
2. No allowance will be made in respect of that portion of any annual premium which is greater than £7 for each £100 assured if the annual premiums are £25 or more.

Subject to the above conditions, an allowance of income tax is granted as under, calculated at the highest rate of tax paid, i.e., 1s. 9*d*., 4s. 3*d*., 6s. 3*d*., or 7s. 9*d*. in the £ (in border-line cases the allowances will be partly at one rate and partly at another).

(*a*) When premiums eligible for relief do not exceed £10 annually, tax allowance is made on the actual premiums paid.

(*b*) When premiums exceed £10 but do not exceed £25 annually, tax allowance is made on £10 only.

(*c*) When premiums exceed £25 a year, tax allowance is based on two-fifths of the premiums paid.

Fire—Burglary—Accident—Personal Liability.—The householder can incur heavy losses through fire, burglary, storm, flood, and burst pipes, or maybe Common Law liability to servants or temporary and occasional employees about the house, or, as owner or occupier, to members of the general public. The householder should therefore effect an insurance on both building and contents against these and other risks under an appropriate comprehensive policy. A comprehensive policy—whether on buildings or contents or on both—gives a wider cover and is cheaper than separate policies. A liability with the possibility of heavy loss is that of a house-owner to the public arising out of accidents resulting in bodily injury or damage to property, for which the comprehensive insurance grants indemnity up to £100,000, with costs and expenses incurred additional. The normal comprehensive rate is 2s. 3*d*. per cent. on the full value of the building and 5s. per cent. on the value of contents.

Flood Damage Insurance.—Extensive floods in recent years in widely spread parts of the United Kingdom brought to light many victims uninsured against such a risk. In consequence, the insurance companies and Lloyd's underwriters have made flood insurance more generally available. As regards the contents of permanently occupied private dwellings, insurers are prepared to grant cover in *all* cases. Most of such comprehensive policies will however be found to include the flood risk, and it can be added to ordinary fire policies. As regards buildings of permanently occupied private dwellings, flood cover can be readily

obtained, but not necessarily in *all* cases as with contents For an extra 3*d* per cent, making 2*s* 6*d*. per cent, flood cover will be included in comprehensive policies on buildings where the risk is normal. In those relatively few cases where the flood risk is abnormal a higher rate will be charged

Accident and Sickness Insurance.—Accidents mean lost earnings during incapacity, and often even in these days of the Welfare State, medical and surgical expenses Personal accident and sickness insurance is therefore of undoubted value Various schemes are available with premiums ranging from, say, £2 a year, according to the cover granted and the occupation of the proposer The main types of cover are.

(*a*) an accidents only policy,
(*b*) an accidents and specified diseases policy,
(*c*) an accident and all-sickness policy,
(*d*) a permanent sickness and accident policy

These schemes are year-to-year contracts, renewal each year being at the option of the company A permanent non-cancellable sickness and all-accident policy is available under which the company guarantees continuous cover to a given age whatever the sickness record may be. A permanent contract of this nature is particularly suited to the professional or business man, who, whilst able to command a substantial income so long as he is physically fit, would suffer considerable loss of earning power, and perhaps complete loss of income, in the event of a prolonged breakdown in health The non-cancellable form requires a somewhat higher premium than the year-to-year contract, and is only issued by certain specialist companies after the proposer has been proved in good health by medical examination

Personal Liability—In daily life individuals may incur legal liability in many circumstances If the individual is negligent, and through his negligence some other person suffers injury or damage to property, the negligent party may be responsible and have to make redress Instances of this nature have increased considerably in recent years Even where negligence is not proved, the cost and worry of defending a claim is something to be avoided by the layman The proposal form of personal liability insurance is very simple, often requiring no more than the name address, and signature of the proposer

Private Car Insurance.—It is an offence to use a vehicle on the roads without an effective insurance to cover liability for death or bodily injury to members of the public The following classes of policies are obtainable: (1) "Act" liability only, (2) Full third party, (3) Full third party, fire and theft, (4) Comprehensive insurance These policies meet the requirements of the Road Traffic Acts, as they cover the minimum protection required, but only the comprehensive form of policy covers damage to the car itself An "Act" liability simply indemnifies the car-owner in respect of his third-party personal injury liability—it does not relieve the owner of his liability for damage to property At the very least a full third-party insurance—which includes both personal injury and property damage—should be effected Fire and theft of the car can be included at a small additional premium

The prudent motorist will take out a full comprehensive insurance which, applied to private cars, includes (*a*) Loss of, or damage to, own vehicle, (*b*) Third party liability, i e, personal injuries, damage to property, and liability to passengers, (*c*) Hospital charges, (*d*) Medical expenses in the event of insured, his driver, or any occupant of the insured car sustaining bodily injury, (*e*) Personal accident benefits to insured, i e, capital sums for death, loss of limbs, etc, (*f*) Foreign use (limited as to extent) Among many additional items which can be incorporated in the policy at an appropriate additional premium are personal accident benefits to passengers and compensation for loss of use of car

An important consideration in the completion of the proposal form is the use of the car, and the declaration at the foot of the form should not be overlooked The various uses are classified and premiums charged accordingly It is material that the exact purpose for which the car is used be clearly defined, as in accordance with particulars given the Road Traffic Act certificate will be prepared.

Holiday Risks.—There is no adequate substitute for a separate baggage insurance which, at quite reasonable cost, insures baggage and all personal clothing and effects on virtually an "all risks" basis while travelling by road, train, boat and aircraft, and while at any hotel, inn, etc Personal accident benefits on a scale comparable with that available on a year-to-year basis are available for short periods, e g, 8, 16, 23 days or one month The traveller abroad, if he meets with an accident or falls sick, will normally get just the amount of medical attention for which he can afford to pay A medical expenses policy is the answer to this risk It ensures payment of doctor's fees and hospital and nursing home costs as well as specialist and consultant fees, X-ray diagnosis surgical appliances, ambulance journeys and so on Provision is also made for extra hotel and travelling expenses due to postponement of the journey home As an example of cost, a £1 premium will insure one person for a fortnight, for compensation up to £100 The medical expenses cover can be usefully combined with the short-term personal accident insurance previously mentioned

Weather Insurance—A further type of holiday insurance is that against rain—or "pluvius" insurance There are two types of policy One which provides payment if a 10th of an inch of rain falls between 10 a m and 6 p m, and available in respect of about 95 leading resorts in the United Kingdom, the other being applicable to anywhere else in Great Britain on a 24-hour basis Twenty-four-hour rain insurance is also available for the Continent The amount of rain which must fall before a claim can be made under a 24-hour policy varies according to the district For example, rainfall stipulation is higher for the Swiss Alps than for the coast of our own East Anglia

V. THE CONSUMER MOVEMENT

It was in the nineteen fifties that the consumer found his voice In 1951 the Association of Scientific Workers declared that "Industrial scientists often find that part of their duties may consist in doctoring products so as to deceive the purchasers" and called for a national organisation to give impartial information based on test reports on goods bought Half the goods on sale were not known before the war and the shopper was less and less able to judge for himself The consumer was often misled by high-powered advertisements. In 1951 the British Standards Institute (see below) set up a Women's Advisory Council mainly to press for improved standards, and four years later the Consumer's Advisory Council was formed. In 1957 the CAC began publishing test reports in its *Shopper's Guide* In the same year a similar magazine called *Which?* appeared, published by the Consumers' Association (see below) But the quality of goods and the information about them formed only one aspect of consumer's needs There were also a number of related matters: hire purchase, sharp practices, shoppers' complaints, price fixing, informative

labelling, and so on The Molony Committee set up by the Government in 1959 reported in 1962

The Molony Report made a number of proposals, the principal being the setting up of a Consumer Council and the extension of the network of Citizen's Advice Bureaux to provide advice for the consumer It recommended a change in hire purchase law to check the social evil of the salesman on the doorstep and other bad practices It deplored the chaos in sizing women's garments and shoes, the absence of a grading system in carpets, and the unsatisfactory labelling of textile goods It commended *Which?* and thought that the Consumers' Association should remain independent. (Anyone who earns his living from manufacturing, selling, or advertising any sort of commodity is barred from being a member of the Consumers' Association) The Molony Committee said that efforts at voluntary control of advertising had been " noticeably imperfect " and thought there was need for some form of machinery to restrain harm to consumers from advertisements. In general the Committee thought the voice of the consumer was strangely silent amidst all the grounds for complaint, perhaps taking the view -more common in Britain than in most countries -" anything for a quiet life."

Questions about the Molony Recommendations.—The Consumer Council is full of possibilities But the question was asked whether it could be strong enough with a Chairman only part-time and near-voluntary members Unfortunately, too, the Report was strewn with references to existing regulations which are enforced slackly or not at all, and this may account for its caution in leaving so much improvement in marketing certain goods to voluntary compliance But it left a doubt whether such caution would go sufficiently far to help the customer who, as we have said, is much too diffident to make a clamour.

Consumers' Council.—The Government in 1962 decided to accept the proposal made in the Report of the Molony Committee to set up a Consumers' Council Legislation relating to monopolies, restrictive practices and mergers was to be reviewed It is expected that the Consumer Council will supersede the existing Consumer Advisory Council of the British Standards Institution (see below)

The Consumers' Association—Upon the strict basis that any Association formed to give advice to buyers must be entirely independent of any trade interest or influence, the Consumers' Association was formed in 1957 as a non-profit-making body Since that time it has undertaken a tremendous volume of work to help the consumer Its main work has been to make comparative tests of all the available brands of a product and publish the results These reports are published in a journal called *Which?* This appears monthly and is posted to members of Consumers' Association The address is 333 High Holborn, London, W C 1

The British Standards Institution (BSI) is supported both by government and by industry, and works through its expert committees to set up national standards of performance, quality, or size The Kite mark which shoppers will find on many products indicates that the goods are up to a recognised standard, which is published and available to the public at-large.

The Consumer Advisory Council was founded as an offshoot of the BSI in 1955 It aims to promote consumer standards and with them the wider adoption of the Kite mark described above. It advises industry on what the consumer really wants and needs, and tells consumers what standards and other safeguards are available to them *Shopper's Guide* was formerly the Council's consumer research magazine The address of the Council is Orchard House, Orchard Ct., London, W 1.

B.B.C. Programme " Choice ".—It is a very important development in the cause of consumer enlightenment that accurate information for shoppers is now presented as a public service by the B B C in the programme " Choice " which began in February 1962 The B B C does not itself carry out any tests or comment in any way on consumer goods but relies on the results of the comparative tests made by the above bodies.

The Council of Industrial Design and its Scottish Committee were set up by the Board of Trade at the end of 1944 to promote the improvement of design in British products The Council is advisory, and its work is educational in the widest sense, both towards the public and towards industry It has no power to tell industry to do this and not to do that Were it given greater powers, there would be a danger of an official orthodoxy developing, which would soon defeat its own purpose, for nothing could be more sterile than a " government taste " The Council advises industry and the retail trade, at the same time it influences the public, for until there is a strong demand for better standards of design, there can be little incentive for manufacturers and retailers to take an interest A good deal of its missionary work is done at the two Design Centres, one in London (28 Haymarket, London, S W 1) and the other in Glasgow (46 West George St , Glasgow, C 2)

The Design Centre in Haymarket, London, offers a permanent, changing, and selective display of well-designed consumer goods The categories of goods displayed are always being expanded The scope of the exhibition is enlarged by *Design Index*, which is a photograph and sample record of some 10,000 well-designed articles in current production, available for reference Visitors are put in touch with retailers in their own areas who stock exhibits they would like to buy The Design Centre Label (black-and-white triangular label) was one of the first labels in the country to put emphasis on the look of the product as well as on its functional efficiency The main aim of the labelling scheme is to give those who live out of London an opportunity to benefit from the efforts of the Design Centre to make attractive things for the home Thus customers can pick out, in their own local shop, furniture, textiles, tableware, kitchen equipment, and a host of other things which are on show at the Centre as examples of good modern British design The Scottish Design Centre at 46 West George St , Glasgow, maintains a permanent changing exhibition on the same lines as the London Design Centre—a wide selection of items from Design Index categories plus a succession of special features.

The Retail Trading Standards Association acts as a valuable watch-dog, being particularly concerned with the protection of the consumer against goods sold with inaccurate or misleading descriptions. It has conducted many successful prosecutions of firms and traders who have falsely described their goods in advertising or elsewhere. A special feature of the Association's work has been the setting up of testing laboratories for textiles to ensure the maintenance of standards which have been agreed between manufacturers and traders. Its address is 356 Oxford St., London, W.1.

Leisure Activities

A window on the world of leisure and recreation

TABLE OF CONTENTS

Leisure Activities

This section suggests ways in which enjoyment can be drawn from leisure hours It describes a wide range of opportunities in the world of recreation and outdoor activities, in music, drama, and art, in natural history and other scientific fields, in hobbies and crafts, and in reading

Among the changes of our time is the discovery that we have *time* for leisure, time to be ourselves, time for living and learning Some of us go to dances or cinemas, others go to football matches or watch television, and a number are seeking new ways of spending their spare-time There may be difficulty in deciding which leisure occupations will be most worthwhile and bring real enjoyment How are we to choose?

In this new section information has been drawn together for the first time in a convenient practical form to give a picture of the varied activities open to everyone, and to tell how societies and organisations in these fields can stimulate and assist those who wish to use them

OUTLINE OF FACILITIES

PHYSICAL RECREATION.

The Central Council of Physical Recreation The facilities offered by this body ought to be known by all likely to benefit by them Activities which come within their scope are listed in the next paragraph The Council works from regional and other offices whose addresses are given below It organises training courses and coaching holidays and offers its services not only to the governing bodies of sport but to all organisations concerned with the development of physical recreation Of special interest are the three National Recreation Centres, which are also described below

What the C C P R. Provides for. To make sure that your particular interest is covered here is a list of activities and subjects which the Central Council cover

Archery	Mountain Activities
Association Football	Mountaineering
Athletics	Mountain Structure and Life
Badminton	National dancing
Ballroom dancing	Netball
Baseball	Pony trekking
Basket ball	Rambling
Billiards	Riding
Bowling	Rock climbing
Camping	Rounders
Canoeing	Rowing
Cricket	Rugby League football
Croquet	Rugby Union football
Cruising	Sailing
Cycling	Shooting
Fencing	Skating
Fives	Ski-ing
Fly fishing	Squash rackets
Gliding	Swimming
Golf	Table tennis
Gymnastics	Underwater swimming
Hockey	Water ski-ing
Judo	Weight lifting
Keep fit	Wrestling
Lacrosse	
Lawn tennis	
Life saving	

National Recreation Centres. As their names imply these centres cater for people from all parts of the country There are three Plas-y-Brenin in Wales, Bisham Abbey on the banks of the Thames near Marlow, and Lilleshall Hall in Shropshire. They offer differing facilities, but their underlying purpose is the same—to encourage more and more young people to take part in games, sports, and all outdoor physical recreation They do this by providing for the training of coaches, leaders, and young people. Lilleshall Hall has excellent facilities for most games and sports At Bisham Abbey there are also facilities for most games and extensive use is made of the river for canoeing and sailing

Snowdonia National Recreation Centre, situated in the heart of the Snowdonia National Park, at Capel Curig, North Wales, offers training in every form of mountain activity—mountaineering, rock climbing, and indeed all the skills of living in the open and mountain safety It also provides courses of field study in geology and land and water life of the area and in the legends and history of North Wales Mountaineering and hill walking are thus given enhanced interest Canoeing, canoe building, and fly fishing are among other courses Cwm Idwal, the first Welsh nature reserve, is within five miles of the centre which is within easy reach of peaks and rock faces and the wooded valleys of the Conway and Lledr The address is Plas-y-Brenin, Capel Curig, near Betws-y-Coed, North Wales (Telephone Capel Curig 214)

Pre-Ski Training. You can get the maximum enjoyment from a winter ski-ing holiday by joining a dry ski training course These are organised in many centres throughout the country, and you can get particulars from one of the addresses (shown below) of the Central Council of Physical Recreation The scheme is organised jointly with the Ski Club of Great Britain and helps the novice to get familiar with the equipment, practise the basic movements, and get physically toned up, so that valuable time will not be wasted on reaching the snow slopes Boots, skis, and sticks are provided, and the course, normally of six hours' instruction in all, costs £1 5s, and you are eligible if you are more than 15 years of age and intend taking a ski-holiday in the coming winter.

Ski Training Holiday Courses are held every winter in Norway and in Switzerland for a fortnight for men and women between 18 and 40 who wish to learn to ski Special courses are arranged in France for young people between 15 and 21 The charges are moderate and cover daily instruction, hire of skis, sticks, boots, and protective clothing Details can be obtained from C C P R *See also* Winter Sports, **U34**(2)

C.C.P.R Addresses.

Headquarters 6 Bedford Square, London, W C 1.
Welsh Office 52 Charles Street, Cardiff
Sub-Office for North Wales 2a Chester Street, Wrexham
Northern Ireland Office 45 Arthur Street, Belfast, 1

English Regional Offices:
North-Eastern (Co Durham, Northumberland, and North Riding of Yorks) 40 Saddler Street, Durham City.

Yorkshire (East and West Ridings): 4 Albion Street, Leeds, 1.
North Midlands (Derby, Leics, Lincs, Notts, Northants, Rutland, and the Soke of Peterborough). Bank Chambers, 125 St Ann's Well Road, Nottingham
Eastern (Beds, Cambs, Essex, Herts, Hunts, Norfolk, and East and West Suffolk): 53a Harpur Street, Bedford
London and South-Eastern (London, Middlesex, Kent, Surrey, and Sussex) 6 Bedford Square, London, W C 1
Southern (Berks, Bucks, Hants, Isle of Wight, and Oxon) Watlington House, Watlington Street, Reading.
South-Western (Cornwall, Devon, Dorset, Glos, Wilts, and Somerset): 29 Market Street, Crewkerne, Somerset
West Midlands (Warwick, Worcs, Staffs, Herefords and Salop) 256 Moseley Road, Birmingham, 12
North-Western (Lancs, Cheshire, Cumberland and Westmorland). 26 Brazennose Street, Manchester, 2

The Scottish Council of Physical Recreation. Information regarding the activities of the S C P R and courses at Glenmore Lodge and Inverclyde can be obtained direct from The Secretary, S.C P.R., 4 Queensferry Street, Edinburgh, 2, or from any C.C.P.R Regional Office Some details of ski-ing in Scotland are given in the next paragraph.

Ski-ing in Scotland If you live in Scotland or the North of England do not overlook the possibility of ski-ing in the Cairngorms. Glenmore Lodge in the Forest of Rothiemurchus is the centre of the Scottish Council of Physical Recreation. From here is a tow operating up the White Lady corrie, and the ascent of Corrie Cas offers a non-stop run of about 1,000 feet Hotel prices are not high (say 10½ guineas including transport and teaching), and British Railways give fare reductions of one-third on presentation of a voucher obtainable without charge from the Cairngorms Winter Sports Development Board, 4 Queensferry Street, Edinburgh The Workers Travel Association offer ski-ing holidays at Newtonmore and Grantown-on-Spey, where equipment can be hired.

The Best Season for Ski-ing. A reasonable depth of skiable snow is essential for a successful winter sports holiday. Sunshine is a very agreeable secondary factor But sun and snow vary from season to season and place to place, so it is a matter both of skill and chance to hit upon the right place and the right fortnight It will help to bear in mind that the Alpine winter can be divided into four seasons. the Christmas–New Year high season, the January low season, the February high season, and, lastly, the late season Briefly, then, high–low–high–late If you must take your holiday during the first season you must select your spot very carefully—not too low to be short of snow and not so high as to be too bleak—say between 4,000 and 5,000 feet in an east–west open valley Try Champéry, Villars, Wengen, or Andermatt in Switzerland or Lech or Serfaus, in Austria

The January Low Season, from January 6 to early February, offers many advantages It is cheaper, and it is easier to get into ski-school classes Think about Champéry, Lenk, Melchsee-Frutt in Switzerland, Saalbach, St. Johann-in-Tirol, Kirchberg, Westendorf, Serfaus, and Galtur in Austria; Corvara and Sauze d'Oulx in Italy

The February High Season is the best season for the average skier, because he is then escaping from the worst weather at home You then have a wide choice of places to go to, including (from the middle of February) Norway After this season comes the late season, when the enthusiastic high-level skier can find a high and north-facing slope—at Zermatt or Davos in Switzerland, Zürs or Obergurgl in Austria, or the Val d'Isère in France. In Norway the high season reaches its peak at Easter.

Mountaineering. The Mountaineering Association, 102A Westbourne Grove, London, W 2, runs training schools for climbers at all stages in Britain and abroad, and also runs evening classes on rock climbing in conjunction with education authorities. The Holiday Fellowship organises climbing tours in the Highlands of Scotland, climbing many well-known mountains. In Scotland useful addresses are the Scottish Mountaineering Club, 406 Sauchiehall Street, Glasgow, C.2, and the Junior Mountaineering Club, 28 Croftmont Avenue, Croftfoot, Glasgow, S 4 At the White Hall Centre for Open Country Pursuits, Manchester Road, near Buxton, the Derbyshire County Council hold courses for those between 13 and 20 plus on hillcraft, rock climbing, camping, ski-ing, and canoeing. The Outward Bound Trust, 123 Victoria Street, London, S W 1, runs schools in Wales and the Lake District to train boys—with a few courses for girls—how to face hazards and hardships of all kinds on mountains and sea

Camping expresses the townsman's desire to get away from cities and fend for himself in quiet. But some organisation is necessary to provide camping facilities and to maintain high standards. The Camping Club of Great Britain has a membership of over 50,000 Its work is twofold it selects sites suitable for mobile campers and caravanners, and establishes and maintains well-equipped permanent camping grounds A *Sites List* published annually contains details of 2,000 camp sites. Members agree to abide by the Club's Code of Campers, which stresses the need of the camper to pay full regard to the countryman's way of life and to maintain by country courtesy the goodwill of those among whom he camps The Club's address is 35 Old Kent Road, London, S.E.1. *See also* **U10(2).**

Camping in the National Forest Parks. Public camping sites have been opened in seven of the eight National Forest Parks which the Forestry Commission have formed amid some of the finest holiday country in Great Britain, while camping is also permitted in the New Forest At the National Forest Parks (though not in the New Forest) the visitor will find a well-laid-out camping ground with a hard road running to firm stands for caravans or tents There is a substantial shelter hut for wet weather, together with piped water supplies and adequate washing and sanitary facilities. The seven camping sites in National Forest Parks are at

Christchurch, Wye Valley in the Dean National Forest Park
Beddgelert near Snowdon in the Snowdonia National Forest Park
Lewisburn, Kielder Forest, Northumberland, in the Border Forest
Succoth, Arrochar, Argyll, and Ardgartan, Argyll, in the Argyll Forest
Glen More, Aviemore, Inverness-shire, in the Glen More Forest
Glen Trool, Galloway, in the Glen Trool Forest
Rowardennan Forest, Loch Lomond, Stirlingshire, in the Queen Elizabeth Forest (Ben Lomond, Loch Ard, and the Trossachs)

There are no prepared camping sites in the New Forest, Hampshire, but visitors who obtain a permit from the Deputy Surveyor, The Queen's House, Lyndhurst, Hants, may camp on suitable enclosed land. Over 64,000 acres of woodland and heath are included in the historic New Forest Particulars of camping in the National Forest Parks can be obtained from the Forestry Commission, 25 Savile Row, London, W C 1. Guides to the National Forest Parks and Areas of Public Access can be obtained from H M. Stationery Office, York House, Kingsway, London, W C 2; 13a Castle Street, Edinburgh; or through a bookseller Each guide includes articles on topography, scenery, hill walks, geology, wild life, and the forests, and an indispensable map.

Camps for Youth Organisations in National Forest Parks. Facilities at reduced charges, or in some instances no charge at all, are provided in some of the National Forest Parks and in the New Forest, for organised groups of Boy Scouts, Girl Guides, and other youth organisations. Enquiries should be made well in advance of the intended stay, to the respective address in the list given in the booklet *Camping in the National Forest Parks*, published by the Forestry Commission, 25 Savile Row, London, W.1.

The Carefree Cyclist. How easy for the cyclist to start his holiday—no trains and no heavy luggage. You may be a potterer or a hard rider, a lone rider or a clubman. You may have the good fortune to spin lazily in sunshine or have to pit yourself, caped-up, against the elements. Fresh places, new experiences, favourite and novel routes await you. Every year over 100,000 cyclists use the hostels of the Youth Hostels Association, which are described in a later paragraph. *See also* **U14(1).**

About Boats. If you have a sailing boat the Royal Yachting Association's *Year Book* will be useful to you. It contains, among other information, a geographical list of all recognised yacht and sailing clubs. Club secretaries are usually able to give information about moorings and local yards. A letter to British Waterways, 163 Euston Road, London, N W 1, will bring all information one needs regarding the use of canals, including moorings. *See also* **U29(1).**

Rivers and Canals. The Wolfenden Committee on Sport recalled that, as the Inland Waterways Association has always urged, there are miles of river and canal which could be made usable and available for canoers and those who just like messing about in boats. The authorities which control reservoirs could, under proper safeguards, allow many more yachting and sailing clubs to sail on waters forbidden to them, and local authorities could do more to facilitate light-weight camping, which has so largely superseded the standing canvas camps of pre-war days. The towing path of a canal offers a pleasant place for a gentle walk. Although these paths were first made for horses rather than for pedestrians, they are a legacy from the past well worth preserving. The Bowes Report on inland waterways recommended that towing paths which were not already rights of way should continue to be open to the public free of charge so far as such use is not inconsistent with the use of the waterway for navigation. It is hard to think that, in general, walkers are, or are likely to become, an impediment to navigation or to some other essential use of waterways. Interesting books will very much add to the enjoyment of wandering on river, canal, or road or even railways. Stevenson's *Inland Voyage* is a classic canal book, and of rivers there is Hilaire Belloc's *Historic Thames* among many others.

Holidays with a Difference. There are three organisations which offer holidays with special opportunities for canoe camping tours, canal cruising, pony trekking, horse riding, sailing. They are the Holiday Fellowship, 142 Great North Way, Hendon, London, N W 4, the Co-operative Holidays Association, Birch Heys, Cromwell Range, Manchester, 14 (with a London Office at 141 Drummond Street, London, N W 1), and the Workers Travel Association, Eccleston Court, Gillingham Street, London, S W 1. These three organisations provide—in addition to ordinary holidays—holidays with a special purpose, and reference is made to them at the relevant points in this Section.

IN THE COUNTRYSIDE

The Youth Hostels enable all, especially young people, to explore the countryside at low cost. It is not, of course, a business undertaking, but a voluntary organisation run by members for members. There are nearly 300 Youth Hostels throughout England and Wales and also hostels in Scotland, Ireland, and abroad. The Hostel buildings are of great variety—farmhouses, water mills, cottages, mansions, and even a Norman Castle. Yet all have this in common: they provide simple accommodation, including separate dormitories and washing facilities for boys and girls, a common room, and a kitchen where members may cook their own food. Cooked meals are also obtainable at most hostels. At the hostel members share simple domestic duties. For under ten shillings a day you can have not just bed and breakfast but also a three-course supper and a packet of sandwiches for lunch. Or you can cook your own food and merely pay 3*s*. a night for your bed—2*s* a night if you are under 16—plus a copper or two for the use of the kitchen. Membership is 15*s* (for those 21 years and over), 10*s* (16–21), and 5*s* (those under 16). Send for membership or for prior information to Y H A (England and Wales), Trevelyan House, St Albans, Herts, or you can join over the counter at the Y H A offices at

29 John Adam Street, London, W C 2
93a Scotland Road, Liverpool, 3
16 Queen Street, Manchester, 2
39 Shirley Road, Southampton

On joining, each member receives a copy of the annual *Y H A Handbook* listing all hostels. Map reading, route-finding, walking, and scrambling—facilities in all these can be acquired, and can be more widely practised, by the use of youth hostels. Details are given in a later paragraph of the facilities for field studies recently introduced at certain Hostels.

The Ramblers' Association (45 Park Road, London, N W 1) has been the pioneer organisation in preserving rambling interests. It is concerned with footpath law and the encouragement of more active interest in footpaths on the part of national and local authorities. The Secretary is Mr Tom Stephenson who for many years advocated the idea of a Pennine Way for walkers. The idea of long-distance walking ways was eventually adopted by the Government and incorporated in the National Parks and Access to the Countryside Act 1949. Some aspects of the work of the National Parks Commission and the proposals for a Pennine Way and other long-distance walking routes (and Horse-riding routes) are described in later paragraphs. A national survey of public footpaths is now taking place in England and Wales, county by county, under the National Parks Act. On this subject another body which is doing excellent work, like the Ramblers Association, is the Commons, Open Spaces and Footpaths Preservation Society, 11 King's Bench Walk, London, E C 4. The address of the Scottish Ramblers Federation is 4 Kildonan Drive, Glasgow, W 1.

Long-distance Routes. Proposals have been made by the National Parks Commission for a number of long-distance walking ways (some of which will also be suitable for horse-riders). The first of these is the Pennine Way, a route of some 250 miles along the roof of England, commencing, at the southern terminal, at Edale in Derbyshire, ascending Kinder Scout, and zigzagging along the Pennine ridges to the Scottish border. Similar routes are in preparation for the Pembrokeshire coast, and a route (using Offa's Dyke) from Flintshire running south to Monmouthshire. A coast walk is being devised which will girdle the entire south-west peninsula of England from Minehead in Somerset, running westwards along the cliffs of Somerset, Devon, and Cornwall, rounding Land's End, and threading eastwards along the coast of Cornwall, Devon, and Dorset as far as Studland. A route eminently suitable not only for walkers but also for horse-riders, at least in part, will be one which is contemplated along the South Downs ridge.

The Ridgeways of England and Wales. The prehistoric ridgeways and tracks offer first-class walking—springy turf, long and varied views, and the exhilaration of upland walking. It was along

these tracks that men walked when they were the only means of communication between Celtic villages above the uncharted weald swamps. These tracks run across the country for hundreds of enchanting miles The chalk Chiltern ridge runs from Cambridgeshire right down to the Thames at Goring and continues west along the Berkshire Downs The escarpments of both the North and South Downs offer similar opportunities For books try H. J Randall's *History in the Open Air* and V. Gordon Childe's *Prehistoric Communities of the British Isles* There are some excellent pictures in a charming book *Early Britain*, by Jacquetta Hawkes This is in the Collins' Britain in Pictures series now out of print, but you might be lucky enough to find a copy in an old bookshop in a little town

Walking and History. A great deal of pleasure can be added to walking about the countryside by taking an interest in those things which will help you to understand the history of this island The countryside is rich in churches, historic buildings, ruins, wayside crosses, prehistoric camps and dykes Besides a good pair of shoes you need a pencil, a notebook, a 1-in Ordnance Survey map, a good guide book, and a fund of optimism, imagination, and curiosity. During your rest intervals you can study the map and plan, and read one or more of the many background books to supplement what you have seen and stimulate you to further adventure Not only is our countryside full of interest, it is remarkably varied Dr A L Rowse takes an interesting example in his very readable and valuable book *The Use of History* (in the Teach Yourself History Series published by English Universities Press) "Oxford," he says, "stands at the gates of four quite different landscapes, itself characteristic of a fifth: the wooded slopes of the Chilterns, the bare lines of the Berkshire downs, the Cotswold uplands and valleys, the quiet rolling country of North Oxfordshire, the city itself a Thames Valley town." Greece, he remarks, was the most diverse country of the ancient world. We, in the modern age, are particularly fortunate in the diversity of ours.

LOCAL HISTORY

But instead of wandering you may want to stop in one locality and evoke as much as you can of the past It may be your own village you want to study or a region you are particularly fond of The writer of these notes has just spent some time in a picturesque village, Little Gaddesden, in the heart of the Chilterns only thirty miles or so from London Its past is the subject of a study by the local schoolmaster (*Little Gaddesden*, Vicars Bell (Faber and Faber)), which gives depth and meaning to a visit there, and is an example of what can be done by affectionate care Does it interest you to know, for example, that George Eliot's Mill on the Floss was an *oil*-mill Ashcroft Mill, Gainsbrough? It is not necessary to undergo extensive training and be called a specialist before one can begin collecting information about one's own locality Enthusiasts for this study are to be found in most villages and towns The Secretaries of the County Local History Committees will always be glad to hear from anyone prepared to act as a Recorder This is a hobby which will earn the gratitude of posterity, and those engaged in it will get valuable guidance from a little booklet called *Notes on the Recording of Local History*, issued by the National Council of Social Service, 26 Bedford Square, London, W C.1 (6d). This is one of a Local History Series, which includes a *Plan for the Study of Local History*, a selection of books on English Local History, a directory of Authorities and Organisations concerned with the study of local history, and other aspects. There are details in a later paragraph of the reference map library of the Royal Geographical Society

Life in the Village. Village halls are a focus of much practical work in a village. Grants for building and equipment can be obtained from the Ministry of Education under the Physical Training and Recreation Act and from the Carnegie U.K. Trust The maximum grant has recently been increased to £3,330, and small villages with a population of under 500 can now qualify for grants of up to one-half the cost instead of the earlier grants of one-third Music, drama, and local history are playing an increasing part in the pattern of life in the countryside The task of maintaining the pattern of co-operation in the countryside is carried largely by the Rural Community Council of the County These councils provide a focus for the voluntary organisations and statutory bodies concerned for the welfare of the community Among the organisations co-operating are the National Association of Parish Councils, the Rural Industries Bureau, and the National Playing Fields Association

Villages Preserved. A few whole villages have been preserved in perpetuity, and these include Lacock (Wilts), West Wycombe (Bucks), and Chiddingstone (Kent) In addition, some 500 farms, historic ruins and abbeys, and many other features, such as the ancient remains of Hadrian's Wall at Housesteads (Northumberland), have been preserved by the National Trust

Historical and Antiquarian Societies. Let us suppose that you have developed a zest for the archaeology and history of your neighbourhood You will find that many countrymen have a real flair for understanding the past, and there are field clubs and local and county antiquarian societies to enable you to share and deepen your interests There has been a great increase recently in the popularity of archaeology and local history If you cannot easily find the address of the best local society the Historical Association, 29 Gordon Square, London, W C 1, might be able to help

The headquarters of the Society of Antiquaries of London is at Burlington House, London, W 1 There are also the Royal Archaeological Institute of Great Britain and Ireland, c/o The London Museum, Kensington Palace, W 8, the Royal Historical Society, 96 Cheyne Walk, Chelsea, S W 10, and the Society of Antiquaries of Scotland at the National Museum of Antiquities of Scotland, Queen Street, Edinburgh There is a later paragraph regarding scientific and learned societies generally.

NATURAL HISTORY

The Centres for Field Studies. There are six such centres in England and Wales, at

- Juniper Hall, Dorking, Surrey.
- Flatford Mill, East Bergholt, near Colchester, Essex
- Malham Tarn, near Settle, Yorkshire
- Dale Fort, Haverfordwest, Pembrokeshire (including Skokholm Bird Sanctuary)
- Preston Montford, near Shrewsbury, Shropshire
- Slapton Ley, Slapton, Kingsbridge, Devonshire

These centres have been set up by the Field Studies Council in localities selected for their ecological features and for their geological, geographical, archaeological, and artistic interest Working facilities and expert guidance are available at the Field Centres to all who have a serious interest in the countryside—whether as amateur naturalists or as students or as research workers They are not reserved for the academic student only The Council want to encourage and help the beginner and the ordinary person who has an interest in some branch of natural history and wishes to learn of this or allied subjects The Centres are staffed and suitably equipped to provide residential accommodation and working facilities for numbers ranging up to about fifty persons Thus, field workers enjoy the skilled guidance of the staff, local contacts and information, bench space, tools, maps and records, with something of the intellectual and social life of a small residential college. There are special courses for amateurs, and some of these are less formal than the word "course" suggests. The

subjects vary widely, including bird study, land structure and scenery, and outdoor painting and sketching.

The Special Features of the Field Centres. Juniper Hall, amidst the beautiful chalk hills of the North Downs, is well situated for almost every kind of field study. Flatford Mill is at the head of the Stour estuary, in the countryside of Constable and Gainsborough. The Stour, with its tributary streams, its mill pools and cattle ponds and dykes, provides excellent scope for water biology. Malham Tarn Centre is on the shore of the tarn on the limestone uplands at the head of Airedale in the Yorkshire Pennines. Here is the rich flora of well-drained pastures, screes, and limestone. The tarn itself supports an abundant fauna of invertebrates and fish. Dale Fort at the tip of a narrow peninsula guards the approach to Milford Haven. The flowers on the cliffs in May and June are the envy of the rock gardener. The opportunities for the marine biologist are unsurpassed. But there is no specialisation to the exclusion of any of the many subjects that can advantageously be studied. The Bird Observatory on Skokholm island is a part of Dale Fort Field Centre, and here work on birds has pride of place. Guillemots and razorbills breed on the rocks, and puffins and shearwaters burrow in the edges of the plateau. Preston Montford lies on the banks of the Severn four miles west of Shrewsbury, where geological formations are displayed conveniently for study. In the North Shropshire plain is scope for the study, too long neglected, of the ecology of ordinary English farming country that man has influenced for more than 2,000 years. There are numerous localities of archaeological interest, including the Roman town of Viroconium. At Slapton Ley the 300 acres of Slapton Nature Reserve offer ample scope for interest in most branches of Natural History. The Ley is separated from the sea by a shingle bank. There are moorland and bog, slate and limestone cliffs, lake shores and beaches, and woodlands. Enquiries can be made to the Field Studies Council, Ravensmead, Keston, Kent.

Ecology and Field Work for All. Everyone who *wants* to work in the field can find something useful to do, whatever his natural bent and his training, since the range of research is vast and the problems diverse, with such varying degrees of difficulty. This opportunity has been greatly extended by the increasing importance of ecology, which is a distinctive point of view in the approach to field biology. In its most general sense ecology may be defined as the study of plants and animals as they live *in their natural homes*. The growing popularity of the subject in this country represents a breakaway from the confinement of serious work in biology to the laboratory and museum. These are still, of course, absolutely necessary, but the primary place in which to work at ecology is the field. This is explained in a little booklet *What is Ecology?*, by Professor Sir Arthur Tansley, F.R.S., published (1s.) by the Council for the Promotion of Field Studies.

Bird-watching. The pleasure of bird-song and the sight of their activities is a common one for most of us. From this point many are prompted to make a closer study of birds and their habits. To get the most pleasure it is a great advantage to turn for advice to those who have had a wide experience. The enthusiast will thus become equipped with some knowledge of methods of bird-watching, how to make field notes and keep records, hides, identification, tables of family likeness, migration, sanctuaries, bird photography, and the structure of the bird. A book which deals with these and other aspects is *Introduction to Bird Watching*, by Trew and Upton (Seeley Service & Co. Ltd.). *See also* **U7(2)**.

Bird-watching in Towns. Bird-watching is not confined to those who live in the country. London has probably more bird-watchers than any other part of Britain. With the possible exception of the parish of Selborne in Hampshire, immortalised by Gilbert White, London, has the longest continuous history of ornithological observation in the British Isles. Groups of enthusiastic naturalists have collected a mass of detail about wild birds and their habits in London. The list of London birds is not only extraordinarily large but also contains many rarities and many birds of great scientific interest, like the black redstart and the little ringed plover. There are also special London problems, like the roosting of starlings in central London and the origin of this starling population. The reservoirs and the river, the commons and woods and parkland around London offer pleasant places for observation. The general reader will be very surprised—and the habitual bird-watcher himself hardly less surprised—by the range of interesting information in *The Birds of the London Area*, by members of the London Natural History Society, published by Collins. Apart from a dozen or more articles by different specialists, there is a detailed systematic list of a large number of birds of the London area, ranging from the little auk and the avocet to the wryneck and the yellowhammer. There is also a list of periodicals and journals and of local societies. The London Natural History Society (headquarters, the Natural History Museum, Cromwell Road, S.W.7) has, as its chief object, the study and enjoyment of natural history in the London area.

Field Studies at Youth Hostels. The Y.H.A. now offers a new service at six selected hostels. These facilities include a simple workroom, a collection of books for reference, geological and other maps, and simple collecting equipment. This service is for students accompanied by teachers. A broadsheet indicating some of the projects which might be undertaken has been prepared for each hostel, and will be supplied to leaders on request. The six centres offering these new special facilities are:

- *The Lake District*. High Close, Loughrigg, Ambleside, Westmorland.
- *Swaledale*. Grinton Lodge, Grinton, Richmond, Yorkshire.
- *North Yorkshire Coast*. Boggle Hole, Fyling Thorpe, Whitby, Yorkshire.
- *Peak District*. Leam Hall, Grindleford via Sheffield.
- *Snowdonia*. Bryn Gwynant, Nant Gwynant, Caernarvonshire.
- *Dorset Coast*. Cluny, Cluny Crescent, Swanage.

Geology Study Holidays. The Holiday Fellowship (142 Great North Way, London, N.W.4) offer geology study holidays at their Arran and Loch Leven Centres. At Arran the programme is designed to demonstrate the fundamental principles of field geology in an area almost unparalleled for its extreme yet compact geological diversity. The course at Loch Leven is more advanced. Applicants for either Centre should be capable of walking up to 12 miles a day over fairly rough ground. These holidays are run in conjunction with the Scottish Field Studies Association.

Country Life Weeks. The Holiday Fellowship also organise special holidays during which many different aspects of the countryside can be explored. There are evening lectures and all-day excursions led by lecturers. A "geography while you walk" holiday has also been devised by the Fellowship. This appeals to those interested alike in the physical and human pattern of the landscape, and no specialist knowledge of geology or geography is presumed in those who join.

Visiting Nature Reserves. The Nature Conservancy welcome visitors to National Nature Reserves within the limits set by the Conservancy's own responsibilities towards these lands and their plants and wild life. The Reserves are maintained on behalf of the nation to conserve their natural fauna and flora, and so far as possible to enhance their interest and value to science. As

far as possible the Reserves are accessible for the use and enjoyment of all who are prepared to respect the necessity for handing them on unimpaired to future generations and for avoiding interference with scientific work. Many Reserves are accessible without formality; elsewhere a permit is required. A list of the Reserves is obtainable from the Conservancy, 19 Belgrave Square, London, S W 1, or in Scotland from 12 Hope Terrace, Edinburgh, 9. There are some eighty National Nature Reserves. Among the extremely small reserves is, for example, the North Fen Reserve, 4 miles S S W. of Ambleside showing a vegetational succession of open water rich in mineral salts to fen, carr, and bog. The largest in Britain is the Cairngorms in Scotland, of nearly 40,000 acres, with fauna rich in variety of species from wild cats to golden eagle and a diverse flora, which includes the arctic-alpine plants of the corries, screes, and exposed summits.

The Council of Nature. If you are interested in any aspect of natural history—for example in plants, birds, rocks, insects, trees, butterflies, or natural history photography—you will have no difficulty in finding the address of your local history society, of which there are a very large number. The local public library would doubtless give you the address you want, or you could enquire from the Council of Nature, 41 Queen's Gate, London, S W 7, to which over two hundred organisations belong. These include the Royal Society for the Protection of Birds, which has upwards of 9,000 members and runs the Junior Bird Recorders' Club for young people interested in bird-watching. The Council links amateur and specialist in the study of natural history and the conservation of wild life. It has an Intelligence Unit which is ready to deal with requests for information on field natural history in the United Kingdom. The Film Officer of the Unit will advise amateur still and ciné photographers on all aspects of natural history photography. He will also be able to advise on what natural history films are available and on likely sources for photographs of any British wild animal or plant.

The Conservation Corps of the Council of Nature was formed to enable young people to serve the community in educational tasks which will help to preserve wild life and the countryside, and at the same time give them a "hard work" holiday. Typical tasks include the clearing of scrub and undergrowth, the clearing and making of footpaths, digging out small ponds and planting suitable vegetation on their banks. In 1960 over 600 young people worked in places as far apart as Box Hill in Surrey and Beinn Eighe in Western Ross on sites of particular interest to naturalists. The volunteers receive training in practical conservation and have lectures on natural history topics. The Council provides the accommodation for volunteers and helps towards the fares.

The Linnean Society. Among the important societies devoted to study and research in biology and microscopy is the Linnean Society of London, Burlington House, W 1, which owed its foundation not only to the great influence of Linnæus (1707–78) on British naturalists in the second half of the eighteenth century but also to the transfer of the Linnæan Collections from Sweden to England. The Society is recognised as the premier natural history society of the British Isles, and the name of Charles Darwin will always be associated with it.

A Directory of Natural History and Field Study Societies is published by the British Association for Science (18 Adam Street, Adelphi, London, W C 2 (20*s*., plus packing and postage 1*s* 6*d*). It covers archaeological, astronomical, biological, botanical, geographical, geological, meteorological, and zoological societies, both national and local amateur bodies—and other cognate societies—some 800 societies in all. A geographical reference section enables naturalists moving from one district to another to get in touch with others having similar interests.

NATIONAL PARKS AND HISTORIC HOUSES

National Parks. While in other countries "National Park" may be used to describe a large Nature Reserve, in England and Wales a National Park is a thinly inhabited region where the natural scenery is safeguarded for amenity and recreation. There are now ten National Parks in England and Wales comprising some of the loveliest regions in the country—The Peak District, Lake District, Snowdonia, Dartmoor, Pembrokeshire Coast, North York Moors, Yorkshire Dales, Exmoor, Northumberland, and the Brecon Beacons—over 5,000 square miles in all. The land, of course, is not "nationalised" and designation confers no right of access. Inside or outside Parks the provision of any additional access to "open country"—which has a specific legal meaning in this connection—considered necessary by the Planning Authority is undertaken by that Authority under a regular procedure. Many projects have been undertaken towards the twin goals of preservation and enhancement of natural beauty and the promotion of facilities for open-air recreation. For those who motor in the Parks there have been provided additional car-parks and laybys. Excellent illustrated guide books have been published on Dartmoor, Snowdonia, and the Peak District by H.M Stationery Office (5*s* each). The boundaries of the Peak District, the Lake District, and the North York Moors Parks are shown on the 1-in coloured tourist maps issued by Ordnance Survey and published by the Stationery Office, and also on the current ½-inch Bartholomew coloured series. Maps useful for motorists visiting the Parks are issued by the main motoring firms.

Areas of Outstanding Natural Beauty. Apart from the National Parks, it is proposed to designate many areas—smaller in extent than the Parks—as areas of outstanding natural beauty. Among those which have already been so designated are

The Gower Peninsula, Glamorgan
Quantock Hills, Somerset
Lleyn Peninsula, Caernarvon.
Northumberland Coast
Surrey Hills
Cannock Chase, Staffordshire
Shropshire Hills
Malvern Hills.

In addition, two areas of Devon, one in the north and one in the south have been so designated—in addition to the Dartmoor and Exmoor National Parks, an area of 400 square miles in Dorset, and 360 square miles in Cornwall. There are something like thirty to fifty areas in England and Wales which might be regarded as deserving and requiring the special concern of local and central planning authorities in order to safeguard their landscape beauty, farming use, and wild life. Among the areas under consideration are the Forest of Bowland (Lancashire–Yorkshire), Chiltern Hills, Suffolk Coast, Kent Downs, Sussex Downs, and East Hampshire. Walkers and others can purchase maps of the Areas already designated from the National Parks Commission, 3 Chester Gate, London, N.W 1

The National Trust is an association of men and women who love our countryside and ancient buildings and who seek to preserve for the nation and for posterity places of historic interest and natural beauty. It is not a Government Department, but since its foundation in 1895 the Trust has depended upon voluntary effort. The annual membership fee is £1, and members are admitted free to houses, parks, and gardens for which there is an admission charge for the public. The membership department of the National Trust is at Blewcoat School, 23 Caxton Street, London, S W 1. Members receive the *National Trust List of Properties*, which can be obtained by non-members for 3*s*. 6*d*.

The Great Country Houses. It has often been said that the great country houses of England represent the most remarkable contribution to

civilisation that England has ever produced. Clothed with the glamour of an historic past, they are certainly a peculiar glory of this country. Many of them, sometimes with their treasured contents, have been presented to the National Trust to be preserved. Over 120 country houses with their valuable collections of pictures, furniture, and works of art are maintained by the Trust and are accessible to the public. A few examples are Knole, Kent; Cliveden, Bucks, Coughton Court, Warwickshire; Sizergh Castle, Westmorland, Wightwick Manor, Staffs, Stourhead, Wilts, Polesden Lacey, Surrey, Blickling Hall, Norfolk, Montacute, Somerset, and Ham House, Surrey. Sometimes these houses are devoted to a public use for example, Attingham Park, Shropshire, is used as an Adult Education College, Dinton Park, Wilts, is a Y.W.C.A. holiday home, and Wilderhope Manor, Shropshire, is a Youth Hostel.

Historic Homes. A ramble or outing can be much enriched by a visit to a home in which great men and women have lived and worked. The homes of Coleridge, Wordsworth, Carlyle, Thomas Hardy, Kipling, Ellen Terry, T. E. Lawrence, General Wolfe, Bernard Shaw, and Beatrix Potter, have all been preserved with the contents of their famous owners. Sir Winston Churchill's house has similarly been acquired by the National Trust, although this will not be open to the public during the life of its present occupier.

Gardens. Among famous gardens recently acquired by the National Trust for public use are Hidcote Manor in Gloucestershire and the gardens of Lord Aberconway at Bodnant in North Wales.

Saving Town and Country: the Civic Trust. Two things are worth preserving: town and country. We shall not save one unless we save both. The town has given us the civic virtues of the arts, and the country has given us recreation, peace, and rest. To save the countryside we must not regard the town as something to flee from, and those in the city must have access to a fair countryside. The Civic Trust was formed in 1957 to promote a wider interest in the appearance of towns, villages, and countryside, and to promote high standards of architecture and civic planning. There are no individual members of the Civic Trust, and those wishing to support its work are advised to join their local amenity society, or to form one if none exists and register it with the Trust. The Civic Trust (79 Buckingham Palace Road, London, S.W.1) issue a list of amenity societies. Among many projects undertaken or encouraged by the Trust, the Magdalen Street experiment at Norwich will interest, literally, the man in the street. The appearance of this street has been transformed by repainting, improvement or removal of signs, improved bus shelters, re-routing of overhead wires, and planting of a waste plot as a garden, and so on. Within a year similar projects had either been started or even being considered in 300 other places. In all this the work and concern of the ordinary man and woman who cares for the character and dignity of our cities and for the beauties of the countryside can play a great part.

Any Old Iron? The part which ordinary young men and women can play is illustrated by the way volunteers have responded to the call to clear up eyesores. The Civic Trust Campaign against ugliness sprang from a small beginning. Michael Dower, a young undergraduate at Cambridge, indignant at the way our countryside was corroded by neglect and indifference, decided to do something about it himself and persuaded others to help him make a start. Six students in 1957 cleared a clutter of wartime works from the lovely Pembrokeshire coast. Next year there were 100 volunteers and ten camps; and the following year numbers of both volunteers and camps were doubled. If you are anywhere between 17 and 60 and would like to join the Civic Trust work camp for a fortnight in spring or summer, write to the Civic Trust, saying when you would be free and where you would like to go. There are many jobs which can best be tackled by locally organised teams at week-end camps or on summer evenings—clearing footpaths or tree planning. The Civic Trust will put you in touch with some group or society in your locality.

DRAMA.

The Do-it-yourself Theatre. Few countries can boast so eager an interest in amateur drama as Britain, and it is estimated that there are some 20,000 groups in the British Isles with half a million membership. The cardinal influence in this enormous movement is the British Drama League, to which some 3,500 groups belong besides nearly 2,000 private individuals. The league's influence on drama is exercised in two ways. Its members have the use of the library, which possesses the largest collection of plays and books on the theatre in Great Britain and of its information services, which give help and advice on every conceivable dramatic topic. They can, of course, hire sets of plays (one copy for each character up to twelve). Then there are the league's training schemes. Courses in production, acting, and décor take place in London all the year round, and there are summer courses in the country. The address of B.D.L. is 9–10 Fitzroy Square, London, W.1.

Producing a Play. It was not until the great International Theatre Exhibition at the Victoria and Albert Museum in 1922 that the English public became fully aware of the "new man" who had arrived in the theatre—the "producer" or "director," as the Americans call him. It is the producer who decides how the play is to be produced and sets his signature upon it, very much like the conductor of an orchestra. In this task he unifies the work of the author, actors, designers, and craftsmen of various kinds. The technical side of staging a play is a fascinating one involving problems of the framework (the stage, sight lines, auditorium); curtain settings, lighting, skycloths; the construction of scenery, designing the scenery and the making of scale plans and models; painting the scenery, lighting, and so on. *Staging the Play*, by Norah Lambourne (Studio Publications, No. 62 in their How to do it Series), will save the producer many headaches. It contains numerous interesting photographs of varied settings, a glossary of materials, a bibliography, and addresses where those who are "putting on a play" can obtain various materials and scenic paints.

Playwriting. You can receive help from the British Drama League through their correspondence courses, with individual tuition, besides week-end courses and written criticisms of members' scripts. Among other bodies who employ a play-reader who will give a criticism on typescripts submitted are the Religious Drama Society, 166 Shaftesbury Avenue, W.C.2, The National Union of Townswomen's Guilds, 2 Cromwell Place, London, S.W.7, and the Amateur Stage, 57 Church Hill, London, W.1. Television offers new opportunities for the playwriting aspirant, with its need for new methods. In the theatre the playwright and actor must make all things plain to distant members of an audience—whereas the television actor's slightest change of expression is clear to the person sitting within a couple of yards of him. A wink, a nod, a shrug on the television screen suffice for the implications which would be lost in the theatre. The gearing, so to speak, between text and meaning is different. A new field opens, therefore, for the writer for television drama.

Some Books for Drama Groups. The book mentioned above is only one of many valuable books for drama groups. The following list, which comprises only a few, indicates the range of such books:

Going to the Theatre, by J. Allen (Phoenix House), 9*s*. 6*d*.

Play Production, by J Allen (Dobson), 2s 6d.
Stage Makeup Made Easy, by M. H Benoliel (Deane), 7s. 6d
Speech in Practice, by C Burniston (English Speaking Board), 2s 6d
Amateur Drama on a Small Income, by H. Conway (Hutchinson), 2s 6d.
The Play Produced, by J Fernald (Deane), 5s
Dressing the Play, by N. Lambourne (Studio Publications), 15s.
Staging the Play, by N Lambourne (Studio Publications), 18s.
Acting Exercises, by F Mackenzie (British Drama League), 1s
Stage Lighting, by G Ost (Jenkins), 5s
Your Problems Solved (Answers to legal and business matters affecting the Amateur stage), by R Stacey (Stacey Publications), 2s
A Guide to Grease Paint, by A Stanley (French), 2s 6d

Our National Theatre. It looks as if, at long last, the National Theatre will be a reality not perhaps in 1964, the year of Shakespeare's Quater-centenary, but soon after In 1961 the Government had declined to make available the £1 million capital which had been agreed under the National Theatre Act 1949, but reversed its decision after the L C C had offered up to £1 3 millions The foundation stone had been laid on the South Bank in London so far back as 1951 but it was not until 1962 that a National Theatre Board was constituted Shortly afterwards Sir Laurence Olivier was appointed the first director of the National Theatre His name had been on everybody's list Hopes were revived that the theatre would not be content to play a safe course with the theatre becoming a museum for audiences in London, but that it would be a truly national centre, with some regard to the new and experimental as well as to tradition

Leisure and the Trade Unions. The trade unions had struggled for generations to get shorter hours and more pay for workers But they had been too burdened by that struggle to engage in a further campaign to encourage workers to use their hard-won leisure to the best advantage Arnold Wesker, the playwright sounded the call to the T U C, who, in 1960, resolved to look into the matter As a result Centre 42 was set up as a cultural hut in London—named after Resolution 42 on the T U C Agenda. One of its intentions was to "take the arts out of the hands of the commercial men" and thus reverse the meretricious trends of the Bingo age If people can spend £1,000 million on alcoholic drink, £1,200 million on tobacco and £760 million on gambling every year they could afford to spend money on good music, art, and other pursuits The T U C believed that everywhere there were men and women ready to give advice and time in helping to awake appreciation in activities which formed the real riches in life Wesker's aim was to create a climate in which the arts become a natural part of the existence of workers

MUSIC.

The Diffusion of Music. One of the most novel changes of the last generation or so has been the widespread diffusion of music not only in this country but all over the world Twenty or thirty years ago it might have been necessary to travel a long way to hear the performance of a classical musical work, and the opportunity of doing so was only occasional We can now have a constant flow of such music from wireless and record player. Several things follow from this change. Leisure has been transformed by "high fidelity" and the long-playing record. People listen more easily and frequently than they read, and it is music, rather than literature, which is at the centre of culture. Access to good music does not depend upon training and application to the same extent as access to good literature It is easier for the tired person to enjoy music than a serious book "Where the library shelves used to stand," says a commentator, "there are now the record albums, row upon proud and esoteric row" The listener may well be submerged by the easy flow of music of vastly different kinds, but there is an opportunity for the discerning listener to compare and to select from the music of the different centuries, to study the difference between the classical and romantic masters, the emergence of modern orchestration, choral music, chamber music, opera, and oratorio We may go on to study other aspects—the study of the personality of the composers, the relation between their work and the problems of the times, knowledge of the different instruments, and how to enjoy reading a musical score By this means the listener can combine refreshment of spirit with the delights of exercising skills of various kinds.

The Making of Music. Another world awaits those who want to create music Those who want to sing or play will find every encouragement "Let the people sing" was the robust declaration of J B Priestley. Church choirs and choral societies afford excellent practice The voice is a natural musical instrument, and the ability to produce beautiful tone and to interpret words and poetry is something well worth fostering The piano, although a comparatively modern instrument, can trace its origin back at least to the 15th century, and most of the great composers themselves started as pianists Some of the richest musical works are to be found among piano music—Bach's Preludes and Fugues, Beethoven's Sonatas, Chopin's Nocturnes During the last couple of years the piano has rapidly come back to favour, and the demand for piano lessons has outstripped supply Good violins can sometimes be picked up in unusual places, but don't buy a violin without reliable advice The 'cello is not more difficult to learn than the violin The flute is an attractive solo instrument and suitable for an ordinary room A church organ offers opportunity for practice, which can redound to the benefit of a congregation

Musical Holidays. All through the summer, all over the country there are opportunities for music lovers, whether active musicians or not, to spend a holiday together and pursue some aspect of music The reader will probably be surprised to learn that there are nearly one hundred such summer schools each year, some for the week-end, others for a week or fortnight The Rural Music Schools Association at "Little Benslow Hill," Hitchin, Hertfordshire, would help enquirers for particulars A glance at the annual list shows how wide are the subjects offered madrigal and other singing, recorder playing, orchestra and chamber music, Russian music, 18th-century music, discussion for wind teachers, the making of musical instruments These summer schools are in addition to the Music Festivals held at Edinburgh, Bath, Cheltenham, and other places, not forgetting the Three Choirs Festival in the West (British Federation of Music Festivals, 106 Gloucester Place, London, W 1) Details of the various continental festivals can be obtained from the European Association of Music Festivals, 122 rue de Lausanne, Geneva, or 32 Beauchamp Place, London, S W 3

How to Borrow Musical Scores. Your local public library probably has a music library The National Operatic and Dramatic Association, 1 Crestfield Street, London, W C 1, has a library of musical scores and dramatic works The National Federation of Music Societies publishes a catalogue with practical details of some 500 choral works and assists music societies by advice, information, and in other ways, its address is 4 St James's Square, London, W C 1. The Workers Music Association provides opportunities for developing musical instincts and tastes, believing that genuine art moves people to work for the betterment of society. It organises classes, lectures, and week-end and summer schools, and offers correspondence courses in Harmony, Counterpoint, and Orchestration. Its address is 17 Bishops Bridge Road, London, W.2.

Jazz and Pop are enjoying an almost unprecedented popularity among the youth of today, and jazz-band leaders and "pop" singers, numerically at least, command a following that any politician might envy. The jazz followers are perhaps the more selective and demanding. But what is important is that a young person's encounter with a "pop" song may well be his first musical experience, and his interest, by no means unhealthy, may well prove a jumping-off ground to higher forms. The audiences that crowd jazz concerts are by no means wholly apathetic to symphonic music, and similarly, the thousands of young people who throng to the Promenade Concerts in London are not immune to the attraction of jazz. Many young people find their way to the English Folk Song and Dance Society through skiffle, and stay to learn the guitar. This has led the Society to declare that we must realise that music, whether with a little m or a big M, does embrace everybody.

Borrowing Gramophone Records. Over sixty local authorities have record departments in their local libraries. The Central Gramophone Library (38 Russell Square, London W.C.1) has a circulating library of records which are available to adult education lecturers, music and gramophone societies and to hospitals and prisons. Those interested in forming a gramophone society should get into touch with the National Federation of Gramophone Societies whose secretary's address is 4 Beulah Hill, London S.E.19. The British Institute of Recorded Sound, 38 Russell Square, London W.C.1 contains the national archives of gramophone records and other sound-recordings and is the national centre for information and documents.

PAINTING.

The Pleasures of Painting are vividly described in Sir Winston Churchill's compelling book *Painting as a Pastime* (Odhams and Ernest Benn), which contains reproductions of some of his paintings. Painting came to his rescue late in life and at a most trying time in his career. Many handicrafts give real relief to the tired brain—including even bricklaying, which Winston Churchill himself enjoyed. But he found sketching and painting in all their forms best of all. Painting does not make, he points out, the undue physical demands of sports and exacting games. It offers to the end of life the companionship of light and colour, peace and hope. It imparts a heightened sense of Nature, and the simplest things are seen to have a beauty. Further it is a spur to travel, for the painter wanders and lingers. Thus it affords a complete distraction and absorbs the mind, without exhausting the body. "Try it then, before it is too late and before you mock at me," he writes.

"Wallop into the Blue and White." If you come to painting late in life, as Churchill did, the first quality you need, he says, is Audacity. There may be no time for the years of thorough grounding. Very well. Not too much ambition. No aspiration to masterpieces. In Churchill's own words, "Audacity is the only ticket. Splash into the turpentine, wallop into the blue and white." Anyone can see that the canvas cannot hit back. Churchill prefers oils to water-colours, because you can more easily get "a certain distance along the road" with oils. You can experiment more easily in oil, change your plans, or scrape it all away.

Sketching and Painting Holidays. A non-technical approach to sketching and painting out of doors is used by the artist-tutors who guide the Sketching Holidays organised by the Workers Travel Association (Eccleston Court, Gillingham Street, London, W.1). These parties are held during the summer at week-ends and during weekly holidays at numerous centres in Britain and abroad. An annual exhibition of work done on these holidays is held at the Royal Institute Galleries, London. The Holiday Fellowship and the Co-operative Holidays Association also offer sketching and painting holidays.

Enjoying Pictures away from the Gallery. Not everyone can easily get to an art gallery, and comparatively few can reach a number in different parts of the country. The B.B.C. have, however, introduced a "Painting of the month" scheme. Listeners can hear painters and others discuss, each month, a famous picture. Before the broadcast, subscribers receive a full-colour reproduction with notes and illustrations of details, to be used during the broadcast for comparison or illustration. The introductory booklet contains a glossary of technical terms used in painting. In this way those who like looking at pictures can learn more about them in the comfort of their armchairs; and they will collect a wallet of reproductions. The address to write to is B.B.C. Publications (Painting), 35 Marylebone High Street, London, W.C.1.

Art Exhibitions, Art Films, and Entertainments. You should enquire what possibility there is of seeing, near your home, one of the exhibitions produced by the Arts Council of Great Britain. There are major exhibitions of important works both historic and contemporary; and also quite modern exhibitions, sometimes of reproductions instead of original works, which can be shown in places where there is no public gallery. The Council circulates widely each autumn and winter a programme of films on art, in co-operation with the British Film Institute.

Enquiries may always be addressed to Arts Council Headquarters or to the Scottish or Welsh Offices.

Headquarters. 4 St. James's Square, London, S.W.1.
Scotland. 11 Rothesay Terrace, Edinburgh 3.
Wales. 29 Park Place, Cardiff.

If you want to know the whereabouts of art galleries and museums—and there are, of course, excellent ones throughout the country—you can consult in any public library the *Libraries, Museums and Art Galleries Year Book*, published by Jas. Clarke & Co.

Local Failure to Back the Arts. Local authorities are spending only one-sixtieth of the money they are entitled to spend on local theatres and orchestras. As explained in the Citizen's Guide (C6), an Act of 1948 permits expenditure of up to a 6*d.* rate on music and drama by certain local authorities. If this were fully applied nearly £15 million would be available for music, opera, theatre, and ballet. If generally there were only a 1*d.* rate there would therefore be available as much as £2½ million. Few local authorities do what they could and should in this respect. It has been commented that Canterbury's 2*d.* rate shines like a good deed in a stingy world. The Government gives an annual grant to the Arts Council which supports, among other institutions, certain repertory companies and orchestras, and in 1960 this was £1½ million—equal to the cost of making 4 miles of the M1 motorway. It works out at a little more than 7*d.* a head of the population. Thus the rate of growth of public patronage of the arts grows very slowly.

Art Galleries of the Future. We may hope that art galleries, both in capitals and in the provinces, will be designed in future on much more interesting lines. Art history has reached a point where it can give us a clear line of evolution from pre-history to the present. How can the existence of such an evolution be conveyed through the eye and mind of the visitor to a gallery? John Berger, the art critic, has made a number of suggestions to this end. Works could be arranged to demonstrate an argument, and this argument should be stated in words which all can see as they go through the gallery. Photographs of works in other places should be shown, he thinks, to make significant comparisons. Models could be exhibited to demonstrate the optical systems under

lying different styles; and constant use made of films. This means that provincial museums with little money for acquiring new works could, nevertheless, do a good deal by using photographs and facsimiles to supplement their originals, and by experimental methods in creating understanding For example, by the use of record-players the music of a period could be matched with its visual art.

FILMS.

The British Film Institute was formed by those who recognised the immense influence of the film as a social force for good and for evil, and who were alarmed lest its potentialities for good should not be realised. Formed in 1933, the Institute's aim has been to educate public opinion to appreciate the great untapped resources of this medium of entertainment and education (not least educative perhaps when it is most entertaining) From it has sprung the National Film Archive holding more than 7,000 films, and a selection of these are available to film societies, universities and other organisations, and to individual borrowers. Film societies exist in all the major British cities and in many lesser towns and even villages, amounting in total to a very considerable educational operation The Education Dept of the Institute provides lectures and courses and advises and trains teachers and youth leaders who want to introduce the study of film into their schools and clubs. Its Lecture Service books lectures not only to film societies, schools, and university departments but also to clubs and the public generally. The Institute's library is the largest of its kind in the world The address of the Institute is 81 Dean Street, London, W 1 The Secretary of the Scottish Film Council is Miss M. B Smith, 16 Woodside Terrace, Glasgow

The National Film Theatre brings the best of cinema—much of it archive material—to an increasingly large audience This theatre is at South Bank, Waterloo, London, S E 1, and performances can be attended by associates (subscription 7*s*. 6*d*. a year) and one guest Those interested in the film as a means to a wider understanding of the scientific outlook can get information about the Scientific Film Association from its Information Officer, at 3 Belgrave Square, London, S W 1 The British Universities Film Council has a lending library of valuable films not otherwise available, and the Hon Secretary (from whom further information may be obtained) is Mr. C. J. Duncan, 10 Eldon Place, Newcastle on Tyne.

The Amateur Film Maker. Increasing use is being made by the amateur film maker of 8-mm films. But those who have the apparatus for such films may be glad to borrow films to supplement the showing of their own film. They will be glad to know, therefore, that the National Film Institute described above lends to the private borrower, through its Film Distribution Section, a number of 8-mm films as well as 16-mm and 35-mm. films. The catalogue contains some 1,200 titles in all and includes films on the history and art of the cinema, as well as others on the arts and sciences

Films and Television. The cinema audience is mainly a young one, with a high proportion of children, and it is not surprising that the study of films, often linked with that of television, is being increasingly introduced into school education Although television has reduced cinema attendances (proportionately less in the case of children than of older filmgoers), it has resulted in both adults and children seeing more films than ever before. Good habits of viewing, once acquired, are applied equally to the viewing of live television. The Society of Film Teachers is open to all people connected with education, and it works in close co-operation with the British Film Institute. Its Secretary is Mr S. G. P. Alexander, 15 Angus Drive, South Ruislip, Middlesex

The Nature Ciné Club. A new national society for amateurs interested in all aspects of natural history film making was formed in 1960, and enquiries should be addressed to the Hon Secretary, Mr. J. W. Carr, Windy Corner, Vicarage Hill, South Benfleet, Essex.

Photography. Holidays combining sight-seeing and expert instructions and tuition in many aspects of photography are offered by the Workers Travel Association; and holidays for photographers are organised by the Co-operative Holidays Association and the Holiday Fellowship.

SONG AND DANCE.

Song and Dance. Whether or not you play, sing, or dance yourself, you can enjoy the heritage of English folk music, song, and dance. To enable you to enjoy it to the full the story of Cecil Sharp House will be useful. Cecil Sharp went out to collect the folk songs of England in the fields and cottages, in almshouses, and by the roadside He systematically combed some counties like Somerset Cecil Sharp and Vaughan Williams joined the English Song Society, which had had Elgar and Parry among its first members Sharp went on to note down folk dances and to publish details of the steps and figures. In course of time he founded the English Folk Dance Society to restore their traditional dances to the people of England The two Societies amalgamated in 1932 and, today, Cecil Sharp House (2 Regents Park Road, London, N W 1) is the home of the English Folk Dance and Song Society, with over 12,000 members The Secretary there will be pleased to put you in touch with members in your neighbourhood or you may enquire at one of the Area Offices

Birmingham: 10 Calthorpe Road.
Exeter 3 Barnfield Crescent.
Liverpool: 4 Bluecoat Chambers.
York. 9 Minster Yard.

Folk Dancing in Scotland and Wales. The address of the Royal Scottish Country Dance Society is 12 Coates Crescent, Edinburgh, 3, and of the Welsh Folk Dance Society, Epworth, Abergele.

Holidays with Country Dances. Scottish Dancing and singing are the primary objectives of special holidays by the Holiday Fellowship at Scottish centres, and Old Time Dancing is enjoyed at an English Centre Folk dancing is also the feature of special holidays by the Co-operative Holidays Association

CRAFTS.

Crafts. Everyone enjoys making things, and in recent years there has been an awakening interest in design and an improvement in taste In the work of raising craft standards the Townswomen's Guilds have played a notable part The following is a list of crafts in which the majority of Federations of the Guilds have expressed interest.

Needle Crafts
- Embroidery.
- Dressmaking.
- Tailoring.
- Millinery.
- Fine needlework (including smocking and quilting)
- Soft Furnishing (including lamp shades).
- Felt Work and Soft Toys.

Light Crafts
- Tatting and Lace-making.
- Knitting and Crochet-work.
- Weaving.
- Fabric Printing.
- Book-binding.
- Pottery.
- Cane-work, Basketry, and Stooling.
- Leather-work and Gloving.
- Silversmithing.

Household Crafts.
Cookery.
Preservation of Food.
Wine Making.
Floral Arrangements.

A Book List on Crafts. A recommended book list on hand embroidery, dressmaking, lace-making, millinery, needlework, ladies' tailoring, home upholstery and soft furnishings, and on cookery will be found in a booklet entitled *Craft Standards*, by Lucile Spalding, published by the National Union of Townswomen's Guilds, 2 Cromwell Place, London, S.W 7.

READING: BOOKS AND INFORMATION.

Reading. Books offer everything. To say that is to exaggerate, but it is an exaggeration on the right side They offer us nearly everything—advice, comfort, wisdom, amusement, inspiration On a desert island a well-chosen book would probably sustain our morale long after we had exhausted a collection of gramophone discs It was not surprising that, a few years back, the British Government dropped half a dozen books (including *Pears*) on a group of airmen stranded on a polar region Indeed, it is difficult to write about the pleasures of reading without using platitudes Some book will make all the difference to our efforts whatever we are interested in, whether ski-ing, cooking, or collecting butterflies We may overlook how very cheap books are, especially when compared to other things, and how little space they take up A bookcase only 3 ft 6 in high and equally wide and projecting only 7 in from the wall will take 180 books or so of various sizes That enables you to have an attractive little library in a very small space.

The Full Enjoyment of Books. The National Book League (7 Albemarle Street, London, W 1) is a public society which aims to stimulate the full use and enjoyment of books Its Book Information Bureau tries to answer most kinds of questions about books Among the list which it has recently compiled at the request of members have been lists of books on sea shells, monastic orders, air-conditioning in textile mills, and translations from the Chinese The house, 7 Albemarle Street, is a beautiful 18th-century building which offers club facilities, including a restaurant, for members The Library of " books about books " is the only library of its kind in the country, and three books can be borrowed at a time. Furthermore, the Arts Council Reference Library of Contemporary Poetry is housed in the Library, and there is a duplicate loan collection The League also has fifty touring exhibitions available for hire.

How to Use Books. A very useful and interesting little book with this title (by Lionel McColvin, published for the National Book League by the Cambridge University Press) offers guidance on the books you want, what books there are, on the buying of books, on libraries, on the use of books, and on their selection and care. It also contains a book list on books and reading

A Guide for Readers. A panel of distinguished scholars advise you how and what to read in nearly twenty fields of knowledge in *The Reader's Guide* in Penguin Books. This planned syllabus for profitable reading contains nearly 2,000 descriptive recommendations of the essential books in different fields of knowledge and interest This guide will enable the increasing number of general readers to get more value out of their reading by making a less haphazard choice of books. Each section of the book is introduced by an essay which endeavours to describe the scope and nature of its particular subject—natural history, novels, politics, and the rest. A useful annotated list of 1,300 classics will be found in *An English Library*, by F. Seymouth Smith, published by the National Book League.

The Stream of Paper Backs. Paper-covered books have become immensely popular, and not only because they are cheap The sales—now running to about 70 millions a year—have trebled in the last three years. They can be obtained from slot machines at railway stations, and no doubt they will soon be obtainable at petrol stations and supermarkets It is claimed that all this will lead, first, to greater adventurousness in reading and, second, that through reading lots of books, people may gradually begin to read better books It remains to be seen whether these hopes will be realised against pressure for mass sales for a limited number of titles The special emphasis now given to selling does not always make the most suitable introduction of books to readers—for example by " sexy " packaging or what has become known as " breast-sellers " The discriminating reader needs to resist being rushed too quickly from book to book, to refuse to be stampeded In other words the reader can make best use of better opportunities for securing books if he is highly selective and discerning.

The Use of Dictionaries It is half the battle in any discussion or thought to get one's terms clear and well-defined. Dictionaries, being concerned with the meaning of words, are, therefore, the first works to be consulted The great *Oxford English Dictionary* (21 volumes) traces in detail the fascinating history of words and their meanings, with the help of literary quotations The *Shorter Oxford* is an abridgement The *Concise Oxford* serves current language with its colloquialisms and examples of modern usage *Chamber's Dictionary* excels in its range of words, and is popular with crossword enthusiasts The American *Webster International Dictionary* provides the largest word list of all

Sources of Information An invaluable guide to sources of information in Great Britain and Ireland is provided in the *Aslib Directory*, which gives details of 3,000 libraries and information services (Aslib is the short title for the Association of Special Libraries and Information Bureaux, 3 Belgrave Square, London, S W 1) This can be consulted in any public reference library, where the librarians are always pleased to help the enquirer *How to Find Out* is the title of an excellent little book by Lionel McColvin which advises you on the use of general reference books, question-answering books, reference books for special subjects on periodicals, and on many topics which will help you to pursue any enquiry or subject of study It is published for the National Book League by the Cambridge University Press.

Use of Maps and Atlases. Maps are the basic source of information about places Ordnance Survey Maps (1 inch and 2½ inches to the mile) enable you to find footpaths, churches, farms, and inns, and also to picture the scenery If you are interested in what lies beneath the surface you can consult geological maps Foreign travel and interest in world affairs make an accurate atlas a desirable reference book to consult The newest and largest is the *Times Atlas of the World* in five volumes (1955–60) Among specialised works is the *Oxford Economic Atlas of the World* (1959), and there are useful historical atlases covering all periods from classical and biblical times.

The Map Collection of the Royal Geographical Society is open to the public for reference It contains several hundred atlases and thousands of sheets of maps The Society is at 1 Kensington Grove, London, S.W.7.

Borrowing Books. Librarians at public libraries are generally pleased to supply reading lists on any subject or give other assistance about books Books not in any particular library can generally be obtained for you through the inter-library loan service, which covers all the public libraries in the United Kingdom and many university and special libraries.

The Pleasures of Browsing. "Browsers" are born, not made They drift among books, following whim and inclination, reading here, reading there as the fancy takes them *Pears* is obvious pasture for the random browser. There is room in life for this pleasant way of tasting the passages you want to enjoy and skipping others But this way of reading needs to be kept within limits The opposite form of reading, for a purpose, is a bracing and adventurous experience.

Newspapers and Periodicals. Don't overlook the stimulating pleasures of good newspapers and periodicals. It is often complained that cultural tastes are falling But the circulation of what is called "quality" papers is steadily rising. Our best periodicals and papers are so very good yet absurdly cheap Weeklies like *The Spectator*, *The New Statesman*, and *Time and Tide* can be relied upon for lively discussions and ideas and amusing commentary—all for the price of say three cigarettes *The Listener*, even cheaper, enables you to read broadcast talks you have missed and give further study to some you have heard *The Observer* and *The Sunday Times* both offer attractive reading and partake partly of a newspaper and partly a weekly review Then there are the monthlies and quarterlies—you will find them in the reading room of the public library. Reference libraries keep back numbers, and the librarian will help you to trace recent articles on subjects which may interest you specially.

LIVING AND LEARNING.

Taking Oneself in Hand. A time sometimes comes when one looks at oneself afresh, and asks what one is doing with one's leisure, and plans to use it more fruitfully—rather like a gardener who looks at his garden afresh and decides to replan it to better effect If one is going to study—whether as whole-time student or for leisure occupation - some sort of stocktaking is useful There has been some sound advice on this—ever since Plato, who summed up his advice in seven phrases—readiness to learn, good memory, love of learning, will to take pains, readiness to learn from another, readiness to ask questions, and—an understanding touch—responsive to praise from a master The problems of taking oneself in hand are discussed by Sir John Adams in *The Student's Guide* (a volume of the Teach Yourself Series mentioned below), with chapters on manipulation of the memory, methods of study, the art of listening, the technique of reading for study, and so on The reader will soon be asking himself many interesting questions, for example, whether he is a *visual* or an *audile* or a *tactile* In other words does he prefer to learn through the eye, through the ear, or, as some do, through a sense of touch.

Teach Yourself. This is the name of a well-known series of books—"The Teach Yourself Books" published by Hodder & Stoughton for the English Universities Press We have already referred to one of them, *The Student's Guide*, by Sir John Adams There are some seven hundred different volumes, so that it would be difficult to think of any subject, a language, an art, a home interest, a sport or hobby, or indeed any practical interest, which is not covered They make good introductions for the adult turning to a new subject Electricity in the Home? Hebrew? Twentieth Century Painting? Good Fruit Farming? Local History? Public Speaking and Debating? New Testament in Modern English? This is a glimpse of the promised land

Living and Learning: the W.E.A. Men and women who are anxious to spend some of their leisure fruitfully in the study and discussion of the affairs of the world round them are often unaware of the assistance which the Workers' Educational Association (W E A) can offer in helping them to meet other adults of like mind, though the increasing number of W.E.A. classes and students show that more and more individuals are discovering the value of the fellowship of group study A W E A class is a group of men and women over eighteen years of age, who assemble voluntarily to study a subject in which they are interested, under a qualified tutor *of their own choice* Such classes are designed, not to prepare individuals for examinations in technical or vocational subjects, but to assist them to estimate the problems confronting society, and a deeper appreciation of the permanent values of our civilisation Among the most popular in a wide range are: history, political theory, the making of public opinion, music, literature, art, philosophy, psychology, biology, and physics and chemistry in everyday life

Students' Control of the Class It is an essential principle of the W E A that the students share in the control of the class They choose the subjects, discuss the syllabus, elect a class secretary No tutor is appointed to a class without its consent It is not enough that the tutor should have attained certain academic standards, the W E A believes that he should have knowledge of, and sympathy with, working people Fees vary locally, but are usually not less than 6*d* a class meeting

Types of W E A Classes The main type of classes offered are

(1) Tutorial classes, which normally extend over three education years, and which meet for twenty-four periods, each lasting two hours, during each of the three years (These classes are always provided by a joint W E A -University Committee)
(2) Classes which meet not less than twenty times in one educational year, each meeting lasting not less than one and a half hours
(3) Classes which meet for not less than ten periods, each of one and a half hours, during one educational year
(4) Other classes meeting perhaps only three or four times

Professor Tawney on the W E A. The W E A has had a distinguished history over more than fifty years Prof R H Tawney (d 1962), the great historian, said

> "We have not interpreted the word 'worker' in any narrow sense We have meant by it all those, whether in factory, mine, office, or home, who render useful service to their fellows We have not taken an austere or highbrow view of education; but while recognising that there is an important place for hobbies and pastimes, we have set ourselves as our primary function to cultivate powers and to form intellectual habits which are the necessary basis of good citizenship and social activity We have not attempted to impose any compact body of ready-made doctrine on our students, but we have insisted that education gains unity, point, and significance when it is related to a social purpose "

Directory of District Secretaries and Offices of the W E A The central office of the W E A is at Temple House, 27 Portman Square, London, W 1.
The following are the addresses of the district secretaries.

Eastern 7 Hills Road, Cambridge Area covered Essex (part), Suffolk, Norfolk, Northamptonshire, Huntingdonshire, Cambridgeshire, Bedfordshire, Herefordshire (most of)
Northern: 51 Grainger Street, Newcastle-on-Tyne, 1 Area covered Durham, Northumberland, Cumberland, Westmorland
South-eastern Merton, Castle Hill, Rochester, Kent. Area covered: Kent and East Sussex.
West Lancs and Cheshire. Room 28, Burton Chambers, 38/40 Church Street, Liverpool Area covered: West Lancashire and part of Cheshire.

London 28 Woburn Square, London, W.C 1. Area covered · London, Middlesex, Surrey, Essex (part) and Hertfordshire (part)
East Midland 16 Shakespeare Street, Nottingham. Area covered Leicestershire, Rutland, Lincolnshire (part), Nottinghamshire (part) and Derbyshire (part)
West Midland · 19 Calthorpe Road, Birmingham Area covered · Herefordshire, Shropshire, Warwickshire, Worcestershire and South Staffordshire
Southern 4 Carlton Crescent, Southampton Area covered West Sussex, Hampshire, East Dorset and Isle of Wight
Berks, Bucks, and Oxon 42 Wellington Square, Oxford Area covered Berkshire, Buckinghamshire and Oxfordshire
North Staffordshire 2 Broad Street, Hanley, Stoke-on-Trent, Staffs Area covered North Staffordshire
Western 7 St Nicholas Street, Bristol, 1 Area covered · Gloucestershire, Somersetshire, Wiltshire and West Dorset
North-western 423 Oxford Road, Manchester, 13 Area covered Parts of Lancashire, Cheshire and Derbyshire
South-western 1 Portland Square, Plymouth Area covered Devon and Cornwall
Yorkshire North. Blenheim Institute, Blackman Lane, Leeds, 2 Area covered The whole of Yorkshire, except that part included in Yorkshire (South) District, and part of Lincolnshire
Yorkshire South Campo Chambers, 26 Campo Lane, Sheffield, 1 Area covered Parts of Yorkshire, Derbyshire, Lincolnshire and Nottinghamshire (including Penistone South to Chesterfield, and East via Barnsley to Scunthorpe, Chesterfield East via Retford to Gainsborough, thence North to Scunthorpe)
North Wales 33 College Road, Bangor, N Wales Area covered: Flintshire, Anglesey, Merioneth, Denbigh, Montgomery, Caernarvon
South Wales 49 Charles Street, Cardiff Area covered Monmouthshire, Glamorgan, Pembroke, Carmarthen, Brecknock, Cardigan and Radnor
West of Scotland 177 Hill Street, Charing Cross, Glasgow, C 3
North of Scotland 36 Albyn Place, Aberdeen
South-east Scotland 13 Abercromby Place, Edinburgh, 3
N Ireland 56 Dublin Road, Belfast, N 1

Long-term Residential Colleges for Adults. You may be so lucky, perhaps with the help of a grant, to go to one of those colleges whose courses last a whole year or in some cases two Among these are

Ruskin College, Oxford, at which there are scholarships and grants from local authorities For both men and women Courses in economics, modern history, politics, industrial relations, languages, etc
Coleg Harlech, Harlech, Merioneth, at which grants are available For men and women Courses similar to Ruskin College and including psychology and music
Wansfell Adult College, Theydon Bois, Epping, Essex.
Fircroft College, Birmingham, 29. For men Bursaries available
Denman College, Marcham, Abingdon, Berks For women Under the aegis of the National Federation of Women's Institutes
Hillcroft College, Surbiton, Surrey, at which grants are available, offers one year residential courses for women interested in literature, history, psychology, social studies, and other liberal subjects of current interest. There are no entrance examinations.

Week-end and Weekly Courses. But most of us can give up only a limited time to a residential course—perhaps only a week-end He would be a strange body who could not find an opportunity which would delight him, for during a normal six months there must be something like 400 different courses. A six-monthly *Calendar of Residential Short Courses* is issued by the National Institute of Adult Education, 35 Queen Anne Street, London, W 1, price 1s 6d post free Glancing through the list of subjects, one notices the Music of Mahler, Existentialism, Jazz and Tempo of the Times, China, Heraldry and Stained Glass, Foremanship in Building, Pleasures of Study in Retirement, Bees and Beekeeping, Italian and Polish Films, Offshore Navigation for Yachtsmen The net could scarcely be cast in a wider or more welcoming way

Addresses of Colleges. The following are addresses of some of the colleges at which there are short courses, including week-end courses, described in the preceding paragraph

Alston Hall, Longridge, nr Preston, Lancs
Attingham Park, nr Shrewsbury, Salop
Battle of Britain House, Northwood, Middx
Belstead House, nr Ipswich, Suffolk
Burton Manor, Burton-in-Wirral, Cheshire
Dunford College, Midhurst, Sussex
Debden House, Debden Green, Loughton, Essex
Dillington House, nr Ilminster, Somerset.
Grantley Hall, Ripon, Yorks
Holly Royde College, 30 Palatine Road, Manchester, 20
Kingsgate College, Broadstairs, Kent
Knuston Hall, Irchester, Wellingborough, Northants
Lambton Castle, nr Chester-le-Street, Co Durham
Missenden Abbey, Gt Missenden, Bucks
Moor Park College, Farnham, Surrey
Newbattle Abbey College, Dalkeith, Midlothian
Pendley Manor, Tring, Herts
Roffey Park Institute, Horsham, Sussex
Urchfont Manor, nr Devizes, Wilts
Wansfell Adult College, Theydon Bois, Epping, Essex
Wedgwood Memorial College, Barlaston, Stoke-on-Trent, Staffs
Westham House, Barford, Warwick
Wrea Head College, Scalby, nr Scarborough, Yorks

A Second Chance for a University Course. It is not so widely known as it should be that men and women over 25 who were, for any reason, unable to take a university course at the usual age can apply for a "mature" State scholarship if they are able to show that, by virtue of continued study, they are likely to benefit by a full-time honours degree course at a university. Among recent holders have been an iron moulder, a postman, a forestry worker, and an aircraft fitter Enquiries should be addressed to the Ministry of Education, London, W 1

Following up Broadcast and Television Talks. Everyone knows of the serial programmes for those who look to sound radio and television for facts and ideas on subjects which interest them Those who would like to continue their interest in a further course of study will find that evening courses are arranged in all parts of the country by one or more of the following

University Extra-Mural Departments
The Workers' Educational Association.
Adult or Further Education Centres.
Technical Colleges or Evening Institutes.

Details can be obtained from the nearest University (Extra-Mural Department) or from a County or Borough Education Office.

Getting the Best Out of Broadcast Talks. The B B C help listeners and viewers in many ways to get the most interest out of many of their features Thus pamphlets are issued to help those who follow the foreign language, and two long-playing records have been prepared for Russian and Italian pronunciation practice.

Week-end Courses and Broadcast Series. Week-end courses at adult residential colleges are sometimes linked directly with broadcast series.

The Townswomen's Guild. The object of these Guilds—of which there are nearly 2,000 throughout Great Britain—is to encourage the education of women to enable them as citizens to make their best contribution to the common good, and to serve as a common meeting ground for women irrespective of creed and party, for their wider education, including social activities Townswomen are thus interested in anything and everything which touches women's place as citizens The Guilds meet monthly Craft classes—pursuing the crafts listed in an earlier paragraph and many others—Drama, Music, and Social Studies groups meet in the intervening weeks An active interest in civics often results in members taking office as councillors, aldermen, and even mayors Each Guild is self-governing.

The Women's Institutes. Women of every age belong to Women's Institutes, of which there are now well over 8,000 in the country To each woman membership means something different To the young girl perhaps a chance to act, to a prospective bride cookery classes, to the mother a course on home management, to the older woman an opportunity of public service. But to all of them it means companionship and friendship Courses of classes and discussions are arranged, and many Institutes have their own choirs and drama groups. The address of the National Federation is 39 Eccleston Street, London, S W 1 Any Women's Institute member is eligible to apply to attend a course at Denman College near Abingdon, Berkshire, and these range from practical everyday interests—cooking, car-maintenance, tailoring, home management, and all crafts—to drama production, music, writing for pleasure, painting in oils, and history (including how to dig for history).

Adult Schools and Home Groups. Adult schools—of which there are some 500 in Britain—consist of groups of men and women who learn together, not, as a rule, on a formal basis of lectures and students but as groups of friends endeavouring to discover and practise a way of life through the search for knowledge and " a deeper appreciation of things lovely and of good report " These schools—which *are* schools and not mere meetings, not services, not assemblies—meet in a variety of places Some meet in premises of their own or in hired rooms, and many meet in the informal and comfortable setting of the homes of members The Adult School Movement is well over 150 years old, and if you want details of your local groups or wish to start a school write to the National Adult School Union, 35 Queen Anne Street, London, W 1 Every year the Union publishes a *Study Handbook*, offered for use as a basis for thought and discussion.

The Interpretation of Science to the Public: the British Association. In the past fifty years the advance of science, both in facts and ideas, has been greater than ever before Unfortunately scientists have been less successful in sharing this advance with non-scientists and even with one another. The proportion of educated people with a reasonable appreciation of contemporary science has hardly risen in the last century, and may even have fallen. For these reasons the British Association, founded so far back as 1831, has in recent years devoted the bulk of its efforts to the interpretation of science to the public at large. The B A 's Annual Meeting is the largest scientific gathering of its kind in the year, and the only one which members of the general public can join on equal terms with scientists. It affords an unrivalled chance for the layman to learn something of the progress of science and of its impact on society as a whole from the scientists concerned.

Scientific and Learned Societies. Great Britain is rich in scientific and learned societies, of which there are more than 800 in existence. The enquirer will find information in any reference library from the handbook *Scientific and Learned Societies of Great Britain*, published by Allen & Unwin (35*s*.). The societies can be divided into sixteen classifications:

General science	Archaeology and history
Mathemetical and physical	Anthropology and sociology
Chemistry	Law
Biology and microscopy	Economics, statistics, and political science
Medicine	Literature and fine arts
Agriculture, horticulture, forestry, and veterinary science	Town and country planning and amenities
Engineering and architecture	University societies and
Geography, geology, and mineralogy	Miscellaneous societies

The headquarters of many of these societies are to be found, as one would expect, in London, but there are others in provincial cities and in smaller towns.

ACTIVITIES ABROAD AND AT SEA.

Vacation Courses Abroad. A complete list of vacation courses in Europe will be sent free, on receipt of a stamped, addressed foolscap envelope, by the Central Bureau for Educational Visits and Exchanges, 55a Duke Street, Grosvenor Square, London, W 1 A book published by UNESCO, called *Vacations Abroad*, lists 800 study tours, summer schools, and work camps in sixty-four countries. This costs 4*s*. 6*d* from UNESCO publications, H M S O., P O Box 569, London, S E 1 The United Nations Association (International Service), 25 Charles Street, London, W 1, also arranges works camps at home and abroad. Remember also the Travel Department of the National Union of Students, 3 Endsleigh Street, London, W C 1.

Continental Tours for Youth Groups. A publication on this subject is obtainable free on request from the Youth Hostels Association, Trevelyan House, St. Albans, Herts

Work Camps Abroad. The work camp has established itself as an organ of social sympathy The work camp carries out useful work, commonly for people in need, such as refugees, and it promotes good feeling between groups who would otherwise have had no contact According to UNESCO figures, about a million volunteers took part in nearly 4,000 in 1959 UNESCO's annual booklet *Vacations Abroad* is a useful guide to the possibilities The work camps of the future will call for more professionals, or semi-professionals, among the amateurs

The Man at Sea. It is possible that this book will come into the hands of a seafarer in the British Merchant Navy or Fishing Fleets, and he will probably feel cut off from all the sources of intellectual pleasure we are describing But he is not overlooked The Seafarers' Education Service and College of the Sea described below are ready to satisfy his hunger for books, study, and hobbies

The Seafarers' Education Service aims to provide a first-class library service to ships, and no charge is made for the loan of the books themselves. Through a department called the College of the Sea it also lends books to the serious reader personally, and gives tutorial help by correspondence courses in all general subjects to those who want it; and it helps with all hobbies. The address of the Head Office is 207 Balham High Road, London, S.W.17, and at Liverpool, the Library and Information Centre is at Corinthian Buildings, South Castle Street. There is surely no man afloat who does not appreciate the work of this Service, which has been working unobtrusively for nearly forty years.

A Guide to Gardening

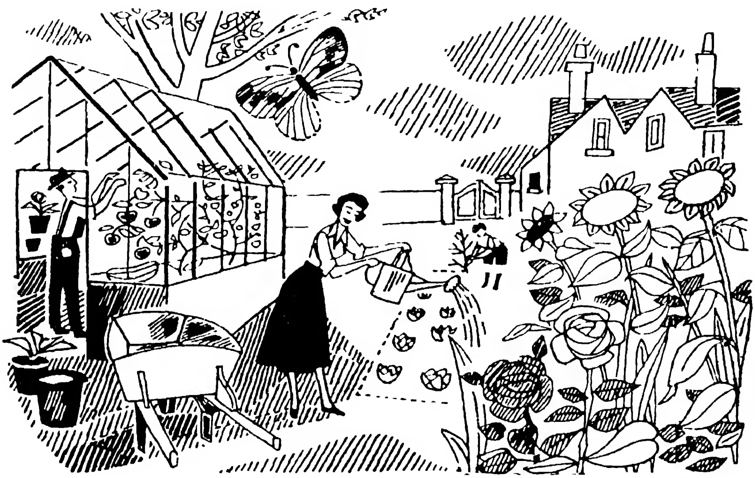

TABLE OF CONTENTS

A Guide to Gardening

CULTIVATION OF FLOWERS.

Throughout this section the notes must be taken to refer to cultural conditions in the British Isles, although in many cases the information can be adopted to suit the necessity of readers living abroad. Undoubtedly, in many temperate parts of the world interest in gardening has increased enormously during the past decade or so, despite the fact that numbers of large gardens have ceased to exist and that few people can afford to pay for full-time help in their gardens. To counteract this, the all important labour-saving garden has come into its own; shrubby plants have replaced annual bedding schemes and large lawns put down instead of herbaceous borders or beds of particular plants.

In addition, the owner-gardener is anxious to avail himself of the excellent selection of modern tools, thus the conventional hoe is being replaced by the "Swoe" or the Wolf pattern of Dutch weeder, both of which are very easy to use, and digging can be done quickly—and with much less effort—by using the new German tool the "Terrex" spade. For grass mowing, the work is easily done with motor mowers like the "Rotosythe," or an electrically-driven pattern.

For greenhouse work, smaller houses are being used and one, say, 12 ft by 8 ft, can be run economically with a minimum winter temperature of 40° Fahrenheit by the introduction of trouble-free, thermostatic heaters or the turbo-heaters. At the moment, besides automatic heating, the prototypes for automatic ventilation and watering are making an appearance.

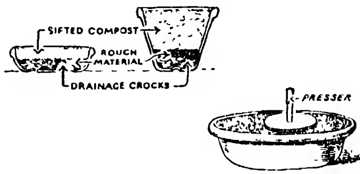
While advocating the use of such appliances, it must be pointed out that there are also to be found tools, sundries, and fertilisers of little value, and many of which have never been properly tested prior to being put on the market. It is, therefore, a good plan to discuss the comparative merits of any appliance or horticultural sundry with a competent horticulturist or to contact a public authority. In particular, many local horticultural societies have special trading facilities, and the merits of most garden things are generally known and discussed among members.

Throughout this Guide the vexed question of change in scientific name has been dealt with as liberally as possible and, whenever necessary, synonyms and cross references are given. In dealing with cultivar names, that is, varietal names like rose 'Peace,' reference is made as recommended in *The International Code of Nomenclature for Cultivated Plants* (1961). By so doing, the references are right up to date and further information on any particular plant or subject is easy to find. For the purpose, a few standard works of reference are given after each section. Normally, all the plants mentioned in the text are available through the usual trade channels.

After each plant listed there is a note on its propagation. Generally, this is the easiest or most efficient way of doing so, but it is not necessarily the only means. Details of the various methods employed are as follows:

Seed. Generally speaking, the early spring is the most suitable time for sowing seeds of trees and shrubs besides those of herbaceous plants and alpines. Where only a few plants are needed, the seed can be sown in pots and a suitable compost made up with 2 parts of soil, 1 part of peat and 1 part of coarse sand. Before sowing, the pot should be stood up to its rim in water so that the soil is soaked. Then the seed can be sown thinly and covered with a light sprinkling of sifted compost.

For very fine seed, like begonias or azaleas, the seed must have only the merest "sugaring" of sand just sufficient to anchor it. When sown, the pots should be covered with a pane of glass (to prevent evaporation) and kept, if possible, in a warm greenhouse or frame. With this method of propagation it is important to remember that failure will result if the seed is sown too deeply, if the temperature is too low, or if the soil is too dry.



CORRECT PREPARATION OF SEED POTS AND PANS—Note provision for ample drainage and compost to rim of its container. After sowing, the containers are covered with a sheet of glass.

Cuttings. There are two main types of cutting: soft-wood cuttings made from fresh, green shoots in the spring and summer and hard-wood cuttings made of mature or semi-mature woody shoots in the autumn. A soft cutting is taken about 3 in long, the lower leaves removed and a clean cut made through a node in the stem. These are then inserted in pots containing a light, sandy soil or a rooting medium such as horticultural vermiculite, well watered, and covered with a bell jar or plastic bag. Delphiniums, hydrangeas, and lupins are all propagated in this way.

Hard-wood cuttings are taken in the autumn and made from shoots about 8–12 in long. These are inserted in a sandy soil out of doors or in a cold frame, and left to develop for a year. Black-currants, forsythia, and roses can be propagated by this means.

Layering. This is one of the easiest ways of propagating the majority of woody plants, and is used to increase stocks of plants like clematis, lilacs, and rhododendrons. Normally, layering is done in the autumn or spring when suitable branches are pegged down. On each of these the young shoots are, in turn, pegged down and tips turned upwards and tied in position. To encourage rooting, gritty sand and peat should be worked around each layer, and usually the young plant can be severed from the parent after about eighteen months.

Division. By this method it is easy to propagate the majority of herbaceous plants, some rock-garden plants, and a few shrubs. A few herbaceous plants, like delphinium and paeony, are slow to get established after moving and here the method should not be employed. In any case, old plants should not be split up in a wholesale manner; instead, it is far better to select a few young healthy plants, divide these, and replant the best of the young shoots, in the autumn.

ALPHABETICAL LIST OF ORNAMENTAL PLANTS.

Abutilon.—The greenhouse species is often used in public parks for bedding schemes. *A. vitifolium*, with white, mauve, or blue flowers makes a fine wall shrub for warm gardens. If given full sun it will quickly reach 10–15 ft., but is sometimes short-lived. *Prop.*—Easily raised from seed sown in March in a warm greenhouse or frame.

Acer (Maple).—Hardy, ornamental trees; the Norway maple is often planted for its magnificent autumn colour and as a lawn tree. *A. palmatum* and vars. constitute the Japanese maples; all colour brilliantly in the autumn but do not grow freely unless given some shade and a light soil rich in humus. *Prop.*—Seed, layering, or budding.

Achillea (Yarrow).—Grey-leaved perennials for open border or, dwarf species, for rock garden. Valued as a cut flower, particularly *A. ptarmica* 'Perry's White,' with double, white flowers and *A. eupatorium* 'Gold Plate,' with large, flat, yellow flower heads. *A. millefolium* is a pernicious weed of turf (T33). *Prop.*—Division in autumn.

Acidanthera.—Scented, bulbous plant introduced from Abyssinia. It is not difficult to grow if the corms are planted in the spring and lifted in the autumn for storing in a frost-proof shed. It requires a sunny position and plenty of water in the summer. *Prop.*—Offsets removed when the old crop of bulbs is lifted.

Aconitum (Monkshood).—Blue-flowered perennial plants particularly useful for lightly shaded positions or full sun, flowers from May to July, height 3–5 ft., roots poisonous. *Prop.*—Seed or division.

Adiantum.—*See* **Ferns.**

A Well-Grown Agapanthus.—In winter the pot should be kept in a cold greenhouse or some protected place, in summer afforded full sun.

Agapanthus.—A bulbous plant, native of South Africa, usually found in seaside gardens and sometimes grown in tubs, flowers blue, violet, or white. It needs winter protection in the form of a covering of bracken or straw and a light soil heavily enriched with manure. Worthy of wider cultivation. *Prop.*—Seed or division in March.

Ageratum.—Blue-flowered carpeting plant. *See* **Annuals.**

Allium (Flowering Onion).—A genus of nearly 300 species of bulbous plants widely distributed over the Northern Hemisphere. The foliage has the distinctive smell of garlic, but some species are grown for garden ornamentation, in particular *A. roseum*, valuable late-flowering rock plant for dry positions. *Prop.*—Offsets, taken from parent bulbs in the spring.

Alstroemeria aurantiaca (Peruvian Lily).—This tuberous-rooted, herbaceous plant is often grown for cutting. Flowers orange-red and height 2–3 ft., of easy culture if afforded a sunny position and left undisturbed. For best results apply liquid manure or soot water when growth starts. *Prop.*—Seed or division.

Althaea (Hollyhock).—A truly delightful, old-world plant, but not often seen, as modern hybrids have given way to rust disease. Best grown in a rich heavy loam. Mulch with manure of any sort and stake as necessary. *Prop.*—Seed in June, thin out, and transfer to flowering position in September. Although a perennial, in some localities the best results are obtained by treating it as a biennial and raising a small supply annually.

Alyssum.—Low-growing annuals and perennials for rock garden and sunny border. The perennial, *A. saxatile*, is deservedly popular by reason of its bright, spring flowers and value as a wall plant. The variety 'Citrinum' is bright yellow and 'Dudley Neville' biscuit-yellow. *Prop.*—Perennial sorts by cuttings in June.

Amaryllis belladonna.—Often this plant is confused with the greenhouse, bulbous plant, *Hippeastrum*. The true amaryllis is a half-hardy bulb for planting at the foot of a warm wall, it has white to pinkish-red flowers. When planting, cover neck of bulb with an inch of soil and leave undisturbed, as the plant resents moving and is slow to get established. Lack of flowering is generally due to planting too deep. Established clumps may be fed with hoof and horn meal at 2 oz. per sq. yd. in July. *Prop.*—Divide and replant clumps in early July.

Amelanchier canadensis.—A large shrub or small tree, valuable for its spring flowers and autumn colour. As it will grow almost anywhere in sun or shade, it makes a good plant for informal screening. *Prop.*—Seed or layers.

Amepelopsis.—*See* **Parthenocissus.**

Anchusa italica.—A blue-flowered perennial with fleshy roots, growing to a height of about 3 ft. Responds to feeding and needs a position in full sun. *Prop.*—Root cuttings in the spring, division in the autumn.

Anemone.—The tuberous-rooted section includes the 'Caen' and 'St. Brigid' strains. These are best grown in an open position in light, rich soil, plant in October, lift and store when foliage dies. The hardy, fibrous-rooted perennials are varieties of *A. hybrida* (syn. *japonica*) and constitute one of the most accommodating of perennials, being particularly useful for damp, shady positions. Worthy of wider attention from gardeners. *Prop.*—Perennial sorts by division in autumn.

Annuals.—These are plants which develop from seed, flower, fruit, and die within a year. Additionally some perennials, like antirrhinums, may be treated as annuals for the convenience of their cultivation. Sunny borders may be planted solely with annuals, they may be interplanted with perennials, used for window boxes, or, occasionally, in the rock garden. All sorts do best in well-worked, light loam enriched each year with a dressing of fish meal at 3 oz. per sq. yd., ten days before sowing or planting.

In the division of the group Hardy Annuals may be sown in the open ground as soon as conditions permit during March or April where the plants are to flower. Wet or cold soils will give many failures, and fine seed should be covered only with the lightest sugaring of soil. Often surprising—but delightful—results may be obtained by sowing broadcast mixed seed of annuals specially offered by some trade houses.

To raise Half Hardy Annuals, seed may be sown in early March in a warm greenhouse and the seedlings pricked out into boxes. Subsequently, the plants are grown on in a cold frame, gradually hardened off, and then transferred to their flowering positions towards the end of May.

Anthemis tinctoria.—Hardy perennial with feathery, grey foliage and flowers in varying shades of yellow. Height 2–3 ft., needs full sun and good for cutting. *Prop.*—Division in the autumn. *Anthemis nobilis* is the chamomile sometimes unwisely used to make lawns.

Antirrhinum (Snapdragon).—The popular bedding plant requiring a good soil and position in full sun now largely in disfavour owing to rust

disease; planting should be restricted to rust-resistant varieties. *See* **Annuals.**

Aphelandra squarrosa.—An evergreen, perennial plant introduced from Brazil. Often sold as a house plant, albeit a warm temperature and a high humidity are necessary for its cultivation. When grown indoors it is best discarded when the flowers fade and the foliage starts to wither, as it cannot be successfully grown on from year to year under normal conditions indoors.

Aquilegia.—The modern race of hybrids are the result of much interbreeding with wild forms to give a wide range of colours. Best when planted in light shade where soil is naturally moist. *Prop.*—Seed in late spring, transplant to flowering position for following year

Arabis caucasica.—Once known as *A. albida*, this common rock plant is often used on dry walls. The double-flowered form is particularly good. *Prop.*—Cuttings in July; a fresh stock should be raised regularly as the special forms tend to die out.

Araucaria (Monkey Puzzle).—This tree was introduced from Chile, where it forms large natural forests, and widely planted in Victorian days Browning of foliage suggests lack of water in the summer or, occasionally, effects of very cold weather. It should be planted in a position protected from the prevailing wind. *Prop.*—Seed in a warm greenhouse.

Armeria maritima.—A hardy perennial with pink or red flowers in the spring; must be grown in full sun where the soil is dry *Prop*—Division after flowering

Artemisia.—A genus of shrubs and perennials suitable for sunny borders or rockeries *A. lactiflora* is among the best of the herbaceous species, having grey foliage and creamy-white flowers *A abrotanum* (lad's love) in the shrubby section has grey, fragrant foliage *Prop*—Herbaceous section by division, shrubs by cuttings in the early summer.

Arundinaria.—*See* **Bamboo.**

Aster (Michaelmas Daisy).—By careful breeding this plant has been improved out of all recognition, and many first class varieties are available in the trade. Responsive to good cultivation, it is used for its colour late in season and properties as a cut flower, particularly *A. yunnanensis* 'Napsbury' and *A* 'Barr's Pink' A wide range of colours are available besides some fine, low-growing forms In the border one pleasing combination can be made with *A.* 'Harrington's Pink' and *Scabious* 'Dinkie' *Prop*—The clumps should be split up *annually* in the spring, and only the plumpest pieces of outer root replanted.

Aster, China or Common.—*See* **Callistephus.**

Astilbe.—Allied to the *Spiraea* and useful for planting in moist, rich soils, flowers white, pink, and crimson; height 2 ft. *Prop.*—Division of clumps.

Aubrieta.—A name often misspelt Throughout the country it is used as edging or for dry walls. Many lovely sorts available apart from the commonly found, pale-blue variety It is a lime lover. *Prop.*—After flowering the plants should be severely trimmed and, as necessary, stock increased by division.

Aucuba japonica.—Much maligned and over-planted shrub, but one tolerant of neglect and sunless or smoky conditions Interesting variants of the type, like 'Crotonifolia,' may be found in trade lists. *Prop.*—Cuttings rooted in the open in July

Auricula.—Correctly known botanically as *Primula auricula* Flowers of alpine auriculas are white or yellow, while in those of florists' auriculas are to be found some of the most delicate colourings among hardy plants Choice varieties are grown in pots under glass; others in moist, shady borders. *Prop.*—Seed or division in the spring.

Azalea.—*See* **Rhododendron.**

Bamboo.—The common name for the large group of woody grasses, reference to which is difficult owing to the confusion in their nomenclature Often grown for screening and wind breaks, and is a favourite shelter for small birds, the best for home-grown canes are *Phyllostachys viridiglaucescens* and *Sinarundinaria nitida*. An interesting account of bamboo growing is found in the *Jour. Roy Hort Soc* (June 1957). Growth can be encouraged by feeding with sulphate of ammonia and mulching with leaf-mould in the spring *Prop.*—Division of clumps in late spring, transplants must be kept watered until established

Begonia.—A genus showing wide diversity of form and much horticultural value Of particular interest is the tuberous-rooted section, of which many of the loveliest varieties have originated in the nurseries of Messrs Blackmore and Langdon at Bath For bedding schemes, the tubers are started in boxes of rich soil under glass in late March and planted out 9 in apart in June. During the summer feed with liquid manure of any sort and keep moist in dry periods *Prop*—Cuttings in early spring in a warm case

Berberis.—An extensive genus of beautiful and easily grown shrubs, evergreen and deciduous, the former used mainly for beauty of flower, and the latter for autumn colouring and ornamental fruits *B stenophylla* makes a fine evergreen hedge, invaluable for preventing illicit entry by dogs and, even, unruly children. *B aggregata* and *B jamesiana* are among the best berrying kinds Prune in the winter by removing old wood *Prop.*—Seed in spring or layering in autumn

Buddleia.—Deciduous shrubs of easy culture for sunny positions Varieties of *B davidii* available in range of colours from purple to white, best when pruned hard by cutting all previous year's growth back to main stems in February The weeping species, *B alternifolia*, often grown as a standard, good specimens at R.H S Gardens, Wisley This sort must be pruned in the summer by cutting off the dead flowering stems *Prop*—Cuttings in July–August in cold frame

Cactus—In the main grown in cool greenhouses or as house plants and, if cultivated well, many will flower every year As a general guide, plants should be watered fairly freely in the summer and little in the winter, but there are exceptions A detailed account of growing these fascinating plants will be found in *The Cactus Grower's Guide*, by Vera Higgings (Latimer House), 1946

Calceolaria.—Seed of the greenhouse biennials sown in June or July for flowering in the following year Mixed seed provides a wide range of colour *C integrifolia* is a half-hardy perennial, raised by cuttings or seed, for greenhouse or bedding work

Calendula (Marigold).—This common hardy annual is freely raised from seed sown in August Of easy culture in any sort of soil, although it is worth getting seed of new varieties now available *See* **Annuals.**

Callistephus.—The China asters are among the best half-hardy annuals for garden and indoor decoration, but good soil and full sun are necessary for best results. *See* **Annuals.**

Camellia japonica.—Hardy, evergreen shrub rightly beloved by connoisseurs and cultivated in gardens for many centuries May be grown in cold greenhouses, woodland gardens, and against north- and west-facing walls; under all conditions camellias must have a moist, acid soil. Best varieties for outdoors are 'Althaeaflora' (dark red), 'Donckelarii' (red, white marbling), and 'C. M Wilson' (pink) Of recent introduction is the desirable *C williamsii* bred from *C. japonica* in part; often the subject of television and gardening notes The dropping of buds is thought due to dryness at the roots at some time

or sharp fluctuation in temperature *Prop.*—Cuttings under glass in early July

Campsis grandiflora.—Sometimes found listed as *Bignonia* or *Tecoma*; choice deciduous climber for warm wall, large reddish-orange flowers in autumn To encourage flowering growth, prune hard back to old growth in spring *Prop*—Cuttings in April struck in a warm case

Canary Creeper.—*See* **Tropaeolum.**

Candytuft.—Hardy annual (*q v*) and perennials with white, crimson, blue, or purple flowers The perennial—*Iberis sempervirens*—is a fine plant for a rock wall *Prop*—Seed or, perennials, from cuttings.

Canterbury Bells.—*See* **Campanula.**

Carnation.—*See* **Dianthus.**

Centaurea (Cornflower).—The perennial species are valuable for cutting and border use, and may be found in such colours as pink, crimson and yellow. *Prop*—Lift and divide every third or fourth year The hardy annual, *C cyanus*, is often sold as a cut flower. *See* **Annuals.**

Cheiranthus cheiri (Wallflower).—Among the finest displays of this biennial are those found each year in the public gardens of Southend-on-Sea, where it is used in conjunction with bulbs and forget-me-nots. *Prop*—Seed sown thinly in rows in May and seedlings thinned or lined out and then transplanted in late autumn The so-called Siberian wallflower, *Erysimum asperum*, which has bright orange flowers, is grown in the same way, but it is intolerant of wet soils Both sorts are lime lovers, and on acid soils plants may receive treatment with 1 oz of lime in a gallon of water

Chimonanthus (Winter Sweet).—Hardy, winter-flowering shrub with heavily scented flowers Although brought to this country from the Far East in the mid-eighteenth century its garden value is not widely appreciated The large-flowered, yellow sort, *C praecox*, is particularly fine but like all the varieties, it is best grown against a sunny wall and where the soil tends to be poor If growth is excessive and flowering poor, trim back young growth severely in March to encourage short, spur-like shoots *Prop*—Easily raised from seed or layers.

Chionodoxa.—Blue-flowered bulbs useful for under-planting shrubs such as forsythia Will tolerate shade and may be left undisturbed to naturalise Height 6 in

Christmas Rose.—*See* **Helleborus**

Chrysanthemum.—Hardy annual sorts are available in a wide range of colours and give a fine display in the summer months *See* **Annuals.** There are also a number of perennials such as the shatta daisy and the oxeye daisy for sunny, herbaceous borders, all do well in ordinary soil, but should be lifted and split up about every three years The plant sold by florists in the autumn is the Japanese chrysanthemum Many are hardy out-of-doors, but no plant is more responsive to good cultivation and normally is best left to the specialist grower For ordinary garden work the best sorts are the Korean and Otley types Under a brief reference the interesting details of cultivation cannot be dealt with fairly, and reference to specialist books is recommended.

Cistus.—Hardy and half-hardy evergreen shrubs, mainly native of Southern Europe Well worth growing in light, sandy soils in reasonably sheltered positions Pruning should be limited to the removal of any shoots killed in the winter Among the hardiest sorts are *C laurifolius*, white flowers, 6 ft, and *C. purpureus* 'Silver Pink,' 3–4 ft. *Prop.*—Easily raised from seed.

Clarkia elegans.—A Californian, hardy annual of easy culture and mixed seeds will give a wide range of colours in white, pink, scarlet, and crimson. *See* **Annuals.**

Clematis.—A hardy climber for walls, screens, pergolas, and the like Best kinds are to be found among named varieties in nurserymen's lists A light, well-drained soil is necessary and if fed annually with a bucketful of manure or compost the plant will thrive for many years Occasionally plants will be found on north walls, and if grown in full sun some light protection from the sun is desirable for the roots Varieties which flower on the *current* season's growth, like *C jackmanii*, should be pruned in late February to within a foot of the ground, other sorts should have sufficient old growth removed, after flowering, to keep them within bounds

Unfortunately, the climber is sometimes killed by clematis wilt, a disease about which very little is known, and the premature death of young plants should not be blamed automatically on the supplier *Prop*—Layering, by which means one shoot will often give three or four plants.

Convallaria majalis (Lily of the Valley).—Well-known perennial that will thrive in any damp, shady position For best results lift every four or five years and mulch annually with old manure *Prop*—Division when foliage fades.

Coreopsis.—The hardy annuals are found in catalogues under "Calliopsis," and all will thrive in ordinary soil The flowers are mainly bright yellow, and many are good for cutting. *See* **Annuals** Similarly, the perennials have the same predominant colour and are useful because of their long flowering season and abundance of flower *Prop*—Division.

Cornflower.—*See* **Centaurea.**

Cosmos.—Tall-growing half-hardy annuals that are best grown in full sun in a dryish border. The large, daisy-like flowers can be had in a variety of colours, including white, yellow, pink, and crimson. *See* **Annuals**

Cotoneaster.—Hardy evergreen and deciduous shrubs or small trees bearing scarlet or sometimes yellow berries in the autumn All may be grown in ordinary or poor soil and planted in open or shady shrubberies and trailing species used against walls, over banks, or as ground cover For shrubberies *C lacteus* and *C* 'Cornubia' with red berries and *C rothchildianus* with yellow berries are among the best sorts, *C conspicuus* 'Decora' is a strong grower for banks, while *C horizontalis* is an excellent cover for any wall Planting may be done in the autumn or spring, and no pruning, apart from occasional shaping, is required *Prop*—Seeds and layering

Crataegus (Hawthorn).—There are many good varieties of our British hawthorn, *C oxyacantha*, worthy of attention, particularly 'Coccinea' (crimson) and 'Paulii' (double, red). All will do well on poor soils, and no pruning is required The common hawthorn makes a stout, impenetrable hedge planted 9 in apart in a double row 9 in asunder *Prop*—Common sort by seed, choice varieties by budding

Crocus.—A hardy bulb of great beauty which was studied for many years by one of the greatest horticulturists of the twentieth century, the late E A. Bowles Does best in rich soil planted in bold groups around margins of beds or borders and naturalised in grass When required, feed in early spring with bone meal at 2 oz per sq yd *C sieberi* and *C tomasinianus* very early flowering; large-flowered, garden forms about three weeks later *C zonatus* flowers in the autumn and is often naturalised in grass *Prop*—Clumps may be lifted and divided about every five years, in July The so-called autumn crocus is *Colchicum autumnale* This bears large, lustrous leaves in the summer, followed by mauve or white flowers—of fleeting duration—in the autumn

Crown Imperial.—*See* **Fritillaria.**

Cyclamen.—*See* **House plants** (T39).

Cytisus (Broom).—Only does really well in dry, poor soils in full sun, choice, procumbent sorts, like *C. kewensis*, used in rock gardens and tall ones

in open shrubberies. Pruning is important, shoots should be shortened after flowering, but old wood must never be cut *Prop* —Seed and cuttings in August in a sandy soil.

Daffodil.—*See* **Narcissus.**

Dahlia.—The cultivation of this plant is a special study, and there are probably more garden varieties of it than any other plant Ordinary soil enriched with manure and an open position is required Tubers may be planted 3 in deep in April or young plants in late May During the summer feed with soot water and liquid manure After the first frosts lift, dry, and then store tubers in peat or straw in frost-proof place. Many stocks of dahlia are affected by virus (T30), and purchasers should be careful to check source of supply.

Daphne.—Shrubby plants, giving some of the most richly scented of all flowers In particular, there is *D. mezereum*, which requires a damp soil, failure with the shrub is due usually to root disturbance or virus disease (T30) *D odora* is one of the evergreen, fragrant species Some references have suggested that this lovely shrub is not hardy, but there is no evidence to support the supposition *Prop* —Seed or layering

Delphinium.—Hardy annuals and perennials. The latter sorts have gained popularity enormously since the War, due in the main to the activities of the Delphinium Society but also to the introduction of many very fine new varieties American hybrids, like the 'Pacific Strain,' are very large but tend to die out and, consequently, lack the true, perennial habit of European sorts, albeit some of these have been weakened by the introduction of poor lines It is important therefore to select stocks of strong constitution Delphiniums need a deep, rich soil and a sunny position protected from wind Plant in autumn 3 ft apart, feed in the summer with liquid soot water, and mulch with decayed compost or manure in the spring When growth starts, thin out weak growths to leave not more than five stems per plant In winter take steps against possible slug damage (T28), and on this point it is beneficial to protect crowns with a covering of ashes *Prop* —Cuttings in the spring or seed, division of clumps is a poor alternative

The hardy annual sorts are the well-known larkspurs, which grow to a height of 18 in to 2 ft and may be found in a range of colours including pink, red, white, and shades of blue. *See* **Annuals**

Deutzia.—Hardy deciduous shrubs thriving in any soil and valuable for their summer flowers of white or whitish-pink shade To keep the plants vigorous, shoots should be shortened after flowering and old or weak wood cut out *D scabra* is of robust habit, reaching about 7 ft, and *D elegantissima* 'Fasciculata' proves a graceful shrub some 5 ft tall with clusters of about twenty flowers coloured rosy-pink and each nearly an inch across *Prop* —Cuttings made from firm young growths about 10 in long in sandy soil out-of-doors

Dianthus.—This name covers a wide range of annual, biennial, and perennial plants At one time often grown for their fragrance, but to a large extent this has been lost with the introduction of wider ranges of colour Border carnations and picotees grown out-of-doors need a limy, fairly rich soil in full sun Plant in the autumn or spring and, as the buds appear, feed with soot water or liquid animal manure, if necessary These groups are *not* of good perennial habit and should be propagated annually to ensure continuation of stock

The common pink requires the same soil conditions, and should be propagated when the stock gets weak, good scented varieties should be sought, and include the 'Imperial Pinks,' 'Mrs Simkins,' and 'White Ladies' *Prop* —The best method is by layering in July so that the new plants can be put in their flowering position by mid-September. The lower leaves are pulled off selected shoots and a slit passing through a joint is made in the stem Each layer is then pegged down with a hair-pin, the pin being placed above the cut The layers are then covered with an inch of sandy compost and well watered.

In this genus is the sweet william, although truly a perennial, it is generally grown as a biennial and, consequently, the plant is raised from seed in May out-of-doors In gardens where it is prone to rust disease control is most difficult and it is not worth a place

LAYERING CARNATIONS—This is a typical example of how many plants can be propagated A strong, new growth is pegged down into sandy soil after a cut has been made in the stem, at the point of pegging Once rooted the layer can be severed from the parent and transplanted a week or two later

Digitalis —The biennial sort generally found in gardens is the common foxglove, which is grown in light shade in fairly rich, moist soil In the past many named forms have been offered in the trade, but undoubtedly the best one is *D* 'Sutton's Excelsior' *Prop* —Seed sown in May out-of-doors.

Doronicum.—Hardy perennials with yellow flowers; warrants wider planting, as they are among the earliest perennials to bloom and will thrive in poor soil or in some shade The best is *D austriacum* flowering in March, height 9 in *Prop* —Division after flowering

Echinops.—Name appropriately derived from *echinos*, a hedgehog, in reference to the spiny, long scales of the flowers The plant does well in an open position, where the globular heads of steely-blue flowers can be seen to advantage *Prop* —Division in March, but best left undisturbed as long as possible, as it must be moved with care

Elaeagnus.—Hardy deciduous and evergreen shrubs generally grown in rather dry positions as foliage plants Of the evergreen sort, *E pungens* 'Aureo-Variegata' has bright golden variegation, and is therefore valuable for indoor decoration during the winter *Prop* —Layering in late summer

Erica.—The heathers are native plants to Britain, and many variants found in the wild have been introduced into gardens to good purpose Indeed, heathers have become so popular that special Heather Gardens have been made, and two fine examples may be found in the Royal Gardens, Windsor where the planting is new and the Royal Horticultural Society's Gardens, Wisley Here, different sorts reaching the dimensions of small trees, dwarf kinds, and many scores of interesting variants, to supply flower throughout the year, will be found.

The Scottish heather is, botanically, *Calluna vulgaris*, and, like all British heathers, it is intolerant of lime or chalk. Where alkaline conditions exist, planters can try *E. carnea*—a winter-flowering heather—or *E darleyensis*, but the results are usually disappointing. When planting all heathers, clumps must be well firmed and after-

wards kept moist; subsequently, mulch all types annually with peat *Prop*.—Division and layering

Erigeron.—Hardy perennial for sunny borders, daisy-like flowers freely develop and are good for cutting. *Prop*.—Division in the autumn.

Escallonia.—Slightly tender evergreen and deciduous shrubs In the Midlands protection of a south wall is necessary, suitable for open shrubbery in the South Ideal for maritime conditions, and here may be used to good effect as hedges Many of the best varieties originated in the nursery of Messrs The Slieve Donard Co in County Down *Prop*.—Cuttings under a glass jar in summer, layers in September

Eschscholzia californica.—A hardy annual of easy culture, height 18 in., flowers mainly shades of orange. *See* **Annuals.**

Everlasting Flowers – *See* **Helichrysum.**

Ferns.—A large number of plants are included under this name and, as they grow wild in many parts of the world, some need hothouse conditions They are distinguished from flowering plants by their method of reproduction, instead of producing seeds, ferns develop spores, usually on the back of their leaves The hardy kinds may be grown in equal parts of leaf-mould and soil, and the fronds of leaf-losing kinds should not be removed until the spring as they offer some protection from the cold Tender ferns should be repotted when new growth starts in the spring in a compost of equal parts soil, leaf-mould, and sand, using a pot just large enough for the purpose During the growing season, in particular, keep the roots moist and plants free from a dry or smokey atmosphere *Prop*.—Division of clumps when growth starts in the spring.

Forget-me-nots.—*See* **Myosotis.**

Forsythia.—Commonly found in many gardens, as it is of easy culture in any soil Flowers bright yellow in early spring To keep in good shape prune directly after flowering by cutting out old wood *F intermedia* 'Lynwood' is upright in growth and *F suspensa* of weeping habit, both types make good wall plants for North aspects *Prop*.—Cuttings in the autumn

Foxglove.—*See* **Digitalis.**

Freesia.—Greenhouse bulbous plant and, if grown for scent, care must be taken to select fragrant varieties Pot in the autumn in a fairly rich compost and keep as cold as possible until growth is seen Then bring into a frost-free greenhouse and water freely When flower stems appear, feed with liquid manure, after flowering, gradually dry-off until time for repotting. Failures almost invariably traced to premature forcing before root growth has been made or growing in excessively high temperature *Prop*.—Offset at potting time.

Fritillaria.—The one mainly used in gardens is *F imperialis*, a handsome, spring-flowering bulb To grow it *really* well this species must be given a deep, rich soil and, contrary to some views, it is best lifted every year as soon as the foliage fades If growth is poor or plants do not flower, feed when growth starts in the following spring with equal parts of bone meal and superphosphate at 3 oz per sq yd *Prop*.—Offsets removed from parent bulb at lifting time. The old bulb should then be replanted at once and any offsets lined out in a nursery row

Fuchsia.—Greenhouse and tender flowering shrubs. The outdoor sorts (of which *F riccartonii* is the best) may be grown in light soil in full sun In the spring prune all growth down to ground level; protect, if necessary, in winter with covering of cut bracken or dry straw Greenhouse varieties are potted firmly before growth starts in the spring and, when buds burst, all the previous year's growth can be cut back hard. To encourage flowering, feed with a liquid manure, such as dried blood, and syringe foliage in hot weather. During the winter keep plants dry and house in a cool greenhouse *Prop*.—Cuttings of new growth taken about 1 in. long and inserted in sand under a bell jar.

Gaillardia.—Hardy annuals and perennials 18 in to 3 ft. high which bear large, richly coloured flowers invaluable for cutting in mid- and late-summer Unfortunately, on heavy soil the perennials are liable to die after flowering, and even on well-drained soils they cannot be considered long-lived plants *Prop*.—Normally it is necessary to raise a fresh stock in alternate years, seed is sown in May in a cold frame and the young plants lined out in a reserve border prior to planting in the autumn

Galanthus (Snowdrop).—Hardy bulbs well worth growing if given a moist, shady position where stock can be left undisturbed Planting should be done in fairly bold clumps, bulbs are not expensive, and many variants, like double-flowered and tall-stemmed ones, are well worth a trial *Prop*.—Lift and divide clumps in August.

Gentiana.—The gentians comprise some of the most fascinating of all rock-garden plants partly, perhaps, because some are difficult to manage In particular, *G acaulis*—which has true "gentian blue" flowers—is exacting in its requirements, and in many gardens flowering can never be induced What controls flowering has not been discovered, and the plant can be grown well in acid or limy soils On the other hand, *G sino-ornata* must have an acid soil and is best in a position out of the direct sun Beginners with the genus are advised to start with easily grown sorts, like *G lagodechiana* and *G septemfida* *Prop*.—Seed sown in cold frame in March or division in early spring

Geranium.—The true geranium or cranesbill is a hardy floriferous perennial for rock garden or open border In the latter case *G ibericum* (blue flowers) and *G sanguineum* 'Lancastriense' (rosy-pink flowers) are exceptionally good, and both do well in dry, sunny positions The so-called "bedding" or "greenhouse" geranium is a pelargonium (*q v*) *Prop*.—Seed in March.

Gladiolus.—Dutch hybridists have done much work on this bulbous plant, and many new and lovely varieties are now available The plant is responsive to good cultivation, and corms may be planted 4 in deep and 6 in apart during the spring in well-prepared ground. When the blooms fade remove the dead spikes of flower and lift the corms in September After a month—and this point is important—pull off the old shrivelled corm and clean the new one By doing this there is less likelihood of spores of diseases overwintering on the new stock Finally, the corms should be stored in a dry frost-free shed, and if given proper attention can be kept for a number of years *Prop*.—Bulbils, removed when the corms are cleaned, can be sown in the spring in nursery rows and will flower within two years

Godetia.—Hardy annual of easy culture and tolerant of poor soil conditions and even some shade There are many varieties, mainly with bright flowers of rosy-pink and crimson *See* **Annuals**

Guernsey Lily.—*See* **Nerine.**

Gypsophila.—The favourite sort is *G paniculata*, which is often grown for cutting, together with its double-flowered form, 'Bristol Fairy' To do well gypsophila must be given a dryish soil which the roots can penetrate undisturbed, if growth is poor mulch in the spring with animal manure *Prop*.—Generally done by seed in spring, special forms by grafting

Hamamelis.—A lovely, but little grown, winter-flowering, heavily-scented shrub. The delicate, lemon-coloured flowers appear interminably from December to February Although it flowers in its young stage, hamamelis is slow to get established and must be left free of root disturbance The best sort is *H mollis* introduced from China in 1879 *Prop*.—Usually by grafting, can be layered.

Heather.—*See* Erica.

Hedera.—Although ivy is seldom planted nowadays, there are a few evergreens to equal it for covering buildings. The large-leaved ivy with golden variegation, *H. colchica* 'Dentato-Variegata,' is invaluable for cold or shady walls *Prop*—Cuttings in August in shady border out-of-doors

Helianthus.—The perennial sunflowers are tall, yellow-flowered plants of vigorous habit They spread quickly and become a nuisance, and therefore clumps should be lifted and single, rooted pieces replanted every other year The annual sunflower may reach a height of 10 ft or so, seed is sown out-of-doors in April or seedlings raised under glass in the spring When the flower bud appears, feed with soot water The seed may be used as food for large birds like parrots.

Helichrysum.—Although this is a large group of plants, the most interesting is the half-hardy annual, *H. bracteatum*, the everlasting flower When the flowers are fully developed they are cut with long stems and hung up to dry for winter decoration. *See* Annuals.

Heliotropium peruvianum (Cherry Pie).—Scented, shrubby plants used for greenhouse decoration or summer bedding *H* 'Sir Edward Fry' is among the scented varieties and *H* 'Princess Marina' is the best dark-purple variety. For really good results, heliotropes need a rich soil and plenty of water in summer *Prop*—Cuttings 2–3 in long in early autumn or spring, struck in sandy loam in a warm greenhouse.

Helleborus.—The Christmas rose, *H niger*, should be planted out of the direct sun in a moist soil which has been liberally enriched with leaf-mould and old manure and here left free from root disturbance Its large, white flowers appear irregularly from December to February with early flowering encouraged by protection with cloches The Lenten rose, *H. orientalis*, flowers from February to April, and it is well worth searching nurserymens' lists for varieties with a wide range of colours *Prop*—Division of clumps in the spring, with each piece having four or five growth buds; the clumps should not be split into small pieces

Hemerocallis.—Hardy perennial for moist border either open or slightly shaded Mulch established clumps in the spring with compost or manure. Many new varieties are coming on the market as a result of introductions from America, where the plant is popular *Prop*—Division

Hibiscus.—The evergreen, shrubby sorts with large exotic flowers are widely grown in the tropics and can be seen under glass in botanic gardens in Britain *H syriacus* is a deciduous, hardy species, little pruning is required, and in full sun it will reach 8–10 ft Normally, it is a free-flowering plant of great beauty and, in cases where the flowers fail to develop, the stock is best replaced with good varieties, like 'Coeleste' (single, blue) and 'Woodbridge' (single, red) *Prop.*—Cuttings under glass, grafting

Holly.—*See* Ilex.

Hollyhock.—*See* Althaea.

Honeysuckle.—*See* Lonicera.

House Leek.—*See* Sempervivum.

Hyacinth.—Bulbs generally used for bowl culture; often results are disappointing, but responsibility does not necessarily rest with the nurseryman, as poor cultivation is the most probable cause. Plant in September–early October (not later) in peat, loam, and sand, and keep as cool as possible until growth starts, when bowls may be brought into a warm room Care must be taken with watering, as the bulbs must not dry out nor the compost allowed to become wet and soggy. After flowering, plant out-of-doors and lift annually in June for replanting in the autumn; for bowls a fresh stock is required every year. Failures are mostly due to late planting or faulty watering.

Hydrangea.—A favourite shrub introduced from the Far East. Of the many forms, the one offered by florists, *H macrophylla*, is the most popular This can be bought in a wide range of shades, from white and pink through to crimson and blue. The colour will depend on soil reaction, in alkaline or neutral soils *only* white and pink shades can be grown, and blue flowers will be found *only* on acid soil The intensity of colour can be improved by adding lime in the first instance and flowers of sulphur in the second, but it is not possible to make an alkaline garden soil acid in reaction Lack of flower is generally the result of buds being killed by cold weather For this reason, hydrangeas are best not pruned until the late spring, then old flower-heads and any weak or unwanted growth can be cut out During the summer the plants must not suffer from lack of water

Among the many other sorts are *H paniculata*, with large, cone-shaped panicles of flower and *H petiolaris* The latter plant is a vigorous climber, well suited to cover cold walls or for climbing over dead trees *Prop*—Cuttings in July–August in a cold frame

Iberis (Candytuft).—The hardy annual sorts will thrive in any soil, and may be had in a range of colours *See* Annuals. The perennial candytuft (*I sempervirens*) is a good plant for a rock wall and has white flowers in early spring *Prop*—Seeds in spring and cuttings in summer

Ilex.—The ornamental value of our native holly is rarely fully appreciated, bearing in mind that, on good varieties, the berries sometimes persist until March The greenish flowers are sometimes bisexual, and sometimes male and female flowers are on *separate* plants For this reason hollies should be planted in groups, and at least one plant of good berrying habit, like *I aquifolium* 'Pyramidalis,' grown Some varieties have yellow berries and gold or silver variegations on their leaves *Prop*—Seed, special forms by budding

Iris.—This plant is divided into two main sections those types which grow from bulbs and those which grow from fleshy rhizomes, with many subdivisions in each of them Of the latter type, there are the commonly grown bearded flag irises, which, owing to their ease of cultivation and wide range of colours, are appropriately known as the poor man's orchid Notwithstanding, these irises respond to good treatment, doing best in well-dug soil to which a little manure has been added and a dressing of rough chalk forked into the surface The site should be in full sun for preference and one that never lies wet in winter Planting or division of established clumps is done in July, setting the rhizome on the surface of the soil but firming the roots well To maintain growth and flower, feed annually in the spring with equal parts of superphosphate and bone meal at 3–4 oz per sq yd Iris gardens are not often seen nowadays, but the fine example still maintained at Kew is well worth close inspection

In the bulbous section the Siberian iris is a graceful plant with delicate foliage, though much smaller-flowered than the flags They make a fine waterside planting or may be grown in the herbaceous border The Japanese iris is another water lover, and this has delicate-coloured, clematis-like flowers. On the other hand, for dry, poor, stony soils in full sun the lovely, winter-flowering, Algerian iris, *I unguicularis* (*stylosa*), is an ideal plant, flowering as it does in December and January This is a plant which must be left undisturbed after planting in June and if leafy growth is excessive the foliage can be cut back by half in August Spanish, Dutch, and English types of bulbous iris are often used as cut flowers. These may be planted in ordinary garden soil in the autumn and left undisturbed until signs of deterioration are found.

Japonica.—Common misnomer of *Chaenomeles* (*q.v.*).

Jasminum.—The yellow-flowered, sweetly scented winter jasmine blooms intermittently

from November to February It grows in any soil, and is best trained up a wall or grown on a trellis Pruning consists of cutting out the flowering shoots as soon as the blossoms fade The summer jasmine is a vigorous climbing plant with white, scented flowers It needs a sunny position and should be well thinned after flowering *Prop* —Layering in summer.

Kalmia.—Hardy American shrubs with clusters of waxy, rose or pink blossoms in early summer. Although slow to get established and requiring a damp, acid soil, the plant is well worth growing It constitutes a feature of the gardens of the National Trust at Sheffield Park, Sussex *Prop* —Seed or layering

Kerria japonica.—A hardy shrub which will thrive in any garden but is best fed with manure to encourage strong growth When the yellow flowers fade, the stock should be kept vigorous by cutting out old or weak growth The plant is named after William Kerr, a young man despatched from Kew to collect plants in China *Prop* —Division in autumn

Kniphofia (Red-hot Poker).—Although these plants are so commonly seen, their full value as late-flowering subjects is not often fully explored There are a number of good varieties worth growing, such as 'Maid of Orleans' (white, 4 ft), 'Mount Etna' (scarlet, 5 ft), and 'Royal Standard' (gold and scarlet, 4 ft) Of equal value is the dwarf variety with grass-like foliage, *K nelsonii* *Prop* —Division in March, easily raised from seed if so desired

Laburnum.—Handsome trees with long racemes of yellow flowers the seeds of which are very poisonous It is not advisable to remove branches, as wounds do not heal well or quickly, and once a specimen shows signs of deterioration it is best replaced with little delay *Prop* —Seed or grafting.

Larkspur —*See* **Delphinium.**

Lathyrus (Sweet Pea).—For general garden decoration, seed may be sown in pots in a warm greenhouse in early February prior to transplanting out-of-doors in April When heat is not available sowing can be done in the open in October, setting the seed 4–6 in apart and 2 in deep where the plants are to grow In this case the rows are best protected by cloches. As the plants flower with great freedom and make strong growth, a rich, deep soil is required During the summer water should be given freely and liquid animal manure or soot water applied weekly when flowering starts When raised for exhibition, special cultural treatment is necessary The cause of the condition referred to as bud drop is not known, but it is thought to be connected with low temperature and faulty root action

There is also the hardy, perennial sweet pea, an old-world plant usually seen at its best in cottage gardens This plant requires the same cultural conditions, except that the old stems are cut down in the autumn. Three or four different species are available, and all are easily raised from seed sown in the spring

Lavandula.—The lavender is one of the best known of garden plants It thrives in full sun in a light soil, old flower heads should be clipped off in the summer, but any cutting back into old growth must be left until the spring The best garden form is *L spica* 'Nana Atropurpurea', it has a neat, dwarf habit, with deep purple flowers, and is available from leading nurserymen *Prop.*—Cuttings out-of-doors in August–September.

Leucojum.—The spring snowflake flowers in February and is a charming plant for any damp, shady border Although it has a large flower, it has never become as popular as the snowdrop, despite its ease of culture. It should be grown by everyone who values early spring flowers *Prop* —Lift clumps and replant after removing offsets in August.

Lilac.—*See* **Syringa.**

Lilium.—The lilies constitute a large genus of plants, some of easy culture, some demanding the most exacting of conditions For a soil containing chalk two of the best lilies are *L candidum*, the Madonna lily, and *L regale* The former is a feature of many gardens in South Wales, where bulbs are planted near the surface of the soil and the clumps eventually left to develop undisturbed Only the easiest-grown lilies are suitable for the herbaceous border and, here, apart from the Madonna lily, the tiger and martagon lilies should be first choices for beginners in the cultivation of this genus *Prop.*—Those referred to above may all be raised from seed sown out-of-doors (or in deep boxes in a cold frame) in the spring In the following April line out into nursery rows prior to transplanting to flowering positions Also propagated by offsets and bulbils.

Lily of the Valley —*See* **Convallaria.**

Lobelia.—The bedding lobelias are perennial plants best raised as annuals (*q v*). They do well in a light soil, but should be firmed at planting time to prevent plants dying off during a hot spell The handsome, tall-growing lobelias with scarlet flowers, like *L fulgens* 'Huntsman,' may be used in herbaceous borders with great effect, but the roots must be lifted and overwintered in a cold frame These sorts grow to a height of 2–3 ft and will do well only on a wet, heavily manured soil

Lonicera —The honeysuckles make effective climbing plants if grown on the shady side of arches or tree stumps or against north or west walls Care should be taken to train young growth before it becomes hard Old shoots may be cut out each spring to keep the plant within bounds, although space must be available for free development If growth and flowering is poor mulch the roots in the spring with old manure *Prop* —Easily done by layering in late summer

Lupins.—There are two sorts of lupins, perennial and annual The herbaceous perennials are among the most colourful of plants as a result of the famous 'Russell' strain being introduced Of late years, however, the constitution of the plant has been weakened through, perhaps, breeding and virus diseases, and it should be taken for granted that most stocks have to be replaced every two years or even annually in some cases. The plant requires a rich soil and is best in ground free of lime. Conversely, in poor soil the tree lupin thrives and will reach a height of 7–9 ft; plant in full sun and lightly prune into shape after flowering *Prop* —Both sorts are best raised from seed sown in May out-of-doors and transferred to flowering positions in October The annual lupin may be obtained in a range of colours, and should be grown in full sun. *See* Annuals.

Magnolia.—Rightly said to be one of the most beautiful of all flowering plants Contrary to popular belief, some kinds are of easy culture, flowering when young and suitable for small gardens Of course, careful selection is necessary and for a specimen on a lawn *M* 'Soulangeana' (large, white or white, purple-stained flowers) is ideal *M stellata* freely flowers in the young stage, and may be planted in an ordinary border if the soil is lime free To encourage growth, mulch annually with peat or leaf mould, but never dig near the roots The evergreen magnolia is often seen as a fine wall plant in old gardens This is the only species which may be pruned, and long shoots can be cut back hard in April. There are a number of non-flowering strains of the evergreen one, and unsatisfactory plants are best destroyed, as flowering cannot be induced. In buying a replacement care is necessary in order to avoid *another* dud *Prop* —Seed sown as soon as it is ripe in October; layering

Mahonia.—Hardy evergreen shrub. *M. aquifolium* is useful as ground cover, and will thrive in any soil and in any cold, shady position providing the soil is not waterlogged. *M. japonica* has long racemes of lemon-scented flowers in the winter, inferior sorts are often offered by nurserymen

under this name. *Prop.*—Seed, suckers, and layers.

Marigold.—*See* **Calandula.**

Mathiola.—The night-scented stock is a hardy annual with insignificant purplish flowers which open at dusk, grown primarily for its perfume Conversely, the so-called Ten-Week stocks and a selection of these, the East Lothian stocks, have a wide range of colours. If sown in March they may be used for summer bedding or if sown in August overwintered in a sunny frame and grown as a biennial.

Brompton stocks flower earlier than the other sorts, and are grown as a biennial by sowing seed in June or early July and, after pricking out into boxes, are overwintered in a sunny frame In mild districts, if the soil is well drained, stocks may be planted out-of-doors in the autumn, but a reserve should be kept for filling up gaps in the spring

Meconopsis.—This genus includes the famous "blue poppy," introduced from the Himalayas It is not a plant of easy culture, albeit large groups are grown in many woodland gardens where soil conditions permit After flowering the plants generally die, although an occasional plant may persist *Prop.*—Seed sown in March

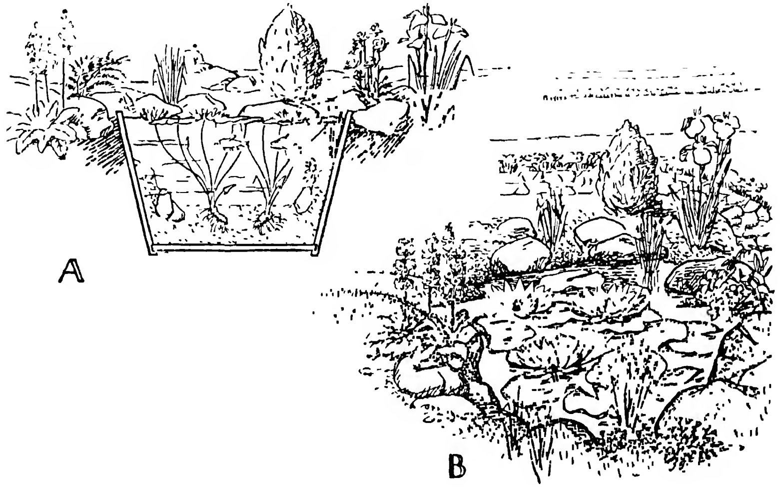
Michaelmas Daisy.—*See* **Aster.**

Montbretia.—This bulbous plant is of easy culture and has a long season of flowering Many new varieties with large flowers are now available, and growth can be kept vigorous by lifting and dividing the clumps every three or four years Plant in early spring 4 in. deep and 6 in apart and in cold gardens protect clumps in winter with a covering of ashes.

Myosotis.—The forget-me-not is grown as a biennial by sowing seed in May and planting out in the autumn in conjunction with spring-flowering bulbs and wallflowers Poor varieties freely establish themselves, and these should be destroyed before planting any of the really good sorts offered by seedsmen.

Narcissus.—This botanical name includes plants commonly known as "daffodil" and "narcissus." Although often grown, the wide garden value of these spring-flowering bulbs is not fully realised, as by careful selection of varieties a long season of flower can be obtained when they are grown in formal borders or naturalised. Thus, a season may be extended with 'Peeping Tom' and 'Covent Garden' (early) and 'Geranium' and 'Buttermilk' (late). The bulbs can be left undisturbed until flowering is affected by over-crowding, the clumps should then be lifted and be divided in the late summer To maintain vigour, feed annually in February with 2 parts bone meal, 1 part hoof and horn meal, and 1 part sulphate of potash at 2 oz. per sq yd. The chief troubles with narcissi are due to eelworm (**T29**) and the narcissus bulb fly (**T28**). For indoor work, plant in bowls in October and keep in cold place until growth is an inch high, failure is invariably due to premature forcing or faulty watering.

Nasturtium.—*See* **Tropaeolum.**



WATER LILIES IN TUBS—Drawing (A) shows a cross-section with correct percentage of water and soil together with water lilies and fish Drawing (B) illustrates marginal planting with primulas, Japanese irises, and a dwarf coniferous tree

Nepeta (Catmint).—In recent years this edging plant with silvery foliage and mauve flowers has become increasingly popular. When flowering in mid-summer there is no finer display of colour It grows freely on any light, well-drained soil in full sun The best sort is *N. faassenii* *Prop*—Division of clumps in March.

Nerine.—Lately this lovely bulbous plant has increased in popularity mainly through the varieties introduced from the late Lionel de Rothschild's garden at Exbury. The hardy sort *N. bowdenii* flowers in the autumn and should be planted at the foot of a warm wall in August or September and left undisturbed for many years As the bulbs gradually multiply and work to the surface, a light dressing of sandy compost, to which has been added a little bone meal, can be applied. *Prop*—Separation of bulbs in August

Nicotiana (Tobacco Plant).—This half-hardy annual is grown mainly for its heavily scented flowers, which open in the evening. It is worth remembering that the white-flowered sorts are the best in this respect; scarlets and pinks are very much inferior *See* **Annuals.** The tobacco of commerce is a different plant, namely, *N. tabacum*

Nymphaea.—No branch of gardening is more fascinating than the water garden, and for it the chief plant must be the water lily. Basically, the main reason for failure is in the fact that in most pools the *average* depth of water is less than 18 in , this means that the water is liable to be adversely

affected by extremes of temperature All nymphaeas should be grown in full sun and where the water is still; in streams it is necessary to utilise a little backwater out of the current. Water lilies are planted in May in large wicker baskets with a compost of three-quarters of loam and a quarter of peat, alternatively, planting sites can be built up with bricks to the desired height If growth is poor, mould Clay's Fertiliser into the size of pigeons' eggs and drop one around each clump To maintain a healthy condition in the water, fish should be introduced as soon as the plants are established *Prop*—Division of tuberous roots in late May

Orchids.—In the main this large group of plants needs greenhouse conditions and specialised knowledge Their cultivation has attracted the attention of some of the greatest of horticulturists, and detailed references may be found in books like *Orchids, their Description and Cultivation*, by C. H Curtis (Putnam), 1950

Paeonia.—There are two sorts of paeony, the tree paeony and the herbaceous paeony The former needs a sheltered, warm position and takes about three years to flower from planting time The latter sort needs a moist, rich soil, and should be mulched annually in the spring with well-rotted manure, some are known not to flower, and as such plants cannot be induced to do so they should be destroyed The old-fashioned variety of paeony has been superseded by many fine new varieties found listed by specialists *Prop*—Tree paeonies by layering or seed sown in the autumn, herbaceous sorts by seed or division

Pansy.—*See* **Viola.**

Papaver (Poppy).—The oriental poppy is a hardy herbaceous perennial with striking flowers, intolerant of shade and root disturbance As it blooms early, it should be set near the back of a border, as the large leaves look untidy later in the year Apart from the commonly grown, red-flowered sort there are others in shades of crimson, pink, and lavender *Prop* A wide range of colours can be obtained by sowing mixed seeds in May This is a better method than division The Shirley poppy is a hardy annual (*q v*), while *P nudicale* is a biennial needing a warm, sheltered position

Parthenocissus (Virginia Creeper)—This climber, with its brilliantly-coloured leaves, makes a fine sight in the autumn, and there is no better plant for covering brickwork or unsightly buildings with a south or west aspect It has been suggested (mainly by builders) that the plant will damage stonework or cause dampness There is little evidence to support these suppositions, and reasons for damage can usually be traced often without difficulty—to other sources The plant has had a number of names—*Ampelopsis veitchii* is one—but up-to-date nurserymen are listing it correctly as *P tricuspidata* *Prop*—Cuttings out-of-doors in the late summer, layering

Passiflora caerulea (Passion Flower).—A south wall in favoured gardens is needed to grow this plant. It is of vigorous habit and, once the framework of branches has been produced, it should be pruned annually in the early spring, by cutting back all the previous season's growth to 2–3 in of the main stem *Prop.*—Layering

Pelargonium (Geranium).—So-called "bedding geraniums," such as 'Paul Crampel,' are really zonal pelargoniums To maintain a stock, take cuttings in early August and insert in sandy soil around the edge of a pot and overwinter in a frost-free greenhouse. In the spring pot-up singly and use for bedding Otherwise pot-on after two months and, if early buds are nipped off, plants can be adopted for late flowering indoors Pelargoniums are easy to grow, but for best results a position in full sun is necessary, and cuttings should be rooted *before* the autumn so that overwintering constitutes no great difficulty.

Petunia.—Although really perennials, these plants, native of South America, are treated as annuals (*q.v.*). They are sun lovers and do best on light soils. Petunias make fine plants for sunny window boxes, and particularly happy combinations can be made by planting together varieties such as 'Violacea' (deep violet) and 'Cheerful' (pale pink) or 'Flaming Velvet' (crimson) and 'Cream Star' (pale cream). The violet-flowered sorts are faintly scented

Philadelphus (Mock Orange).—Although some fine varieties of this shrub are available in the trade, it is not grown as widely as its merit deserves As a scented shrub it has few equals, while it is tolerant of poor soil conditions and shade Particularly good sorts worth searching for are 'Albatre' (double), 'Beauclerk' (single), and 'Sybille,' which, at 3 ft, is about half the height of the others. After flowering, prune annually by removing as much old flowering wood as possible *Prop*—Hard-wood cuttings out-of-doors in November

Phlox.—A wide range of varieties of the border phlox are offered to make an impressive display late in the season If grown on light soils some shade is desirable, as phloxes do well where only the soil is damp For this reason, mulching should be done annually in the spring with compost or animal manure. Failures are usually due to eelworm (**T29**) *Prop*—Seeds in autumn. division.

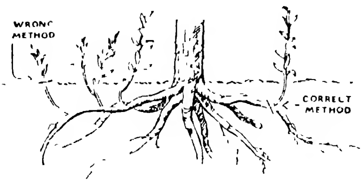
Poppy.—*See* **Papaver.**

Polyanthus.—*See* **Primula.**

Polygonium—In the main these plants are weeds of gardens, although originally they were introduced from the Orient for ornamental purposes at a time when their invasive habits were not fully appreciated The one woody climber in the genus, *P baldschuanicum*, makes an admirable cover where a very vigorous plant is wanted. Rampant and unwanted species may be eradicated by hormone treatment (**T33**).

Primula.—Polyanthuses, primroses, greenhouse primulas, and the hardy primulas all belong in this genus The first two are the most popular, both will do well only in damp soil and respond to generous manurial treatment, both are available in a wide range of colours *Prop*—The Blackmore and Langdon strains of seed will give a magnificent display of mixed colours Sow in warm greenhouse in early March or cold frame in April, prick out into boxes and transfer to flowering positions in the autumn

Prunus—A large genus which includes the flowering peaches, Japanese cherries, and flowering almonds. All of them are best left to develop



REMOVAL OF SUCKERS—As illustrated, these must be sawn off into the root or pulled off the root with a sharp tug and never so removed that dormant buds are left.

naturally and are not responsive to pruning or cutting back in any way A few sorts are over-planted in gardens and as street trees (by Park Superintendents), but anybody wishing to be a little out of the ordinary would do well to see the wide range of some of these lovely trees flowering in April and May in our botanic gardens and many of the large gardens now under the jurisdiction of the National Trust The selection offered by nurserymen is often strictly along conventional lines Lack of flower in some seasons can often be traced to bird damage.

Red-hot Poker.—*See* **Kniphofia.**

Rhododendron.—Greenhouse and hardy, evergreen and deciduous shrubs, including *Azalea*. With something like ten thousand different sorts, it is impossible to deal with individual requirements General cultivation: an acidic soil is essential, with adequate moisture in summer If growth is poor on established plants, mulch liberally with animal manure Beginners should plant from the accepted list of hardy garden hybrids Since the turn of the century widely planted and fine examples are to be found, for instance, in many gardens of the National Trust *Prop*— Seed and layering.

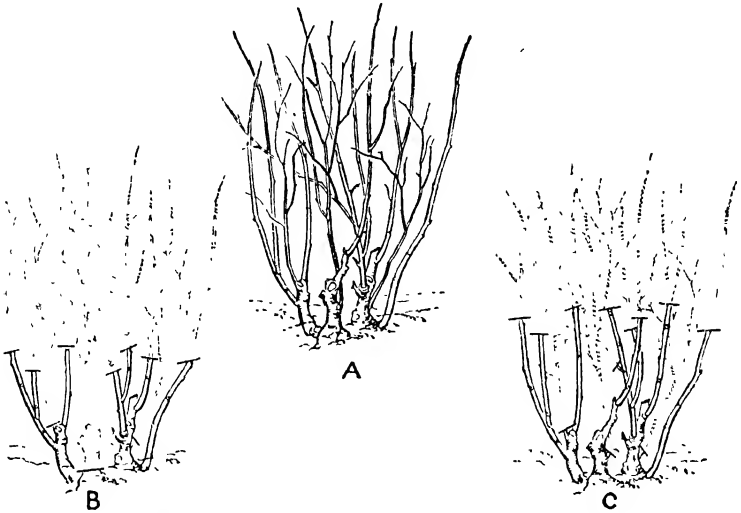
Romneya.—Since its introduction from California in about 1850 the plant has proved a fascination to gardeners, as sometimes it fails completely or does exceedingly well It apears to require a light soil and a sheltered position, preferably against a sunny wall, and there is no point in trying to grow a romneya on a heavy, wet soil Usually the annual stems die off in the winter and may be cut down at ground level in the early spring, if persistent the stems can be cut back to sound growth The new growth is susceptible to slug damage, and appropriate steps must be taken (**T28**) *Prop.*—Seed or suckers taken off in the spring.

Rosa (Rose).—Undoubtedly the rose is the most popular of all garden flowers, and it may be found in a multitude of forms The dwarf roses for bedding may be grown on most soils, but are best on a rich, heavy loam Planting is done from early November onwards when soil conditions permit and the first pruning carried out in the following spring, when the extent of any winter damage can be seen. Opinions differ sharply on pruning; a sound, general rule is to do the work in March and—unless there are special circumstances—to prune on the light side Thus, for Hybrid Teas and the like, reduce strong stems by about one-third of their length, medium ones by a half, and weak ones to within two or three buds of the main stem

Whatever sorts of soil roses are grown in, feeding is important, but, of course, it is particularly so on poor ones. It is in soils of *low* fertility that diseases such as rust and black spot are most prevalent and, in some measure, persistence of the disease is due to bad cultivation and lack of treatment with fertilisers. Where black spot is established, spray with "Captan" For a manurial programme, an application of 2 parts of superphosphate and 1 part of sulphate of potash can be applied at 3 oz. per sq. yd after pruning. Following this, a surface mulch of animal manure, compost, peat, or leaf-mould or a mixture of all of them is given about 2–3 in. thick. Subsequently, if growth is poor, a dressing of nitro-chalk can be made at 1 oz. per sq yd. Some other manurial treatments, like the so-called "Foliar Feeding" and use of "special" (and often expensive) compounds, have little to commend them

Where soil conditions are poor and disease prevalent, it is important to buy plants only from nurserymen who take special precautions to ensure that their customers have disease-free stock Likewise, varieties of robust constitution are essential, and a selection list may include: *Hybrid Teas*: 'Christopher Stone' (crimson), 'Dame Edith Helen' (pink), 'Eden Rose' (magenta pink), 'Granmere Jenny' (yellow, rose-pink flush), 'Madam Henri Guillot' (salmon pink), 'Quebec' (yellow), and 'Tzigane' (bicolor, vermilion and yellow) *Floribundas*: 'Dainty Maid' (rose pink), 'Dusky Maiden' (dark red), 'Tantau's Surprise' (deep crimson), and 'Yellow Holstein' (yellow)

In most of the modern hybrids scent is almost absent The true rose perfume is found only in the Old Fashion or shrub roses and, normally, these are planted in a mixed shrub border. For the richest perfume varieties like 'Mrs. John Laing' and 'Conrad F Meyer' should be sought. *Prop*—Nurserymen's plants are budded; many varieties are easily raised from cuttings taken in the autumn and struck in sandy soil out-of-doors.



PRUNING ROSES—(A) A vigorous unpruned plant. (B) The same plant pruned for the production of exhibition blooms, (C) and pruned for garden decoration

Salvia.—Annuals, perennials, and tender shrubs The most popular one is the scarlet sort used for bedding It requires careful attention, and seed should be sown in February in a temperature of 60° Fahrenheit and seedlings put into single pots when large enough. Gradually the young plants are hardened off and finally planted out in rich soil in a sunny bed.

Saxifraga.—A large genus of plants suitable for the rock garden and valued for their bright flowers in the spring The encrusted saxifrages are cushion-forming plants requiring sharp, surface drainage and an open position out of the direct

sun. The mossy saxifrages are mat-forming in growth and of easy culture In time old clumps develop brown patches and then require splitting up and replanting in the spring.

Scabiosa.—The commonly grown perennial sort is *S caucasica* and is invaluable as a cut flower. It is not at home on all soils, and only does really well in a deep, rich loam containing plenty of chalk In addition, it must be grown in full sun and particular care taken against slugs *Prop* —Old plants divided in the spring and rooted pieces replanted in their flowering positions A wide range of shades in white, blue, and purple can be had normally from sowing mixed seed in April.

Sedum.—The stonecrops make up a large group of hardy and tender plants, but comparatively few are of horticultural value Notwithstanding, *Sedum spectabile* is to be found in most herbaceous borders, where its fine, flat heads of pink flowers are a feature for many weeks It is beloved by bees and butterflies *S sieboldii* was introduced from Japan about 100 years ago and, although hardy, it is usually grown as a house plant In the winter it can be stood out-of-doors, and every two or three years repotted in the spring, keep well watered during the summer and feed with liquid manure occasionally. *Prop*—Division in the spring.

Sempervivum (House leek).—These hardy plants with succulent leaves often decorate the crevices of old walls and are regular features of trough or sink gardens If given a light poor soil and a position in full sun a fascinating collection of house leeks can be built up The species which gives the plant its common name can be established easily on a sunny roof by planting in a mixture of cow manure and clay during the spring *Prop.*—Division in the spring.

Skimmia.—A hardy evergreen 2–3 ft tall which is tolerant of shade and some degree of dryness If growth is poor water with a liquid manure and mulch with peat or leaf mould. Some forms bear only male flowers and to ensure a good crop of berries plant an hermaphrodite like *S foremanii* *Prop* —Layering in the autumn.

Snowdrop.—*See* **Galanthus.**

Snowflake —*See* **Leucojum.**

Solanum capsicastrum (Winter Cherry)—A berrying plant with bright-red fruits which is often used for house decoration To maintain the plant in a healthy condition it should be clear of draughts and fumes of gas fires and the foliage kept fresh and free of dust by vigorous syringing If the stock is to be kept for more than one season water should be given only sparingly in the New Year, and in early March all the side shoots pruned back hard to within a bud or two of the main stems. As new growth develops, water can be given more freely and syringing started when the flowers first appear; liquid manure will prove beneficial when berries develop.

Spiraea.—Hardy deciduous shrubs for open borders; tolerant of poor soil conditions The commonly grown one is *Spiraea bumalda* (syn *japonica*) After flowering, a percentage of the old wood should be removed together with any weak growth, and development of new shoots encouraged by mulching with compost or animal manure. *Prop* —Cuttings rooted in sandy soil under a hand light in summer, suckers thinned out in winter.

Stocks —*See* **Mathiola.**

Sunflower.—*See* **Helianthus.**

Sweet William.—*See* **Dianthus.**

Symphoricarpos (Snowberry).—Often found existing in deep shade and in competition with roots of overhanging trees, presumably as a result of the generalisation that the shrub is a shade lover. Certainly a useful one in this respect, but it is responsive to good treatment. Given an average soil and if growth is thinned annually in the early spring, then *S. albus* 'Laevigatus' is well worth having. Its large white fruits are untouched by birds and hang well into the winter, and are thus beloved by the floral decorator. *Prop.*—Suckers removed in the winter.

Syringa (Lilac).—The botanical name of *Syringa* is often erroneously applied to the Mock Orange, correctly named *Philadelphus* (*q v.*) A wide selection of first-class varieties are available in nurserymen's lists To obtain heavy crops of flowers nip off all dead flower-heads as the blossom fades, but do *not* cut back into the old stem, as this will prevent flowering At the same time any branches causing overcrowding can be removed Annually feed with "National Growmore" at 2 oz per sq yd and on poor soils mulch with any sort of manure or compost *Prop.*—Layering in the autumn

Tagetes (African and French Marigolds).—Half-hardy annuals of free-flowering habit and easiest culture. Best if fed generously with soot water or other nitrogenous manure during growing season. *See* **Annuals.**

Tropaeolum —The common nasturtium and the flame flower (*T speciosum*) belong to this genus The former is easily grown from seed sown in May in a sunny position The latter is a very difficult plant to grow outside the conditions which it demands. To be successful this perennial climber must be planted in acid soil which is naturally damp and lightly shaded but yet where the new growth can reach full sun Much disappointment often results from planting it in eastern England, for instance, after seeing it flourishing almost as a weed where the rainfall is high in Ireland and the west of Scotland

In the genus will also be found the canary creeper, which can be used for screening purposes and will thrive in full sun or shade Seed is sown in May in open ground and light supports supplied by way of pea sticks or strings, failure is normally due to nothing more than lack of moisture.

Tulipa (Tulip).—Thrives in a deep, rich loam, but will do well for one season in ordinary garden soil When used for bedding, bulbs must be lifted after flowering, replanted in a trench, and thoroughly watered Sometimes tulips may be left in the ground *if* conditions are favourable, and then the stock only needs lifting and replanting every three years To check the incidence of tulip fire plant in late November or early December, covering the bulbs with 4–5 in of soil and treat the ground with a fungicide like "Botrilex" Before doing so rake in a dressing of 2 oz superphosphate and 1 oz sulphate of potash per square yard A small collection of wild tulips is being got together at Cambridge and grown there in the University Botanic Garden.

Viola —This name embraces pansies, violas, and violets Although the viola has not got the rich colours of the pansy (or its attractive markings), it has got a remarkably long season of flower, and for this reason it is invaluable as an edging plant or as ground cover for roses *Prop* —Both plants are easily raised from seed sown in a frame in the spring, pricked out, and then transferred to their flowering positions in late May Alternatively, seed may be sown in July for planting out in October Named varieties increased by cuttings in a frame in late summer.

Virginia creeper.—*See* **Parthenocissus**

Wallflower.—*See* **Cheiranthus.**

Water Lily.—*See* **Nymphaea**

Winter Sweet.—*See* **Chimonanthus.**

Wisteria.—One of the finest of all climbing plants for south or west walls or stout pergolas. Plants which do not flower, or only do so poorly, are probably seedlings and the true flowering habit cannot be induced, the only solution is to replace with a *grafted* plant of known flowering capacity from a reliable nurseryman All young shoots not required for the extension of branches should be shortened to within 3 in. of the old stem in the

autumn. Wisterias growing over trees do not require pruning. *Prop.*—Layer shoots of current season's growth in the autumn.

Zinnia.—Half-hardy annual, ideally grown on moist, deep loam liberally enriched with well-decayed manure. Mulch with manure after planting and apply liquid fertiliser as buds appear, plants must not suffer from lack of water. *See* **Annuals.**

MAKING A LAWN

In almost every garden the most prominent feature is the lawn, and often a lot of work is put into making one without any great measure of success Usually, the reason for failure may be found in faulty preparation of the soil or premature sowing, albeit the blame is often placed on bird damage or poor seed.

For anything like a reasonable turf, the site must be thoroughly dug and the content of organic matter increased by incorporating generous quantities of materials like peat, leaf-mould, compost, sewage sludge, and animal manure A dressing of these ingredients can be applied in a layer 3–4 in thick and buried in the bottom of the top spit of soil As the ground is dug to incorporate the organic matter, roots of perennial weeds should be removed

If the site is one on which water tends to lie or if the soil is heavy, then surface drainage should be sharpened by forking into the top 2 or 3 in a liberal application of some coarse material such as builders' rubble, road grit, screened ashes, or coarse sand In some cases this treatment will not be sufficient, and then the installation of land drains must be resorted to This particular task is not as difficult as is sometimes imagined, but, before a start is made, it is always a good plan to discuss the matter with an experienced man

After the initial work a fine tilth on the soil may be obtained by thoroughly raking and cross-raking and at the same time establishing a level surface On this point, it should be remembered that good lawns can be made on undulating ground or on natural slopes, but the things to avoid are the shallow depressions where water will naturally tend to lie Finally, ten to fourteen days before sowing the subsequent growth of grass can be encouraged by making an application of " National Growmore " at 2 oz per sq yd.

Sowing is best done in the late summer at a time when the soil is moist For the purpose, a good mixture of seed should be obtained from a reliable seedsman, and it is worth paying a reasonable price for it, as, by and large, the coarsest and roughest grasses have the largest and heaviest seeds. Opinions differ on rates of sowing, but, with care and in a well-prepared soil, 1 oz per sq. yd is ample, heavier rates may give quicker results, but the density of seedlings in such cases often leads to the finer grasses being choked by the coarser ones.

After sowing, the ground should be lightly raked, but not rolled At this stage the important point is to protect the seed bed from birds by the use of hazel sticks, strings of papers tied to stakes after they have been dipped in lime-wash, and strands of black cotton Subsequently, annual weeds may appear in quantity, these are of no consequence, and they will be eliminated once the grass is cut regularly Until a good turf is formed —usually about twelve months after sowing—it is not desirable (or probably necessary) to use hormone weed-killers.

Care of Established Lawns.

Most turf is never manured from year to year, and the soil may seriously lack plant foods. In the first place this can be corrected by making an application annually in the spring of " National Growmore " at 1 oz. per sq yd. Subsequently, if growth is below par in the early part of the year an application of sulphate of ammonia can be made at the same rate To avoid scorching or blackening of the foliage, each fertiliser can be mixed with equal parts of dry soil or sand as a carrier to ensure even distribution and, what is most important, each one should be applied only when the turf is wet and there is the prospect of rain to follow. Linked with this treatment, turf is always responsive to top dressings. A compost for the purpose can be made up with:

2 parts of loam;
1 part of sieved compost;
1 part of fine peat or leaf soil.

This may be used in the spring at 3 5 lb per sq. yd and if the soil is heavy 1–2 parts of gritty sand may be added.

With the introduction of new designs in motor mowers, most lawns are seriously overcut, and this has led to a sharp decline in the quality of the grass and the appearance of one or two pernicious weeds. It is appreciated that special turf, such as that found on a bowling green, may be shaved off to $\frac{3}{16}$ in, but if a utility lawn is cut below half to 1 in, then the quality of the grass will deteriorate. Of course, it is a good thing to occasionally cut the grass very short, but, conversely, if the blades of the mower are set as low as possible and left like it throughout the season nothing but harm can result The reason for this hard fact is that when the turf is cut very close the grasses simply cannot develop and spread, and weeds will gradually establish themselves Eventually the cultivator will be faced with the difficult problem of trying to deal with such plants as pearlwort, yarrow, and various mosses, all of which are resistant to hormones

As for the vexed question of whether or not to remove the mowings, there is no doubt that the best turf is found where the mowings are collected up, although in very dry weather they can be left on the surface If the clippings are not removed the surface of the turf tends to become choked with semi-decayed organic matter, and conditions are brought about which are inducive to the spread of moss.

Finally, it is worth noting that the finest turf is found on acidic—not alkaline—soils For this reason, lime should not be applied as a general rule, for apart from helping the development of coarse grasses, it encourages the growth of clover Of course there are times when lime is necessary, but the occasions are rare and before it is used it is a good plan to test the soil by chemical means

THE FRUIT GARDEN.

The guidance of an expert is probably more important in the growing of fruit than for most of the commoner vegetables and ornamentals This is primarily because the majority of fruit trees and bushes are long-lived, and only in the case of strawberries can a change of site or variety be made easily and inexpensively

Gardens which are low-lying are very prone to damage from spring frosts, and should not have too much space devoted to fruit, as returns may well prove unprofitable. Here, as with the selection of varieties, advice of a local expert is invaluable. Some varieties do better in certain localities and on certain soils than others, although personal preferences will naturally be met where possible. Varieties chosen should cover as long a season as is practicable so that the fruit can be used and enjoyed to the full.

Tree fruits are grown on a rootstock, and for apples and pears special dwarfing stocks make these a possibility for the small garden. It is therefore important to explain to the nurseryman what type of tree is required. As a general rule, however, the smaller gardens will gain by concentrating on currants, gooseberries, raspberries, and strawberries. Plums and cherries have no

dwarfing stocks, and should be included only where sufficient room is available.

Adequate preparation of the ground is important and this, followed by good management, can result in worth-while crops from most soils, providing they are reasonably free of frost, well-drained, and sufficiently sunny

Apples —Can be grown on most soils Manure should not be used when planting except in sandy and chalky gardens Obtain trees on dwarfing rootstocks, such as M IX, M VII or MM 106 Always stake trees on M IX, otherwise this practice is necessary only in exposed sites The tie must be rigid, with a "cushion" between tree and stake to avoid chafing, and must be renewed annually to avoid constriction Plant between late October and early March, preferably before Christmas if soil and weather allow Make the hole large enough to spread the roots evenly, firm thoroughly while filling in and plant level with the nursery soil mark already on the tree Mulch around each tree with manure or compost, mainly to avoid drying out, and supplement with watering during the summer when necessary

In the first year any flowers produced are best pinched out to encourage root and shoot development For walls or fences use oblique cordons or espaliers, these are also useful for flanking paths and lawns Plant cordons 2½ ft apart with 6 ft. between rows, and espaliers 12–15 ft apart. For larger areas use bush trees 12–15 ft apart.

Manuring for cropping trees should be varied according to growth Generally apply 1 oz sulphate of ammonia (or nitro chalk on acid soils) in early March, repeating this in early April if trees are growing in grass. Give ½ oz sulphate of potash in February and add 3 oz of superphosphate every third year The above rates are per square yard, and a complete fertiliser can be used in lieu if preferred

Young bush trees should have main shoots reduced by half in early years to produce strong branches Thereafter prune side shoots to three to six buds For weak growers prune harder, and for strong growers prune less It is wiser to leave a strong tree unpruned than to prune it too severely, the latter merely encouraging even stronger growth. A few varieties (*e g*, 'Bramley's Seedling,' 'Worcester Pearmain') fruit at shoot tips, and here a proportion of side shoots should be left unpruned Summer pruning is advisable on restricted trees, such as cordons, for details see pears Very few varieties are self-fertile, and at least two sorts should be planted to ensure satisfactory crops Good combinations are 'Cox's Orange Pippin' with 'Laxton's Fortune' and 'Winston' with the cooker 'Lord Derby' Seek expert advice on pairings if in doubt

Apricots.—These are often an unreliable fruit to grow, needing a well-drained, calcareous loam and a warm wall for success Train the tree as a fan, and once established pinch unwanted side shoots to four leaves in summer Thin fruits when young, these developing mainly on spurs on older wood 'Moor Park' and 'Hemskirk' are good varieties

Blackberries.—Allow plenty of room and train against fences or wires Autumn planting is preferable, using good, well-manured soil and cutting back the cane to 9 in from the ground Mulch with manure each spring, water freely in drought, and cut out old canes as soon as they have fruited Good varieties are 'Himalaya,' 'Merton Thornless,' and the parsley-leaved blackberry. Increase by tip layering

Cherries.—Sweet cherries are unsuited to most gardens The trees become too large, and *must* be planted in selected pairs to fruit satisfactorily, as all varieties are self-sterile Large wall spaces are ideal for fan trees, as the fruit can then be protected from birds by the use of nets Pinch side shoots on fans to four leaves in July, further pruning details being as for plums Expert advice is essential to ensure that suitable varieties are grown together, the factors involved being complicated 'Early Rivers' with Bigarreau Schrecken' and 'Merton Heart' with 'Waterloo' are good combinations.

For the small garden the dwarf-growing, acid 'Morello' cherry is more useful, being infinitely superior for preserves as well as self-fertile It also succeeds on a north wall, but unlike sweet varieties, fruits *only* on one-year-old wood

Currants, Black.—These are perhaps the most valuable of all hardy fruits, and bushes will give up to 10 lb and more of currants with correct treatment Plant from November to February, preferably autumn, at 5 ft square on clean, heavily manured ground Then cut all shoots to one bud above soil level. Mulch each spring with well-rotted manure and supplement with fertilisers if necessary. The mulch is essential as much for keeping the soil moist as for a general feed

On established bushes prune preferably after fruiting or in winter, retaining strong young wood and cutting out older shoots, where possible from ground level If necessary, alternate bushes can be cut down completely every other year to maintain vigour, as the bulk of the crop is always borne on young wood Increase by 8-in. cuttings of one-year-old wood taken in late September from healthy bushes Remove lower leaves and insert firmly with one bud above ground Good varieties 'Boskoop Giant,' 'Wellington XXX,' 'Baldwin'

Currants, Red and White —One or two well-grown bushes are usually sufficient for the average household Plant between November and March at a minimum of 5 ft square on well-manured ground and mulch each spring Supplement with fertilisers it necessary, potash being particularly important in the form of sulphate of potash at 1 oz per sq yd in February Can be grown as cordons or fans against walls or fences, on which the pinching of young side shoots to four leaves in mid-June is essential Winter pruning of all types simply involves cutting side shoots to one bud and tip pruning branch leaders Propagate by 12-in. cuttings of young shoots in late September inserted to half their length with all buds removed except the top four This enables the bush to be grown on a "leg" A permanent framework of branches is then developed, as, in contrast to the black currant, fruit is borne on spurs on the old wood. Good varieties 'Laxton's No. 1,' 'Red Lake,' 'White Grape'

Damson.—*See* **Plums.**

Figs —A warm south wall is usually essential, 'Brown Turkey' being one of the few reliable outdoor varieties Plant in a brick or concrete trough (with drainage holes) about 2½ ft wide, 5 ft long, and 2½ ft deep so that the root run is restricted This will curb excessive growth (which otherwise is difficult to control) and encourage fruiting Plant in March for preference, to avoid frost injury to young shoots, and then train fan-wise A rich soil is not essential Figs visible as such in the autumn will never over-winter, and should be rubbed out Those the size of a pea and less at the tips of short, well-ripened shoots, on the other hand, are the potential crop for the following year, and should be covered in severe weather to avoid frost damage, To encourage the formation of these embryo fruits pinch young shoots back to the fifth leaf in late August Winter prune in March, removing any wood that is frosted, overcrowded, or worn out, growths should be spaced at about 1 ft. Apply a spring mulch and water freely when required to avoid premature fruit drop

Gooseberries.—Need conditions and spacing very similar to red currants, but with rather more moisture to ensure ample new wood, as this bears fruit as well as the older wood Apply sulphate of ammonia and sulphate of potash annually in late February at up to 1 oz. per sq. yd. of each in addition to mulching. Can also be grown as cordons, etc, as for red currants. Pruning is also similar, though not quite so severe, as the young wood is productive of fruit. Cuttings are more difficult to root, and for best results should

be taken in mid-September, again as for red currants. Good varieties: 'Lancer,' 'Leveller,' 'Whinham's Industry.'

Grapes.—Outdoor vines should be grown against a warm south- or south-west-facing wall. With good cultivation, the grapes should then ripen successfully providing suitable varieties are chosen. In preparing the site ensure that it is well drained and break up the soil to a depth of about 2 ft. Add bone meal to the top few inches at 4 oz. per sq. yd. and incorporate mortar rubble, particularly on the heavier soils. Do not dig in any manure except on poor, light soils, but always apply some as a mulch after planting, repeating this every spring. On poor, hungry soils the importation of some fibrous loam is advisable where possible.

Plant in November or, failing this, before early March, with the stem about 6–9 in. away from the wall. Firm well and then wait a further two months before tying to any wires or stakes, in case of soil sinkage. Cut the vine back in winter to well-ripened wood and to just above a bud. The training of subsequent growth will then depend on the space available, single and double cordons being the most convenient. Unwanted shoots should be pinched at about 2 ft. in summer and leading shoots carefully tied in to wire or bamboo supports. The following winter (December) prune leading shoots back to well-ripened wood so as to leave 3–4 ft. of new growth. Then cut all laterals hard back to one bud. In spring reduce young side shoots to one at each bud, stop laterals at about 12 in., and pinch any sub-laterals that may develop to the first leaf. Do not allow any crop to develop, except perhaps one bunch if growth is adequate, others should be pinched off. As fruit develops, thinning should be done as required. Winter prune as before, and then in the third summer four or five bunches of grapes can be allowed if the vine is healthy, the crop then increasing annually. Shoots carrying bunches should be pinched to two leaves beyond the bunch. Winter pruning is repeated each year as already described. Sour top-soil should be carefully removed when necessary and replaced with good loam while the vine is dormant. Good varieties: 'Black Hamburgh' and 'Foster's Seedling.'

Loganberries.—A very popular hybrid berry which should be treated as for blackberries. A thornless form is now available. Suitable for a north wall.

Medlars.—A tree of spreading habit, the peculiar fruits of which are best used for jelly before they are fully ripened. Most soils are suitable, and no pruning is needed except to keep in shape.

Nectarines.—A fruit very closely allied to the peach but with a richer flavour and needing rather more warmth. The skin is smooth, as distinct from the hairiness of the peach. For full details see **Peach.**

Nuts.—The most important kinds grown are cobnuts, the closely related filberts, and walnuts, but none of these is cultivated to any great extent. The two former kinds flower very early in February, and are therefore predisposed to frost damage; similarly, the young shoots of walnuts are easily injured by spring frosts, and all are therefore inadvisable for frosty areas.

Cobnuts and filberts.—Highly developed forms of the ordinary hazel nut. The nut of a cob is only partially covered by the husk, whereas a filbert is completely enclosed by it, this being the essential difference between the two. Will grow on most soils, including the poorer ones, and spacing should be about 15 ft., choosing sites sheltered from the colder winds. Plant during the autumn. Prune established bushes in March, cutting back shoots that have borne nuts to two or three buds; strong young shoots are cut back to a catkin near their base, and the weaker ones are left untouched. In August any strong new side growths are "brutted"—that is, broken off—and left hanging until the March pruning. Gather the nuts as they fall and allow to dry. Then store in jars for Christmas use, packing salt and coconut fibre between each layer of nuts.

Walnuts.—Special, grafted varieties are now available which produce early crops compared with the unreliable seedling trees that used to be planted. Plant between October and March and water well in spring and summer. Do not prune, as walnuts bleed badly. Gather nuts in mid-July for pickling. For storing allow to drop naturally and remove outer husk immediately, scrubbing the shell clean and then drying thoroughly. The shells can be bleached if necessary before storing the nuts as for cobs above.

Peaches.—This fruit along with its close ally, the nectarine, is best grown against a warm south or south-west wall, but two varieties of peach, 'Peregrine' and more particularly 'Rochester,' will succeed as bushes in the open in southern England. The fan-trained peach is one of the most difficult trees to keep in order, as sufficient new shoots must be retained annually to replace old wood. This is essential, as it is only the previous year's shoots which bear fruit. Badly placed shoots are rubbed out when only an inch long, and the principle is to allow one young replacement shoot to develop near the base of each fruiting shoot, pruning back to the former and tying it in as soon as all fruit has been picked. Other shoots may be used to extend the fan where space allows or to replace any branches or parts of them which may have become worn out. Other unwanted shoots are bound to arise during each summer, and these are either removed immediately or pinched to three leaves and then removed when pruning in late summer. Those shoots retained are spaced at about 4 in. apart.

Most peaches are self-fertile, but hand-pollinating on sunny days can improve the set. Excessive feeding should be avoided, varying this according to each tree's performance, but as a general rule a surface mulch of well-rotted manure or compost should always be given each spring, together with sulphate of potash at ½ oz. per sq. yd. Prick over and rake off top-soil and replace with good loam every few years. Never allow the sub-soil to dry out—this can quickly occur against warm walls—and water thoroughly when doing so to ensure an even distribution of moisture. On the other hand, drainage must be satisfactory to avoid waterlogging.

There are numerous other essential operations in the growing of trained peach trees (for example, fruit thinning), and it is impossible to deal with these adequately in brief notes. Would-be growers should therefore seek expert advice and obtain literature dealing specifically with the crop rather than risk disappointment. Good varieties for outside wall training include *Peaches:* 'Peregrine,' 'Bellegarde.' *Nectarines:* 'Early Rivers,' 'Lord Napier.'

Pears.—The requirements for pears are similar to those for apples, but the necessity for adequate summer and autumn warmth rules out many varieties for northern areas. In these less-favoured localities enquire which varieites do succeed, and where possible make use of a warm, south-facing wall. Protection from wind is very important, particularly from the cold easterlies of spring. Many soil types grow pears satisfactorily, providing drainage is good and the trees are looked after. Plant as for apples. Fertiliser requirements are also similar once cropping commences, except that pears may require a little more nitrogen.

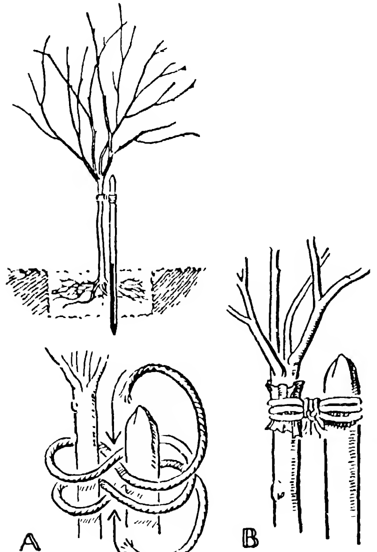
Pruning (winter) is comparatively simple, the spur pruning given for apples suiting all except a very few pears. Initial shaping is essential, cutting the stronger shoots selected to form branches by about half their length and keeping the centre of the tree open. For cordons and other restricted forms of tree, to which pears lend themselves particularly well, summer pruning is advisable. This involves shortening all young shoots more than 10 in. in length to about 5 in. from the base. Do this when the base of such shoots is hardening and turning brown in colour, usually late July–early August. Pruned shoots may then be further reduced in winter. Such summer treatment may also be given to trained apple trees with advantage during August.

Only a few pears are self-fertile and 'Con-

ference' is the most reliable if only one tree can be planted Good pollinating pairings include 'Laxton's Superb' with 'Doyenné du Comice' and 'Conference' with 'Williams' Bon Chrétien.' Early varieties should be picked a little before ripening and used quickly.

Plums.—This general term includes gages and damsons Numerous varieties are easy to grow but are unsuited to small gardens because of the amount of space required. Unlike apples and pears, there are no dwarfing rootstocks, and a minimum spacing of 14 ft. should be allowed for, growing the trees as half standards, or fan-trained against a south or west wall Flowering is during April, and frost damage can be serious in some seasons Plant preferably in the autumn, and by early March at the latest, using no manure unless soil is distinctly poor Young trees should be staked during their early years, and must not be allowed to rub against the support

Pruning should be reduced to a minimum, as the spores of silver leaf disease gain entry through wounds such as pruning cuts and stake rubs Shorten branch leaders on young trees just as buds are bursting, but on older trees prune only when branches become overcrowded Do this between June and August, when the risk of silver leaf is at a minimum Cut cleanly and coat the wounds thoroughly with a bituminous paint, treat broken branches similarly immediately they are noticed Trees fruiting heavily should have the branches supported and the fruit thinned in late June Side shoots on fans must be cut to four to five leaves in late June and reduced still further following picking if necessary Feed cropping trees regularly to encourage new growth, using well-rotted manure or sulphate of ammonia at 1 oz per sq yd in early spring Some varieties are self-fertile including 'Victoria,' 'Oullin's Golden Gage,' and 'Merryweather Damson'



A Well-planted Tree, illustrating (A) a good method of tying and (B) sapling firmly secured with sacking around the trunk and held with stout cord

Raspberries.—These are an ideal fruit for the small garden, but because of virus disease always buy certified canes from a fruit nursery. Plant between November and March on clean, well-manured ground, allowing 18 in. between canes and 6 ft. between rows. After planting prune each cane back to 12 in. Do not attempt to crop them in their first year, or the production of young canes for the following year's fruit will suffer.

A semi-shaded position will answer, but full sun is preferable for quality fruit New canes should be looped with string to a post-and-wire fence and later tied individually to each wire when fully hardened Space them at about 4 in and remove any weak or diseased canes at ground level. In late February cut each cane to just above the top wire, which is usually 5–6 ft high This removes any damaged tips and may encourage fruiting over a longer length of cane. In the second summer a fair crop should result, and netting against birds is essential Regular watering is imperative in dry weather, and spring and summer mulches of well-rotted manure or compost should always be applied Supplement this in March with nitrogen and potash (fertilisers) if required, this depending on how well the ground was manured before planting After fruiting cut out all old canes and tie in the new ones as already described 'Malling Promise' and 'Lloyd George' are good varieties.

For autumn-fruiting varieties prune all canes to the ground in late February and tie in the best during the summer for cropping in September–October 'September' is a good variety, and 'Lloyd George' can also be used

Strawberries.—This is the one fruit that should be included in the vegetable garden Fresh ground can then be used regularly for establishing new beds Plants more than two years old are seldom profitable, and the best fruit is always picked from healthy one-year-olds planted the previous August or September Runners put in later than early October should be deblossomed the following spring, the reward being a much heavier crop in the second year This wastes ground, however, and early planting is preferable on all counts Prepare the ground well in advance of planting and dig in plenty of well-rotted manure or compost or both, as this is the key to success

Because of virus diseases order certified plants from a fruit nursery and burn any unhealthy ones in old beds before planting Insert firmly with the base of the crown of each plant just at soil level and refirm after winter frosts, space at 20 in in rows and 2 ft 6 in between rows (3 ft if possible) A mulch of rotted manure or compost is beneficial each autumn, and if this is lacking apply sulphate of potash at 1 oz per sq yd. instead Bonemeal is also advisable in spring and again in July, but quick-acting *nitrogenous* fertilisers should normally be avoided

During flowering cover the plants where possible to guard against frost damage reducing the crop. Keep the ground weed-free and remove runners regularly, a few plants should always be grown away from the main bed, deblossomed and kept purely for runner production, as this then helps to reduce the spread of virus Ruthlessly burn any plant that remains stunted, including its runners, as this is usually a symptom of virus disease When the young fruits are just forming spread clean straw underneath them to avoid splashing from the soil, it is a mistake to do this too early, as it increases the risk of frost damage. Net the fruit against birds and remove any rotting specimens when picking

After fruiting remove and burn all old foliage, weeds, and straw, and feed as already described. Plant a percentage of new, vigorous runners each year on fresh ground, at the same time burning the old ones they are replacing Good varieties include 'Royal Sovereign,' 'Cambridge Favourite,' and 'Talisman.'

Alpine strawberries require similar treatment, preferably with a semi-shaded position, and should be raised from seed Perpetual fruiting types continue fruiting on and off well into the autumn, and should be treated as for ordinary varieties In all cases cloches can be used from late February onwards to obtain early fruit.

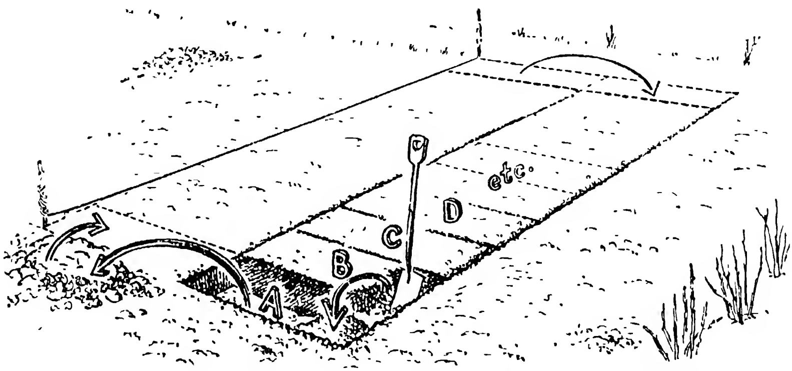
THE VEGETABLE GARDEN.

The vegetable garden is, or should be, an integral part of home economy nowadays. Home-grown vegetables, although requiring considerable labour, are cheaper and fresher than most shop supplies The ideal site is in an open, sunny position sheltered from cold winds with the soil a deep, rich loam well supplied with humus, quite obviously very few gardens have the ideal site, and we have to do the best we can with the ground available In laying out the vegetable plot, ease of working should be considered: the lines of vegetables should go from north to south, and paths should be wide enough for a barrow to pass. The vegetable lines should not be too long, or the soil will be trodden down too much.

Each individual will have to decide the size of his plot according to the amount and types of vegetables required, and the land available Shelter from a hedge or wall is desirable, and a plot about 90 ft by 30 ft can be made to produce a succession of vegetables to feed an average family over the year. Land preparation is important, on a new site the weeds should be cut down and removed, but any turf can be left and dug in The land should be dug two spits deep (" double digging ") in winter, and for this the plot is divided into two longitudinally and a trench 2 ft wide and 10 in deep is dug out at one end, as shown on the accompanying diagram The sub-soil below the trench is then broken up and manure or compost incorporated (or turf if grassland is being dug). The next strip is then dealt with in a similar manner, and this continues down the plot until the last trench, which is then filled with the loose soil from the first trench



DOUBLE DIGGING —A sound cultural practice. A trench 2 ft wide and the depth of a spade is taken out at A and placed as shown. The bottom of trench A is then forked up and filled in with soil from B and the process repeated with C and D, etc. In double digging the sub-soil is *always* left on the bottom and never brought to the surface

Clay soils which are sticky are much improved by humus and constant working, but should not be dug in wet weather Sandy soils also require plenty of humus to conserve moisture, but are less fertile, though often warmer and earlier. For the majority of vegetables a slightly acid soil is best, and a dressing of lime is only desirable if the soil is too acid. Double digging is not necessary each year, and single digging, carried out in a similar manner without breaking up the second spit, or a light forking over is sufficient for some crops, provided the ground has been well cultivated previously.

The lay-out with vegetables must be designed to provide a succession through the year and to utilise the full capacity of the ground by catch crops and a suitable succession. The land can be divided into four plots; one is used for the more or less permanent crops, such as asparagus, rhubarb, and globe artichokes, and the other three will provide a rotation. This is used to stop any group of vegetables being grown on the same land more than once in every three years, so preventing the carry-over of some pests and diseases and providing for a full use of the manures in the soil, as different groups of vegetables need more of some nutrients than others. It also allows the clearance of one section to enable winter digging and manuring to be carried out On this freshly manured plot peas, beans, onions, leeks, and lettuces, all revelling in rich ground, should be grown. The next plot, manured for the *previous* crop, can be used for root crops—early potatoes, carrots, parsnip, and beet. A light dressing of artificial fertiliser such as " National Growmore " should be applied before sowing On the third plot the green vegetables should be grown; a dressing of fertilisers is desirable, and lime should also be applied.

In the following season the root crops can be grown on the plot which was manured the previous year, and the brassicas grown on the land vacated by the root crops. The plot on which the brassicas were growing is double dug and manured ready for the peas, beans, and onions. A system of this type proves very satisfactory, but numerous variations can be devised, and it is really a matter for the gardener to decide his best method The growing of maincrop potatoes will complicate the system, as a large area is usually required They are better grown separately in another part of the vegetable garden

Usually it is wise to have a small piece of ground available for a nursery bed This should be of good, fine soil in which seeds can be sown to supply the main plot. In all cases seed should be sown very thinly to prevent the necessity for much pricking out, and a slug-killer is often a wise precaution to use before sowing. Sowing dates, as given, are mainly for growers in the South In the North sowing dates in spring will be generally two weeks or more later and autumn operations the same amount earlier. Any gardener must adjust his work to suit local conditions of soil and climate, and this knowledge is only gained by experience of the particular area.

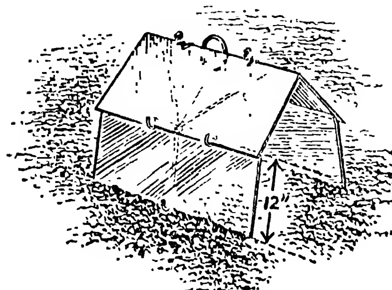
General cleanliness in the vegetable garden is at all times desirable; weeds and rubbish only harbour pests and diseases, and the hoe should be busy whenever possible Waste material can be utilised in that essential of the modern garden—the compost heap. *See* **Manures and Fertilisers** for description.

Frames and Cloches.—The gardener is able to extend the season of many crops by protecting them under frames and cloches, this is particularly useful where spring or early autumn frosts are prevalent The use of frames is limited, as they are in a fixed position, but nevertheless they are very useful for obtaining out-of-season salad crops, especially if they are heated by electricity or a hot bed.

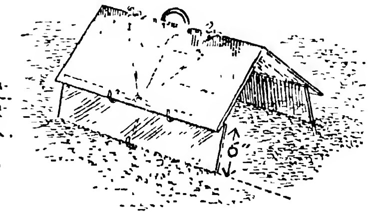
Cloches have the advantage of mobility and can be used on a number of crops in succession. Essentially, each is a number of pieces of glass in a tent or barn shape held together by wire. Pattern, size, and height vary according to the crop to be covered and the manufacturer's design. A good cloche should be of simple design, rigid and capable of standing up to ordinary winds, easily transported, and well ventilated.

The low barn cloche is probably the most economical type. This is 23 in. wide and 13 in. high when erected, and will allow two rows of lettuce to be grown, with an intercrop of another vegetable. The large barn or barn cloche of similar design, but with 12-in. side is 19 in. high in the centre, enabling taller crops, *e.g.*, peas and dwarf beans, to be grown on, almost to maturity.

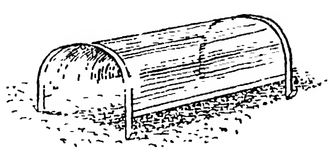
Dwarf varieties should be used for growing under cloches, although methods of raising the cloches another foot or so have been devised and are on the market, which allow the use of taller growing varieties. Many different vegetables can be helped to some extent in the early stages, besides those crops which can be grown entirely under cloches, the grower must decide what crops he needs and fit a rotation to cover as many crops as possible with the cloches available. This is mainly a matter of experience, but books on the subject will suggest many variations that can be tried. Intercropping with quick-maturing crops can also be practised. As instances, radish or mustard and cress can be cropped between two rows of lettuce, or a row of cos lettuce can be grown between two rows of cabbage lettuce.



BARN



LOW BARN



PLASTIC

TYPES OF CLOCHES.—The most popular is the barn cloche, with 12-in. sides it will cover strawberries and peas and beans in their early stages. The low barn will accommodate three rows of lettuce in winter and cucumbers in the summer. Plastic cloches are growing in popularity, especially those patterns using toughened plastic, and have some decided advantages over glass ones.

The tomato cloche has sides 24 in. square and a basal width of 26 in. Many others of various shapes and sizes are offered, the amateur should buy to suit his own requirements. Other materials have been tried instead of glass with varying success. Plastic cloches are on the market, but their lightness entails very safe anchoring, and at the moment glass still seems to be the best material in most instances.

Gardening under cloches obviously is a subject too large to be dealt with in a few sentences, and the reader would be well advised to refer to one of the books mentioned in the bibliography for fuller information. A few of the main points are mentioned here and also under the individual crops.

Cloche cultivation is an intensive method of production, and this means that the land must be well cultivated and manured to ensure good-quality crops at all times. About ten days before crops are sown or planted the cloches should be put in the position where they are to be used, to warm the soil. The crop is sometimes sown a month before the normal date, and this prewarming ensures that the soil can be cultivated to a good tilth, as well as giving the plants a good start. Watering is a problem that often bothers the amateur. Provided the soil is well watered at sowing time, there should be no need to decloche to water. Rain seeping under the cloches and a spray directed over them occasionally will provide enough for the crop in normal weather; on dry, sandy soils it may be necessary to spray over the cloches more often. A mulch of compost is also very useful to help retain water.

It must be remembered that the glass of cloches will need cleaning from time to time, the crop still needs the maximum light available, although shading of certain crops may be necessary in hot sun.

Artichokes.—Two different plants are grown as artichokes. One, the Jerusalem artichoke (*Helianthus tuberosus*), is related to the sunflower and is grown for its tuberous roots, which are second in food value only to the potato. It will grow in poor soil, but amply repays good cultivation, and may be placed at the more exposed end of the vegetable plot as a windbreak and screen. Tubers should be planted during February or March, on well-manured ground in drills 4–6 in. deep, and 2 ft. 6 in. apart, with 15 in. between the tubers. Hoe frequently during the summer and cut the stalks down in early winter. The tubers may then be lifted and stored, or better dug as required, reserving a number for replanting the following February.

The other type, the globe artichoke (*Cynara scolymus*), is often grown as an ornamental plant, but is esteemed as a vegetable for its young, fleshy flower-heads, which must be cut before the scales begin to open, after which they become hard and unpalatable. A deep, rich, well-manured soil is required, and after planting in early spring in rows 4 ft. apart, with 2 ft. between the plants, a compost or manure mulch is beneficial. A good crop may be expected for five or six years provided an annual dressing of manure is applied. After this time they should be replaced by young suckers,

planted in a fresh position. A covering of straw or bracken on the crowns is advisable during winter.

Asparagus.—This will grow on most types of soil provided that drainage is good and that plenty of organic matter is available The site for the asparagus bed should be double dug in the autumn prior to planting, and a generous dressing of about half a barrow load of manure per square yard incorporated. Crowns up to three years old may be bought, but it is found that one-year-old crowns give the best results Plants may be obtained cheaply by sowing seed in late March in drills 1½ in deep and 18 in apart and thinning the seedlings to 4 in apart It is thought that male plants produce more stalks of better quality than female plants, but at present no supplies of male crowns alone are available

Planting may be on the single-row system or the wide-bed system In the single-row system crowns are planted 18 in apart in rows 4½ ft apart, the wide-bed system consists of 5-ft beds, with three rows of crowns 15 in apart each way, and 2 ft between each bed. Planting is best done during April and the plants are placed in a trench 8 in deep and 1 ft wide, with a slight ridge at the base, and covered with 3 in of soil The remaining soil is worked in during the summer. The roots should never be allowed to dry out

The following March 2 oz per sq yd of sulphate of ammonia should be applied, in subsequent years 3 oz. per sq yd of "National Growmore" applied at the same time, followed by 2 oz per sq yd of sulphate of ammonia in June, after cutting, can be used Salt, as a fertiliser, is not recommended nowadays An annual dressing of manure or compost in November is desirable

No cutting should be done for the first two years after planting and only a light cut taken in the third year After this a six-to-eight-week season beginning in early May is usual The spears should be cut when about 4 in above soil level and severed about 2 or 3 in below the soil, giving an overall length of 6–7 in The fronds should be cut in October before the seeds drop, but not during the summer, as the plant is weakened Weeds should be kept down and in the autumn the plant may be earthed up

Varieties 'Connover's Colossal' and 'Kidner's Pedigree'

Beans. Three types are commonly grown, as follows.

Broad Beans are the hardiest and can, in warm gardens, be sown during autumn to obtain an early crop. Little is gained by this as a rule, and sowing in well-manured ground in February, when the soil is frost free, with successional sowings during March and April, is generally better in most gardens The soil is broken down, finely raked, and the seed sown 9 in apart in drills 3 in deep, with 18 in. between each row. If double rows are sown 10 in should be left between the rows, and 2 ft between each pair of rows Staking may be necessary Plants from sowings under glass or under cloches in January may be used to obtain an earlier crop, the cloches should be removed in March and a further crop sown, and recloched.

Black aphis was a serious pest, but is now easily checked by pinching out the young tips and applying malathion or lindane as soon as any are seen The pods may be used before the beans are fully developed and sliced as are runner beans, but normally they are picked when the beans are well formed but not tough

Varieties. 'Aquadulce' and 'Green Masterpiece.'

Dwarf Beans (which include French, Kidney, and Haricot Beans) may be either used as young pods in a similar manner to runner beans or ripened in the pod for winter use. A rich well-manured soil gives the best results, and seeds sown during the first week in May, 2 in. deep and 6 in apart, in drills 18 in apart, may be followed by a second sowing at the end of May. The young plants should be thinned out to 1 ft. apart and small twigs used to stake them. If sown earlier, frost damage may occur. Seeds may also be sown in the greenhouse and the seedlings transplanted, or sown under cloches in the last week in March, provided the soil has been prewarmed.

The plants, as long as the pods are picked over frequently, will continue to bear until the frosts, a little liquid manure will be beneficial during the summer. A late sowing in July, cloched in September, will continue the season into the autumn

If required for winter use (Haricot varieties) certain plants should be left unpicked and the pods allowed to ripen on the plants. They should not be picked green, if unripe when frosts come, the plants should be pulled up and dried in a shed.

Varieties 'The Prince' (Cloche), 'Masterpiece,' and 'Comtesse de Chambord' (Haricot).

Runner Beans are the most popular type, and can be grown in two ways either without stakes, in which case the tips of main and side shoots are regularly pinched out to make a bushy, dwarf plant, a method often used by farmers, or staked, with cross poles, allowing the plants to climb to the tops of the poles before pinching Seed is sown from early May (mid-April under cloches) until late June, depending on the danger of frost, usually in a double row with drills 15 in apart, and with seeds 3 in deep and 6 in apart in the rows, alternate plants being removed later

Staking should be done as soon as the first pair of leaves unfolds, and a surface mulch is then applied If the beans are to be dwarfed the rows should be about 18 in or 2 ft apart, and pinching may be required about once a week A good, well-manured soil is essential, and plenty of moisture is required The flowers may fail to set in dry weather, and an evening spray of water is helpful in preventing this "running off" Harvesting should be carried out regularly while the pods are young, before the seeds swell, older pods are stringy and seldom worth eating

Varieties 'White Czar' (white-flowered, heavy cropper) and 'Streamline'

Beetroot.—From mid-April onwards varieties of beet may be sown on soil that has not recently been manured but is in good heart, on freshly manured soils coarse, forked roots subject to cracking occur. If in poor condition a light dressing of a complete fertiliser should be given before sowing Sow in drills 1 in deep and 12 in apart and make a first thinning to 4 in apart when the first rough leaf appears, and a second later, leaving 9 in between the plants Transplanting is inadvisable Early roots for summer pulling may be obtained from a sowing of a Globe type in mid-April, and the main sowing should be made during May or early June for the winter supply A sowing under cloches in late February will provide roots for pulling in late May

On a heavy soil the oval-rooted types are best but on a lighter soil the long-rooted types may be used A sowing in late July of the Globe type will provide beet for use at the end of winter Salad beet from early sowings may be pulled as required, the main crop should be allowed to mature and is lifted in October before the roots become woody and tough. Any damaged roots should not be stored Twist off the tops just above the roots, shake the soil from the roots, and store in boxes of sand or peat in a frost-free shed If clamped outside, straw and a thick layer of soil should be used, if frost reaches them they are spoilt

Varieties globe—'Detroit Red,' 'Red Globe, and 'Crimson Globe', oval—'Cobham Early', long—'Cheltenham Green Top'

Sugar beet is similar but is white, not red-fleshed, and is mainly a farm crop; if desired it may be grown in a similar manner. Care should be taken in hoeing all beet crops to avoid damage to the small surface roots which feed the swollen rootstock.

Borecole.—*See* **Kale.**

Brassica.—A generic name of vegetables usually known to gardeners as "greens." This group includes brussels sprouts, cabbages, cauliflowers, kale, turnips, kohl-rabi, broccoli, and couve tronchuda. As they are all related, similar soil and cultural treatment is needed, and many pests

and diseases are common to them. Each is dealt with under a separate heading.

Broccoli.—*See* **Cauliflower.**

Brussels Sprouts.—Young plants from seed sown thinly in a nursery seed bed during mid-March can be transplanted during May or June. The soil should be firm, well drained, in good heart, and contain adequate lime, some manure preferably having been dug in during the winter; a supplementary dressing of 2 oz. superphosphate and 1 oz. of sulphate of potash per square yard is given before planting. The young plants should be set out 3 ft. apart both ways, planted firmly, and watered in thoroughly. Regular hoeing is necessary, and about a month after planting a little soil should be drawn round the stems.

If growth seems weak a top dressing of nitro-chalk should be given and this repeated in early September. As the lower leaves yellow, cut them off and gather the sprouts as they mature, picking from the bottom of the stem. Where space is available a succession of sowings from March to June can be made to lengthen the cropping period.

Club root, the worst disease of brassicas, is kept in check by only using well-limed, well-drained soil, and dipping the roots in 4% calomel before planting, and cabbage root fly, a frequent insect pest, by using dieldrin.

Varieties: early—'Cambridge No. 1', mid-season—'Rous Lench' and 'Triumph' (dark foliage, distinct).

Cabbage.—Sowings in March and April for summer use, in May or June for winter use, and in late July or August for spring use will give a succession of cabbages all the year round. Seed is sown thinly in a nursery bed of well-firmed, limed soil, clear of weeds, in drills ½ in. deep and 6 in. apart, and the seedlings are dusted with D.D.T. to check flea beetle attack (prevalent with all brassica seedlings). All cabbages are gross feeders, and a well-drained soil in good heart, with adequate lime, is required.

"Spring cabbage" should be sown during late July (north) and August (south). If sown too early the plants may "bolt" without making a heart. The young plants are set out in mid-September 18 in. apart and with 18 in. between the rows if for hearting, or 9 in. apart with 18 in. between the rows, in which case the alternate plants are cut for "spring greens". On a heavy soil ridging along the rows of plants keeps the soil round the roots drained and helps to prevent loosening by frosts. In cold districts cloches may be used with advantage to help plants through the winter. In early March a dressing of 1 oz. per sq. yd. of sulphate of ammonia or nitro-chalk is a good stimulant.

Seed of "summer" and "autumn cabbage" is sown in March and April and planted during late May and June, 18 in. to 2 ft. each way between the plants, depending on the variety. The plants should be thoroughly watered, both before and after transplanting. A top dressing of 1 oz. per sq. yd. nitro-chalk may be given if required.

"Winter cabbage," maturing from October to February from sowings during May and early June, are set out 2 ft. apart each way in July or early August, usually on ground which has been cropped with early potatoes or peas. No nitrogen fertiliser should be given late in the season, as soft growth, liable to frost damage, is encouraged. A balanced fertiliser, such as "National Growmore," may be used if needed. When the stalks of cabbage are left standing over winter a common practice is to cut across the tops to obtain bunches of leaves, for use as greens during early spring.

"Savoy cabbages" mature during winter and early spring from seed sown in May. Seedlings are transplanted in late July and early August on to land manured for the previous crop, to which a dressing of 2 oz. superphosphate and 1 oz. sulphate of potash per square yard has been given. The young plants should be set out 2 ft. apart each way, they are exceptionally hardy, and should be grown in every garden in case of a hard winter.

Varieties: Spring sowing—autumn cutting, 'Greyhound' (early), 'Winningstadt'. Autumn sowing—spring cutting, 'April,' 'Wheeler's Imperial.' Savoy 'Ormskirk Late Green'.

Red Cabbage is slow to mature; plants from sowings in August are transplanted 6 in. each way in autumn and set out in early spring 18 in. each way. They are ready to cut in late summer.

Cardoon (Cynara cardunculus).—Closely related to the globe artichoke and grown for the blanched hearts. Seed is sown in trenches 18 in. wide and 1 ft. deep, 3 in. of manure is worked into the bottom soil and covered with 3 in. of fine soil. Three or four seeds are dibbled in every 18 in. and covered with a flower pot till visible, and then thinned out, leaving one strong seedling at each station. Protection from sun and late frosts is provided by twigs over the trench, and copious watering is given during the summer. On a fine day in September the plants are blanched by tieing the leaves together and covering with dry hay, 3 in. thick, kept in position by raffia, and earthed up in the same way as celery. Blanching is completed in about a month. Litter over the top protects them from frost.

Carrots.—A light, well-drained soil, enriched with decayed organic matter, is suitable for carrots. No fresh manure should be given, but a light dressing of "National Growmore" fertiliser can be applied prior to sowing. The surface is left rough until sowing time and then broken down to a fine tilth. The first sowing is made in early April in drills ½ in. deep and 12 in. apart, and a succession is obtained by sowing at intervals of a month until the end of July.

On heavy, unfavourable soils stump-rooted varieties are best grown, long-rooted varieties needing a light soil. Thin out the stump-rooted varieties to 4 in. apart and the longer varieties to 6 in. Thinnings should be removed and the soil pressed firmly back to minimise damage by carrot fly. The early sowings are pulled as required, but the later sowings for winter use should be lifted in October and stored in slightly damp sand in a frost-proof shed or clamped in the open.

Frames and cloches are sometimes used to obtain early and late carrots. Seed of a quick-growing variety, such as 'Amsterdam Forcing' or 'Early Nantes,' sown in late January under cloches or in frames will provide an early crop, the same varieties sown in frames or cloches in early August will provide young carrots for the autumn. Carrot fly is a bad pest, especially on light soils, the seedlings should be dusted with lindane or dieldrin when 2–4 in. high to prevent the flies from egg laying.

Varieties: globular—'Early Gem', stump-rooted—'French Short Horn'; intermediate—'Amsterdam Forcing' and 'Early Nantes', long—'St. Valery' and 'Long Red Surrey.'

Catch Crops.—A term used for quick-growing crops interplanted between rows of other crops. Radishes between rows of broad beans, and lettuce between celery rows provide examples. In this way the best use of a limited amount of land can be made.

Cauliflower.—Broccoli is for all practical purposes a hardy winter cauliflower. Seed is sown ½ in. deep in a nursery bed from mid-April to mid-May, depending on the variety, and transplanted during June and July on to firm soil, well manured for the previous crop. The plants are set out 2 ft. apart each way, 2 oz. superphosphate and ½ oz. of sulphate of potash per square yard may be hoed in before transplanting. No nitrogenous manure should be given late in the year.

Varieties: cauliflower—'Snowball' (summer), 'Majestic' (autumn). Broccoli—'Snow's Winter White' (winter), 'St. George' (early spring). Sprouting broccoli—'Nine Star Perennial' (a many-headed sort).

Sprouting broccoli is very hardy, has a more leafy head, and is cultivated in the same way. Purple- and green-sprouting varieties are grown.

Summer cauliflowers require a soil which has been limed and manured during the winter, 1–2 oz. per sq. yd. of superphosphate should be given before transplanting. An early sowing in frames

in February or March will provide plants for cropping in June. These should be hardened off and planted in March or April from 18 to 24 in. square, depending on the variety. Seed sown outdoors in April in drills ½ in deep will give plants for transplanting in May or June, for cropping from late July onwards. If growth is slow a dressing of 1 oz per sq yd. of sulphate of ammonia should be given Leaves broken over the curds will help to prevent any damage from early frosts. Varieties given in previous paragraph.

Celeriac.—A plant allied to celery grown for its edible root, which resembles a turnip but has the flavour of celery, the stems are bitter to the taste and are not eaten It is used in salads or boiled as other root crops Seed is sown in gentle heat in March and seedlings pricked out into seed-boxes, 2 in apart each way In June, after hardening off, the seedlings are planted out in shallow drills 18 in apart, leaving 12 in between each plant in the row. Water freely during the summer and remove side shoots as they appear. Lift the roots in October or November and store in a frost-free shed.

Celery.—Richly prepared ground is required A trench 15 in wide and 1 ft deep is taken out and manure worked into the bottom of the trench The soil is then returned to within 3 in of the ground level Seed should be sown in early March at about 60° Fahrenheit and the seedlings pricked out in deep boxes 3 in each way and gradually hardened off Celery seed is very fine, and care should be taken to cover it with only a fine layer of soil; if covered too deeply it may not germinate

In late May or June set the plants out in staggered double rows 1 ft apart, with 10 in between the plants, and water them in Frequent watering during the summer is required, and a light dressing of nitrate of soda will stimulate them if growth is poor Before earthing up to blanch the plants, tie the stems loosely below the leaves and remove any suckers. Earthing up begins when the plants are about 15 in. high, the ground should be moist, and the first earthing should only be slight. The second and third earthings, at intervals of about three weeks, should be more generous, but should never reach higher than the base of the leaves, and no earth should fall into the heart For exhibition purposes brown-paper collars may be tied round the stalks before earthing. The final earthing should cover all the stems right up to the leaves, and the soil should slope away neatly In winter litter or bracken spread over the plants will help protect them from frost

Celery fly is a serious pest, and the brown leaf-blisters should be pinched to kill the maggot inside and lindane applied two or three times at fortnightly intervals Slugs should be discouraged with a good slug killer Leaf spot, a seed-borne disease, can be prevented by spraying with Bordeaux mixture

Varieties white—'Solid White': pink—'Clayworth Prize Pink', red—'Standard Bearer' self-blanching—'Golden Self-Blanching.'

Chervil.—An annual herb sown during March in drills 10 in apart, and thinned to 6 in in the rows Further sowings can be made during the summer Used in salads and soups.

Chicory.—The young, blanched growths are used in winter salads. Seeds are sown in drills 1 ft apart in May, the young seedlings are thinned to 8 in. apart and grown on until October or November, when they are lifted and the roots trimmed to 8 or 10 in. long. They are then planted in deep boxes in a moist, sandy soil 5 in apart each way, leaving 1 in. above the soil surface, and the boxes put in a warm greenhouse or cellar. No light must reach the crowns, one method sometimes used is to cover the crowns with 6 in. of sand When the blanched growths show through they are about 6 in. high and ready for cutting.

Chives.—These are like small onions, and the leaves are used for flavouring salads and soups. They are easily grown in window boxes and town gardens. Bulbs can be planted in March 6 in. apart and divided when the clusters become too large

Corn Salad or Lamb's Lettuce.—Occasionally grown for the leaves, which are used in early spring salads. Seed sown from August to October will provide plants for winter and spring use.

Couve Tronchuda.—A large brassica known as "Portugal cabbage," not generally suitable for smaller gardens Seed is sown in March and the plants set out 2–3 ft. apart each way The hearts may be cooked in the same way as cabbage.

Cress.—An annual growing rapidly from seed and used as a salad when only the seed leaves have developed. Seed sown as required, in boxes of light, moist soil and covered with brown paper until germination, when it is removed, will provide salad all the year round. The seed is merely pressed into the soil and the boxes kept moist Cress may even be grown on damp flannel in a window.

Cucumber.—The cucumber of the shops is grown as a specialist crop under glass Temperatures of 85° Fahrenheit or more may be required, and only occasionally are they grown by the amateur, although cloche and frame culture is now popular

Ridge cucumbers, which are smaller and prickly outside, may be grown outdoors in summer Plants from seed sown singly in pots under glass can be planted during late May on ridges of good, well-manured soil or, alternatively, sown on the ridges 1 in deep at the same date Water freely during the summer and cut the cucumbers while young to encourage further production

If cloches are available greenhouse-raised cucumbers can be planted under them, in mid-April Frame cucumbers are less hardy, but young plants raised under glass can be planted under cloches in early May

Varieties· ridge—'King of the Ridge' and 'Stockwood Ridge', frame—'Conqueror' and 'Telegraph'

Endive—Used in winter or autumn salads Seed is sown during April in drills 18 in apart and the seedlings thinned to 12–15 in apart Sowings in June and August will provide a succession A rich soil and plenty of moisture are the main requirements, before eating blanching is necessary, as the leaves are very bitter This is achieved by tieing the leaves loosely together and covering the plants with inverted flower pots (with the holes blocked) to exclude the light, frost should be kept out by piling litter over the pots in winter If cloches are used they can be coated inside with lime-wash to achieve the same effect Alternatively, plants may be lifted in October and blanched in darkened frames

Varieties summer—'Green Curled', winter—'Batavian Broad Leaved'

Fennel.—A perennial culinary herb used in fish sauces and salads Blanched stems may also be cooked in the same way as celery Seed is sown in drills 2 ft apart in rich soil and the seedlings thinned to 18 in.

French Beans.—*See* Dwarf Beans.

Garlic.—One or two "cloves" planted in February, 9 in. apart, will provide ample garlic for salads, as only a little is required After growth is complete in summer the bulbs can be lifted, dried, and stored and some saved for replanting

Haricot Beans.—*See* Dwarf Beans.

Herbs.—Many herbs are useful in small quantities for flavouring and garnishing, as well as being decorative If possible, a separate herb garden should be made as a feature in the garden, or they

may be used as edging plants. Perennial herbs, of which borage, caraway, chamomile, chives, fennel, garlic, horseradish, lavender, mint, pennyroyal, marjoram, rosemary, rue, sage, tansy, tarragon, and thymes are the main types grown, should be given a permanent position. Those grown as annuals—anise, basil, coriander, dill, parsley, purslane, and summer savory—can be used as "fill-ins" on the vegetable garden. Brick and cobble paths associate well with herbs, imparting something of the character of the gardens of bygone days, when herb gardens were considered one of the most important features.

Horseradish.—A deep-rooting perennial herb which appreciates a well-manured, moist soil. It is easily propagated from root cuttings and can become a nuisance, as pieces of root left in the soil will make a new plant; care should be taken to lift the complete root when digging it for use. Straight roots planted in spring with the crowns 6 in below soil level and 1 ft apart can be lifted for use in autumn, no further treatment is required, apart from keeping weeds in check. Some of the roots should be kept for planting the following spring.

Kale.—Very useful during a cold winter, when other green vegetables are scarce, because of its hardiness. Seed sown in April or May will provide young plants for transplanting 18 in apart each way in July or early August, on to a site used for peas or early potatoes, in good heart. A catch crop of lettuce can usually be taken from between the rows. The variety 'Hungry Gap' is usually sown in rows 18 in apart where it is to mature and thinned, leaving 18 in between the plants. There are many varieties, which types are grown is a matter of personal preference.

Varieties: 'Cottager's' and 'Hungry Gap'.

Kidney Beans.—*See* **Dwarf Beans.**

Kohl Rabi.—A brassica with a swollen stem base, in flavour and appearance something between a turnip and a cabbage. Seeds sown in April in rows 1 ft apart are thinned to 1 ft apart in the rows, and the swollen stem harvested when about the size of a tennis ball. If left to grow it becomes coarse.

Lamb's Lettuce.—*See* **Corn Salad.**

Leeks.—A vegetable which repays planting on a well-manured soil. If they are to follow winter greens, then manure or compost should be dug in after the previous crop is cleared. Leeks may be sown from early March to April in lines 8 in apart on a prepared seed bed and the seedlings transplanted as land becomes available during June and July, when about 6 in high. Thinning in the seed bed should be unnecessary provided the sowing has been correct. The seedlings are set out 9 in apart in rows 15 in apart, a hole is made with a dibber, and each seedling dropped in and watered thoroughly. No firming is needed, the watering should tighten the plants sufficiently. Alternatively, drills 4 in deep and 15 in apart can be drawn out with a hoe and the plants put in 9 in apart in the drills.

Regular hoeing is required, and a feed of sulphate of ammonia (1 oz per gallon of water) can be applied if in poor growth. In September a little earth should be drawn up around the roots, which should, by then, be almost full grown. Leeks are very hardy and can be left in the soil until required for use.

Varieties: 'Lyon' and 'Musselburgh'.

Lettuce.—Two main types are grown, cos lettuce, a summer crop with long, straight leaves that curl inwards naturally or are tied in so that the heart is more or less blanched, and cabbage lettuce, which are broad and spreading, with round cabbage-like hearts, and are grown to supply salad all the year round. Lettuce should be grown on ground manured during autumn or winter, dug and left rough till planting time, when it is broken down and raked to a fine tilth. Seed, sown in January in frames and cloches, or outdoors in March and at fortnightly intervals thereafter, a little at a time, until September outdoors, or October in frames and cloches will provide lettuce for most of the year. Sow thinly in drills ½ in deep, in rows 1 ft apart, and thin out or transplant young seedlings so that they are 9–12 in apart, depending on the variety. Quick, unchecked growth with adequate moisture is required, a dressing of bonemeal worked into the soil before planting and a light dressing of sulphate of ammonia in water on poor soils will help growth considerably. Aphids may be troublesome, and should be checked by using lindane or malathion.

Varieties: summer—'All the Year Round' and 'Continuity', early spring—'Arctic King' and 'Cobham Green'.

Maize.—*See* **Sweet Corn.**

Marrows.—Pumpkins, gourds, bush, and trailing marrows all require similar treatment; plenty of sun and water and a rich soil, such as an old hotbed or compost heap, which will provide a porous medium of humus. Seed can be sown singly in pots under glass in March, or outdoors on the site in May. For cloches a bush variety must be used, and greenhouse-raised plants are cloched in mid-April. Plant four or five seeds in groups about 6 in. apart and 1 in deep and finally thin to two plants 15 in apart. Protection from late frosts may be necessary. Water copiously and hoe regularly. Cut marrows when about 12 in long to encourage further fruits. Some can be left until they are full size and cut before the frosts, for storing in a dry, frost-proof place.

Varieties: bush—'Green Bush' and 'White Bush', trailing—'Long Green Trailing'.

Melons.—Although usually a glasshouse crop, melons can be grown outdoors under cloches and in frames. Seed is sown under glass in April at 60° Fahrenheit, and seedlings can be set out 3 ft apart in early May. The soil should be manured generously and the seedlings planted on a mound of compost mixed with soil. The plants must be stopped at the fourth or fifth leaf to encourage laterals. Two can be selected to grow on and, when 18 in long, pinched out to obtain sub-laterals, which will bear the fruit. The female flowers may require pollinating, and on a sunny day a male flower or rabbit's tail can be used to transfer the pollen, as soon as the young fruits swell, remove all but two or three per plant and pinch back the laterals bearing fruit to two leaves from the melon. A feed of dried blood once a week, with plenty of watering (though not saturation!) will help the developing fruits. Light shading may be necessary.

Varieties: 'Dutch Net' and 'Tiger'.

Mint.—Easily grown from suckers in any soil. For winter use a few pieces can be planted in a frame. A number of varieties—'Apple Mint,' 'Peppermint,' and 'Spearmint'—can be grown besides common mint.

Mushrooms.—Growing mushrooms is really a specialist occupation. For the experimental amateur, beds of composted stable-manure are made up in a warm, damp cellar or disused air-raid shelter. Pieces of spawn are inserted when the temperature of the compost has dropped to about 70° Fahrenheit and the whole bed covered with an inch of inert sub-soil. The air temperature should be from 60° to 70° Fahrenheit, and in a few weeks mushrooms may appear. Full instructions will be given with the spawn, but it is advisable to consult a text-book dealing with the culture, as even for professional growers a crop is never certain.

Mustard.—Grown exactly in the same way as cress, but is ready two or three days earlier. If used together, mustard seed should be sown two or three days after cress. Again it is the seed leaves which are eaten.

Onions.—These respond well to good cultivation. The site is dug deeply in winter, manure

incorporated, and left rough until February, when it is broken down to a fine tilth and firmed well. Seed can be sown ½ in. deep in drills during August and planted in March for exhibition onions, but the usual practice is to sow seed in late February outdoors or under glass in January and transplant during April in rows 12 in. apart with 6 in. between the onions, taking care to keep the bases about ½ in below the surface. If sown outdoors and thinned the thinnings may be used in salads. Autumn-sown onions are liable to bolt, but less liable to attack by onion fly than spring-sown plants.

Dressings of sulphate of ammonia or nitrate of potash may be given during the growing season, but not later than July. In August the tops are bent over to hasten ripening and the bulbs harvested in a dry spell at the end of the month, first laying them on the ground for a day or two to dry off. They should be stored in a dry, airy place. The chief pest is onion fly, controlled by dusting the seedlings with aldrin at the loop stage. Onion sets are small onions produced the previous summer, stored and replanted in spring to obtain very large bulbs. They are particularly valuable on poor soils.

Varieties: spring sowing—'Bedfordshire Champion,' 'Best of All,' and 'White Silverskin' (pickling); autumn sowing—'Giant Zittau,' 'Sutton's Solidity,' and 'White Lisbon' (salad onions); sets—'Ebenezer' and 'Stuttgarter Reisen.'

Parsley.—Sow thinly in rows 8 in. apart during March and again in July for a succession of young foliage, thin to 4 in between plants.

Parsnip.—Grow parsnips on ground manured for a previous crop, if given fresh manure splitting and forked roots occur. Dig the soil deeply, and at sowing time in March, work the soil to a fine tilth. On a soil unsuitable for deep-rooted crops special holes 10–12 in. apart, filled with sifted soil, may be prepared. If this method has to be used four or five seeds are sown per hole, normally drills 15 in apart and 1 in deep are made and four or five seeds sown every 9 in. The seedlings are thinned, leaving one at each station. Parsnips should be left in the ground until needed, litter over the rows will ease lifting in frosty weather.

Varieties: 'Evesham' and 'Student.'

Peas.—Dig the ground well in autumn and add a generous amount of manure or compost. Seed sowing begins at the end of February, and can be continued at three-weekly intervals until early July. Under cloches sowings in January and October will lengthen the season. Both early and late sowings should be of a quick-maturing variety. Seed is sown in drills 6–8 in wide and 3 in deep, with 2 ft between drills, the seeds can be scattered thinly in the drill or spaced 3 in apart in a treble row. Cover with 2 or 3 in of soil and as soon as the peas are about 2 in. high stake with twigs.

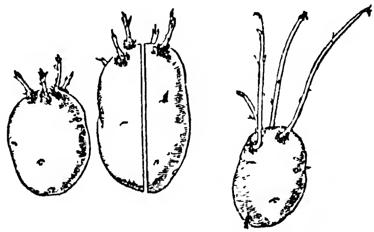
Failures are often due to attacks by birds and field-mice. The former should be discouraged by netting and the latter by trapping. Pea-sticks will be necessary for the taller varieties which should have 3–4 ft. between the rows. With limited space only the dwarf quick-maturing varieties should be used. A summer mulch will keep the soil moist, and picking should be done regularly.

Varieties: 1½–2 ft.—'Kelvedon Wonder,' 'Kelvedon Triumph,' and 'Meteor' (cloches); 2½ ft.—'Onward', 3½–4 ft.—'Gladstone.'

Potatoes.—In general, it is only economic for the amateur to produce an early crop; the main winter supply can be grown if room and labour are available. They should be grown on land well manured the previous season, dressed at planting time with a mixed fertiliser, such as "National Growmore," at a rate of 1½ lb. to a 30-yd. row. The soil should not contain too much lime, as the damage of scab disease is increased.

"Seed" tubers about the size of a large egg are best used, and these can be bought or saved from the previous season's crop. Large potatoes may be cut leaving about three eyes to each part. New stocks should be bought occasionally if the "seed" is home saved to obviate risk of virus. "Seed" should be put in trays during February in a frost-proof shed to sprout, and in early April the "first-earlies" can be planted.

Drills 2 ft. apart and 4–5 in. deep are taken out and the sprouting "seed" planted 12 in. apart in the rows. Maincrop varieties are planted in early May 15 in. apart. The young growths should be protected from frost by earthing up slightly, and a further earthing is done as the potatoes mature. This practice of earthing prevents the tubers near the surface from becoming green when exposed to light, keeps weeds down, and protects the tubers from spores of potato blight, which are washed into the gullies. If growth is poor sulphate of ammonia can be applied at a rate of ½ lb per 30-yd. row. Early varieties should mature in late July and later varieties in September and October; when the tops (haulm) turn yellow the crop can be lifted, dried for a few hours (too much light will turn them green), and stored in boxes in a frost-proof shed or clamps. No damaged tubers should be stored. Clamps outside can be made by laying straw on a flat site and building the potatoes into a ridge-shaped heap, this is then covered with a thick layer of straw and then by a 6-in layer of soil, interspersed with straw "chimneys" to aerate the clamp.



SEED POTATOES—Good seed is essential for first-rate crops. Illustration shows (*left*) a well-sprouted tuber, (*centre*) a large well-sprouted tuber suitable for cutting, and (*right*) a poor, badly sprouted tuber.

Potato blight is a common disease, and control by spraying with "Bouisol" before the leaves touch in the rows is effective. Virus diseases, spread by greenfly, are checked by using "seed" from Scotland, where greenfly is less troublesome because of the lower temperatures. Colorado beetle should be watched for, and if found notified to the Ministry of Agriculture.

Varieties: early—'Arran Pilot,' 'Duke of York,' and 'Epicure', main—'Arran Banner,' 'King Edward,' and 'Majestic.'

Pumpkin.—*See* Melon.

Radish.—Most cultivated ground is suitable for growing radishes, successional sowings at fortnightly intervals from early March until May in drills ½ in deep should be made. Summer-sown radishes bolt and are hot and tough, but autumn sowings for late salads can be made. As radishes germinate very quickly, they can be sown together with another crop and used quickly, and also enable the rows to be seen and hoed early.

Varieties: 'French Breakfast' and 'Scarlet Globe.'

Rhubarb.—Before planting the ground should be generously manured and deeply dug. Crowns are planted in March, 3–4 ft. apart each way and mulched, but no rhubarb should be pulled until the following year, when a light pull can be taken. Remove any flowering shoots and give a dressing of sulphate of ammonia if growth is weak. Manure well each winter; if early supplies are needed, some of the crowns can be covered with inverted boxes or barrels and a packing of loose straw or bracken. An established, well-cultivated bed will continue almost indefinitely.

Sage.—A hardy shrub for the herb garden easily raised from cuttings. The leaves are harvested and dried in summer.

Salsify (Oyster Plant).—A winter root rather like a parsnip which requires similar growing conditions

Savoy.—*See* Cabbage.

Scorzonera.—A winter root cultivated in the same way as salsify It has a purplish root instead of the yellow-green one of salsify.

Sea-kale—A perennial plant native to our sea-shores, which can be either grown from seed sown in March and left for two years to produce forcing crowns or from bought thongs, which are planted during March, 9 in apart in groups of three, leaving 3 ft between groups During summer a manure mulch and nitrogenous fertiliser can be applied When the tops die down in autumn the crowns are covered with boxes to force and blanch the new growths Crowns can be covered in succession to keep a supply Earlier sea-kale can be obtained by lifting crowns in November These are planted in batches five or six to a pot, watered well, and a second pot, with the hole blocked, placed over them In a warm greenhouse or similar position they should develop sufficiently for cutting in about three weeks Slugs are the chief pest outside, and should be kept in check by a proprietary slug-killer

Shallots—A popular crop for the small garden Shallots are purchased as bulbs, like small onions A deep, well-manured soil is required, as for onions, and they are planted during February, the bulbs being pressed about half their length into soft soil, 6 in apart in the rows, leaving 1 ft between rows. In mid-July the little bunches of bulbs can be lifted Leave them on the surface to dry for a few days and then store in a dry, frost-proof shed Some, about the size of a shilling, should be kept for planting the following year

Spinach—Sowings in February to April on a well-manured soil will provide a succession during the summer Sow in drills 1 in deep and 12 in apart and thin the young plants to 3 in, and then to 6 in, using the second thinning to eat A sowing of the prickly variety in August at the same distances will provide a winter crop When picking gather a few leaves from each plant in the row

Varieties 'America' and 'Giant Prickly'

Sprouting Broccoli.—*See* Cauliflower.

Sugar Beet.—*See* Beetroot.

Swede.—*See* Turnip.

Sweet Corn (Maize).—Gardeners should distinguish between the types of maize used for poultry food and those which supply sweet corn for human consumption It is wise to use cloches for growing sweet corn, as it is only half-hardy and resents transplanting Seeds sown under cloches in mid-April in two drills 12 in apart and 1½ in deep should be placed 1 ft apart in staggered positions in the rows. More robust varieties may need 15 in from plant to plant A soil well manured for the previous crop is best used, and a mulch can be given as soon as the plants are a few inches high The first cobs should be ready by mid-July, and should be eaten when the cob is milky

Variety recommended: 'John Innes Hybrid.'

Tarragon.—A herb used for flavouring vinegar Raised by root division in spring. Cut down and dried for use in winter.

Tomato.—A sunny, sheltered site is required, otherwise ripening outdoors in our climate is uncertain. Sow seeds under glass in late March and harden off the plants in a cold frame or buy plants for setting out in late May or early June The soil should be thoroughly dug and some artificial manure applied before planting Allow 18 in between plants and 2½ ft between rows, and put in a strong stake with each plant. Keep to a single stem, pinching out side shoots regularly When four or five trusses are set pinch out the top of the main shoot

Feed with a liquid manure during summer Fruit which fails to ripen outdoors can be gathered and stored at about 50° Fahrenheit or the plants laid flat on the ground and covered with cloches, when the tomatoes should ripen Under cloches plants can be planted out in mid-April instead of late May, gaining six weeks growing time, and the cloches removed when they become too large

Potato blight attacks tomatoes, and a spray of "Bouisol" during the first week in August and repeated after fourteen days will give a control

Varieties: 'Market King' and 'Money maker', some heavy-cropping sorts have little or no flavour and a thick skin

Turnips.—Ground manured the previous season should be dug well and dressed with 2 oz superphosphate per square yard An early variety can be sown during April in drills ¾ in deep and 15 in apart, followed by successional sowings at three-week intervals as required The main crop for storage is sown in July and August, and seedlings should be thinned gradually to 10 in apart Use when about the size of tennis balls A sowing can be made in September, left almost unthinned and the tops used as "greens" in spring In autumn the storage crop is lifted and all undamaged roots put in sand in a shed or clamped Flea beetle and turnip fly can be checked by D D T at the seedling stage

Swedes are grown in a similar manner.

Varieties turnips—'Early Milan' (summer) and 'Green Top Stone' (winter storage), swedes—'Purple Top.'

FERTILISERS AND ORGANIC MANURES

The elements essential for healthy plant growth may be roughly grouped into classes—first, those required in some quantity, the major elements, nitrogen, potassium, and phosphorus, secondly, calcium, magnesium and sulphur, which are required in lesser quantities, and thirdly, the trace elements, boron, manganese, iron, zinc, copper, and molybdenum, of which only minute quantities are needed. As well as the elements mentioned, others, such as silicon, aluminium chlorine, nickel, and sodium, are often found on plant analysis, but the evidence that these are essential is inconclusive, though they may be beneficial to certain crops

It is important to remember, when adding fertilisers to the soil, that different crops may require relatively more of one element than another, but a balance between all the elements is essential As an instance, brassicas (the cabbage family) are gross nitrogen feeders, while root crops (*e g*, carrots) require far less nitrogen, and an excess may be harmful A further point to notice is that although an element may be present in the soil the plant may be unable to absorb any because it is being kept in an insoluble state by excess of another element An instance of this is the frequent yellow and sickly appearance of plants on very chalky soils due to lack of iron, which is present, but locked in an insoluble state by too much calcium

The elements needed by the plant are in the form of various compounds, such as nitrates and phosphates, and may be applied as artificial fertilisers, which are manufactured, or as humus, which contains most of the foods required and

also provides the essential soil micro-organisms or bacteria, without which the soil would be inert and no plants would grow. Bacteria break down the complicated animal and vegetable matter of which humus is composed to soluble compounds which plants can absorb. Humus can be supplied as farmyard and poultry manure, leaf mould, compost, sewage sludge, spent hops, and from animal by-products like hoof and horn, dried blood, meat and bone meal, and many others.

Nitrogen is mainly concerned with vegetative growth, encouraging leaf and stem formation. It is also contained in chlorophyll, the green colouring matter of the plant, and one of the symptoms of nitrogen starvation is a pale-green colour to the leaf, indicating a lack of chlorophyll. Most of the nitrogen compounds used are soluble, and it is a wise maxim to apply "little and often", if given in large doses much is washed through the soil and wasted.

Nitrogenous fertiliser should not be given to any plant late in the season, as sappy growth, easily damaged by winter cold and frosts, is encouraged. Similarly, at no time should large quantities be given to any plant, as this results in an excess of leafy growth, which is very susceptible to disease and adverse conditions of drought and cold, also plants tend to be later flowering.

Sulphate of ammonia is the most used inorganic nitrogenous fertiliser, and is excellent for spring use on seed beds, lawns, and early crops, and it is contained in most fertiliser mixtures. It makes soils acid in reaction, and if both lime and nitrogen are required, nitro-chalk should be used instead. Other nitrogen fertilisers used are potassium nitrate, which has the advantage of supplying two major elements at once, and is very soluble, and nitrate of soda, often used on beet and mangolds. The latter chemical should not be applied in excess, as too much sodium has a bad effect on soil structure. These inorganic fertilisers are all soluble and quick acting. As a general guide, 1 oz. of the fertiliser to a gallon of water, applied at 1 oz. to a square yard, is a good general summer dressing, given at intervals of two or three weeks. It should always be given after rain or watering, and should be applied to the soil and not to the foliage.

Among organic fertilisers containing a percentage of easily available nitrogen are dried blood, soot, and meat and fish meals. Slower to decompose, and so having a more lasting effect, are shoddy (wool waste) and hoof and horn.

Phosphorus is concerned in the plant with the production of young cells of the root and shoot, and also encourages flower and fruit production and early ripening. Most of the compounds are relatively insoluble (rendering absorption by the plant difficult), and so large amounts can be supplied without deleterious effects, especially on acid soils, where the availability is less than on alkaline soils.

Phosphorus is generally applied to the soil in the form of phosphates, and among these superphosphate of lime is quick acting, and is usually applied at 2–3 oz. per sq. yd. in spring and summer, when the need is greatest. More slow acting is basic slag, a by-product of the steel industry, sold as a fine black powder and containing, besides phosphates, many of the trace elements, as well as a considerable percentage of lime. This is good for application to acid, wet soils, but should not be applied to potatoes owing to the risk of scab disease with the increase in the content of lime. It should not be applied with sulphate of ammonia. Bonemeal is also slow acting and also contains some nitrogen. It is excellent for crops like tomatoes, and is also used extensively for ornamental and pot plants.

Potassium, the third major element, is essential for good flower colour and ripeness in fruits. Dessert apples, potatoes, cereals, and root crops all need potash in some quantity, and if excess nitrogen has been applied a dressing of potash may counterbalance the effect. Sulphate of potash is the main inorganic compound in use. Muriate of potash (potassium chloride), to which some crops are sensitive, is much less used; it should be applied as a winter dressing before the crop is sown to lose the impurities by weathering. Sulphate of potash is purer, and may be applied during the growing season at 1 oz. per sq. yd. on the vegetable plot, and is used in many proprietary fertiliser mixtures.

Wood ash contains variable quantities of potassium, and provided that the ash has not been washed by rain and the potassium leached out, is a useful addition to the soil. Bracken, cut during June and July, when large amounts of potassium are present in the foliage, can be composted when green to provide a good supply of the element.

Elements Required in Lesser Quantity.—Calcium, although required in small quantities in the plant, has profound effects on the soil. Its main function in the plant is in the production of the cell walls, but in the soil it helps to bind light soils together and to make the structure of sticky clay soils finer and more workable. Also soils without calcium are acid and tend to lock up some elements in an insoluble form. Addition of calcium changes the acidity, making it slightly alkaline or neutral, and releases the locked elements.

Calcium is applied as some form or derivative of calcium carbonate, commonly known as lime, which can be obtained in various forms. Hydrated or slaked lime (calcium hydroxide) is commonly used on clay soils, and chalk or ground limestone on lighter soils. Calcium is gradually leached from the soil, and it is necessary to replace it, or the soil becomes too acid and many crops will fail to grow. A normal dressing of lime for a vegetable garden is about 4 oz. lime or ½ lb. chalk per square yard every two or three years, and is best applied in autumn as a surface dressing after digging. It should not be applied together with other fertilisers. The amount of lime will depend on the type of soil, but it must be remembered that most vegetables grow best on a slightly acid soil.

Gypsum, or calcium sulphate, is sometimes recommended to supply calcium, but its solubility is negligible, and it is preferable to chalk or limestone only on soils containing salt due to sea flooding. It has been used to help reclaim parts of East Anglia flooded by sea-water during recent years by improving the soil structure. Sulphur, as sulphates, and magnesium, as an impurity in limestone, are usually present in sufficient quantities for the plants' needs.

Trace Elements.—In the case of the trace elements most soils contain enough for the plant, but in certain circumstances deficiencies occur. Iron on very alkaline soils is insoluble and, as it is essential for the production of chlorophyll, deficiency results in the chlorosis of the leaves. It can be rectified by spraying the leaves with "Sequestrene Plus," as can the lack of magnesium and manganese, which may also be deficient on acid soils.

Chlorosis in brassicas and marsh spot of peas are due to magnesium deficiency. Boron deficiency, often occurring on light, calcareous soils, is responsible for brown heart of cauliflower and several other "diseases," mainly affecting the growing point. It can be rectified by applying borax to the soil at about 1 oz. per 15 sq. yd. Zinc and copper deficiencies are unusual in England, but lack of molybdenum has caused whiptail disease of cauliflower. Only minute quantities of the last three are required; more may be poisonous to plants and animals.

Organic Manures.—It should be noted that most of the deficiencies will not concern the amateur, especially if he keeps the ground in good heart with ample organic manure, which contains all the plant foods necessary. Well-rotted farmyard manure from cows and pigs is by far the best organic food, but is scarce now, good farmers returning it to their own land, and generally the material offered is low in nutrients. Poultry manure, which is rich in soluble nitrogen salts, is excellent either applied direct to the soil (not to the growing crop for fear of damage) or composted with straw.

Many substitutes have been devised to use in place of manure, among them sewage sludge, best applied some time before growing the crop, spent hops from breweries, dried seaweed, excellent for potatoes when supplemented by superphosphate, soot, rich in nitrogen, composted town refuse, and the waste organic animal products mentioned earlier. The organic matter in all these materials is essential for maintaining the soil structure and cannot be replaced simply by artificial fertilisers.

Liquid manure, produced by suspending an old sack of animal manure or soot in water for a few days, is useful for the amateur to apply to pot plants and to individual crops like sweet peas, tomatoes, and chrysanthemums. Leaf mould and peat can be used as a mulch and also to supply organic matter to the soil. Sawdust in a well-rotted condition is also useful for inclusion in compost and as a mulch. It is emphasised that it must be well-rotted, and it is advisable to apply a nitrogen fertiliser, such as sulphate of ammonia, at the same time.

Composting of organic refuse from house and garden is much practised by the amateur nowadays.

Compost-making.—The methods developed for making compost heaps are many and various, they depend on three basic principles, good aeration, plenty of moisture, and a nitrogen supply for the decomposition bacteria. A fairly simple method by which much garden and house refuse can be utilised is as follows. An area about 9 ft. by 4 ft. is marked out and all waste vegetable matter—weeds, lawn mowings, cabbage leaves, pea haulm, straw, dead leaves, and hedge clippings—are put in this area and trodden down. Care should be taken not to use diseased material but grass clippings and weeds which have been recently treated with hormone weed-killers may be applied. When the heap is about 9 in. thick it is sprinkled with sulphate of ammonia and superphosphate, at ¼ oz. of each per square yard (2 oz. of each for a 9-ft. by 4-ft. plot) and any wood ash available, and then sprinkled with 4 gallons of water and covered with an inch of soil. This process is repeated with 9-in. layers of rubbish until the heap is about 4 ft. high, when it is better to begin a second heap. A sprinkling of ground lime may be given as each layer is added, but should not be applied until after watering to avoid reaction with the sulphate of ammonia.

The completed heap should be watered occasionally, and after about a month or six weeks, if time permits, it can be turned completely over, watered again, and re-covered with soil. The heap may then be left until rotted, and the compost can be dug in as required, any unrotted material can be used as a basis for a new heap. The time taken for rotting will vary with the time of year and material used, but generally a compost heap made during the summer should be available for autumn use, and one made during the autumn ready for spring use.

There are a number of compounds on the market, known as compost makers, which are said to accelerate the decomposition, but in general a heap made in the way described is eminently satisfactory, and although requiring a certain amount of labour, is the least expensive way of obtaining humus for the garden. This latter point is extremely important nowadays with the scarcity of animal manure and the high costs of both inorganic and organic fertilisers. Prices are, of course, not static, but comparatively the organic manures, such as dried blood, hoof and horn, and guano, are more expensive than the inorganic salts, but these lack humus, which is an essential of a well-cultivated soil.

General Fertiliser.—Many firms supply compound fertilisers containing given amounts of the main nutrients needed, in either liquid or powder form, and some are made up with quantities of nitrogen, potassium, and phosphorus suitable for specific crops like roses, tomatoes, and chrysanthemums. A general fertiliser which can be made up by the amateur is as follows:

7 parts by weight superphosphate.
5 parts by weight sulphate of ammonia.
2 parts by weight sulphate of potash.

All the ingredients are easily obtained from local sundriesmen, and a mixture of this sort will supply a good general feed.

Green Manuring.—Another method of enriching the soil with organic matter is green manuring, which has been practised for some time by farmers and can no doubt be adapted to the gardener's purpose. Green manuring consists of planting a fast-growing catch-crop and ploughing the mature crop back into the soil. Legumes are especially good for this, as certain bacteria in their roots can "fix" the nitrogen in the air. Field peas, sown at 4 oz. per sq. yd. and Italian rye grass at 2 oz. per sq. yd. are commonly used, and clover and annual lupins are also suitable.

If sown after an early crop on land needing organic matter the green manure may be dug in during late summer. Alternatively, if the land is not being cropped at all during the year two green-manure crops may be grown, an early sowing of field peas in April may be dug in during July, and a further sowing of field peas or Italian rye grass sown immediately after may be dug in following the first few frosts.

New chemicals often appear on the market at exorbitant prices and with fantastic claims as to their value as "soil conditioners" and the like. Contrary to this generalisation, in recent years a chemical known as "Gibberellin" has been used to increase the growth of certain plants. It is now available to the amateur, but should be used with care and mainly in a spirit of experimentation, as no conclusive proof of its efficacy has yet been put forward.

GARDEN PESTS.

Every garden abounds in insects and other small creatures, but comparatively few species are pests which feed on plants. The great majority are quite harmless, while many are positively beneficial and help to keep the number of pests under control by catching and eating them. Every good gardener should make it his business to be able to differentiate between friend and foe. This is not always easy, but the speed of a creature's movements may often provide a clue. Fast-running, active creatures, such as the black ground-beetle or the centipede, are usually beneficial, while the slow-moving and sluggish ones, e.g., wireworms, aphids and caterpillars, are usually pests. This is by no means an infallible rule, but it is handy to remember when in doubt.

The good gardener should also get to know the pests which are most prevalent in his district and which can be expected to crop up year after year. The first principle of good control measures is to act while an infestation is still in its early stages and before a great deal of damage is done. When one knows what to expect, steps can be taken to prevent an attack or to stop it developing to serious proportions.

Also, from the experience of past years one can often forecast whether a pest is likely to become numerous enough to make chemical treatment worthwhile. Remember, insecticides can become an expensive item, and there is little point in using them if the damage is negligible. In these circumstances insecticides may eventually increase the numbers of pests, since the treatment will also have killed off many of their natural enemies which had hitherto kept the pests under adequate control. In addition, good cultivation and general garden hygiene helps to reduce the numbers of pests.

The common pests of garden plants can be roughly divided into four main groups.

I. Root Pests.—These destroy the feeding mechanism of plants or tunnel into fleshy tap roots, tubers, and bulbs. Attacked plants make poor growth, and may eventually wilt and die.

Some insects are general root-feeders. These include (*a*) **Swift Moth Caterpillars**, soft, white caterpillars with reddish-brown heads; (*b*) **Chafer Grubs**, large, C-shaped, whitish grubs with chestnut-brown heads, (*c*) **Wireworms**, long, cylindrical, yellowish-brown grubs with a hard shiny skin, and (*d*) **Leatherjackets**, greyish-black grubs with a wrinkled, leathery skin. These are particularly prevalent in recently cultivated grassland or in gardens surrounded by fields, and will attack the roots of a wide range of plants. Chafer grubs, however, are particularly fond of the roots of shrubs, and wireworms will often tunnel in potato tubers and other fleshy roots, whereas leatherjackets prefer the roots of grasses, and may cause browning on large patches of lawn.

Badly infested ground should be dressed with aldrin or lindane dust when cultivating, working the dust into the top 4 in. of soil. Where this is not possible, *i.e.*, on lawns or around established shrubs, the liquid form of the insecticide should be watered into the soil.

Cutworms are stout, fleshy caterpillars, varying in colour from greyish-brown to dingy green. They feed on roots during the day, but at night come to the surface and feed at the base of the stems of plants, causing them suddenly to collapse and wither. Brassicas and lettuce are commonly damaged in this way. Infested ground should be dusted with aldrin or D.D.T.

Millepedes are hard-skinned, cylindrical creatures, brown or black, with numerous short, hair-like legs. They are slow-moving and curl up when disturbed. They should not be confused with the active, long-legged centipedes, which are beneficial. Millepedes commonly extend the damage made by other pests, such as slugs and wireworms. They also bore into the sown seeds of peas and beans. During the day they hide in dark, damp places, such as long vegetation or under stones and pieces of wood. Such hiding-places should be removed or dusted with lindane or aldrin. Drills for pea and bean seed should also be dusted before covering.

Weevil Grubs, small, curved, white grubs, may infest the roots of pot plants and plants in rockeries. Such plants should be removed, the roots cleaned, and replanted in soil which has been dressed or mixed with aldrin dust. Where it is not practicable to remove the plants they should be watered copiously with a liquid form of these insecticides and soil dressed properly at the earliest opportunity.

Slugs need no description. They vary greatly in colour. The most destructive are the underground keeled slugs, small, grey-black in colour, which tunnel in roots, tubers, and bulbs. There are also several foliage-feeding species which rasp holes in the top parts of plants. Slugs like wet conditions, and much can be done to control them by ensuring that the soil is well-drained and that long, tangled vegetation is removed.

Poison baits can be bought or made by mixing 1 oz. metaldehyde with 3 lb. bran (or bonemeal for keeled slugs). The bait is sprinkled over the infested ground or distributed in small heaps and protected from the rain. There is also available on the market a metaldehyde spray for dealing with the foliage-feeding types.

Cabbage Root Fly attacks brassicas and wallflowers. The small white maggot eats away the side roots and tunnels in the main root, causing the plant to wilt and collapse. The roots of young seedlings should be dipped in aldrin or dieldrin before planting out. Alternatively, the plants can be given a drench of aldrin or dieldrin within four days of planting out. The maggots also tunnel in radishes and turnips, and this can be avoided by dusting the seed drills with aldrin.

Carrot Fly.—The maggot of this fly tunnels in carrots and parsnips. Where the pest is serious it is best to delay sowing until the end of May. If possible, seeds should be sown in exposed, windy places, which are avoided by the egg-laying flies. Seedlings should be dusted or sprayed with lindane or dieldrin when 2–4 in. high, particularly in late May or early August, the peak periods for egg-laying.

Onion Fly maggots tunnel into the bulbs of onions, leeks, and shallots, causing the foliage to collapse. Dig out attacked plants carefully, ensuring that parts of them are not left in the soil, and burn them. To prevent attacks dust around the seedlings with lindane or aldrin when they are at the "loop" stage, *i.e.*, about 1 in. high, and again ten days later.

Narcissus Bulb Flies are serious pests of narcissi and also snowdrops and other bulbous plants. The maggots burrow in the centre of the bulbs, causing them to rot. All soft bulbs should be burned and the remainder immersed for three hours in a solution of lindane containing a wetter. To prevent future attacks immerse the bulbs in aldrin for fifteen minutes before planting out. Alternatively, dust around the necks of growing bulbs with lindane at fortnightly intervals from the end of April until the end of June.

Insects which feed above ground include:

II. Sucking Pests pierce the tissues of plants with needle-like mouth parts and suck the sap. This devitalises the plant, checks growth, and causes wilting. Some species cause distortion of leaves and young shoots, and aphids, suckers, scale insects, and mealy bugs excrete a sugary fluid which disfigures the foliage, attracts ants, and allows the growth of sooty moulds.

Aphids, *i.e.*, blackfly, greenfly, etc., are serious pests which attack almost all plants and multiply rapidly in warm weather. They feed on the shoots and undersides of the leaves, and many species are responsible for the transmission of virus diseases. Infestations should be treated as early as possible. Malathion, lindane, D.D.T. emulsion, and nicotine are all good sprays to use, and should be applied to the undersides of the leaves. With the advent of these sprays the control of aphids on roses and broad beans, for example, is no longer a serious problem.

Tree fruits should be sprayed when the buds are bursting and again when the flower buds are still green. Currants should be treated at the "grape" stage, but lindane should not be used on this fruit. Tar oil, applied to deciduous woody plants while they are completely dormant, will kill the over-wintering stages of these and many other pests. It does not, however, give a good winter control for **Woolly Aphid** on apples. This pest is best controlled by spraying at the pink-bud stage with B.H.C. with a succinate spreader added. Small colonies on the bark can be eradicated by painting with 10% tar oil.

Some aphids feed underground on roots, particularly of lettuces, currants, and cacti. Where practicable, infested plants should be lifted and the roots cleaned and sprayed before replanting in clean soil. Otherwise water them copiously with malathion or lindane.

Scale Insects are often found in greenhouses, but also occur out-of-doors on trees and shrubs. Flat or dome-shaped, these creatures spend most of their lives immobile, and they do not at all resemble insects, or even appear to be alive. Again tar oil is useful for killing the overwintering stages on deciduous woody shrubs which are dormant. Plants which are in leaf should be sprayed with malathion or nicotine/white oil emulsion two or three times at fortnightly intervals. These substances are more effective if as much as possible of the scale is first removed by means of a sponge, brush, or scraper with water in which soft soap has been dissolved. **Mealy Bugs** are common pests of greenhouse plants, and should be given the same treatment as scale insects.

Capsid Bugs are very active insects which cause considerable damage to fruit trees and bushes and also to various ornamental plants, principally

chrysanthemums and dahlias. They feed on the young leaves, causing distortion and raggedness, and on the buds, which later produce misshapen blooms. These insects, green or reddish in colour, can be controlled by spraying with lindane or D D T when the flower buds are still green (tree fruit) or with D D T at the "grape" stage (currants). Herbaceous plants should be sprayed two or three times at three-weekly intervals, starting when the plants are young and before the damage is seen The ground under the plants should also be sprayed to kill those insects which fall off during treatment.

Leafhoppers are small, yellowish-green insects like aphids but much more active They feed on the undersides of the leaves of a variety of plants, causing them to become speckled with yellow Roses are commonly attacked. The treatment given to capsids on herbaceous plants will control these also, the sprays being directed to the undersides of the leaves

Whiteflies are serious pests in greenhouses, and also occur out-of doors on rhododendrons and other evergreen shrubs The adults are like miniature moths with white wings, and the young are small, scale-like creatures, generally greenish in colour, which feed without movement on the undersides of the leaves To control this pest D D.T., lindane, or malathion should be used as a spray or smoke, two to three applications being given at fortnightly intervals

Red Spider Mites are extremely small creatures, red or greenish in colour and just visible with the naked eye. They feed on the undersides of the leaves of many greenhouse and outdoor plants, including fruit, causing the leaves to turn sickly yellow. Control is difficult, the most effective materials being malathion, derris, summer ovicides, or azobenzene smoke The directions on the labels of these products should be followed carefully.

III. Biting Insects have chewing and biting mouth parts which are used to cut away pieces of plants.

Caterpillars (the young stages of moths and butterflies) are the best-known pests in this group They vary in size and colour according to the species, and most plants are liable to be attacked These should be sprayed or dusted with D.D T or derris as soon as damage is seen On fruit trees D D T should be used when the fruit buds are still green, and again at the pink-bud stage if the infestation is serious

The Codling Caterpillar, which tunnels in apples is controlled by spraying with D D T at the end of June and again three weeks later Since this latter treatment tends to encourage red spider mites, it is advisable to add to the D D T one of the materials recommended for these pests.

Sawfly Caterpillars are very similar to those above, and commonly attack gooseberry and rose foliage. They can be controlled by spraying with D D T., derris, or lindane Attacks by the **Apple Sawfly,** which burrows in young apples and forms ribbon-like scars on the skin, can be prevented by spraying with lindane seven days after 80% of the blossom has fallen

Beetles and **Weevils** which feed on foliage are usually best controlled by spraying or dusting with D.D.T. To kill the tiny **Flea-beetles** which eat small holes in the seedlings of brassicas and turnips, treat the plants at fourteen-day intervals until they reach the "rough-leaf" stage

The golden-brown **Raspberry Beetle,** which feeds on the flowers and whose grub tunnels in the fruit, is eradicated by D D T. or derris applied ten days after full bloom and again ten days later. For other common pests in this group, *e g*, **Vine Weevil, Clay-coloured Weevil, Pea and Bean Weevil,** etc., apply the D.D.T. as soon as the damage is first seen.

Earwigs feed at night on the foliage and flower petals of many plants. They hide by day inside flowers, in the folds of leaves, and in nooks and crannies on the ground, under flat stones, etc These pests are killed by D D T, applied to the plants (but not to open flowers) and to their hiding-places.

Leaf Miners are very small grubs which tunnel between the upper and lower surfaces of leaves, forming pale blisters, as on lilac, holly, celery, etc., or long, twisting galleries, as on chrysanthemum, pea, and tomato In small infestations the affected leaves should be picked off and burned. Otherwise spray with lindane as soon as the damage starts, giving three applications at fourteen-day intervals.

IV. Eelworms are microscopic pests which are invisible to the naked eye They are able to live for very long periods without food and are extremely difficult to eradicate. The most common species are:

Stem and Bulb Eelworm, which infests narcissus, phlox, strawberry, hyacinth, onion, and other plants Infested plants show distorted foliage and dwarfing and gradually deteriorate They can only be sterilised by immersion in hot water kept at well-defined temperatures for one to three hours, but expert diagnosis and advice should be obtained before this or any other control is attempted Infested ground must be kept clear of any host plants for at least three years to starve out the eelworms.

Chrysanthemum Eelworm causes the formation of yellowish blotches between the veins of chrysanthemum leaves, which later turn black and drop off In severe infestations the blooms are undersized and malformed. Expert advice should be obtained before control measures are attempted

Potato Root Eelworm is a serious and widespread pest of potatoes, causing the plants to become stunted and sickly, giving very poor yields The pest can only be kept in check by crop rotation, potatoes being grown on the same ground only once in four years This is difficult in small gardens, and where land becomes heavily infested the only remedy is to rest it from potatoes for at least five years

The Purchase and Use of Insecticides.—To ensure that an insecticide will do what the maker claims, it is advisable only to buy brands which have been tested and approved by the Ministry of Agriculture This can be ascertained by the presence of an Approval Mark (**T30**) on the label. Read the directions and follow them carefully Over-strength insecticides can cause damage to plants, and certain plants (usually listed) can be injured by some insecticides at any concentration, *e g*, cucumbers, marrows, etc, by D D T and lindane Never apply insecticides to flowers in full bloom, otherwise many valuable pollinating insects will be killed.

DISEASES OF PLANTS.

Plant diseases are important because they can cause great loss not only in growing crops but also in the produce after it has been harvested and stored. The skill in growing crops is wasted if they are destroyed by disease, and many people know the wastage of potatoes through blight disease in winter stores and rotting of onions when they decay through neck rot disease. For these reasons the keen gardener must take notice of

diseases and use the knowledge available to him in checking them wherever possible.

The most important point to remember about plant diseases is to recognise the first signs so that the remedy can be applied at once. In greenhouses this is of great importance because the atmosphere is warm and moist, and in such conditions diseases flourish. It must also be remembered that the same crop is often grown in the same soil in a greenhouse so that we get a build-up of disease, and this causes the well-known "soil sickness" This means that new soil must be brought in or the old soil enriched and also sterilised by steam or by chemicals. Even frames and propagating pits require periodic cleaning up by a disinfection treatment.

Unlike insect pests, the actual cause of a plant disease cannot be seen with the naked eye, and microscopic examination is required for its detection. The scientists who study diseases are called plant pathologists, and these are stationed

THE APPROVAL MARK—An officially approved crop-protection product shows on its label this design.

at universities and other institutes throughout the country, where they carry out research on various plant troubles and advise on suitable remedies for checking them It is obviously necessary to understand the exact cause of a disease and how that cause operates before a means of checking the trouble can be devised The advice can then be passed on to growers, farmers, and the gardening public

The presence of disease in most cases can only be detected by the symptoms shown by the affected plant, which is called the "host" plant The actual cause must then be determined by careful examination in the laboratory, which is done by the pathologist.

Plant diseases in general are divided into three classes as follows 1 Fungus and Bacterial 2 Virus. 3. Functional Disorders

1. Fungus and Bacterial Diseases.—The first kind called fungus diseases are caused by the attack of fungus parasites, examples being the well-known club root of cabbages, potato scab, apple scab, and plum brown rot. These parasitic fungi are microscopic and composed of fine threads, but they attack plants and penetrate them either through wounds (insect bites, hail damage, pruning cuts) or directly through the surface cells (epidermis). The threads grow into the plant, killing the cells and absorbing their contents There is usually some discoloration or even decay of the tissues around the point of infection, but it is possible for the plant to show distress in one part although the parasite is at work some distance away. Examples are silver leaf in plums and the honey fungus, which kills trees by attacking the roots.

The fungus spreads by means of spores which are equivalent to seeds in flowering plants but which are microscopic in size. These spores are produced on the surface of the plant in enormous numbers and are blown (wind), splashed (rain), or carried (insects, etc.) in all directions to alight on other healthy plants, where they germinate and spread the disease This occurs in the growing season, but when winter approaches, the parasite forms tough, resting bodies of one kind or another, and these are resistant to extreme cold

They overwinter in the soil or in the surface of tree bark, etc., so that in the following spring they can germinate and cause disease again So we get the reappearance of such troubles as damping off in seedlings, scab in apples, brown rot in apples and plums, foot rot in peas, wart disease in potatoes, mildews on all kinds of plants, and so on This question of soil contamination by overwintering spores is one of the most serious in the fight against plant disease.

The signs of fungus and bacterial diseases are varied, and may show as yellowing, silvering, brown spotting, or blackening of leaves (potato blight, rose black spot, celery leaf spot, antirrhinum rust), as stunting (cabbage wire stem), as pustules and cankers in stems (coral spot, apple canker), as gumming or dieback in branches (rose canker, plum dieback), as galls, warts, witches brooms, or other malformation (club root in cabbages, crown gall, leafy gall, peach leaf curl), as dry or soft rots of fruits, tubers vegetable bulbs, and corms (gladiolus dry rot, potato dry rot, iris rhizome rot, celery heart rot), and many other abnormal conditions Sometimes only a part of the plant is affected and can be removed, *e g*, branches showing attack by coral spot or one of the large bracket fungi seen on trees, these having gained entrance through a wound.

2. Virus Diseases.—This class of disease is becoming increasingly important as more is discovered about them, although research on them is a comparatively recent development A virus disease is caused by infection with a virus, and the exact nature of this is not yet clearly understood, but it is so small that it cannot be seen with ordinary microscopes Its detection is therefore not easy, but when the sap of a virus-diseased plant is injected into a healthy one it causes the disease

In nature this spread is brought about by biting and sucking insects, which are referred to as **Vectors** They transmit the virus by feeding on infected plants and then travelling to healthy ones, on which they feed and so spread the disease Most viruses are transmitted by aphids (greenflies)

In the garden and nursery they can be carried from plant to plant by pruning knives or by the fingers in the process of trimming plants such as tomatoes, melons, and cucumbers or by the use of the knife in taking cuttings In general, the virus does not kill a plant quickly but tends to cripple it and cause a slow deterioration Infected plants cannot recover but remain, sometimes for years, as sources of infection on which insects feed and carry on the disease. So viruses may increase in lily stocks, strawberry beds, and raspberry plantations unless virus-infected plants are removed and aphids strictly suppressed

The signs of virus disease are of different kinds, but the commonest are those of the type called mosaic, in which the leaves show a mottling with light-green or yellow patches scattered in irregular fashion on the darker green of the leaf There may be also some reduction in the leaf blades These symptoms can be seen in the mosaic of cucumber, vegetable marrow, lettuce, cabbage, turnip, tomato, delphinium, primula, dahlia, apple, raspberry, and many other common plants In some, such as lilies, daffodils, and onions, the mosaic is more in the form of stripes down the leaf blades

Another virus symptom is flower "breaking," where the normal colour of the petals is broken by streaks and spots of white, and this can be seen in tulip, wallflower, pansy, stocks, or carnations affected by the mosaic virus Other viruses cause bronzing of the top leaves (as in tomato spotted wilt) or small light-coloured rings arranged in concentric circles (as in dahlia ring spot) or even reduction of leaves until they are tendril like (as in tomato fern leaf). Sometimes there is malformation or even proliferation, producing innumerable stunted shoots, as in blackberry dwarf disease.

The important point to note about these virus diseases is that every part of the plant is quickly

infected, so that the sap is infectious to other plants of the same kind The virus is present in all parts, and for this reason it is useless to propagate from a virus-infected plant. This means that all the scales and offsets from bulbs such as lilies and tulips, all the tubers from potatoes, and all cuttings from herbaceous plants which are taken from a virus-infected plant are useless, because they will carry the virus They should be destroyed, and the only exception is where the plant is greatly valued, in which case seed can be taken from it before it is destroyed In general viruses do not travel in the seed, and only in one or two cases is seed infected, and this only in negligible quantity.

3. Functional Disorders.—This third class of disease is often called non-parasitic, because unlike the previous two kinds there is no parasite involved, and these troubles are therefore not infectious They are due to faulty cultivation or unsuitable environment, in which soil conditions or climate affect the plants adversely In this group we include cases of unsatisfactory growth due to waterlogging, drought, frost, high temperature, damage by fumes or atmospheric pollution, or even excess lime

Perhaps the most important kinds of trouble in this class are the so called **Deficiency Diseases**, where the plants suffer from shortage of some important food This may be one of the common food substances, such as nitrogen, potash, or phosphate, and details will be found under the section on manures and fertilisers (T25).

CONTROL OF DISEASES.

1. Garden Hygiene.—The control of plant diseases can be dealt with only briefly, but to begin with we must emphasise the value of good cultivation as an insurance against losses from disease Robust plants are better able to stand up to disease than sickly ones, and everything in the way of proper drainage, soil aeration, proper spacing, sensible feeding, and so on, will help to keep the plants vigorous, and this is the first line of defence against diseases Garden hygiene is important, weeds need to be kept down, wounds in trees and shrubs covered with a good paint against infection, new stocks examined carefully, seed bought only from reliable sources, diseased plants burnt, and dead material regularly removed from plants, especially in greenhouses

2. Soil Sterilisation—There are other precautions, among which the sterilisation of the soil in greenhouses by means of steam or chemicals is of some importance Outdoors this is not possible, but rotation of crops is a most useful system in helping to avoid disease Disinfection of frames, propagating pits, and seed boxes by formalin or cresylic acid are other useful measures

All these operations aim at destroying the resting spores of fungus parasites responsible for such diseases as tomato leaf mould, gladiolus dry rot, damping off in seedlings, root rots, and downy mildews of many kinds in young plants such as stocks, cheiranthus, cineraria, tomato, aster, and calceolaria when grown in boxes or pots

3. Disease Resistant Plants—The use of disease-resistant varieties of plants is very desirable, but there are not many kinds available, and often the resistant kind does not possess flowers or fruit of such fine quality or flavour as the more susceptible kind. The outstanding success of this kind is that of potatoes immune to the dreaded wart disease, and these can be grown safely in the most heavily infected land There are antirrhinums resistant to rust disease, and there is resistance in some degree in the case of delphinium mildew, potato blight, tomato leaf mould, and some others. Research goes on to discover still more, because any such plants are always worth a trial.

4. Treatment of Seeds and Bulbs.—For seed-borne diseases seed treatments may be done with an organo-mercurial seed dressing, or even by immersion of the infected seed in warm water.

In some diseases, for example, tulip fire, we can protect the bulbs from the danger of infected soil by raking in a powder such as "Botrolex" when planting the bulbs, and a similar treatment is done with calomel dust against club root in beds intended for sowing brassica seeds.

5 Fungicides—Even after all this, a disease may still appear in the crop, and more direct action must be taken It is then necessary to protect the plants by means of a **Fungicide**. This is a chemical which is poisonous to fungus parasites but which will not harm the crop plant (host). Fungicides are used as wet sprays or in powder form as dusts, and they are sprayed or dusted all over the plants to protect them from infection by diseases

The object of the treatment is to cover the plants with a film of the fungicide so as to protect the still healthy ones To help the spray fluid to spread over and adhere to the foliage another substance, called a wetter, spreader, or sticker, is added to the spray but sometimes this is already included by the manufacturer

5. (*a*) Sprays—Sprays are applied by means of machines called sprayers which vary from small, hand-syringe types giving a continuous jet of spray to those pumped up to a pressure and carried on the back (knapsack machines), and so on to the large machines driven by a petrol engine, which deliver the spray at a high pressure It is necessary to have a suitable nozzle giving a fine mist-like cone of spray which settles on the foliage and is not wasted

5 (*b*) Dusts—Dusts are similar chemicals produced in such finely divided form that the powder can be blown over and on the foliage almost like a fog This is best done after a shower of rain or after a heavy dew The machines used are far more varied in design than spraying machines. There are small hand dusters worked either like a small pump or like a bellows, of which the "Acme" is a good example, and there are those which are carried on the back and worked as a double-bellows action or on the front of the body with a rotary-fan action It is important in gardens to clean and dry the machines after use, and small sprayers may be best put upside down to drain for a time after use

The substances used as sprays and dusts against plant diseases for many years have been copper and sulphur and their compounds Perhaps the best known copper-containing spray is "Bordeaux Mixture," which is still a good spray, but which has been largely replaced by colloidal copper available under trade names such as "Bouisol" for such diseases as tomato blight, etc Sulphur is used extensively as lime-sulphur against apple scab and as colloidal sulphur against the powdery mildew diseases. As dusts, copper is mixed with lime to give copper-lime dust and sulphur is used alone either as flowers of sulphur or green sulphur

5. (*c*) The Newer Fungicides—In recent years much research has been carried out in tests to see whether other chemicals have value as fungicides, and the search has been in the field of organic chemistry and among all kinds of these chemicals. Tests of this kind take a long time, but a few substances have already been picked out as showing great promise, and we can mention "Captan," which is so good against apple and pear scab, "Zineb" against tomato leaf mould, onion mildew, and tulip fire, "Karathane" against any of the powdery mildews, such as american gooseberry mildew, strawberry mildew, vine and peach mildews, as well as the same diseases on ornamental roses, delphiniums, michaelmas daisies, and the like.

6. Control of Viruses.—The control of virus diseases is very different, because in this case the only spray treatments likely to be of use are those designed to keep down insects. The other necessary control measure is to remove and destroy the virus-infected plants, which are a danger as sources of infection.

This is best done when the plants are young, so that any young marrows, cucumbers, dahlias, delphiniums, sweet peas, lupins, lilies, etc., which show virus symptoms as commonly revealed in leaf mottling and poor growth should be removed as soon as detected. Propagation should be done carefully, so that young stock is not propagated from stocks of strawberries, raspberries, and all kinds of herbaceous perennials which show signs of virus infection. Even the knife used for taking cuttings should be wiped occasionally on a rag dipped in a good disinfectant.

7. Prevention of Functional Disorders.—In the case of Functional Disorders (non-parasitic diseases) it is not always easy to advise remedies. Where the soil conditions are faulty attention can be directed to improving drainage if necessary or counteracting dryness by digging in humus, irrigating, and general mulching. Dryness at the roots of tomatoes causes loss of fruit, and so does extreme dryness in the air of the greenhouse, but these should be adjusted fairly easily.

Hail damage can spoil many crops, but robust foliage may help a little to lessen the damage. Late frost damage to fruit in some areas can be lessened by various methods of cultivation and planting. The effects of drought can be aggravated by shortage of certain foods, especially potash, so that even here some attempt can be made to avoid loss. Excess liming may cause food shortages by causing the appearance, in the leaves, of a yellowish or even whitish colour, which is known as lime-induced chlorosis. The real reason may be lack of iron or manganese due to the excess lime in the soil, but recently very good results at counteracting this condition have been obtained by using the substance known as "Sequestrene Plus."

Another method of treating these food shortages is to spray the young foliage in early summer with the required element in a very weak solution. They can even be included in sprays used for keeping down diseases or pests. It must not be forgotten that even the ordinary foods, such as nitrogen, potash, and phosphate, may sometimes be in short supply, and the effect can be seen by the trained plant pathologist. In these cases the effect may not always show clearly in the growing crop, but may appear long afterwards in the stored fruits and vegetables, which as a result deteriorate and break down long before they are required for use.

The present-day methods of cultivating large numbers of the same plant in one spot tend to increase the risk of large-scale disease attacks. Modern plants may be highly bred and selected for great purity of strain. Indeed, they have often been chosen for fine quality and flavour, with little regard to their ability to resist disease, so that the gardener must always be ready to give them the protection they may need.

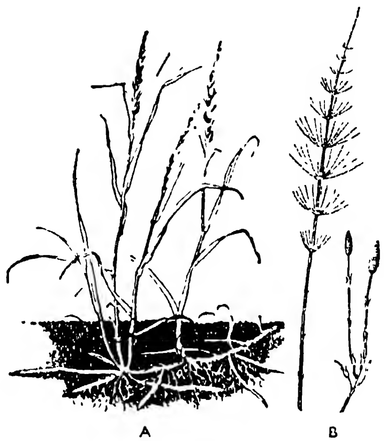
USES OF MODERN HERBICIDES

The control of weeds by chemical means is one of the greatest advances of recent years, mainly resulting from a chance discovery made during the War. Occasionally, troubles have arisen in not following makers' instructions. Sometimes the damage has been most unfortunate, as the majority of herbicides are toxic, in varying degrees, to a wide range of plant life. In the main, controls are determined by circumstance, as typified in the following cases:

Open Ground.—On ground free of crops all plant life can normally be killed by watering the herbage with sodium chlorate at 1 lb. to a gallon of water. In some cases repetition may be necessary. In using this method it should be remembered that treated ground will remain toxic to plant life for a period of up to six months; where doubt exists about the presence of sodium chlorate still in the ground, then it is advisable to wait for the appearance of annual weeds. Further to this, the chlorate is liable to seep through the soil and affect plants for some distance away. It should always be handled with care and stored in closed metal containers. Clothes which have been saturated in the solution and then dried are highly inflammable.

At one time arsenical weed-killers—which are very poisonous to humans—were widely used, but they have now been superseded to a large extent. If a considerable area of open ground is to be treated and the foliage is dry a fair control can be established sometimes with a hooded flame gun, but it is seldom possible to kill the roots of many weeds.



COUCH GRASS (A)—A shallow-rooting weed, nowadays easily eradicated by chemical means (see T33). HORSETAIL (B)—Usually a persistent weed of low-fertility soils. Botanically it is a poor, but interesting survivor of a large race of prehistoric plants. Details of its control will be found on T34.

Cultivated Ground.—Where grasses of all sorts, including couch grass and annual grass, are growing on cultivated ground around woody or perennial crops a control may be established by watering with "Dalapon." This is a new herbicide of American origin and is of great interest, *but* full details about its use should be obtained from the manufacturers before making an application.

If annual plants like groundsel and chickweed are found under similar conditions the plants may be eliminated with "Herbon." Here again, it is important to have full information about the preparation and to apply with care.

Garden Paths.—On any surfaced path or drive a first-rate control of weeds can be maintained by watering with a residual herbicide such as "Weedex." As this preparation is virtually insoluble in water, it does not seep through the soil as sodium chlorate would, and therefore it can be used near garden crops and grass edgings. Further to this, it is not easily washed from the soil and remains active near the surface for up to twelve months. Notwithstanding, the herbicide should not be used carelessly.

A dilute solution of sodium chlorate with 4–6 ozs. to a gallon of water may be applied, but it is liable to affect garden plants near by, and for this reason application should be confined to the centre of the path, thereby leaving room for the chlorate to seep through the soil.

Lawns.—The majority of weeds in turf can be easily eradicated with formulations of 2,4-D such as "Dicotox" or "Lornox" In particular, daisies, plantains, dandelions, and all broad-leaved plants are susceptible, although it may be necessary to repeat the dose after ten days The best time to do the work is on a warm, fine day in the spring when the plants are growing actively and there is the prospect of fine weather to follow for twenty-four hours The action of the herbicides is rapid, and grass may be cut after a couple of days, composting with mowings in the normal way It appears that the hormones are not injurious to bacterial life in the soil and in a few weeks break down into harmless substances.

Where bulbs are naturalised in grass, steps to control weeds should not be taken until the foliage of the bulbs has died down and the bulbs are dormant Thus, as a general rule, control measures are best applied throughout July

To deal with weeds in turf where there arises the danger of the spray—or even drift from it—touching cultivated plants near by, as, for instance, on grass paths in a rose garden, then a wax bar impregnated with a hormone can be lightly drawn over the turf. Such bars are available at a reasonable price under the trade names like "Wonderweeder"

Some weeds are resistant to normal doses of hormones and need special treatment These are mostly mat-forming plants of low-growing habit which are not cut off by mowing Typical examples include clover, moss of various sorts, pearlwort, speedwell, and yarrow Here, the main control must be in the use of lawn sand, and a good mixture can be made up as required with.

3 parts of sulphate of ammonia.
1 part of calcined sulphate of iron

Application to patches of the weed should be made when the turf is damp and there is the prospect of fine weather, if a period of drought follows an application, then water should be applied to avoid serious scorching Repeat the treatment as necessary throughout the growing season Linked with this "spot" treatment, the growth of grass must be encouraged, as this will tend to smother low-growing weeds Thus, in the early spring when the turf is wet, feed with a mixture of equal parts of superphosphate and sulphate of ammonia at 1 oz. per sq yd over the whole area and repeat after a month, if desirable In addition, do *not* shave off the grass by close cutting; instead, the blades of the mower should be set as high as possible for a whole season

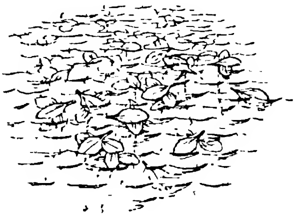
Ponds.—Problems of weed control in ornamental ponds are often not easy to solve Where duckweed is prevalent this small floating plant can be eliminated by sweeping the surface of the water at regular intervals If this practice is carried out thoroughly much of the vegetative growth will be eliminated, and the plant will not be able to form resting bodies whereby it overwinters Once a control has been established, further spread of the plant can be prevented by introducing a few moorhens or ornamental ducks.

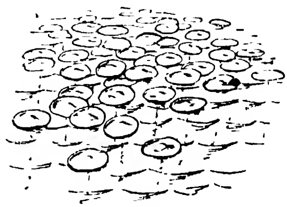
The most common of unwanted plants in pools is blanket weed There is no single means of dealing with this plant, for its spread is governed, to a certain extent, by unbalanced plant and animal life in the water With this fact in mind, water lilies should be established so that their foliage shades about 25% of the water In addition, a few oxygenating plants should be introduced from ponds or streams and a supply of gold fish added. Blanket weed is usually found in pools where the water gets overheated in summer, for this reason, the average depth of garden ponds should be a minimum of 18 in. and preferably a minimum of 2 ft.

Large Expanse of Water.—It sometimes happens that aquatic plants with large floating leaves, such as water lilies, get out of hand Here, control can be established by cutting off the foliage with a long-handled appliance like the "Corypu Water Scythe" The work should be done early in June and repeated as often as any fresh growth is seen. Bulrushes are difficult to eliminate, but can be destroyed by digging out the roots when the level of the water permits. "Dalapon" has been found to give a control. Application should be made, with a wetting agent added, when the rush reaches maturity.

SPECIAL PROBLEMS OF WEED CONTROL.

Bindweed is to be found in most gardens. Up to the present time the main control has been to carefully fork out the roots as new growth is seen, if this is done methodically the plant can be eliminated within a reasonable time. Lately, chemicals have come to the fore, and bindweed may now be eliminated by watering or painting the foliage with a formulation of 2,4-D when the annual growth has nearly reached maturity Thus, first applications can be applied in July and the treatment repeated as necessary to good effect





DUCKWEEDS—In limited numbers these make good oxygenating plants, in quantity they become a great nuisance Controlled by methodical sweeping or introduction of ducks *Top*, Ivy-leaved duckweed *Below*, Lesser duckweed.

Bracken.—Horticulturally, control is not a big problem, and in limited places it is easily dealt with by repeatedly cutting the aerial stems with a grass hook as the first frond opens This practice will exhaust the underground food supply of the plant, and gradually it will die out. The young fronds are rich in plant food and, while still green and fresh, they should be composted No chemicals will offer a reasonable control of this plant and, indeed, it is best dealt with by cutting and final digging out of the roots.

Couch Grass.—Where the soil is light and tends to be low in fertility, it is often found that this is a difficult plant to eradicate If the long, underground stems are forked out in the conventional manner and left on the surface to dry the roots may be composted to advantage and a good control established To prevent reinfestation, manures and fertilisers should be applied generously and the ground kept hoed regularly. See note on Cultivated Ground (T32).

Ground Elder.—Without question this is one of the worst garden weeds and, whether or not the fact is pleasant or acceptable, it is indubitably a weed of neglected ground. In varying degrees it is resistant to hormone weed-killers of all sorts. On ground free of crops it may be reduced by an application of sodium chlorate, as explained in the paragraph Open Ground (T32). The first treatment

should be made as soon as growth starts in the spring and repeated if the desired effect is not abundantly clear. When ground elder is to be found among herbaceous plants they must be lifted out and the weed removed by repeated hand-forking. In shrubberies reasonable control can be had by smothering the young growth in the spring with a thick dressing of peat, leaf mould, baled straw, or sawdust. If growth penetrates the surface dressing it will be found that the etiolated shoots are not difficult to remove by hand, or a second layer can be applied to complete the treatment.

Horsetail.—This is sometimes erroneously called mare's-tail and on poor, sandy soils it is often a common weed. Fortunately, recent experiments have proved that it can be easily controlled by spraying or painting the *mature* growths with a formulation of 2,4-D, taking care, of course, to keep the spray off cultivated plants near by As the appearance of horsetail is symptomatic of low fertility, manurial treatment should be carried out on a generous scale

Perennial Nettle.—Although this is a common weed, it is easily eradicated by thoroughly watering the foliage in the spring with a solution of a hormone like 2,4-D or, preferably, 2,4,5-T This treatment should be repeated once or twice until the plants are eliminated. Isolated clumps can be dealt with by repeated cutting of young growth with a grass hook The annual nettle is controlled by regular hoeing throughout the summer months.

Oxalis.—Of all weeds this is probably the most difficult to destroy It is easily identified by its large, trifoliolate leaves like that of clover Unlike other weeds, oxalis cannot be efficiently removed by hand, as this disturbs the bulbils clustered around the base of the stem of mature plants. On ground free of crops, sodium chlorate can be applied in March (see paragraph on **Open Ground**) Perhaps a second application may be necessary, but, even so, control may not be complete Among shrubby plants, it may be possible to eradicate the weed by smothering, as suggested in the paragraph on ground elder (T33).

Woody Plants.—These may be killed with 2,4,5-T. This hormone is particularly useful on bramble, gorse, ivy, and other unwanted shrubby plants. It is necessary to thoroughly saturate the foliage of deciduous trees, and the best results are obtainable when the leaves are fully mature but not starting to die off In the case of ivy, the dormant shoots should be generously sprayed for the best results

To sum up, there are many, many aids for eradicating weeds The important point is to get the *right* method for *each* plant Equally important is it to check on the reason why certain weeds grow profusely under some conditions, and to counter this natural tendency by appropriate cultural treatment, such as in the application of manures where horsetail is to be found.

THE GARDEN CALENDAR.

January.—All digging should be finished this month. As the work is done, so generous applications of organic matter such as peat, compost, sewage sludge, leaf mould, animal manure, or a mixture of any of them, should be incorporated into the ground. On clay soils the physical condition can be improved by raking into the surface dressings of rough materials like screened ashes, road grit, or coarse sand.

Fork over ground between rows of fruit trees and in shrubberies and bury annual weeds. If land is not free of weeds in January it is unlikely to be so throughout the year.

A trench for runner beans can be made, the bottom forked over, a thick dressing of compost or kitchen waste added, and the soil replaced.

Rhubarb will require protection with compost or straw and early growth forced by covering with small tubs.

GROUND ELDER.—A pernicious weed of neglected land. Best eradicated by methodical hand-forking early in the year (*see* T33).

Pruning of orchard trees and fruit bushes should be completed. When bird damage is severe gooseberries can be left until bud burst.

Autumn-planted shrubs and trees should be checked over, and any which have worked loose through the action of frost or wind should be firmed by thoroughly stamping over the soil.

February.—Broad beans can be sown if conditions are favourable and shallots planted by pressing the bulbs into the soil until only the tips show.

Jerusalem artichokes are an unusual crop well worth growing: plant tubers as early as possible to give a long season for maturity.

Parsnips should be lifted to check new growth and stored on the north side of a wall or fence.

"Seed" potatoes can be arranged in boxes and kept in a frost-proof shed; a light, airy position will encourage short, sturdy shoots.

Protective covering on half-hardy shrubs, like fuchsias and mimosa, should be removed as early as possible.

Herbaceous plants which do not over winter easily, such as delphiniums and gaillardias, may be planted at the end of the month.

Turf may be laid in February so that the grass can be established before the ground starts to dry out in the spring. Before laying, rake in a dressing of "National Growmore" at 1½ oz. per sq. yd. to encourage root action.

Vines under glass should still be kept as *cold* as possible to maintain the dormant period. As the buds swell the temperature can be higher, but ventilation must be increased if it reaches 45° Fahrenheit.

Fuchsias grown under glass should be pruned hard by cutting back all of last season's growth to within a bud or two of the old stems. Later, as new growth appears, take cuttings which will root easily in sand under a plastic bag.

Shrubby plants like the india-rubber plant and most pot plants grown indoors or under glass should be repotted or top dressed with fresh potting compost.

Early strawberries can be obtained by cloching rows at the beginning of the month.

March.—Sow round-seeded spinach and broad beans for a succession in cropping.

Brussels sprouts, cabbage, lettuce, leeks, onions, parsley, parsnips, peas, and radish should all be sown as the soil gradually warms up.

Asparagus is easily raised from seed sown this month. Sow the seeds individually 1 in. apart and mark the rows by sowing a pinch or two of radish seed at intervals, as the asparagus is slow to germinate.

Onion sets can be planted as early as possible on well-manured ground.

Spring cabbage will respond in the spring to an application of nitrate of soda at 1 oz. per sq. yd.

Tomato seed may be sown in a warm greenhouse at the end of the month. It is a mistake to sow early in the year, as then seedlings get drawn and weak before it is time for planting outdoors.

Seed of half-hardy annuals, such as antirrhinums, China asters and *Phlox drummondii*, may all be sown in a greenhouse or frame. Remember the seed should only be covered with a sugaring of fine soil sufficient to "anchor" the seedlings and to sow thinly.

Hedges, and particularly evergreen sorts which have outgrown their stations, should be cut back, and this is the *best* month for doing so. Often drastic reduction is necessary, and such treatment will save endless, unnecessary work in trimming later on in the year. As an example, privet may be safely reduced to a width of 9 in. and a height of 4–5 ft.

Evergreen shrubs, like some daphnes, rhododendrons, and hollies, may be planted and—what is most important—kept moist until growing freely.

Over-grown lavender may be reduced in size by cutting back into old wood.

Lawns should be fed with fertilisers to encourage new, strong growth when the turf is damp.

As buds burst on roses, so pruning and manuring can be started.

Planting time for all fruit trees is nearly over, and should be completed without delay.

As buds burst on early planted raspberries, so the already shortened canes can be cut down to just above the lowest bud in growth, as further growth develops so the old stems can be shortened further until, finally, cut to ground level.

April.—Potato planting for an early crop is done this month using well-sprouted "seed." Protect from late frosts by covering the first shoots with earth and, if necessary, applying a coating of straw or sacking.

Onions raised under glass in boxes can be planted outdoors.

Watch for germination of asparagus seed, as the fern-like growths appear, hand weed the rows with great care and thin seedlings to 2–3 in. apart.

Hardy annuals can be sown outdoors when soil conditions are right, lightly cover and protect from birds. Half-hardy sorts must be grown-on in frames.

New stocks of carnations, chrysanthemums, and violas may be planted outdoors.

Transplant autumn-raised sweet peas to open garden early in the month.

Lawns may be sown as the soil warms up, and a good surface tilth can be obtained by raking; *prior* to sowing, make arrangements to protect the seed bed from birds by use of pea sticks, wire netting, strips of newspaper dipped into lime-wash, or "Glitterbangs" or a combination of these scarers.

Evergreen shrubs, like bamboos, hollies, and rhododendrons, should be planted and kept moist until well established.

Gladioli and montbretias can be planted in sunny positions where soil is in good heart.

Prune winter-flowering shrubs, such as winter jasmine and forsythia, by cutting off the old flowering stems.

Weeds will be appearing on garden paths and drives; establish an early and efficient control by watering with "Weedex".

Early planted fruit trees should be mulched with organic matter to conserve moisture in the soil.

May.—Brussels sprouts should be planted early in the month and also late potatoes. Watch out for blackfly on broad beans, as the first infestations are the important ones to deal with promptly.

Encourage growth on leafy vegetables, like lettuce and spinach, by a dressing of nitrate of soda at 1 oz. per sq. yd.

Towards the end of month plant out tomatoes, or in the first week if cloches are available.

Sow sweet corn and vegetable marrows in the open. Bedding plants and half-hardy annuals may all be planted outdoors.

Roses should be checked over for first signs of greenfly infestation, spray with nicotine if necessary.

Garden pools in need of cleaning should be dealt with thoroughly. At the same time water lilies may be lifted and divided when growth in the previous year was excessive.

Delphiniums now develop rapidly, for best results cut out thin shoots to leave five to seven strong growths to each plant. Stake and tie each one and encourage healthy growth by feeding with liquid animal manure or soot water on one or two occasions.

Faded blooms on azaleas, lilacs, and rhododendrons should be removed.

Agapanthuses and hydrangeas grown in tubs can be brought into a sunny position. If repotting has not been necessary remove top 2 in. of soil and replace with fresh compost. Encourage new growth with applications of liquid animal manure.

Window boxes should be repaired, filled with fresh compost, and replanted. Remember a generous layer of peat or leaf soil placed in the bottom will do much to conserve moisture.

Lawns will need attention, and broad-leaved weeds can be eliminated by treatment with hormone weed-killers.

Small greenhouses are liable to get very hot and plants suffer accordingly especially if short of water, therefore keep staging and floors well damped. Conversely, sharp falls in temperature may be experienced and every day the ventilators should be shut down in the late afternoon in order to conserve the heat from the sun.

June.—Plant cabbages, cauliflower, celery, marrows, and tomatoes.

Sow seed of garden swedes.

After thinning beet, carrots, onions, and parsnips, feed with nitrate of soda at ½ oz. per yd. run.

Asparagus raised from seed must be kept clear of weeds and watered thoroughly at the least sign of being dry. Beds cropping in their third season should not be cut after June 1st; on old beds cutting may continue until the third week of June.

Sweet corn should be thinned and a surface dressing of compost applied.

Aubrietas now past their best should be clipped back hard to the old stems, with a pair of shears.

Seed of delphiniums, hollyhocks, lupins, and wallflowers may be sown.

Phloxes, especially if grown on light soil, should be mulched with compost and watered when necessary.

Herbaceous plants of all sorts respond to feeding if growth is below par; individual species may be fed with soot water or large beds given an application of sulphate of ammonia at 1 oz. per sq. yd. taking care to keep the crystals off the foliage of plants.

Old flower-heads on roses should be removed regularly by cutting back old flowering stems to within 4 or 5 in. of the mature wood.

Raspberries and similar berries should be mulched with compost or old manure to encourage new growth.

Strawberries may be layered if the stock is healthy and growth vigorous.

July.—Plant winter cabbage, leeks, sprouting broccoli, and kales as ground becomes available.

Sow prickly spinach and turnips for autumn and winter use.

Water celery, marrows, and runner beans at first sign of dryness. If setting is poor, beans should be sprayed vigorously with water from a hose.

Shallots may be lifted and dried off as foliage gradually yellows.

Carnations may be layered as sturdy young shoots develop; remove sufficient leaves to make a horizontal cut up the stem passing through a joint, and peg down.

Flag irises can be lifted and divided as flowering finishes. After replanting, the tubers should be showing above ground but, nevertheless, firmly in the soil.

Wallflowers may be lined out in nursery rows. To avoid sappy, lush growth do not plant on rich soil. Where ground is acid water plants with lime-water (a large handful to a gallon).

Hydrangeas can be easily propagated in July by cuttings of short flowerless shoots. These should be inserted in pots in a sandy compost and kept under a plastic bag or hand light until rooted.

Transplant into nursery rows, seedlings of biennials and perennials sown earlier in the year.

Order supplies of daffodils, hyacinths, and other bulbous plants for delivering in September. Stocks in good trade houses are often soon exhausted.

Late in the month hedges of beech, holly, hornbeam, and yew can be clipped.

August.—Runner beans are now in full bearing, and the pods should be gathered while still young, to encourage further croppings, often beans are picked much too old Water and feed with nitro-chalk at 2 oz per yd run if necessary If properly grown this is one of the most profitable of *all* crops

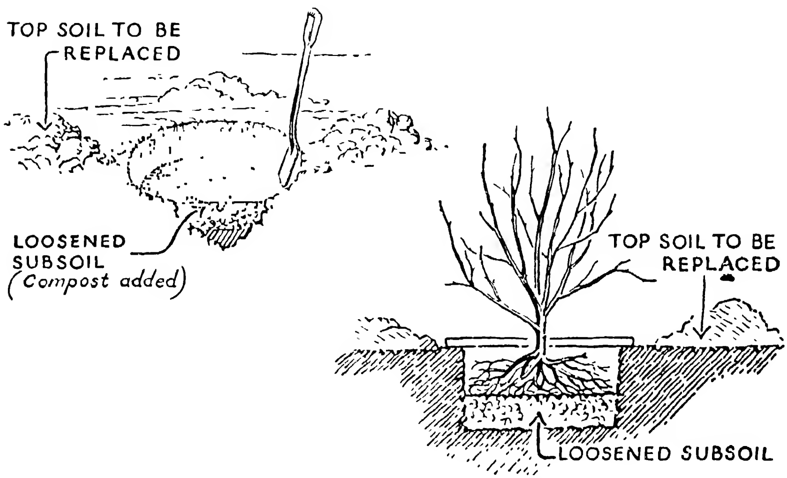
Marrows should also be gathered while still young and fresh; early development of seeds checks fruiting.

Strawberries layered in pots earlier in the year may be planted when the soil conditions are right Use a well-manured site and plant at approved distances

Raspberries and loganberries will now have finished cropping, and all the old fruiting canes may be cut out at ground level.

September.—Tomatoes can be gathered while still green and ripened easily and quickly by storing in open boxes, out of the direct sun, in a warm kitchen Such a practice is better than putting the fruit in a dark, airless cupboard

Ground recently cleared of onions and potatoes is admirable for planting out cabbages for spring cutting. Apart from removing any weeds, no preparation is desirable.



CORRECTLY PLANTED SHRUB, showing planting hole and bush in position The loosened sub-soil must be firmed prior to planting, and any tree or shrub must never be planted deeper than it was in its previous position or nursery row.

Seed of prickly spinach—a valuable winter crop—may be sown As seedlings develop, thin out and on acid soils apply lime-water

Tomatoes should be sprayed with "Bouisol" at fortnightly intervals to prevent potato blight

Winter greens, if not already planted, should be put in as soon as possible

Pelargoniums ("Geraniums") should be propagated by cuttings taken throughout the month as young, short side-shoots develop Rooting soon starts if the cuttings are inserted in sand or a mixture of sand and peat

Border carnations may be layered, encourage rooting by not allowing the plants to suffer from a lack of water

Madonna lilies may be planted this month in an open position where they will not be disturbed

Flowering shrubs of a wide range may be propagated in August Short side-shoots of the current season's growth should be taken off with a heel when the wood is still young but starting to harden at the base Insert in sand and cover with a plastic bag.

Grass seed is best sown this month whenever the soil is moist but not wet, as in the notes for April. Before sowing, any perennial weeds must be removed by hand forking.

Brussel sprouts are heavy feeders and growth should be encouraged by an application of nitro-chalk at 1 oz per sq yd early in the month

Carnation layers will now be rooted and the young plants may be severed from the parents and transferred to their flowering positions.

Crocuses, daffodils, and snowdrops are often planted too late, September is the time for the job Similarly, these, together with hyacinths, may all be planted in bowls for indoor decoration before the end of the month

Lavender bushes can be trimmed when the flowers fade, do not, however, trim or cut back in any way the old stems or foliage.

Grass seed not sown last month should be put in without delay

Roses of nearly every sort can be propagated by inserting cuttings 8–10 in. long in a shallow trench outdoors A sprinkling of sand should be put in the bottom of the trench and the cuttings firmed well

Brown rot is often prevalent on fruit There is no remedy for the disease, and brown, rotten fruit on apple and other trees should be picked off and burnt.

October.—Jerusalem artichokes are safe left in the ground, but the stems should be cut down.

If a regular supply is wanted, then a store of tubers may be lifted to ensure against hard frost.

Parsnips may, similarly, be left in the ground until needed.

Asparagus stems should be cut down before the seeds drop. If "fern" is cut during the summer for indoor decoration, subsequent cropping is affected.

Lettuce for early cutting next spring should be sown, late in the month, under cloches.

Virgin ground which is to be taken into cultivation should be dug as soon as possible in order that it may be exposed to a *full* season of winter frosts. There is no doubt that the maximum value in digging virgin land can only be had if the work is completed well before Christmas.

Evergreen shrubs should be planted before the weather turns severely cold.

Lily-of-the-valley will respond to a top dressing of old animal manure or an application of bone meal at 2 oz per sq yd followed by a mulch of leaf soil.

Clematis grown in pots may be planted in their permanent positions.

Lilies of various sorts can be planted early in the month.

Gladioli should be lifted, cleaned, and stored in a dry, frost-proof shed.

Polyanthuses and all sorts of primroses may be planted in moist, rich soil for flowering in the spring.

Sweet Williams and pansies may be transferred from nursery rows to their flowering positions.

Wallflowers should be planted without delay, firming the plants well. Forget-me-nots and daffodils may be used in conjunction with them and planted at the same time.

Most plants grown indoors have been watered freely during the summer, from now on care must be taken in applying water as soil only dries out slowly in winter, and growth has virtually stopped.

Bulbs in bowls must be kept as cold as possible, and up to early November not more than about ½ in of growth should be showing. Damp the peat as it shows signs of drying out.

Black and red currants and gooseberries may all be propagated by cuttings.

November.—Runner beans can be cleared and the haulms used for compost, the old roots can be left in the ground and later dug-in. If the sticks are pulled up early and stored they will last for some years.

Broad beans may be sown outdoors in districts where they are known to succeed, an allowance for losses should be made by sowing 3 in apart.

Asparagus responds well to a top dressing of animal manure or compost, if supplies are short, aim to apply once in three years.

Lettuce sown last month under cloches can be transplanted and, under wide barn cloches, three rows can be grown easily for cutting in the spring. Slugs may cause serious losses, so water with "Slugit" at planting time and keep a few spare seedlings to fill any gaps.

Tulips may be planted throughout November.

Heaths and heathers of all sorts can be planted in peaty soils. Large clumps may be split up and replanted.

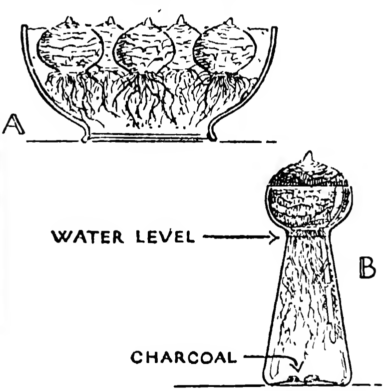
Roses and all deciduous shrubs and trees, including fruit trees of all sorts, should be planted as soon as possible. Always firm the soil well, but do not plant too deeply.

Where necessary, herbaceous borders can be replanted. Large clumps of perennials can be split up and the strong pieces from outside of the clump replanted; the centre of the clump should be discarded.

Continue to keep indoor bulbs as cold as possible. By the second week in November, growth should be about an inch high. Towards the end of the month, transfer to a cool, light position.

Throughout the winter continue digging and incorporating organic matter like compost, spent hops, and coffee grounds.

Vines grown in a cold greenhouse should be given full ventilation night and day. After leaf fall cut back annual growth to one bud.



Bulbs Indoors.—Note strong root development before leaves appear. This factor can only be brought about by early planting (*see* September notes). In both bowl (A) and glass (B) a little bonfire charcoal is necessary for healthy growth.

December.—Decaying leaves on winter greens should be removed to give free circulation of air around the plants.

Bird damage may be prevalent on spring cabbages because of pigeons. In serious cases it is worthwhile to erect fish netting.

When frost makes cultivations impossible, pruning of fruit trees should be done. The only exception may be red currants and gooseberries, because in districts where bird damage is serious any pruning is best left until the spring.

Deciduous hedges of beech, hawthorn, and the like can all be cut back hard where the plants have got out of hand, with a view to reducing work of trimming during the growing season.

Well-berried holly is always in demand, and a variety of regular fruiting habit to fulfil the requirement is *Ilex aquifolium* 'Pyramidalis'.

For those wanting mistletoe, the seed should be planted on apple trees in the spring—not in December.

Early in the month, hyacinths can be brought into full light and warmth for Christmas flowering. If growth is a little stunted cover plants with a sheet of newspaper and give more warmth; if growth is poor look to the cultivator not the supplier.

Christmas trees to be brought indoors in pots should be thoroughly watered first, to check the needles falling through lack of moisture in hot, stuffy rooms.

Care of Indoor Plants

By definition a house plant is one which can be permanently grown for decoration indoors Such plants should not be confused with orchids, crotons, hibiscus, and the like, for these are really greenhouse plants or denizens of Scandinavian or American houses, where heat and air conditions may be automatically controlled Conversely, the average British home is often cold and draughty, and has a high temperature in the evening and a very low one at night. This is far from satisfactory, but, in view of the fact, the cultivator of house plants must choose subjects tolerant of existing conditions.

Cultural Conditions.—Ideally, the temperature should be kept as constant as possible, and in cold weather plants grown in window-boxes are best moved nightly into the centre of the room to avoid damage by frost. Linked with temperature is the question of humidity, for plants respond well to a moist atmosphere. Here again the majority of rooms are ill-suited for growing plants The condition can be improved, however, by sinking the pots in peat or wrapping them around with sphagnum moss Alternatively, pots may be stood on a layer of gravel which can be kept damp without allowing water to seep through the bottom of the pot and thereby saturating the soil

Other factors influence the health of plants indoors—gas fumes, for example, and draughts—so both must be avoided if possible It will also be found that dust collects on the foliage, therefore plants with large leaves should be sponged regularly with soapy water Others, with hairy leaves, like saintpaulia, may be gently sprayed, but the water must not be allowed to remain on the foliage, as it may lead to scorching or rotting

Of all cultural practices, the most important is watering Unfortunately the right way and time to do this cannot be laid down emphatically, because the practice is essentially an art and not a science As a general guide, plants may become *nearly* dry before watering and then be given a *thorough* soak by standing the pots up to their rims in a bucket of water For all plants, rain-water is best, if tap water has to be used it should reach the same temperature as that of the room before being applied.

Soils and Potting.—However well a plant has been grown, the turning point culturally is in its repotting, as from this juncture it either grows vigorously or soon declines The important factor is to get the correct compost This may vary slightly, but an all-round mixture can be made up of

7 parts by loose bulk medium loam
3 parts by loose bulk granulated peat (or leaf soil)
2 parts by loose bulk coarse, gritty sand

This mixture is the basis of John Innes Potting Compost and, with fertilisers added, can be purchased in small quantities from horticultural sundriesmen If fertilisers are not added, plants should be fed during the growing season at about fortnightly intervals (depending on the particular plant) with a dilute solution of liquid animal manure, alternatively, 2 oz of the following mixture dissolved in a gallon of rain-water can be used:

5 parts by weight of sulphate of ammonia
7 parts by weight of superphosphate
2 parts by weight of sulphate of potash

Normally a plant will grow satisfactorily in the same soil for three or four years. After this annual growth may be poor together with yellowing or dropping of the foliage The plant is then in immediate need of repotting To do this a large crock should be put into the bottom of the new pot—which should be generally a shade larger—followed by a little compost Then the matted roots of the plant can be teased out with a pointed stick, put in the pot and more compost worked firmly around the roots. Some plants, of which palms are an example, prove intolerant of root damage, and repotting must be done with particular care, but, nevertheless, the compost must be made firm When repotting is not absolutely necessary, the top inch of soil can be taken off annually and the pot top-dressed with fresh compost. Both repotting and top-dressing are best done before growth starts in the spring

Propagation.—Many house plants are easy to propagate from cuttings or layered shoots. The former are taken off the parent plant at a joint in the stem by severing cleanly with a razor blade. After the lower leaves have been removed, the stems are inserted into a mixture of equal parts of sand and peat in a pot. A glass tumbler or specially-made, small, plastic tent is then placed over the top to avoid loss of moisture, and in a week or two rooting will have taken place As for layering, this can be done by bending a shoot into a pot of sandy soil and pegging it down at a joint When the layer has rooted it can be severed from the parent.

Health of Plants.—Fortunately the number of pests and diseases affecting indoor plants is small, and the large majority of troubles are due to faulty cultivation Occasionally aphids (green or black flies) may be found on young growth, and can be destroyed by carefully wiping affected leaves and shoots with water containing a little detergent, repeating the practice if necessary On ivies, in particular, sometimes a brown, waxy scale can be found. Underneath the protective scale is a small insect which sucks the sap, and without difficulty these can be removed by hand. Another insect occasionally seen is the mealy bug, an aphid which is surrounded by a prominent coating of a white, woolly substance, control in this case is to paint individuals with a dab of methylated spirits and to deal regularly with any reinfestation.

Basal rotting of flower stems and leaves, to be seen often on cyclamen and peperomias, is due to fungal infection, but this can be avoided by attention to correct watering and temperature. Similarly, premature yellowing of the foliage and leaf dropping is primarily a cultural trouble brought about by excessive cold, draughts, gas fumes, dryness, over-watering, perhaps over-feeding, or a combination of some of these factors

SELECTION OF PLANTS FOR GROWING INDOORS

Florists' Plants

These are plants, like cyclamen and cinerarias, which are purchased in flower and usually discarded when flowering has finished, as their value lies only in providing temporary colour. Most of them are forced for seasonal trade in the moist atmosphere of a heated greenhouse, so do not respond kindly to treatment indoors

One of the loveliest of these plants is *Azalea indica*, the Indian or evergreen azalea. After flowering it can be kept in a cool greenhouse It needs plenty of moisture, and as it is a calcifuge, only rain-water can be used To encourage growth after flowering, spray the foliage regularly and apply dilute, liquid animal manure or dilute soot water

The most popular florists' flower is the cyclamen. It is difficult to grow really well, and cultural notes should be followed. With expert attention old plants can be flowered for ten years or more, although the best results are obtained from one-year seedlings On the other hand, varieties of cineraria are grown as biennials These need cool, airy conditions, and should be watered freely but, at the same time, with care not to over-water.

At Christmas-time numerous varieties of primula will be offered for sale All of them are of comparatively easy culture, and if top-dressed and fed can be grown-on for a year or two. Some varieties, particularly those of *Primula obconica*, can cause a rash on those susceptible to it Other plants which can be kept after flowering are the varieties of *Solanum capsicastrum*, the winter

cherry. It is a pleasing little subject and quite easy to grow. In season, the small, bushy plants are covered with large, red fruits and can be kept healthy by regular spraying of the foliage and attention to watering. When the fruit falls the young shoots can be trimmed back, the plant repotted and then grown-on in a cool greenhouse.

Indoor Plants

Unlike the florists' plants, those in this section are grown as permanent features of a house. The ones listed can be grown in most homes if given reasonable care, and all of them are available through normal trade channels

Araucaria excelsa (Norfolk Island Pine).—Because of its likeness to a small fir tree, it is a plant to stand on its own. It is not difficult to grow if kept out of the full sun and the soil moist. One of the earliest plants adopted for growing indoors, but not often seen at present.

Begonia.—An enormous genus of plants of world-wide distribution, many being suitable for indoor cultivation. Of particular interest are *B. heracleifolia* and *B. manicata*, both being easy to propagate from cuttings under a tumbler

Billbergia nutans.—This is a member of the pineapple family, the Bromeliads, having typically narrow, spiny-edged leaves Nearly hardy, and will flower in a warm room. Do not repot unless absolutely necessary, as the roots are best confined.

Campanula isophylla (Harebell) —A charming blue-flowered plant with a long flowering period Easily grown in cool conditions, and its pendulous habit makes it useful for a basket After flowering, remove dead flower-heads and trim straggly shoots There is a good white form, 'Alba '

Cacti.—Innumerable sorts are used as house plants. In the main, all should be grown in a sandy, gritty soil with sharp drainage, water may be given freely in the summer, but withheld in winter, except to prevent the soil drying out Two cacti which will flower freely and are particularly worthy of cultivation are *Aporocactus flagelliformis*, the rat's tail cactus, and *Epiphyllum ackermanii* Both are tolerant of poor conditions and neglect Mention should also be made of the old-fashioned Christmas cactus, *Schlumbergera bridgesii*, as a great favourite, but an infinitely more exciting one of a similar type is the rare *Rhipsalidopsis gaertneri* with bright-red flowers These two are both easy to grow, and the latter was shown well at Chelsea in 1956

Chlorophytum elatum.—Will tolerate a range of temperature and responds to occasional feeding in the summer. It is most attractive, with its green leaves striped with cream-coloured bands. A good plant for beginners.

Crassula.—Shrubby members of this genus make fine house plants, growing well in light soil in full sun. Particularly valuable are *C. lactea*—which has white flowers annually and large, succulent, spoon-shaped foliage—and *C falcata*, a choice plant with red and yellow flowers

Ferns.—Some will grow in rooms, but well-grown specimens of maidenhairs and the like are hallmarks of first-rate cultivation Species of *Asplenium*, *Blechnum*, and *Nephrolepis* are worth trying. Compost is made up with equal parts of fibrous loam, peat, leafsoil, and coarse sand.

Ficus —Species like *F. elastica* 'Decora' with broad, leathery, shiny leaves are often seen as window decoration in large stores. Not easy to grow in some circumstances, leaf-drop and yellowing may be caused by fluctuations in temperatures or draughts, and rain-water should be used when watering.

Helxine soleirolii (Mind-your-own-business).—Appropriately named from its habit of thriving where it is not wanted. Makes a pleasant mass of thin, green, trailing stems. Should be kept always on the wet side.

Ivy.—Common in many continental houses, for ivies show an interesting range of colour, shape, and size in their foliage. Invaluable as climbing plants and in warm rooms, the Canary Island ivy is worth trying A related plant raised in France is *Fatshedera lizei*. All of these prefer a damp, leafy soil, and the foliage should be sprayed occasionally.

Monstera deliciosa.—A striking plant with large, deeply-cut leaves and long, thick, aerial roots, many of which do not reach the ground. Often seen as a prominent decorative feature of continental homes. Requires a leafy soil and generous watering. Spray or sponge foliage regularly and avoid fluctuation of temperature in its cultivation.

Nepeta hederacea variegata (Ground Ivy) —Creeping, hardy perennial native of Britain; variegated form makes an attractive addition to a hanging basket, having long stems and small kidney-shaped leaves. Correctly known botanically as *Glechoma* not *Nepeta* Good plant for beginners.

Palms.—Like the aspidistra, the palm is considered a relic of Victorianism, and on such slender evidence is condemned on many counts. Notwithstanding, palms of various sizes make good decorative plants Care must be taken when repotting, and for a number of years it is only necessary to top-dress provided that feeding is done in the summer To keep the foliage green, the leaves should be sponged regularly or, better still, the plant taken out of doors and vigorously sprayed with water from a hose.

Pelargonium (Geranium) —Ease of cultivation and beauty are found in this plant and its infinite varieties. Some of these, like 'Mrs Cox,' have multi-coloured leaves and are well worth hunting for in trade lists During the summer feed generously and keep the stock vigorous by rooting cuttings annually in the late summer

Philodendron.—Most climbing plants with aerial roots and represented by a number of species from tropical America Fairly tolerant of adverse conditions, but dislike draughts and require light shade, free watering, and a rich, open soil *P. scandens* with heart-shaped leaves, is typical of the climbing group, *P bipinnatifidum*, with broad, incised leaves, of the non-climbers

Saintpaulia (African violet) —A charming, dwarf plant with hairy leaves and pretty single and double flowers in many colours It is a *difficult* plant to grow well, as it thrives in a steady temperature of 65–70° F and a wet atmosphere Water from below Rotting of leaves is due to excess of moisture, draughts, cold, or gas fumes

Sansevieria trifasciata.—Perhaps unkindly but appropriately known as mother-in-law's tongue It has a distinctive appearance, with stiff, erect leaves striped with gold Keep warm and fairly dry, do not over-pot, tough

Saxifraga sarmentosa.—Of easy culture and hardy out of doors, should be afforded a cool position and kept moist Reddish leaves and pink flowers make it most attractive

Tradescantia (Wandering Jew) —Tolerant of neglect and makes a fine trailing plant For best results keep moist and feed during the summer When green shoots appear on variagated forms these should be cut out at once.

Vines.—Two of these are particularly valuable as climbing plants, *Cissus antarctica*, kangaroo vine, is a native of Australia, and *Rhoicissus rhomboidea*, a Natalese plant which does not appear to have been grown to any extent in Britain until after the Second World War.

Zebrina pendula.—Related closely to *Tradescantia*, and often their nomenclature is confused. Like its relative, *Zebrina* is a difficult plant to kill. Its leaves have a pleasing metallic lustre, and beneath are a shade of blood-purple. Introduced from Mexico sometime before 1850.

Games and Recreations

RECORDS

Games and Recreations

INTRODUCTION

THE people of Britain have always been fond of spending their leisure hours in pursuits requiring physical effort or mental effort or both, and of thinking out special ways of celebrating special occasions The result of this is a long history of games, recreations, and customs, some based vaguely on the pastimes of very ancient races, others appearing from time to time as the years and centuries passed; and, in a country with a strong sense of tradition, many activities of long ago still remain virtually unaltered, while many others retain much more than a trace of distant origins. For many years, most of the more highly organised pastimes were restricted to the nobility, but the ordinary people often contrived simplified or less formal versions of them, and always had plenty of recreations of their own. While the nobility took part in the joust that was the forerunner of fencing, the people took part in wrestling that remains wrestling, while the nobility enjoyed casting the bar that became throwing the hammer, the people enjoyed throwing the javelin that remains throwing the javelin, while the nobility performed masques and court dances, the people performed country dances both sections of the populace thus playing their parts in paving the way for the theatre and the ballet

About a century ago, games began to show more signs of organisation, with governing bodies coming into being to control them, and rules becoming fixed and codified The object of these measures was to make the games available to more people, but the effects were, firstly, to make them more formal and less spontaneous, and secondly, to make the eventual classification of players of them according to ability at them inevitable The next stage was probably equally inevitable. If you have classes, you have a top class, and the top class is presumably worth watching. People began to spend the leisure time that had been used for playing games in watching others play them This development began about seventy years ago, and reached its climax between the first and second world wars, when not only games but also entertainments had multiplied and reached such high standards that they attracted as spectators those who, feeling that they were not good enough to participate, began to lose the desire to do so

The second world war changed that, and started to swing the pendulum back again It was a testing time that might have driven all thoughts of games and recreations out of people's minds, but it actually had the reverse effect People needed recreational activities and entertainments as a relaxation, and a great many people were stationed in remote areas where, if they wanted these things, they had to provide them for themselves Many, forced into a more active life than they had led for years, returned to games they had not played for years, and many, starved of entertainment, took to providing entertainments for their fellows In many cases, the taste for these activities acquired during the war was retained after it, and it was helped and strengthened by various developments On the one hand, there was a definite effort by certain associations and bodies to bring recreational activities, including some that had previously been the prerogative of the wealthy, within the reach of all, and to provide facilities and instruction in them, on the other hand, there was television Television has been accused of restricting social activities by an ability to hypnotise people and keep them tied to their sets It may well deserve some of these strictures, but there is also something to be said on the other side. It brings demonstrations of various activities to people who have never seen them before, and who, having seen them, often feel that they would like to try them, and, by bringing top-class sport to people's homes, often at times other than those normally used for outdoor recreation, it frees people who want to see the events from the necessity of giving up their own outdoor activities to watch them. This showing of major events at times more compatible with viewers' own recreational activities is achieved in two ways, one being the use of telefilms, and the other because of yet another post-war development, that of the playing of first-class fixtures in the evening by floodlight Still another factor in the move back to practical, physical recreation is, of course, the increased leisure provided by shorter working hours To-day, there are more people about than there ever were before, there is more spare time than there ever was before, and there are more recreational activities than there ever were before

Any attempt at a thorough coverage of the present vast field of games and recreations in one section of this volume would be doomed to failure unless some limitations were applied There is, therefore, no mention of sports in which the participant is largely dependent on mechanical aids, and none of racing, in which only a comparatively few people can actually take part as riders There is however, some mention of most sports and games popular in Britain, including fairly recent importations from abroad, and including also some overseas games that have not yet reached Britain Indoor games are also included, though one section of them, card games, has had to be restricted to what might be called the major and most popular games of skill Mention is also made of various non-competitive recreations, indoor and out, of children's games, again indoor and out, and of old games and customs in Britain and elsewhere, some of which survive to-day in whole or in part

One problem that confronts those keen to try some game or recreation is how to set about it In many cases, the simplest way of finding out what facilities exist in a particular area is to enquire at a local newspaper office, which will have particulars of all sports clubs, dramatic societies, and other recreational bodies in the area A few addresses that might be useful to those with certain specialised interests appear at the appropriate places in the text, and a valuable source of helpful information on many games and recreations is the Central Council of Physical Recreation, which has English, Scottish, Welsh, and Northern Irish addresses as follows: England, 6 Bedford Square, London, W C 1, Scotland, 4 Queensferry Street, Edinburgh, 2; Wales, 18 Windsor Place, Cardiff, and Northern Ireland, 45 Arthur Street, Belfast Those keen on touring the country at moderate cost might appreciate the services provided by the Youth Hostels Association, which has addresses as follows: England and Wales, Trevelyan House, St. Albans, Herts, with a London office at 22 Gordon Square, London, W.C.1, Scotland, 7 Bruntsfield Crescent, Edinburgh, 10; Northern Ireland, 28 Bedford Street, Belfast; and the Irish Republic, 39 Mountjoy Square, Dublin.

American Football.

American Football is played eleven-aside on a pitch marked by a line across it every 5 yards, and with goals and a ball resembling those used in Rugby Football (q v), though the ball is smaller. Scoring is by "touchdowns," which are like Rugby tries, but count six, goals after touchdowns, which count one, field goals during play, which count three, and "safeties," which give the attacking side two points if the defenders carry the ball over their own goal-line and touch it down The ball is advanced by carrying it, forward passing, and kicking The game consists of a series of "plays" or "downs," the ball becoming dead when the ball-carrier is tackled A team must advance 10 yards in four downs or give up the ball to their opponents Players can run ahead of the ball-carrier to protect him by "blocking" opponents. Penalties take the form of distance, usually 5 or 15 yards, lost A game lasts 60 minutes, divided into four 15-minute quarters

Angling.

Angling, which is catching fish with rod, line, and hook, goes back to beyond the beginning of history, for it was known to the Greeks and Romans It is now a recreation, for, though the catch may subsequently be cooked, it is not primarily fishing for the pot It has its competitive side, with competitions offering prizes for the biggest catch, and there are angling clubs, but many people prefer to use it as a recreation to be enjoyed alone in quiet surroundings It is actually not so much a recreation as many recreations, for fishing can take place in the sea, rivers, lakes, ponds, and even canals, and there are several entirely different kinds of angling The most obvious divisions are fresh-water fishing, including coarse and fly-fishing, and sea angling, including fishing from piers and the shore and big-game fishing

The biggest branch of angling is fresh-water fishing for general or "coarse" fish, which are so called to distinguish them from "game" fish like salmon Coarse fishing is bait fishing, or, in the case of pike, spinning, groundbait also being thrown in before and during fishing It covers many varieties of fish, and the bag may be a very mixed one Certain fish, of course, are known to frequent certain localities or types of locality, but, though the angler may know exactly the kind of fish he is after, he rarely knows if his catch will consist entirely of that kind of fish, or even if it will include any of that kind Coarse fish do not generally make good eating

Fly-fishing for salmon and trout differ widely from coarse fishing, and from each other As the name implies, artificial flies are used, but those used for trout are quite different from those that attract salmon In the case of trout, a fly is made to resemble a real insect as closely as possible, but, with salmon, this is not necessary Salmon rarely, if ever, feed in fresh water and, when in that type of water, they are usually irritable They will dart wildly at any objects that attract their attention, so salmon flies are simply bright objects designed to draw them on. Fly-fishing is rather an expensive sport, for it means hiring beats on private water In both coarse and fly-fishing the angler would be well advised to keep out of sight of the quarry as much as possible

Old though angling itself is, sea angling is a comparatively recent development of it, really dating back only to the nineties of the nineteenth century. It is now the most competitive form of angling, with sea-angling festivals and competitions plentiful during the holiday season As with coarse fresh-water fishing, the catch can be a very mixed one Sea angling has what might be called its equivalent of fly-fishing in fishing with feathers, which attract several kinds of fish

The sea is also the scene of the greatest of all forms of fishing, big-game fishing, when a single bite can mean a catch of 1000 lb., if the angler can win the terrific battle to land it. Big-game fishing takes place from a motor-launch, which is not towed by the hooked fish, but follows it, so that the ensuing fight is between man and fish, and not between the fish and the dead weight of the boat. Such a fight could last for 12 hours, and it is never certain that the angler will win it. With fish of this size, some of them with a terrifying armoury of razor-sharp teeth, liable to turn back on the boat or leap clear of the water, big-game fishing can sometimes be as dangerous as the most adventurous sportsman could wish.

Archery. *See* **Old English Games and Customs.**

Association Football.

Games that may have resembled football were played by very ancient races, and games that certainly were football of a kind were played in the England of several centuries ago, but the Association Football that is the most popular game in Britain, and perhaps the world, to-day had its origins in the games played at English Public Schools in the days before sport became organised.

It was not surprising that some of those who had played football of one kind or another at school should want to go on playing after they left, but, before they could do so, it was necessary to work out a set of rules that would be universally understood and accepted Meetings were organised by those interested, and, as the universities were natural meeting-places for boys from many schools, it was there, particularly Cambridge, that these took place

It was soon evident that there was a major difference of opinion between those who wanted handling permitted and those who opposed this. The rival factions proved irreconcilable, so they went their separate ways The handling enthusiasts based their rules on those in force at Rugby School, and thus pioneered Rugby Football (q v) Those who felt that football should be played primarily with the foot brought into being the game that was to take its name from the Association that was formed, in 1863, to govern it, and became Association Football, often called by the abbreviation, "Soccer"

Soccer is played with a round, leather-covered ball weighing from 14 to 16 ounces, and with a circumference of from 27 to 28 inches, on a pitch marked out as in the accompanying diagram It is played eleven-aside, the positions being goalkeeper, right and left full-backs, right, centre, and left half-backs, and five forwards, playing at outside-right, inside-right, centre-forward, inside-left, and outside-left The object is to score goals by putting the ball between uprights 8 yards apart and under a crossbar 8 feet high. The ball is advanced by kicking or heading, but only the goalkeeper when in his own penalty area may handle it, and he may not carry it A game lasts for 90 minutes, divided into two halves.

The game is started by a kick-off from the centre, with all the opposing players outside the centre circle and in their own half. The ball must travel at least its own circumference into the opponents' half, and the kicker may not play it again until someone else has done so. The right to kick-off is decided by a toss that gives the winner the option of kicking or choosing which goal he will defend. Ends are changed at half-time, after which the ball is kicked-off by the side that did not do so at the start. The game is restarted in this way after each goal, the non-scorers kicking-off

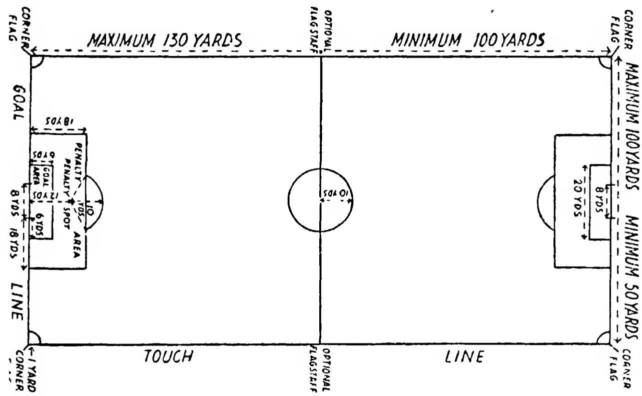
If the ball crosses the touch-line it is thrown in by a player of the side that did not put it out, the throw being two-handed. If it crosses the goal-line wide of the goal it is kicked-off by a defender from the 6-yards line if the attackers were responsible, and by an attacker from the intersection of the goal-line and the touch-line if the defenders were responsible.

Infringements are penalised by free kicks, which may be "direct" or "indirect" Direct free kicks, from which a goal may be scored, follow deliberate infringements, indirect free kicks, from which a goal cannot be scored, being for more technical offences Offences by defenders in the penalty area are generally penalised by a penalty

kick, which is a shot from a spot 12 yards out from the centre of the goal, with only the kicker and the goalkeeper in the penalty area, and the goalkeeper barred from moving until the ball has been kicked. However, certain offences in the penalty area, such as carrying by the goalkeeper and obstruction, are penalised only by an indirect free kick.

A player is "offside"—called "sneaking" in the school games from which the rule came—if he is nearer the opponents' goal-line than is the ball unless there are two opponents between him and the goal-line, or unless the ball was last played by an opponent. He cannot, however, be offside in his own half, from a corner kick, or from a throw-in. If a player in an offside position interferes with the game, a free kick is awarded

A game is controlled by a referee, who has the assistance of two linesmen. These may signal



infringements, but the referee is not bound to act on such signals.

In Britain, soccer is a winter game, the season lasting from August until May, though, in Scotland, it continues even during the short summer season in the form of five-aside football, known as the "short" game. British soccer is highly organised, ranging from the fully professional Football League of four divisions and the equivalent, though slightly smaller, Scottish League through minor professional leagues to amateur leagues. There are also many cup competitions, from the Football Association Challenge Cup and the Scottish Cup downwards

The game has also spread almost all over the world, being extraordinarily popular all over Europe and in South America, and played to some extent in the United States, Canada, South Africa, Australia, and other areas. There is a World Cup competition that is played for every four years, and an annual European Cup competition played for by the top club of almost every European country Soccer is also included in the Olympic Games.

Athletics.

The sport of Athletics, which includes running, walking, jumping, and throwing, is probably the most natural of all sports, and certainly one of the oldest, for it began in the days of pre-history or of mythology. Details of the Olympic Games of 776 B.C. are known, and it is certain that the Games were being held long before that. The story of Athletics is not, however, a continuous one, for the Romans discontinued the Games.

A later starting-point might be found in the country sports of various periods of English history, but, though these included some events that might be regarded as the ancestors of certain modern athletic events, they were mainly concerned with activities far removed from Athletics.

Modern Athletics probably really began in 1849, when the Royal Military Academy instituted a meeting that was followed by a similar meeting at Exeter College, Oxford, and, subsequently, at other Oxford and Cambridge Colleges The Civil Service were also early in the field; and the first athletic club was the Mincing Lane Athletic Club, now the London Athletic Club. There was also the Amateur Athletic Club, which organised an annual championship meeting, and acted as a governing body for both athletics and amateur boxing

In 1880 the Amateur Athletic Association was formed as a governing body. Other countries, particularly the United States, took to the sports and in 1896 the first modern Olympic Games were held at Athens. Other international meetings and matches followed, and championships and competitions of all standards were started in many countries Women came into the sport in the early 1920s, and were included in the Olympic Games in 1928 There is now a long list of internationally agreed standard events, including distances measured in yards and miles, and also their metric equivalents; and including also a major all-round test, the ten-event Decathlon

The longest strictly standard distances are the Marathon of 26 miles 385 yards for runners, and 50,000 metres for walkers, but there are regularly held longer events For runners, the longest annual race is between Durban and Maritzburg, about 55 miles, the longest in Britain being from London to Brighton, about 53 miles, but there are occasional 100-mile and 24-hour events. For walkers, there are annual 100-mile races and fairly regular 24-hour ones.

The Marathon is not, as might be expected, a revival of an ancient Greek race, for the Greeks had no races longer than 3 miles. It does, however, commemorate an ancient Greek event that is quite possibly no more than a legend the supposed run by Pheidippides to take the news of the Battle of Marathon to Athens in 490 B C The first Marathon race, in 1896, was from Marathon to Athens, but the standard distance of the race is that of the 1908 Olympic Marathon from Windsor to the White City, London, which had just been held when it was thought advisable to have an exact standard distance. All Marathons commemorate the Battle of Marathon, but the oldest annual Marathon, the Boston Marathon, also commemorates the Battle of Lexington (the first battle of the American Revolution), and, more particularly, the ride by Paul Revere that preceded it

Athletics is entirely an amateur sport. There are some professional races, but this side of the sport is called, not athletics, but pedestrianism.

There is a famous annual professional meeting at the Powderhall Grounds, Edinburgh, and there are other events in Scotland and the North of England. There are also professional meetings in Australia, chiefly in Victoria.

●

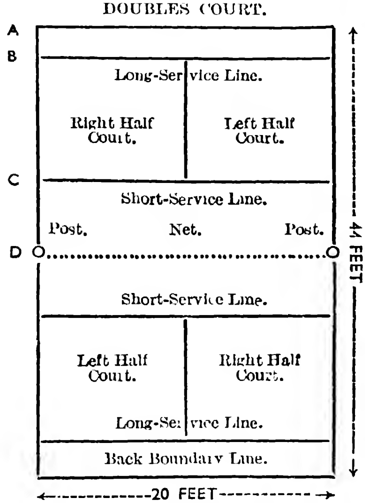
Cross-Country. Athletics is mainly a summer sport, but in cross-country running it has an extremely popular winter branch

Cross-country originated in the traditional runs at various English Public Schools, particularly Rugby and Shrewsbury, and came into wider prominence when it was adopted by the Thames Rowing Club as winter training. It is still used as training by many sportsmen of all kinds, but it is

Badminton might be described as an indoor version of Lawn Tennis (*q.v*) in that it is played over a net, and can consist of either singles or doubles. There, however, the resemblance ceases Scoring is by single points, and only the servers score, winning shorts by the receivers ending service sequences. The equipment used is lighter than that of Lawn Tennis, particularly the "shuttles" or "birds" that replace the ball. These are half-circles of cork in which feathers are fixed, and, as they do not bounce, all shots are volleys Unlike Lawn Tennis, shots are made with the wrist, rather than the whole arm

It is often said that it is impossible to play both Lawn Tennis and Badminton well, but this is not really true. Though the techniques differ, the

DOUBLES COURT.



NOTE.—If it is practicable place the posts on the side boundary lines, failing this, place them at any distance not more than 2 ft. outside these lines.

now also a thriving competitive sport in its own right There is an International Championship, but this is not yet fully representative, being virtually confined to Western European nations. Major cross-country championships are over courses of 9 or 10 miles

Australian Rules Football.

Australian Rules Football is played 18-aside on large, oval grounds There is no offside, and scoring in goals and behinds (near misses) is high It is played to the practical exclusion of all other forms of football in the southern half of Australia

Badminton.

Badminton is said to have been invented by two guests at the Duke of Beaufort's house at Badminton in Gloucestershire, who spent a wet afternoon playing with the children's battledores and shuttlecocks. It seems certain that the game we know to-day did take shape at Badminton, from which it takes its name, but it is likely that its basis was a game originally played in the Orient.

eye for the moving object is the main requisite of both games Badminton is a winter game, and many Lawn Tennis players turn to it during that season

Ballroom Dancing.

Though the actual dances have changed from time to time, Ballroom Dancing has been one of the most popular of all recreations for a very long time, and while, in recent years, some other evening activities and entertainments have declined in popularity owing to the growing interest in television, the popularity of dancing has actually increased to a remarkable extent.

For many years, the "standard" ballroom dances have been the foxtrot, the quickstep, the waltz, and the tango, but these have frequently been augmented by various other dances, often novelty dances, that have been the subjects of sudden, and generally short-lived, crazes. A stronger challenge, however, has come from Latin America, which has exported quite a number of dances, most of them arousing some interest, and some of them winning and holding firm places Many of them are ballroom versions of old native

and folk dances, which were often solo dances in their original form.

Dancing is highly organised, with its "governing body" composed of qualified teachers, and each dance has its recognised and approved fundamental steps and variations on those steps. If the popularity of a new dance justifies it, the authorities recognise it and approve step sequences. Many people dance regularly without ever having a dancing lesson, but, for the many others who really want to know all about the different dances and steps, there are countless dancing schools all over the country, where dancing is taught both in classes and in private lessons, and where special classes are arranged to teach any new dances that appear. These schools cater for absolute beginners absolutely regardless of age, and also for experienced dancers who want to rise to still higher standards.

A great many people dance purely for pleasure, and never think of dancing as a competitive activity. It is one, though, and there is a link between purely recreational dancing and competitive dancing in the system of medal tests. In these, dancers do not compete with other dancers, but simply try to achieve a certain standard. Beyond these tests, there are numerous competitions, ranging from local ones to world professional and amateur championships and international matches.

A fairly recent and very popular ballroom dancing innovation is formation dancing, in which teams consisting of a number of couples perform dances either as exhibitions or in competitions.

Old-Time Dancing. The most striking and, in some ways, surprising dancing development of recent years has been a tremendous increase in the popularity of Old-Time (often described as Old-Tyme) Dancing. A few old dances, such as the veleta, which, despite its name, is of English origin, had always retained at least a small place in dancing, but the organisation of dances in which every dance was of what might be called approximately veleta vintage was a new idea that seemed destined to enjoy at most the short-lived success that is the reward of novelties. That, however, was not the case. Interest in this type of dancing increased, and it has long since become firmly established, even to the extent of offering competitions. It is, in fact, no longer really true to describe it as old-time, for it is definitely part of the dancing of to-day.

This popularity is not, after all, so very surprising, for an old-time programme offers a wide variety of dances, most of them accompanied by exceptionally tuneful music. The dances are really similar to what, in some other countries, such as, for instance, Scotland, would be called country dancing, and include ordinary "pair" dances, sequence dances, progressive dances, and set or square dances. The veleta holds its place, as do several kinds of tango and many kinds of waltz, as well as the Canadian barn dance, the Boston two-step, the maxina, the lancers, and cotillions and quadrilles. Strangely enough, the cheerful Bohemian dance, the polka, is rarely seen. Old-time dancing provides no scope for just "walking round." The steps are in regular sequences, and all the dancers are making the same movements at the same time.

Bandy. *See* **Skating.**

Baseball.

The invention of Baseball, a summer game played from April until October, and the national game of the United States, is generally credited to an Army officer, its origins being old country games called "One Old Cat" and "Two Old Cat."

Teams are nine-aside, and bat and field in turn. The main part of the ground, the "diamond," has a "base," marked by a sack, at each corner, the lines from sack to sack being the "base paths." One base is "home," and there the batter stands, by a square of rubber on the ground, called the "plate." The base forward and to the right of a right-handed batter is "first," the one straight ahead of him is "second," and the one forward and to his left is "third," the distance from one base to the next being 30 yards. 20 yards out straight in front of the plate is the pitcher's "mound." The lines from home to first and from home to third are continued beyond these bases, and are the "foul lines."

It is the object of the batting side, using a bat which resembles a long, heavy Indian club with which to hit a hard, white ball weighing 5 ounces, to score runs, one being scored each time a player completes a circuit of the bases, not necessarily from one hit. When a batter leaves the plate, either "out" or to proceed along the base paths, the next man comes in, the team's innings lasting until three men are out. Nine such innings complete the game, and, in each innings, the batting side carries on at the point in the batting order reached in the previous innings. There is no toss for first innings, the visiting side always batting first.

The pitched ball reaches the batter without touching the ground, and, if not hit, it should pass over the plate between the batter's shoulders and knees. If it does so, it is a "strike," and three such strikes dismiss the batter. If it does not, it is a strike only if the batter swings at it, otherwise it is a "ball," and four balls give the batter a free passage to first base, called a "walk." A batter also walks if he is hit by a pitched ball. Other ways in which the batter can be dismissed are by being caught, and by being "put out" while on the base paths by failing to reach the base to which he is running before the ball. When an out is made, the ball does not become "dead." If there is more than one runner on the base paths, then, if the ball can be relayed quickly enough, two, or even three, men can be put out on the same "play."

If the batter hits fairly, he must run, but, to be fair, the hit must be in front of him and between the foul lines. A "foul hit" counts as a strike against him, except that the third strike, which actually dismisses him, must be a clean one across the plate. If a foul is caught, he is out.

The fielding side is divided into three sections, the "battery," the "infield," and the "outfield." The battery consists of the pitcher and the catcher, who stands behind the plate and gives signals indicating the kind of ball he thinks the pitcher should deliver, for, though the pitched ball does not touch the ground, pitchers can produce a wide variety of deliveries, including various kinds of curve. The infield consists of the first baseman, at or near first, the second baseman, between first and second, the shortstop, between second and third; and the third baseman, at or near third. The outfield covers the ground beyond the infield, the three remaining fielders taking the right, centre, and left sections of it. Catchers wear a large glove on the non-throwing hand, a mask, a chest protector, and leg-guards. All the other fielders wear a glove on the non-throwing hand, the first baseman's being larger than the others. The batter wears no protective gear.

Substitutes are permitted, pitchers frequently being changed if they are being hit, and "pinch hitters" being sent in instead of weak batters if a hit is desperately needed. If this happens, the man replaced, often the pitcher, cannot return when his side fields again, though his field replacement need not be the man who batted for him.

As with Cricket (*q.v.*) batting averages are recorded, these being calculated by dividing the number of times at bat into the number of hits. An average of 0.400, referred to as "four hundred," would be exceptionally good. "Hits" mean safe hits on which the batter achieved one or more bases without giving a chance. If he reaches base because a catch was dropped or a ball misfielded, he plays on from there in the usual way, but is not credited with a hit. Pitchers are graded according to the number of games won and lost. Recorded fielding statistics include each man's "put outs," "assists," which are throws from which a team-mate made a put out, and "errors."

In the United States there are clubs and leagues of all standards, from professionals of various classes through semi-professionals to amateurs, called "sandlotters," and boys The top class of all consists of two major leagues, the National and the American, each with eight clubs. The champions of these two leagues meet in a best-of-seven-games series for the "Championship of the World," always known as the World Series.

Baseball is also the chief summer game of Canada, and it is quite widely played in some other countries, including Australia, Britain, and Japan

Softball. Similar to Baseball is Softball, which is popular in the United States with girls as well as men, and which was demonstrated in Britain during the War by American and Canadian servicemen. The ball is not particularly soft, but it is larger than a baseball, and pitching is under-arm Distances between bases, and between the plate and the mound, are shorter than in the parent game.

Basketball.

Basketball was invented by an American Y M C A official at Springfield, Massachusetts, as a winter team game that could be played indoors It can be played in almost any gymnasium or hall, and it can also be played outdoors on an asphalt court In America it is played by teams of all standards from schoolboys to professionals, and it is watched by more spectators than any other game. It has also spread to almost as many other countries as has Association Football (*q v*), and it is included in the Olympic Games It has been established for some years in Britain, where it has been encouraged by the Services and the Y.M C A

Basketball is played five-aside, substitutes being permitted, with a ball resembling that used in Association Football, and goals consisting of posts that have iron rings with short nets attached to them and backboards It is purely a handling game, and the ball is advanced by dribbling, which means bouncing, and by passing Deliberate bodily contact is not allowed Goals thrown during play count two points, and goals thrown from free throws after infringements one point Height is an asset in the game, which demands stamina and agility, and which has been highly recommended as an ideal training activity by coaches of other sports, particularly Athletics (*q v*).

Girls also play Basketball in many countries, but not in Britain, where the nearest approach to it for women is Netball (*q v*).

Billiards.

Billiards, which originated in France, is a game of angles, and of very great skill It is played on a table measuring 12 feet by 6 feet 1½ inches, having six pockets, one at each corner, and one in the middle of each side The table is covered with green baize, the edges being of cloth-covered rubber, called "cushions" Across the table, 2 feet 5 inches from the bottom edge, is a line, called the "baulk" line, the space between the line and the bottom of the table being "baulk" On the baulk side of the line there is a semi-circle with a radius of 11½ inches from the centre of the line. Down the centre of the table are four "spots," one 12¾ inches from the top, one midway between the top and the centre, one in the centre, and one in the middle of the baulk line. Two white balls, one with a spot for identification purposes, and one red one, are used, the balls being played with "cues" that taper down to a striking tip. The remaining equipment includes a long, cue-like stick with a metal cross fixed diagonally on the end, called a "rest" or "jigger," and a special long cue, these being used when the player cannot reach his ball in the ordinary way Most games are "singles," though "doubles" can be played, the object of the game being to score points according to fixed rules, an agreed number of points making the game.

To decide who is to start, players "string" by playing their balls simultaneously from baulk up to the top cushion, the ball which returns nearer to the bottom cushion winning. At the start, the red ball is "spotted" on the top spot, and players start from the baulk circle Scoring is three for pocketing, or "potting," the red or going in off the red, two for potting the white, which is, of course, the opponent's ball, or going in off the white, and two for a cannon, which is hitting both the other balls A player whose shot hits no other balls at all gives one point to his opponent, unless his ball goes into a pocket, when he forfeits three. A player's turn, called a "break," continues as long as he is actually scoring. When the red is potted, it is immediately respotted

Snooker. Also played on a billiard table, and perhaps even more popular, is Snooker, which uses 22 balls, positioned as follows: 15 reds in the form of a triangle with its apex on the second spot from the top, and its base at the top end; a black on the top spot, a pink touching the apex ball of the triangle, a blue on the centre spot; a brown in the middle of the baulk line, with a green beside it on the left end of the baulk circle, and a yellow on the right end, and a white, which is the cue-ball to be played. The points values of the balls are from one for red, through yellow, green, brown, blue, and pink, to seven for black A player's turn continues as long as he scores, his first shot being at a red, when, if he pots one, he plays at one of the other colours, play being at reds and colours alternately as long as balls are being potted, and as long as there are reds on the table, after which the remaining colours are played in ascending order of value.

A variation of Snooker is Snooker Plus. This uses two additional balls, an orange, placed between the pink and the blue and valued at eight points, and a purple, placed between the blue and the brown and valued at ten points

Pool, Russian Pool, and Pyramids Other games played on a billiard table include Pool, Russian Pool, and Pyramids In Pool each player has a ball of a different colour, the order of play being white, red, yellow, green, brown, blue, pink, black Each player plays at the ball of his predecessor, and tries to pot it, the game starting with white spotting his ball on the top spot, so that red is actually the first to play A player whose ball is potted loses a life, players losing three lives dropping out of the game A turn continues as long as a player is potting balls, and if he clears all the balls on the table he then spots his own ball for the next player.

Russian Pool uses the yellow, green, blue, and black balls, with the white as cue-ball, the black being placed on the top spot, the blue on the centre spot, the green on the left side of the baulk circle, and the yellow on the right side A player's first shot must hit the black, after which he can play at will Scoring is by potting balls, by going in off balls, and by cannons, but the black can be used only for the top pockets, the blue for the middle pockets, and the green and the yellow for the bottom pockets Cannons count two, potting or going in off counting nine for the black, seven for the blue, five for the green, and three for the yellow A player's turn continues as long as he is scoring, but consecutive cannons on the same balls are limited to 25, and the same ball must not be potted from the same spot more than three times in succession A complete miss forfeits three points. A variation of Russian Pool adds the pink ball, which is spotted on the second spot from the top, counts six, and can be used with any pocket

Pyramids uses the 15 reds, starting in their triangle, and a white cue-ball, the object being to pot the reds. A turn continues while a player is scoring, 8 balls potted ending the game.

Bird-watching.

Mention of Bird-watching might well bring thoughts of uncomfortable, and even hazardous, journeys to remote islands off the coast of Scotland, or at least to desolate parts of the Scottish

mainland, but, while it is true that expert bird-watchers of long experience do frequent these localities, as well, of course, as less-remote places like the Norfolk Broads, bird-watching can be practised, and should certainly be started, much nearer home, and with birds seen by almost everybody, though properly observed by very few, every day.

Bird-watching means exactly what it says: watching birds flying; watching two birds to see if they are, in fact, a pair, or if they are two males competing for the attentions of a hen-bird, which may be near by, watching where and how and with what materials they build nests, watching what they eat and how they get it, watching a pair in a nest to see if the male plays a full part in their domestic life, or if he just sits on a branch singing while the female does it all. If the bird-watcher really wants to increase his knowledge, and perhaps that of other people, careful observation accompanied by careful note-taking is essential, and will reveal some surprising facts It has, for instance, been discovered that a pair of quite ordinary "garden" birds may fly sixty miles a day for every hundred yards their source of food is from the nest, and that the collecting of materials for building a nest may mean a total of six hundred miles flying In time, the bird-watcher may wish to go in search of more unusual birds in remote places, but if he is anxious to increase the general knowledge of birds he might do better to remain close to his home, for, so keen have the experts been to track down the rarer birds, that far more is now known about them than is known about "ordinary" birds like the blackbird and the thrush.

Bird-watchers who would like to contact and compare notes with those with similar interests can do so by joining a Natural History Society, of which there is at least one in almost every county, full particulars generally being available at public libraries.

Boat Races.

Race rowing is a strenuous sport that makes no pretence of attracting as many active participants as some other sports and games, yet its long history includes races with unusual stories about them, races that are amongst the greatest annual international sporting events, and one race that provides what is probably the most enthusiastically supported free sporting spectacle in the world.

That, of course, is the Oxford and Cambridge University boat race, rowed on the Thames from Putney to Mortlake First rowed in 1829, it has offered its excited public, which includes thousands of people with no connection of any kind with either university, everything, including runaway victories, dead heats, and even sinking boats. To all intents and purposes, this is a regular annual event, and has been so since 1856, but, in actual fact, every race is the result of a separate special challenge from the losers of the previous race to the winners of it The race has an interesting parallel in the United States, where Yale University, whose colours are dark blue, annually meet Harvard University, which is at Cambridge, on a river called the Thames.

The Oxford and Cambridge race is the best-known annual race on the Putney-Mortlake stretch of the Thames, but it is by no means the only one. There are other races that attract entries sometimes numbered in hundreds entries that are far too big to race abreast on the Thames, and so race in single file, with crews following each other at fixed intervals in what are known as the Head of the River races The biggest of these is for crews of eight, but there are other Head of the River races for women's crews, who cover only part of this famous stretch of water, and for single scullers Single scullers also cover this course in a straightforward race in the Wingfield Sculls event, which ranks as the English Amateur Championship, and which was first held one year after the first Oxford and Cambridge race, in 1830.

Head of the River races, but with a difference, are also held between the colleges of Oxford and Cambridge, where the Isis and the Cam, respectively, are much too narrow to permit straightforward racing These are the Bump Races, in which each crew endeavours to catch and bump the crew ahead of it, except for the leading crew, which can concentrate on staying in front. When a bump is achieved, the two crews pull into the bank, and change places for the next day's racing The racing goes on for four days, and it is, of course, the ambition of each crew, apart from the leaders, to register a bump on each day.

Back on the Thames, but farther down it towards the port and docks of London, is the scene of a race that makes the Oxford and Cambridge race and the Wingfield Sculls look like recent innovations This is the annual race from London Bridge to Chelsea for the Doggett's Coat and Badge, a single sculling event open only to young watermen who are within twelve months of completing their apprenticeship It was founded in 1715 in honour of the House of Hanover, and to commemorate the anniversary of "King George I's happy accession to the throne of Great Britain," by Thomas Doggett, a Dublin-born actor connected with the Drury Lane and Haymarket theatres, who regularly travelled on the Thames in preference to using the roads, and who left a sum of money to perpetuate the race, which is now controlled by the Fishmongers' Company.

This race is more truly an annual one than almost any other event, for, while most so-called annual races have been subjected to long interruptions because of the two World Wars, those qualified for the Doggett races during those years were subsequently traced, and the races duly decided after the wars The event is a colourful one, always followed by a barge carrying a batch of past winners wearing the Coat and Badge, and also the cap, breeches, silk stockings, and buckled shoes that go with them The scarlet, pleated, quilted Coat, with its silver buttons and the large silver arm Badge bearing the White Horse of Hanover and the word "Liberty", are presented at the Fishmongers' Hall, where the winner is greeted with a salute of trumpets and the tune, "See the Conquering Hero Comes"

For a rowing event of a very different kind, dating back "only" to 1839, one must go up the Thames, far beyond the end of the Tideway, to Henley, for the annual Royal Regatta This consists of events open to the world and others closed to English colleges and schools for eights, fours, pairs, double sculls, and single sculls, the most famous of its races being the Grand Challenge Cup for eights and the Diamond Sculls

A journey far from the Thames will bring to light the story of a rowing trophy that first appeared sixteen years before Oxford first met Cambridge The Carrow Cup was awarded for a four-oared race on the River Yare, in Norfolk, from Carrow Bridge to Whitlingham and back in 1813 Sometime during the 1840s that cup disappeared to reappear in 1890—in Australia In 1947 it came into the possession of the Victoria Rowing Association, which made it the trophy for a pan-oared race, but sent it to England for exhibition in the 1948 Olympic rowing museum There it was recognised as a Norfolk trophy, and, though it returned to Victoria, it came home again in 1950, when the Melbourne club gave it to the Norwich Rowing Committee, which now annually awards it to "the Norwich club whose general performance, judged by a points system in Regattas, shall be best"

Bobsleigh Riding. *See* **Winter Sports.**

Bowls.

Bowls, one of the oldest of all games, was once regarded as "an old man's game," but it actually has many devotees of all ages and both sexes, and is played indoors as well as outdoors. It certainly goes back to the thirteenth century, when its

popularity made it one of the games legislated against as likely to draw people away from archery Henry VIII played, and the famous game on Plymouth Hoe, in which Sir John Hawkins stayed to beat Sir Francis Drake even after the Armada had been sighted, if not definitely authenticated, is accepted as fact by several historians It is interesting to note that, if this game was played, it would have been almost identical with a game of to-day, for it was in that century that the "bias" that is a leading feature of the bowls or "woods" was introduced. A century later, however, Bowls, which was largely played on greens attached to taverns, acquired a reputation as being merely an adjunct to pot-house revelry, but it was revived on a higher level in Scotland, and never again came so near to oblivion

There are actually two games of Bowls, the Rink or Level Green game and the Crown Green game, and it is the rinks rather than the objectives that differ The Level Green game is the more widely played, and it takes place on a perfectly flat piece of well-cared-for turf The Crown Green game, which is popular in the North and Midlands, is played on a green of which the centre is 6 inches or more higher than the corners The games differ—for instance, in the putting into play of the object ball—but only slightly, so it will be appreciated that the Crown Green game demands a good deal of experience and skill It is mainly a singles game, whereas the Level Green game is played between sides consisting of one, two, three, or four players

Bowls looks a simple game, the object being simply to place the bowls as near as possible to the object ball, or "jack" The bowls, however, are "biased," and the game is actually one of considerable skill When bias was introduced, it took the form of weighting with lead, but it is now achieved by turning one side of the bowl less round than the other Level Green bowls weigh up to 3½ lb, but Crown Green bowls are smaller and less biased On the Crown Green, however, the jack, which is played into position by the first player, is also biased

Players normally use two bowls in a game, or four in singles, and the side with the best record of bowls near the jack wins the "end," and the best record of shots in an agreed number of ends the game

A Bowls green is such a perfect piece of grass that it might be thought that the expression "rub of the green," used to describe an unavoidable piece of bad luck, comes from this game In actual fact, though, it would probably be more correct to attribute this phrase to Golf (*q v.*)

Boxing.

Boxing, sometimes called "The Noble Art of Self Defence," though actually aggression is its keynote and defence an incidental, is a modern continuation of the old sport of prize-fighting, which, though always illegal, was popular from the time of the Regency until it was succeeded by the present day glove fighting at the end of the nineteenth century

In prize-fighting bare fists were used, and wrestling holds were allowed Rounds ended when a fighter went down, and fights continued until, following a knockdown, a man failed to come up to the scratch line in 30 seconds.

In modern boxing, gloves are worn, and no wrestling is allowed. Rounds last for a fixed time, generally 3 minutes with 1 minute between rounds, and fights last only for a fixed number of rounds, never more than fifteen. A knockdown does not end a round, the man who is down having 10 seconds in which to rise If he fails to do so, his opponent wins by a knock-out If a man fails to come up at the beginning of a round or if the fight is stopped to save a man from further injury, the victory is by a technical knock-out. If, however, both men are still on their feet at the end of the stipulated number of rounds, a decision is given on points Boxing is therefore technically a contest of skill for points, and, as such, far removed from prize-fights to a finish.

Fights are controlled by a referee, and, in British professional boxing, he is solely responsible for any points decision In amateur boxing the decision is given by several judges, who sit apart from each other. The difference between a good professional and a good amateur is probably more marked in boxing than in any other sport

Boxing contests are arranged in classes according to weight, the divisions being: fly-weight, up to 8 stone; bantam-weight, up to 8 stone 6 lb.; feather-weight, up to 9 stone, light-weight, up to 9 stone 9 lb; welter-weight, up to 10 stone 7 lb., middle-weight, up to 11 stone 6 lb, light-heavy or cruiser-weight, up to 12 stone 7 lb. and heavy-weight, any weight In amateur boxing some of these weights are slightly different, and there are two additional classes, light-welter-weight, up to 10 stone, and light-middle-weight, up to 11 stone

Prize-fighting was governed successively by "Broughton's Code," the "New Rules of the Ring," and the "London Rules" Then, in 1867, the eighth Marquess of Queensberry and Mr J G. Chambers drew up the rules that have been the basis of boxing ever since. British professional boxing has been controlled since 1929 by the British Boxing Board of Control The Amateur Boxing Association has governed amateur boxing since 1884, when it took over from the Amateur Athletic Club, which had looked after both boxing and athletics.

Prize-fighting is finished, but it has left a legacy, not only in modern boxing, but through an expression that has become part of the language, for the phrase "come up to scratch" originally referred to a prize-fighter stepping up for a new round

Bridge.

Auction Auction Bridge is a card game in which two partnerships of two oppose each other, each player facing his partner A complete pack is used, the suits having special values, ranging from 6 points per trick for Clubs, through Diamonds, Hearts, and Spades, to 10 points per trick for No-trumps When bidding, it is the points value of the bid, and not the number of tricks bid, that decides seniority, though the highest number of tricks prevails when the points values are equal If a bid, or contract, is doubled or redoubled, the trick score is doubled or redoubled.

A player may pass, but, should he bid under the previous bid, he can be penalised, the player on his left having the option of closing the bidding at the previous bid or demanding that the offender make a proper bid. In this case, his partner is barred from bidding again unless the opponents do so Should a player bid out of turn, the player on his left can demand a new deal

Points are counted in two ways, below the line and above it Points below count towards game (30 points), and are awarded for all tricks over six made by the contracting side. Points above the line are gained in various ways, and count in the final score, but not towards game. The first side to win two games wins the rubber, and 250 extra points above the line The holding of honours also wins points above the line, as follows three honours, twice the suit value; four, four times the suit value, five, five times the suit value, four in one hand, eight times the suit value, four in one hand and one in partner's, nine times the suit value, five in one hand, ten times the suit value At No-trumps the honours count for Aces is 30 points for three, 40 for four, and 100 for four in one hand The points for defeating a contract are 50 for each trick by which the contract fails. Extra points for making a doubled or redoubled contract are 50 for the contract plus 50 for each trick over when doubled, and 100 for the contract plus 100 for each trick over when redoubled. 50 points are awarded for a little slam, which is 12 tricks, and 100 for a grand slam, all 13 tricks

The player who first named the contract suit is the declarer, and his partner is dummy After the lead, which comes from the player on declarer's

left, dummy lays his hand face upwards on the table, and it is played by declarer, dummy having only limited rights of intervention. If his partner fails to follow suit, he can ask him if he has no cards in the appropriate suit; he can draw attention if too few or too many cards are played in a trick, or if the wrong side gathers up the trick, he can discuss questions of fact, and correct any claims made by the opponents to which they are not entitled. He cannot draw attention to any revoke, he cannot claim any penalty, and he cannot warn his partner against leading from the wrong hand.

Revoking is failing to follow suit when this is possible, the revoke becoming established when the player or his partner plays to the next trick. Up to then, the offender may correct it. The penalty is 2 tricks for the first revoke, and one for subsequent revokes, the penalty tricks to be taken only from the trick in which the revoke occurred or later ones.

A lead from the wrong hand may not be withdrawn unless the opponents request this. If they do, the card is replaced, and play continues. If declarer's opponents lead from the wrong hand, declarer may either demand a lead in a particular suit from the right hand or reserve the right to have the exposed card played whenever he chooses to call for it. In this case, though, the offender may play the card before it is called, if he has an opportunity.

Contract. At Contract Bridge only the tricks contracted for are scored below the line, overtricks being recorded above it. The score for tricks is 30 in a major suit (Spades or Hearts) and 20 in a minor suit (Diamonds or Clubs). In No-trumps the first trick counts 40 and subsequent tricks 30. In bidding, the highest number of tricks prevails, regardless of suit values.

A game is 100 points, two games won constituting a rubber, which carries a bonus of 700 points, if the opponents have not won a game. In an unfinished rubber, a game gains 300 points and a part score 50, provided the opponents have no part score at all. A side winning a game becomes vulnerable, and this affects subsequent scoring.

Penalties for failing to make a contract are 50 points per undertrick if the declarer is not vulnerable and 100 points per undertrick if he is. If an opponent has doubled, the penalties are 100 for the first undertrick and 200 for subsequent ones if not vulnerable, and 200 for the first undertrick and 300 for subsequent ones if vulnerable. If the declarer has redoubled, these penalties are doubled. In successful contracts doubled, overtricks score 100 if declarer is not vulnerable and 200 if he is. A successful doubled or redoubled contract wins a bonus of 50 points. Bonuses are awarded for making slams, if they have been bid. If declarer is not vulnerable, the bonuses are 500 for a small slam (12 tricks) and 1000 for a grand slam (13 tricks). If vulnerable, the bonuses are 750 and 1500. Honours points are 100 for four honours in the contract suit in one hand, 150 for five honours in one hand, and, in No-trumps, 150 for four Aces in one hand.

A player making an insufficient bid may be required either to pass or to make a sufficient bid. If he passes or makes a sufficient bid in a different suit, his partner is barred from further bidding. A call out of turn is void, but, if it was a pass, the offender must pass in his turn, and, if it was not a pass, his partner is barred from further bidding. A player has no redress if he misunderstands a bid, though he can ask for a bid or a sequence of bids to be repeated. When three successive players have passed, the contract is fixed, declarer being the first player on the contracting side to nominate the suit, and dummy being his partner.

Dummy is entitled to ask for or give information on the laws, to point out revokes and try to prevent those about to occur, and to remind his partner from which hand he should lead. If, however, he looks at any hand other than his own, he forfeits these rights.

If declarer leads from the wrong hand the opponents can demand a lead from the correct hand; and, if it is possible, this must be in the same suit. If a defender leads when it is the declarer's turn, the card becomes a penalty card. If a defender leads when it is his partner's turn, declarer may either bar a lead in that suit or make the exposed card a penalty card. A penalty card must be played at the first legal opportunity.

Contract Bridge is a game of systems. There are systems for assessing the value of a hand, and there are more important and more involved systems governing bidding, the object of these being the interchange of information between partners.

Bumping Races *See* **Boat Races.**

Camping.

For those whose holiday requirements are a maximum of fresh air and a minimum of formality, Camping is the ideal solution. Choice of equipment, such as tents, tent furniture, and cooking accessories, is entirely a matter for the camper, the only difficulty in this department being making a selection from the very wide variety available. The choice will, of course, depend to some extent on the type of camping holiday planned, for Camping can take several forms. It can, for instance, be static, or it can be combined with motoring, canoeing, cycling, or walking. The more static the camp or the heavier the transport, the more elaborate the equipment that can be taken, cyclists and walkers being restricted to the lightest, though not necessarily the least comfortable, gear.

Practically all suitable camp sites are privately owned, so permission to use them must, of course, be obtained. The choice of site is of major importance, and should combine proximity to water with shelter from winds. The pitching of the tent or tents is also important, as, if the campers intend to keep the tent "door" open at night, they will not want to face east, and be wakened unduly early by the rising sun. If the camp is static, tents should not be allowed to remain too long in one position, as this is not good for the ground on which they are pitched, and the hallmark of the experienced camper is that he leaves the site exactly as he found it. Rain is always a possibility, and demands certain precautions, particularly the slackening of the guy ropes, which might otherwise become taut enough to pull out the pegs, in which case the tent would probably be blown away. In wet weather the tent walls and roof should not be touched from the inside, as this tends to cause, or to reveal, leaks.

Several organisations exist to assist campers, including the Camping Club of Great Britain and Ireland, of 35 Old Kent Road, London, S.E.1, which specialises in lightweight camping, and has done much to develop suitable equipment and to obtain and list sites. There is also the Youth Camping Association, of 106 Ashurst Road, Cockfosters, Herts, and canoe-campers have an organisation of their own in the Canoe Camping Club, of 4 Felstead Road, Wanstead, London, E.11.

Canadian Football.

Canadian Football resembles American (*q.v.*), but is twelve-aside, uses only three downs, and limits blocking.

Canoeing.

Canoeing is both a recreation and an organised competitive sport.

As a recreation, it can take the form either of simply taking a canoe out and "paddling about" for a short period or, by combining it with Camping (*q.v.*), of a lengthy and interesting river trip, the canoe-camper proceeding, of course, at his own pace, and giving as much time as he wishes to sightseeing.

As a sport, Canoeing has Olympic Games status. In Britain it has its headquarters on the Thames

at Teddington in Middlesex, the governing body being the British Canoe Union. There are races for singles and pairs, including events for women. There is also one long annual race for pairs that really combines Canoeing with Camping. The course is from Devizes in Wiltshire to London, and the competitors have to negotiate a long series of locks.

There are two types of canoe: Canadian canoes, like those used for many years by Red Indians, and kayaks, the very light Eskimo-type canoes, in which an expert, but not a beginner, can turn a complete circle into the water and out again without losing his seat in his craft. Both types are catered for in the Olympic Games, but most of the Canoeing in Britain is in kayaks.

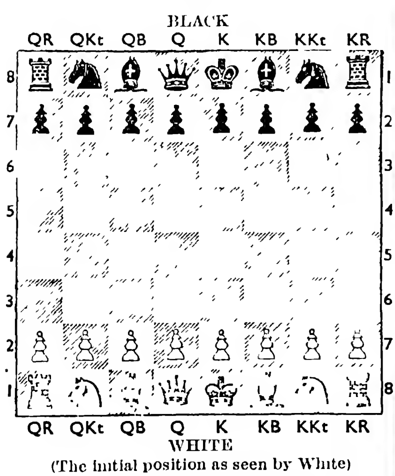
Card Games. *See* **Bridge; Patience, Solo Whist, Whist.**

Chess.

Chess, greatest of all board games and a game of pure skill, has a known history of some 1500 years. Eastern players, who originated it, reached a high standard, but the game's greatest advances were made in Italy in the fifteenth and sixteenth centuries. In the early days the value of the pieces and their moves underwent periodical changes, but the game we know to-day dates from the sixteenth century.

The board has 64 squares in eight rows of eight, and each player has 16 pieces, one set being white and the other black or red, but always referred to as black. A toss decides possession of white, which always starts. The object is the capture of the opponent's King, no matter how many pieces are lost in doing so, nor how many opposing pieces remain untaken. If the King could be captured on the next move, it is in "check." It must move out of check, and, if it cannot, it is "checkmate" and the game is over. If the King is not in check, but cannot move except into check, and the player has no other pieces he can move, it is "stalemate," and a draw. Games may also be drawn if neither player has sufficient pieces to force a win.

In addition to the King, each player has a Queen, two Bishops, two Rooks—sometimes wrongly called Castles—two Knights, and eight Pawns, and all these move in accordance with rigid rules. The following diagram shows the pieces at the start of a game.



(The initial position as seen by White)

Each line of squares across the board is a "rank," and each line up and down the board is a "file."

The permitted moves are as follows:—

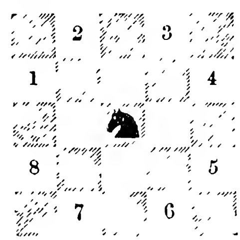
The King can move one square at a time in any direction.

The Queen can move in accordance with the powers described below for both Bishops and Rooks.

The Bishops move diagonally as many squares as desired.

The Rooks move straight along the ranks or files as far as desired.

The Knights move as shown in the following diagram:—



(The Knight's Move)

Stationed away from the side of the board, and on a black square, the Knight illustrated can move to any of the numbered white squares. The move is one square along rank or file in the desired direction, and one square diagonally. The Pawns move straight forward, one square at a time, but may move two squares when moved for the first time. They capture by moving one square diagonally forwards. A Pawn reaching the eighth rank may be replaced by any other piece.

Once during a game, a player may "Castle," by moving the King two squares towards the Rook, which is placed on the last square passed over by the King. This move cannot be made if either the King or any of the squares he would pass over are in check. Neither King nor Rook must have moved previously.

Games of Chess can be recorded, so players can play over great "Masters" games, and record their own games.

Draughts. Draughts—called Checkers in America—is also played on a chess board. Possibly older even than Chess, it is much simpler, but not devoid of skill.

Each player has twelve pieces or "men," all alike. Squares of one colour only are used, the men starting on the first three rows on the board. The move is one square diagonally forward, but a man reaching the eighth row becomes a "King," and may then move forward or backward. The object is the capture of all the opposing men by jumping over them. If the arrangement of the men permits it, more than one man may be captured in a single move. A man which can effect a capture but does not do so is removed from the board, or "huffed."

Children's Games.

Amongst the many sports and games that have come into being through the years and the centuries is a lengthy list of what, for lack of a more precise name, might be called Children's

Games, suitable for playgrounds or, indeed, practically any open space. Almost without exception, they are simple; they require little or no equipment, they can be adapted to almost any number of players, and they are good fun and good exercise. Most of them are also very old; few of them have any "official" name; and many of them have had many names.

The "basic" playground game is Tag, in which one player, called "it," chases the others, any player he touches becoming "it". A variation of this allows players to rest without being tagged if they can find a piece of wood to touch, but there are many more variations that make more interesting games. In Imitation Tag "it" can follow any mode of progression he chooses, such as running, walking, running or walking backwards, hopping, or crawling on all fours; and whatever he does the other players must do, too. In Partner Tag all the players except "it" and one other stand about in pairs with their arms linked. "It" chases the other free player, who may link up with any pair, when the player at the other end of the link becomes "it's" quarry. For Chase Tag, all the players except "it" and one other form a circle, each player just touching his neighbour's shoulder with one outstretched arm. "It" and his quarry start at opposite sides of the circle, and the quarry may dive in and out under the outstretched arms, "it" being compelled to follow exactly the same route. A variation of this has three players running, with the second chasing the first, and the third chasing the second. Pursuit Race is a form of tag in which every player is both chaser and chased. Players station themselves in a very large circle, all facing either clockwise or anti-clockwise, and with approximately the same distance between each. At the word "Go," each player sets off after the one in front of him, tagged players dropping out.

Marching Tag also starts with the players in a circle facing clockwise or anti-clockwise, but they are close behind each other, and there is an "it" inside the circle. "It" announces a number, and then starts counting steadily up to it. As he does so, the others march round in their circle, but when he reaches the chosen number, they all dash away to a "home" line 25 or 30 yards away, with "it" in pursuit. Listen Tag starts with the players in a circle, facing inwards, and with "it" and one other player inside the circle. This other player announces a word, and then goes on talking or telling a story, in the middle of which he casually introduces the word. When he does so, the players dash for the home line, with "it" either in pursuit or calmly tagging some player who has missed the word and is still listening to the story. Numbers Tag has the players in two teams, who form rows, one behind the other, and both with their backs to the home line. The front team agree on a number that their rivals do not know, and a member of the rear team then calls out numbers in any order. If he hits on the agreed number, the front team swing round, each man trying to tag the man behind him before that player realises what is happening and dashes for the home line. Hidden Numbers Tag starts similarly, except that the teams face the home line, each player in the front team having a number that is unknown to the rear team. A player in the rear team calls out a number, and the player with that number dashes for the home line with the caller in pursuit. This goes on until everyone has gone, the last front-team player being allowed to run immediately his predecessor is either safe or tagged.

Bucket Tag has all the players in a line with their backs to the home line, "it," who is in the middle of the line, having a bucket several yards in front of him. He tries to toss a tennis ball or a rubber ball into the bucket, and the moment he succeeds, everyone dashes for the home line with "it" in pursuit. Ball Tag and Football Tag are like ordinary tag, except that, in ball tag, "it" must hit his quarry with a tennis ball or a rubber ball, which he throws, and in football tag he must hit him with a football, which he kicks. Another form of Ball Tag is between teams, and uses a football, which is thrown. The area is divided into two halves, one team being in each, and each half having an additional, narrow zone behind it. A non-player should act as referee, and start the game by throwing the ball up over the centre line, which no player must cross. The game consists of trying to hit opponents on the legs with the ball, any player who is hit retiring to the zone behind the other team, from where he can still take part in the game by throwing the ball at his opponents from behind if it should come through to him. The game continues until one half has been cleared. This "pitch" also serves for End to End Ball, in which half of each team starts off in the zone behind their opponents, and the ball is not thrown at opposing players, but through to team-mates behind the other team, each successful effort counting as a goal.

There are several popular "combat" games, in which players take part two at a time. Two are described, not very accurately, as Indian Wrestling. In one, the two opponents face each other, clasp their right hands, and press their right feet against each other, the "fight" consisting of an attempt to make the opponent move his foot by pushing with the clasped hand. In the other method opponents face each other, each with his hands pressed against his rival's shoulders, and with some object, such as an Indian club, a skittle, or even a stone bottle, on the ground between them, the object being to push the opponent in such a way that he will knock the object over. In Cock-Fighting two players with arms folded hop, each trying to make the other put his raised foot to the ground by pushing into him with his shoulder. Hat Snatch is more tag than combat, unless it is a combat of wits. Two teams face each other, some way apart, and having a hat or cap or some other suitable object on the ground between them. Each player has a number, the same numbers being used for both teams. A non-player acting as referee calls a number, and the players concerned, one from each team, try to snatch the object and carry it back to their own team, the one who does not get it trying to tag his opponent before he reaches safety.

Finally, three Tug-of-War variations. In Elbow Tug two players stand back to back with their elbows linked, each having in front of him a line, across which he tries to pull his opponent. In Rope Tug three players grasp a rope that has been tied so that it is actually a circle. The players are outside the circle of the rope, holding it with one hand, and having their backs to it. In front of each player is a small stick, which he tries to pick up, without letting go of the rope, before his rivals can pick up their sticks. Sprint Tug may end up as an ordinary tug-of-war, but it starts with the rope being placed at right angles across a line in the middle of the ground, and the two teams lined up at opposite ends of the ground. At the word "Go" they rush forward, the object being to pull the whole of the rope across to their side of the line. If this is not achieved before the other team arrives, it becomes a real tug-of-war.

Cricket.

Cricket, traditionally England's national game, has a longer history than most team games. There have been attempts to trace its origin in various games played by ancient races, and, even if some of these derivations are a little far-fetched, it certainly developed from very old country games, and has been played in a form not so very dissimilar from that of to-day for over 250 years. The men of Hampshire, particularly the village of Hambledon, Surrey and Kent were the real pioneers of the cricket of to-day.

Cricket is played by two teams of eleven players, which bat and field in turn. In the centre of the ground are two "wickets," 22 yards apart, and each consisting of three "stumps," joined at the top by two "bails." The bats used have a flat striking surface, and the ball is a hard red one weighing 5 ounces.

There is a batsman at each wicket, and their object is the scoring of runs by hitting the ball away, and running before it can be returned, each time the two batsmen cover the length of the

pitch counting as one run. Should the ball be hit beyond the boundary line round the ground, it counts four or, if it crosses the line without touching the ground six

The ball is "bowled" from one wicket to the batsman at the other, six balls, or, in some cases, eight, which comprise an "over," being bowled from each end in turn. The object of the fielding side is to get the batsmen "out," ten dismissals completing the "innings," as the eleventh man is left without a partner.

A batsman can be dismissed in several ways If he misses the ball and it hits the wicket, or if he plays it on to the wicket, he is out "bowled" If he leaves his ground, indicated by a line in front of the wicket, misses the ball, and has the wicket "broken" by the wicket-keeper he is out "stumped." If he hits the wicket with his bat he is out "hit wicket." If his hit is caught he is out "caught" If, when running, he fails to reach his ground before the wicket is "broken" he is out "run out." If a ball, when bowled, would have hit his wicket, but hits his leg instead, then, subject to certain provisions regarding where the ball actually pitched, he is out "leg-before-wicket" A batsman may also be given out if he handles the ball or obstructs the fielding side, but these are rare occurrences

In addition to runs hit by the batsmen, there are certain "extras" If the ball passes the bat, misses the wicket, and goes far enough for the batsmen to run, it is a "bye." If, however, it goes off the batsman's leg it is a "leg-bye," but leg-byes cannot be run unless the batsman was definitely attempting a stroke If it is bowled so wide that the batsman cannot reach it, it is a "wide" If the bowler comes in front of his wicket before releasing the ball, or if he throws it, it is a "no-ball," in which case the umpire calls it as quickly as he can, for the batsman can hit such a ball, but he cannot be out to it, unless he is run out If he does not score, one extra is added

Of the fielding side, one, of course, is the bowler, and another, placed behind the batsman's wicket, is the wicket-keeper The others will be placed as the bowler and his captain decide, for there are far more recognised positions than can be occupied at one time To gain some idea of these positions, imagine a right-handed batsman at the wicket, his left side towards the bowler. The side of the wicket in front of him, nearer to his bat than to his body, is the "off" side, the side behind him, nearer to his body than to his bat, the "leg" side On the off, behind the wicket and close to it, are the "slips," and, behind them, "third man" Farther round, but still behind the bat and close to it, is "gully" Level with the bat is "point" or, if he is some way from the bat, "deep point" In front of the bat, but in front also of the bowler's wicket, is "cover" and "extra cover" Roughly level with the bowler's wicket is "mid-off," with, behind him, "long off" Similarly on the leg side, where "long on" is the equivalent of "long off," "mid-on" of "mid-off," "mid-wicket" and "deep mid-wicket" of "cover" and "extra cover," "square leg" and "deep square leg" of "point" and "deep point," "short leg" of "gully," "long leg" of "third man," and "leg slip" of "slip"

First-class cricket matches last for three six-hour days or longer, but there are also two-day, one-day, and half-day matches Matches of two days or more are two-innings games, of one day or half a day, one innings If the side batting first, which is decided by a toss that gives the winner the choice of batting or fielding first, dismisses the opposing side for a smaller score, the victory is by the number of runs by which the smaller score was exceeded. If the side batting second pass the other total, the game ends, and the victory is by the number of wickets the second side still have standing. In a two-innings match, should the side batting first gain a first-innings lead of a certain size, normally 150 runs in a three-day match, it can require the other side to follow straight on with its second innings, the leading team keeping its second innings in reserve, to be played if needed. If a batting side has sufficient runs, and is anxious to see the other side batting while there is still plenty of time to dismiss it, it can declare its innings closed. In this case, should the second team score enough runs to win, it does, in fact, win, even though it may have lost more wickets than had the declaring side

Cricket is not a fast-moving game, and for years views have been expressed to the effect that it must be "brightened up" if it is not to die out Periodically, small changes in the rules are made, but, for the most part, the game just goes steadily on, easily retaining a large following that is satisfied with it as it is, and still able, when big international matches take place, to command a place, not only on the sports pages, but on the front pages of the Press

The game is unusual in that it has no really official governing body It is ruled by the M C C, which stands simply for Marylebone Cricket Club, from its headquarters at Lord's ground in London and the M C C's pronouncements are accepted almost without question

Outside England, the development of cricket has been peculiar Even as near at hand as Scotland and Ireland, the game has never aroused much enthusiasm, and in Continental Europe, where many British games have won great acclaim, cricket has gained a real foothold only in the Netherlands In the United States and Canada it is played, but only to a small extent However, in the other Commonwealth countries of Australia, South Africa, New Zealand, the West Indies, India, and Pakistan, it is extremely popular, and the national teams of these countries, together with England, provide the top-class international sides of the game They meet regularly in "Test Matches," a "rubber" normally being decided in a series of five Tests

Cricket is rich in technical terms and expressions, which are seen and heard frequently through newspapers, television, and radio when a Test series is in progress Many of these are almost self-explanatory, but a few never fail to puzzle less-experienced readers, viewers, and listeners Prominent amongst these are three types of ball used by bowlers, the "yorker," the "googly," and the "chinaman"

A yorker is a fast ball that pitches just in the batsman's block-hole, and often passes under his defensive stroke The term is believed to have originated in Yorkshire, but the only known explanation of it is that attributed to a Yorkshire cricketer, who, asked why a yorker was so called, replied simply, "Well, what else would you call it?" There is an answer to that, for the yorker was originally known as a "tice" A googly is an off-break or a leg-break which is disguised, because the bowler has delivered the one with the action of the other A chinaman is an off-break bowled by a left-handed bowler to a right-handed batsman These words also lack an authentic derivation

Cricket has provided one expression that is now heard in many connections. That is "hat-trick," which dates back to the days when cricketers wore top-hats, and any player who took three wickets with three successive balls was presented with a white top-hat Now, he is usually given the ball.

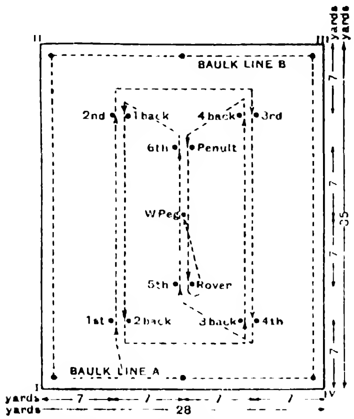
Croquet.

Croquet originated in France, and has been played in Britain for about a century The governing body, the All-England Croquet Club, was founded in 1868, with headquarters at Wimbledon Soon afterwards, this also became the headquarters of Lawn Tennis (*q v*), and it is probable that the rapid growth of that game was a factor that restricted the development of Croquet Croquet, however, still retains a following, and, in addition to Championships and tournaments, it is widely played on private lawns

The equipment consists of four balls, coloured blue, black, yellow, and red, four mallets, usually marked with the same colours, six hoops, and a peg The playing area is 35 yards by 28 yards, but this can be reduced, provided that the proportion remains 5 to 4 The hoops, which stand 1

foot out of the ground, and the peg are placed as shown in the diagram. Generally two players, taking the blue and black balls, oppose two using

STANDARD SETTING.



Only those portions indicated by a continuous line need be marked on the court.

The order of making the points is indicated by the arrows.

the yellow and red, but singles can be played, each player using two balls, blue being paired with black, and yellow with red. Each player completes the circuit of hoops twice, finishing by hitting the peg.

Croquet is a game of skill, and players can earn extra turns in various ways, such as hitting another ball with their own or passing through hoops. While making their own circuits, players also concentrate on leaving their opponents at a disadvantage. Handicap matches are possible through the giving of extra turns, or "bisques" A "half-bisque" is an extra turn in which no hoop may be scored.

Croquet can, perhaps, claim some credit for a phrase used in everyday life "Pegging out" has the rather sinister meaning of "dying" or "finishing," but it is actually the term used for finishing a Croquet round by hitting the peg

Cross-country. *See* Athletics.

Cycling.

That few inventions have been so widely adopted so rapidly as the bicycle is not surprising, for this comparatively simple machine is at once a useful method of transport, a means of healthy and enjoyable recreation, and, for those who desire it, the "key" to participation in a thrilling and well-organised competitive sport.

The earliest cyclists aroused considerable hostility on the roads, but as cycling progressed through a series of unwieldy and dangerous machines to the present "safety" models, more and more people realised its many advantages, with few counterbalancing disadvantages, and it soon became established and accepted. A bicycle is not expensive, it should have a long life, and the riding of it is not difficult to learn.

From a utilitarian point of view alone, a bicycle can be extremely useful. A small amount of "luggage" can be carried, so it can be used for shopping, as well as for travelling to and from work, and for any necessary journey of reasonable length. Like walking, it provides exercise, but the cyclist can travel three or four times as fast as when walking. The rider is also independent of local transport services, while probably travelling, at least in towns, as fast as the public transport.

As a pleasant recreation, cycling offers a wide range of possibilities. Outings can ben for a day or part of a day, or they can be tours of any length the rider wishes, with the overnight halts spent in hotels or hostels or Camping (*q.v.*), which can easily be combined with cycling. The cycle tourist has distinct advantages over both the walker and the motorist. The walker gets exercise and a good view of the country, but covers only a limited distance. The motorist covers plenty of ground, but sees little and gets no exercise. The cyclist, however, gets exercise while covering a distance which, if much less than the motorist's, is four times the walker's at a pace that still enables him to see the country, and spot places worth a stop for a closer investigation. Progress can be fast or slow, and exercise strenuous or leisurely, as the rider wishes.

As a competitive sport, cycling offers a remarkable variety, for no other form of racing provides events of so many different types. On the Continent, cycle racing is by far the most popular sport, and the leading riders are national heroes. The sport, which caters for both amateurs and professionals, also has a large following in Britain, where it would soon progress still farther if there were more tracks suitable for big events available.

Cycle races are held on banked tracks rather like motor-racing tracks, on flat grass tracks, on cinder tracks, on indoor banked board tracks, on roads, and even across country. There are races at all distances, from short sprints to road tours divided into daily stages lasting for several weeks. There are massed-start races, in which all the competitors start together; races in which competitors are drawn in twos or threes through several rounds up to a final, and time trials, in which each rider starts alone. Track races may be straightforward races or time trials, or motor-paced, with the riders behind motor-cycles, or tandem-paced, or pursuit races, with riders or teams of riders starting on opposite sides of or spaced round the track, or point-to-point, with points awarded to the leaders at the end of each lap, or courses des primes, with a prize for the leader at the end of each lap, or Madison races, for teams of two, and occasionally three, riding one at a time, and relieving each other at will. There are also races for tandems and tricycles, and the sport includes races on both track and road for women as well as men.

In the cross-country side of cycle racing, called Cyclo-Cross, riders cover a cross-country course of perhaps 10 miles, riding when they can and carrying their machines where riding is impossible. Still another form of cycle racing is roller racing. In this, the cycles are fixed on rollers, and do not move at all, the distance the riders pedal being registered on large dials. There is also cycle speedway, a sport devised by youths, and practised only by youths. Events take the form of team matches, generally on rough cinder tracks constructed on waste ground by the youths themselves, with pairs of riders opposing rival pairs in a series of races, and points awarded to the leaders in each race. Corners have to be "skidded" round, as they sometimes are in ordinary grass-track cycle racing. Very different, but still competitive in a way, is a form of event that provides a link between the sporting side of cycling and the more purely recreational side, the reliability trial or attempt to achieve a fixed standard.

Cycling also has its team game in Bicycle Polo, a hard game requiring a high level of cycling skill and considerable nerve.

Taking up cycling is simply a matter of purchasing a bicycle and devoting a short time to learning to ride it. After that, it is for the individual cyclist to decide for what purposes he wishes to use his machine, and whether he prefers to ride alone or in company. If he likes company there are many clubs which provide facilities for touring cyclists of all degrees of energy and ambition, as well as for racing cyclists.

There is also an organisation that caters especially for the distance tourist in the Cyclists

Touring Club, which keeps a check on premises offering accommodation to cycle tourists, and provides a sign for use on approved accommodation. It is interesting to note that the Automobile Association, which offers similar services to motorists, but which is not as long-established as the C.T.C., originally based its methods on those of the C.T.C. The C.T.C. address, for those who might be interested in joining, is 3 Craven Hill, London, W.2.

Dancing. *See* **Ballroom Dancing; Folk Dancing.**

Darts.

Originally just a casual amusement confined almost entirely to public-houses, the game of Darts is now one of Britain's most popular pastimes. Public-houses still provide facilities for it, but to-day clubs, canteens, factories, offices, and private houses also have their boards, and there are numerous team and individual competitions, including a National Championship. The prizes rival those of any other game for value, matches are widely reported, and the attendance for the bigger contests is limited only by the size of the hall. This enthusiasm is not misplaced, for the game is a test of skill, and luck plays little part in it.

The circular board has a diameter of 18 inches, and is divided into segments numbered from 1 to 20, but not consecutively. In addition, there are two rings, each ⅜ inch wide, that go right round the board and through each segment. These are the "double" ring, at the extremity of the board, and the "treble" ring, near the centre of the board, darts in these rings counting double or treble the value of the segment. In the centre of the board there are two small rings, the "bull" or "dosser," counting 50, and the "outer," counting 25. The bull is 5 feet 8 inches from the ground, and the wooden or metal feathered darts are thrown from a line, called the "hockey," 9 feet away.

Matches may be singles, doubles, or between teams of four or eight players. Games are for a certain number of points, usually 101, 201, 301, 501, 801 or 1001, the lower totals being used for individual, and the higher for team contests, and matches are generally the best two out of three games or "legs." Conditions for matches vary, but normally stipulate either "straight start and finish on a double" or "start and finish on a double." In the first case players score from the start, but in the second they do not score until one double has been registered. In both cases they must finish on a double, and they must finish with the exact number they require. Scores are counted downwards, players being told how many they need, rather than how many they have scored.

In addition to the straightforward game, there are many Darts variations. In one, "Round the Clock," a player has to throw one dart into each segment from 1 to either 20 or the bull, his turn continuing until he throws three darts unsuccessfully. In "Shanghai," players start with a complete throw of three darts at number 1, and continue with a throw at every number up to 9, but players who fail to score at number 5 drop out. In "Cricket," one player "bats," throwing normally, and counting everything over 40, while the other "bowls," throwing only at the bull, and counting one wicket for every "outer" and two for every "bull," five wickets ending his opponent's "innings." In a Darts version of Shove-Ha'penny players have to get three darts in each segment from 1 to 9, and three in the centre. In "Fives," players score only if their total is divisible by five.

Diving. *See* **Swimming.**

Dramatics.

For many years, "amateur theatricals" were a popular indoor pastime, but they were a recreation for the performers, offering little in the way of real entertainment to the spectators, and relying for their audiences on relatives and friends who had little option but to attend. In no sense were they either connected with or comparable to the professional stage.

There may still be a few "entertainments" of this kind, but the vast bulk of amateur drama to-day is something very different. It is something that is taken really seriously, that is worked at, and that can entertain a paying audience on its merits. Relatives and friends still attend, of course, but so do strangers in search of entertainment, many productions, particularly big musical ones, depending on public audiences to cover their heavy expenses. The change from light-heartedness to seriousness, and from play to work, far from driving performers to seek recreation elsewhere, has increased the popularity of this particular recreation to a phenomenal extent. Nobody can say with certainty how many amateur groups there are in Britain at any one time, for new ones are springing up all the time, but there are certainly thousands.

Surprising though it may seem, the amateur theatre movement made tremendous advances through the Services in the Second World War. There was a certain amount of professional entertainment available to servicemen, but, for much of the time, service units had to provide their own entertainment. In many cases a few enthusiasts who knew something about entertaining were found to start things moving, and these soon built up casts by "conscripting" those in whom they thought they saw talent, and, often with considerable ingenuity, staged some excellent shows under very difficult conditions. Many of those who were "forced" into amateur entertaining during those days remained in it after the War, and many of the things that producers of those shows had to teach themselves by experiment and trial and error have contributed to better productions since then.

People often query whether or not it is fair to judge amateur actors by a severe standard, or to compare them with professionals. Generally speaking, it is perfectly fair to do both. Though amateurs are acting voluntarily, and because they like it, they are, nevertheless, setting out to entertain audiences whom they charge for admission. This renders them liable to criticism, and most serious amateur performers would not want it otherwise. With regard to comparisons with professionals, amateurs cannot, of course, fairly be compared with the best professionals, but they can be compared with, say, professional repertory companies, and they should emerge from such comparisons with distinction. Professional repertory actors generally perform a different play every week, rehearsing each play while they are acting another, and rehearsing only for a short time. Amateurs usually rehearse for a long time, and with only one play to think about. They should, therefore, if they are of any standard at all, give a better performance than the harassed repertory players.

The connection between the professional and amateur stage to-day goes beyond the mere making of comparisons. Professional theatre people sometimes assist at summer and week-end schools for amateur actors, and many amateurs have helped out both repertory and touring companies by playing small parts and appearing as "supers." Many young amateurs, particularly in musical shows, hope that the amateur stage might prove the first step towards a professional career, and some amateur groups include former professionals who, for one reason or another, have left the theatre.

There are several ways in which the amateur theatre can be of real assistance to the theatre as a whole, particularly in that amateurs can try out new or experimental plays that the professional, commercial theatre dare not risk. Many amateur groups conduct vigorous and useful theatrical experiments, and this also applies to some musical groups. Other companies, both straight and musical, prefer to concentrate on proved successes.

The days when the first consideration in choosing a play was that it should have parts for every member of the group are gone. Groups now normally select plays on their merits, and often cast them, as in the professional theatre, by competitive audition. This, however, need not discourage those who might feel that, if parts have to be "won," they would never get any. Even these more ambitious groups often, in addition to their main plays, stage supplementary programmes consisting, perhaps, of three or four one-act plays, which are cast from those omitted from the bigger productions; while some groups definitely pick an occasional play, possibly a costume drama, that has a long cast. There are also plenty of small groups that often find themselves with too few people for the play they want to do. A newcomer can always find a welcome somewhere. Many amateurs start with small groups, and either remain with them or move farther up the tree, as their particular ambitions or talents may suggest.

There is also a vast field for enjoyable and useful activity behind the scenes. Many of those in the amateur theatre movement never appear on the stage at all, preferring to concentrate on producing, stage-managing, set designing, lighting, or one or other of many essential jobs, and anyone whose ambitions follow these lines is always welcome. Producing plays is, of course, an extremely important and satisfying activity. Small groups will often let a new producer try his hand, while the more ambitious groups will offer opportunities to new producers in the supplementary programmes which they also use to give newcomers acting opportunities

Straight plays and musical comedies, comic operas or operettas are the best-known branches of the amateur theatre, but amateur revues are also frequently seen. Many of the improvised Services shows were of this type, and the taste for them has increased They provide opportunities of many kinds, not only in singing, dancing, and acting, but also in composing, song-writing, and writing sketches Still another type of amateur entertainment born during the War is the radio-style play, which was first tried in prisoner-of-war camps, when no other type of play was possible. In this, performers read their parts behind a curtain, submitting themselves to the severe test of holding their audiences by the voice alone

One other branch of "home-made" entertainment that is not generally considered a part of the amateur theatre, but that is definitely worth a word, is skiffle In its commercialised form skiffle became associated with, and almost indistinguishable from, the "rock 'n roll" craze, but it would be more correctly regarded as something that should be quite remote from "rock 'n roll," and remote also from periodical crazes It might be described as the making of music by ordinary people, often with improvised instruments, and it probably had its origins in various times and places, where, had it not been for this type of music, there would have been no music at all. The music normally takes the form of songs, and these should really be descriptions of actual local, national, or world events, rather as the calypsos are The songs may be old folk-songs, or up-to-date songs of the same type, set, perhaps, to old or existing tunes, and if skiffle groups would include in their repertoires modern descriptive songs of their own making they would add considerably to their own and their audience's entertainment.

Film-making While it is not too difficult for amateurs to present their own plays, it might seem that amateur film-making, apart from purely private records of things like family holidays, is too ambitious a project to be seriously considered This, however, is not the case; and if those whose ambitions are to act, direct, and write for films have fewer opportunities than their stage counterparts, they nevertheless have opportunities, and a growing number of them, in the various film societies, now more often called ciné clubs.

These clubs make their own films, including fiction films, documentaries, and cartoons, and many of them attract attention far beyond the club that made them. The clubs also show members films other than those made by themselves, including some made by other clubs, and they periodically entertain and visit other clubs.

Draughts. *See* **Chess.**

Eton Fives. *See* **Fives.**

Fencing.

Fencing can claim a longer history than most sports, for it is the modern equivalent of duelling In mediæval tournaments mounted knights fought with lances, and, in addition to actual fights to the death, they also met with special, less lethal lances purely for sport. Later, duels were fought dismounted, and with different weapons In Elizabethan days duellists used a sword, for attacking, in the right hand, and a dagger, for defence, in the left Later still, the dagger was discarded, and duels were fought, as are fencing bouts to-day, with a sword only.

Duelling declined in Britain during the Regency period, when it became fashionable for gentlemen to learn to fight with their fists, but they continued to learn swordsmanship, and to fence with the practice weapon, the foil. Eventually, duelling became illegal almost throughout the world, but swordsmen of other countries similarly continued to fence with the foil. Even before Britain took to fist-fighting, most of the advances in fencing technique had been made in France and Italy, and the fencers of these and other Continental countries are still the best in the world, countries like Britain and the United States relying largely on fencers of Continental European descent

Duelling was restricted to "gentlemen," and something of this restricted atmosphere pervaded the early days of fencing as a sport, clubs being few, expensive, and rather exclusive Now, however, that has changed, and widespread class tuition in fencing has opened the sport to anyone

Modern fencing includes contests with three weapons: the foil, which is the only one used by women, the epee, the real duelling sword, and the sabre, which cuts as well as thrusts These weapons have "buttons" on the points, but fencers wear a special glove, a padded jacket, and a mask Fencing requires grace of movement, lightness of foot, agility, strength of wrist and forearm, quick mental reactions, and good eyesight, and it will do much to develop these qualities, including the eyesight As masks are worn, it is perfectly practicable to fence wearing glasses

The language of fencing is French, all the terms used, many of them traditional, being French.

Film-making. *See* **Dramatics.**

Fives.

There are two games of Fives, Eton Fives and Rugby Fives They are court games using walls, but an Eton Fives court has the addition of a buttress or "pepper" jutting out from one side wall The striking implement is the gloved hand Eton Fives is a doubles game, but both singles and doubles are played in Rugby Fives.

Folk Dancing.

From the ballet, by way of the less-serious stage and the ballroom, to country and folk dancing, there are many forms of dancing, and it is easy to trace links from one kind to another, but much harder to say definitely exactly where one kind stops and another starts. Of all types

of dancing, perhaps Folk Dancing is the most difficult to pinpoint. Its name implies that it would be found chiefly in remote areas, where it would be performed, almost instinctively, by simple country people. Originally, it was, and, to some extent, it still is; but it is now also to be seen in ballet and in the ballroom in adaptations that may or may not have retained the main features of the original, but that have almost certainly lost the spirit of it. To many people, thoughts of folk dancing mean thoughts of Central Europe; of places like Bohemia with its polkas. Central Europe, however, by no means covers the subject. Italy, for example, is rich in gay dances, and in dances with folk-lore-type stories behind them, like the famous tarantella, which is reputed to induce enough perspiration to cure the bite of the tarantula. Latin America, too, has its rumbas and other native dances that were originally solos, but are now known mainly in their ballroom versions.

There are good grounds for regarding the term "folk dancing" as nearly synonymous with country dancing, for if country dances differ, as they do, in different countries, they are not only countryside dances, but dances of a particular country, and therefore of its people. Almost every country has its country or folk dances, though it has been said that England is an exception. It is, however, nothing of the kind, for English Morris dancing has been a part of England, and of England's holiday festivals and customs, for centuries, and remains so to-day, about fifty different teams or groups now being affiliated to the Morris Ring of England.

The origins of Morris dancing, and even of its name, are shrouded in mysteries that will probably never now be solved. The name probably comes from the word "Moorish," and it was certainly used to mean Moorish by Shakespeare. Morris dancing, though, dates from long before Shakespeare's time, so, while the word may be the same as Moorish, it is probably used in the mediaeval meaning of Moorish which was simply "pagan." It may be, therefore, that Morris dancing was based on rituals of the old religion, and that the facial disguises that figure in it were originally necessary if the dancer was to avoid persecution and prosecution. A theory that Moorish was used in its more normal sense because the dancers blacked their faces falls down on the fact that only a minority of Morris dancers ever did this. To-day, only the Lancashire Coconut Dancers do so. For centuries, Morris dancing was mainly associated with England's May-day revels, but it was, and is, also seen at other times, such as for instance, Boxing Day.

There are many different Morris dances, including handkerchief dances, stick dances, using either 3-foot quarter-staves or seed-planting sticks of half that length, and jigs. Most of the dances are for teams of six, but some of the jigs are danced as solos. The accompaniment was originally on pipe and tabor, both being played by one man, but is now mostly on accordions and violins. The dancers are generally preceded by their Fool, armed with a stick and bladder, with which he clears a space for the dancing.

Scottish dancing is famous, but what is less generally realised is that there are two distinct kinds of it, Highland dancing and Scottish country dancing. Highland dancing consists of dances like the sword dance, or Gillie Callum; the fling, and the seann triubhas (which means "old trousers"). It is solo dancing, and though many girls now take part, it should really be danced only by men. Highland dances are danced mainly, though not quite entirely, on the ball of the foot.

Scottish country dancing includes set dances, such as reels and the similar, but generally slower, strathspeys, and also jigs and progressive dances, during which each dancer meets practically every other dancer. Highland dancing is normally accompanied by a single piper, but the accompaniment for Scottish country dancing should be built round Scotland's national musical instrument, the violin. Scotland is also the home of the unusual "mouth music." This is, of course, vocal, but it is not song, being, in fact, an entirely practicable substitute that can be used when no musical instruments are available to accompany dancing.

Ireland also has its reels and its jigs, also normally performed to an accompaniment led by a violin. With lesser-known tunes, people who are not Celtic sometimes find it almost impossible to tell the difference between Scottish and Irish country dance music.

A country that does not spring very readily to mind when one thinks of folk dancing is the United States, but it has its country square-dancing, and, here again, the violin is the prominent accompanying instrument. Many of the tunes used are clearly based on old Scottish and Irish airs that were taken across the Atlantic by emigrants many years ago.

Football. *See* **American Football; Association Football; Australian Rules Football, Canadian Football; Gaelic Football; Public-School Football; Rugby Football.**

Gaelic Football.

Gaelic Football is seldom played by anyone who is not Irish, but it is frequently played outside Ireland, for Irishmen have taken it with them to Britain, the United States, Australia, and South Africa.

Played fifteen-aside, it is a blend of Association and Rugby Football (*q.v.*), the goals having the uprights, cross-bar, and net, exactly as in Association, but having the uprights extended above the cross-bar, as in Rugby. If the ball goes under the cross-bar it is a goal, and if it goes over it is a point, a goal equalling three points. The ball is round, and it may be kicked or caught, but not thrown forward, nor carried, though it may be dribbled by bouncing it. In its essentials, it is probably simpler than most other forms of football, but it is fast and involves frequent hard bodily contact. Substitutes are permitted in case of injury.

Gaelic Football joins with Hurling (*q.v.*) in coming under the old-established Gaelic Athletic Association.

Gliding

The first serious efforts to develop Gliding, which is flying in engineless aircraft or sailplanes, took place in Germany in 1919, and were successful enough to lead to experiments in France and England, where it arrived in 1922. At that time, however, it failed to gain much support, and the real history of gliding in Britain dates from a second attempt to encourage it in 1929. Little more than ten years later, gliding had advanced sufficiently to be a real factor in the Second World War.

Normally launched from hills and by catapult, gliders at first achieved nothing more than small hops. These were followed by steady descents from high hills, and, eventually, by the achievement that ensured the success of the idea, ascents to points higher than the starting-point, for, with altitude, flights of considerable duration, and also over considerable distances, became possible. The altitude is gained by using air currents, which, when the wind strikes the hills that are the ideal starting-points, must rise, and must, if the force of the wind is strong enough to overcome the sinking speed of the glider, carry the glider upwards. Skilful use of air currents enables the glider pilot to stay up, and skilful use of the rising currents beneath clouds enables him to cover long distances by hopping from cloud to cloud.

The extent to which gliding has developed can be gathered from the fact that world championships now take place, and that, in Britain in one recent year, gliding enthusiasts made over 180,000 flights of a total duration of nearly 25,000 hours, and covering altogether over 50,000 miles. Gliders can now reach altitudes of over 40,000 feet, stay in the air for over 50 hours, and carry

out flights of hundreds of miles. Both men and women pilot gliders, and the best pilots are often people in their forties and fifties.

Golf.

Golf, a game of great antiquity, originated in Scotland, and is now widely popular in many countries. It consists of using a set of clubs with which to play a small white ball over a cross-country course of eighteen holes. Each hole will be several hundred yards long, and will have its fixed starting-point and its finish with an actual hole in the ground, the object being to complete the course, which will be several miles long, in as few strokes as possible.

The playing of each hole falls into three sections, driving, approaching, and putting. The starting-point will be a flat piece of ground on which the player will "tee up" his ball on a small rubber peg, or "tee," which he will carry round with him. He will then hit the ball towards the hole, concentrating on achieving distance. From the tee to near the hole is the "fairway," which will consist of fairly smooth ground, not entirely devoid of natural obstacles, and probably containing some sand traps, or "bunkers." On each side of the fairway is the "rough," which may consist of long grass, shrubs, woods, or even roads. The player will continue to play his ball towards the hole, concentrating now chiefly on direction. On the fairway or off it, he should always play his ball where it lies, but, should it be quite unplayable, or even lost, he may drop it or a new one, and pay a stroke penalty for the privilege. The actual hole will be on the "green," a rough circle of exceptionally well tended grass, and, once on it, the player will cover the last few yards by the more delicate art of "putting."

There are many different types of club, players being limited to fourteen. The shafts are generally steel, the striking surfaces being iron or, in the case of drivers, wood. The different "irons" have numbers, but golf clubs used to have special names, often descriptive of their functions, for instance, lofter, cleek, mashie, niblick, and even blaster. Originally, most golf courses were by the sea, and these were called "links," a term now loosely applied to any course.

There are two actual methods of competitive play, match play and medal play. Match play is by holes, a player completing any hole in fewer strokes than his opponent winning that hole. Once a player leads by more holes than there are still to play, the game finishes, the victory being by *X* and *Y*, where *X* is the number of holes he is "up," and *Y* the lesser number of unplayed holes. When a player leads by the same number of holes as there are still to play he is said to be "dormy" so many. Opponents level after eighteen holes proceed to the first hole, and play on until one is one hole up, when he is said to have won at the 19th, 20th, or whatever it may be. Some important match-play events are over 36 holes, or two complete rounds. Medal play is simply stroke play, the result depending on the number of strokes needed to complete the course. This demands a higher level of consistency, for one bad spell can ruin the total, whereas, in match play, it may cost only one hole. In play after the initial drive, the player farthest from the hole normally plays before his opponent.

In match-play championships and tournaments players are drawn against each other, the winners going on to the next round, and so on up to the final. In medal-play events players go round in pairs, but each is, of course, playing against the whole field. Team matches consist of singles and foursomes, in which the partners play shots in turn. Other, less-formal forms of golf are four-ball foursomes, in which each player plays his own ball, best-ball foursomes, in which both partners drive, but, thereafter, play in turn only at the most successfully driven ball, and three-somes, in which each player plays for himself against the others. During a match, a player must not receive advice from anyone except his "caddie," if he has one, the caddie being an attendant who makes a profession of carrying golfers' clubs round.

Every course has its "bogey" and "par" figures, these being scores, with par representing the higher standard that a first-class player might achieve for the course. By assessing a member's own scores against these figures, clubs can allocate a handicap which indicates the player's standard. There are many minor competitions in which golfers play, not on level terms, but from their handicaps, which also serve as a perpetual incentive to players to improve their game, and therefore their handicaps. The possession of a handicap also makes it easier for players to arrange even matches with strangers. Handicaps are subject to alteration as a player's standard changes, and such alterations may be in either direction. The operation of the handicap in play takes the form of strokes deducted from the actual score at certain holes, in accordance with the arrangements in force at any particular club.

Golf offers a tremendous number of competitions of all standards, as well as championships and team matches. Probably the four most important individual championships are the British Open, the British Amateur, the American Open, and the American Amateur. These are long-established, but the two major international team events are quite new. They are the Canada Cup, open to teams of two professionals from any country, and the Eisenhower Cup, for teams of four amateurs, the three best scores counting, from any country. Other, much older international team events include the Ryder, Walker, and Curtis Cups, which are contests between Britain and the United States for professionals, amateurs, and women, respectively, though it is interesting to note that the actual inscription on the Curtis Cup indicates that this trophy is open to women golfers of any country.

Golf is ruled by the Royal and Ancient Club of St Andrews, Scotland, which is recognised all over the world as the game's headquarters. There was an unusual illustration of this widespread recognition when the Eisenhower Cup competition was instituted by the United States in 1958, for, at the special request of the American organisers, the first meeting took place, not in the United States, but at St Andrews. The Royal and Ancient Club makes the rules of golf, but these are generally supplemented by local rules in force at particular clubs.

The popular expression "rub of the green," used to describe an unexpected and unavoidable mischance, comes from golf, where it is used when a putt fails to take the expected line because of a slight flaw in the normally perfect turf of the green.

Gymnastics

Gymnastics is a system of exercising with apparatus, and also a competitive sport, the chief items of apparatus used being the horizontal bar, the parallel bars, rings, ropes, ladders, and the vaulting horse. The horizontal bar, the parallel bars, and the rings can all be used for similar exercises, some being fast swings and others slow movements requiring considerable strength. Strength and swinging also come into ladder exercises; and the rope, which can be climbed in several different ways, is a simple form of apparatus that demands, and will develop, strength. The horse can be used for a variety of vaults, in either the lengthways or sideways position, and still others are possible when pommels are fitted to it. In addition to those who specialise in gymnastics, many sportsmen of various kinds regularly attend gymnastic classes as part of their training for their own particular activities.

Hockey.

Hockey originated about three-quarters of a century ago as a game confined to Britain, but with rules that varied in each of the home countries. However, in 1900, England, Ireland, and Wales combined to form the International Hockey Board, with a view to formulating rules that would apply wherever the game was played, and, two years later, Scotland joined the alliance. The game was also taken up with terrific enthusiasm in India, and Indian players became, and remain, the best players in the world. Their enthusiasm extended to what is now Pakistan, so the division that brought that country into existence also added one more to the list of hockey-playing countries, and without noticeably weakening India's own national team.

Hockey is now played in many other countries, but, for some time, it made little progress on the Continent. Eventually, though, it was tried, liked, and adopted in a number of European countries, and one of these, the Netherlands, has now established a right to a place alongside India, Pakistan, and Britain as the game's top layer. Hockey has, and has long had, Olympic Games status.

Hockey is played eleven-a-side on a pitch marked out as in the accompanying diagram, the normal positions of the players being a goalkeeper, two full backs, three half-backs, and five forwards, exactly as in Association Football (*q.v.*). The white ball can be either sewn, as is a cricket ball, or seamless, and it must weigh from 5½ to 5¾ ounces. Sticks must weigh from 12 to 28 ounces, and have a handle that can be passed through a ring with an inside diameter of 2 inches. They have a striking surface on the left side only, left-handed sticks not being permitted. A game consists of two 35-minute halves, unless the captains have agreed on a shorter period.

The game is started, and restarted after half-time and after a goal, by a bully at the centre of the ground. The players bullying stand facing the side-line, each with his own goal on his right. Each taps the ground between the ball and his own goal and his opponent's stick over the ball three times alternately, after which one of them must play the ball. At any bully, all the other players must be 5 yards from the ball, and between it and their own goal.

In play, the ball must be propelled only by the stick, and it must not be stopped with any part of the body except the hand, in which case it must only be stopped, and not caught or knocked forward. These prohibitions, however, do not apply to goalkeepers, who may stop the ball with any part of their body, and also kick it, when in their circle. No part of a player's stick must be raised above the shoulder either at the beginning or end of a stroke, or to stop the ball. Hitting the ball in the air and scooping it are allowed, but deliberate undercutting is not, and umpires can penalise any hit which they judge to be dangerous. Interfering with an opponent's stick, running between an opponent and the ball; and charging or other bodily contact are not allowed. Players must not tackle from the left unless they can play the ball without touching the opponent or his stick.

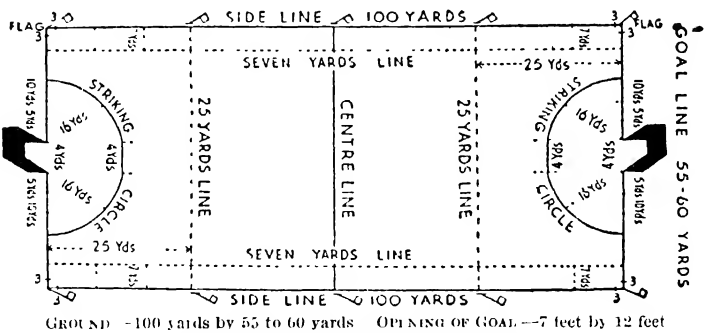
A player is "offside" if there are fewer than three opponents between him and the goal-line, unless he is in his own half, or unless a team-mate playing the ball is nearer to the goal-line than he is. A player who is offside is put onside if an opponent plays the ball, but not if the ball merely touches or glances off the opponent. Players who are offside are not penalised if they do not interfere with the play.

If the ball crosses the side-line it is rolled in by a player of the side that did not put it out. This player must have his hands, feet, and stick outside the field of play, and he must not play the ball again until someone else has done so. All the other players must have their feet and sticks inside the 7-yard line until the ball leaves the roller's hand.

If the ball is sent across the goal-line wide of the goal by an attacker, or unintentionally, by a defender who is more than 25 yards from the goal-line, the restart is by a bully on the 25-yard line. If it is hit behind unintentionally by a defender who is within 25 yards of the goal-line, a corner is awarded to the attacking side. If it is hit behind intentionally by a defender from any part of the ground, a short, or penalty, corner is awarded to the attacking side. A corner is a hit from a point on either the goal-line or the side-line within 3 yards of the corner flag, while a short corner is a hit from a point on the goal-line 10 yards from the nearer goal-post. At a corner, all the defenders must be behind the goal-line, and all the attackers outside the circle. When the corner hit comes into the circle, attackers are not allowed to take a first-time shot, but must first stop the ball or slow it down. At no time during the game can a goal be scored unless it was hit from inside the circle.

Penalties for infringements outside the circles are generally free hits. Penalties for infringements inside the circle by defenders are short corners, unless they have been deliberately committed to prevent a goal, or have, in fact, prevented a goal, in which cases a penalty bully is awarded. In extreme cases, both short corners and penalty bullies can be awarded for offences anywhere behind the 25-yard line.

A penalty bully is a duel between the offender and one opponent, taking place in the circle, and with all the other players, including the goal-keeper, if he is not the offender, beyond the 25-yard line. The players bully 5 yards from the centre of the goal, and play between them continues until either the attacker scores or hits the



GROUND—100 yards by 55 to 60 yards. OPENING OF GOAL—7 feet by 12 feet.

Diagram of Ground as marked out for Hockey

ball behind or hits the ball out of the circle, or the defender hits it out of the circle. If the defender hits it behind, the bully is restarted. If no goal results, the game is restarted by a bully on the 25-yard line.

A game is controlled by two umpires, each of whom takes one half of the field and one complete side-line. Substitutes are not permitted in hockey.

Hockey is entirely an amateur game. Almost every match is a friendly, for, in Britain, there are no leagues and only a very few rather specialised cup competitions. There are, however, a great many representative games, from county matches up to internationals.

A major feature of the hockey season, which normally lasts from October until March, is the end-of-season Easter Hockey Festival. There are actually several festivals, most of them taking place at seaside resorts. Teams go to them from many different areas, including the Continent, and play three or four matches in four days against opponents whom they would not normally meet. Six-aside tournaments also take place occasionally during the season.

Hockey is played by women, as well as men, and there is a certain amount of mixed hockey between teams composed of both men and women.

Hurling.

Hurling, which might loosely be called the Irish brand of Hockey (*q v*), is played fifteen-aside, and has been described as the fastest game using a ball in the world. The ball, called the "slitter," and the sticks, called "hurleys," bear some resemblance to Hockey's ball and sticks, but nothing like Hockey's "sticks" rule applies. The slitter may be hit at any height, and with either side of the hurley, and it may be kicked or caught, though it must not be carried more than three steps, nor picked up off the ground. There is no offside, apart from the fact that attackers must not enter the parallelogram marked out near the goal ahead of the slitter. The goals have uprights that are extended above the cross-bar, and scoring is by goals, under the bar, and points, over the bar, a goal equalling three points. There is a good deal of bodily contact, and substitutes are permitted for injured players.

Hurling, rarely played by anyone who is not Irish, but often played by Irishmen outside Ireland, is of great antiquity, and the English authorities in Ireland first tried to suppress it six hundred years ago. It was kept alive, however, and it is very much alive to-day. To Irishmen, Hurling and Gaelic Football (*q v*) are symbols of nationalism and patriotism. They are governed by the Gaelic Athletic Association, which has a rule that states. "Any member who plays or encourages Rugby, Association Football, Hockey or Cricket by that very fact incurs immediate suspension from membership of the Association."

A form of Hurling with slightly different rules, called Shinty, is still preserved in another Celtic country, Scotland.

Korfball

Korfball is a team game with several unique features, the most striking being that it is a mixed game, a team consisting of twelve players, six being men and six women. The game resembles Basketball (*q.v*) in some ways, the goals, which are 11½ feet high, and the scoring of goals being similar. It can be played on any firm surface, the pitch measuring 300 feet by 133 feet, though a smaller pitch can be used, provided that length and width are reduced in proportion. The pitch is divided into three sections, and players do not move from one sector to another during actual play. They must, however, change to another zone after every two goals. This encourages all-round attacking and defensive ability, and ensures that, even in a one-sided match, every player gets a fair share of the game. Four players from each team play in each section, and players always mark opponents of their own sex. Players must not run with the ball, which is advanced purely by passing. There is no tackling, and the ball can only pass from one team to the other by interception. Players may not score if there is an opponent within arm's length. A game lasts for 90 minutes, divided into two halves.

Korfball originated in the Netherlands, where it was first played in 1902. It spread to Belgium in 1927, and reached England in 1947. There is a British Korfball Association, and also an International Board, on which the Netherlands, Belgium, and England are represented. International inter-club matches are a regular feature of the game. Though really a winter game, Korfball is actually played all the year round, the international games between clubs from the three Korfball countries taking place during the summer.

Lacrosse.

Lacrosse, which originated from a game played by the Red Indians, was introduced into England from Canada in 1867, and has been played here ever since.

Basically, it is, perhaps, the simplest of all field team games. The object is the propelling of a rubber ball through goals 6 feet wide and 6 feet high with a wooden "crosse" not more than a foot wide at its widest point, where there is a "mesh" of strings. The goals are from 90 to 110 yards apart, but play can take place behind them, for there are no boundaries to the pitch except the natural borders of the field, unless the captains have agreed otherwise. The only lines required are the centre circle, the goal-lines, and the goal-creases.

In England teams consist of twelve players, but in Canada and the United States the number was reduced to ten some years ago. Players line up right down the field, instead of only in their own half, and there is no offside, except that no attacker may enter the goal-crease before the ball. Should a player leave the field through injury, his opponents must also withdraw a man.

A game consists of four 20-minute periods, but the captains can agree to vary this, either to two 45-minute halves or otherwise. The game is started or re-started after a stoppage by one player from each side "facing" by placing the ball on the ground between the backs of the two crosses, and then drawing them apart, after which the ball is in play. It can then be advanced by running with it on the crosse, throwing it from the crosse, or kicking it, though no goal, except an "own goal," can be scored by a kick. Only the goalkeeper, who can deflect the ball with his hand, but not catch or throw it, may handle the ball. Players can shoulder opponents when trying to get the ball off the ground, and "body check" them by simply standing in front of them to impede them. A player can also check an opponent's crosse with his own crosse if the opponent has the ball. A foul is penalised by giving the non-offending player a "free position," which means that he is given the ball, and the game is then re-started.

Lacrosse demands speed and stamina, and a high level of skill demands practice, but it is not hard for a beginner to grasp the main objects or master the comparatively simple rules.

It is interesting to note that Lacrosse, which can be one of the roughest of all games, has been made a suitable game for women by very simple measures, such as the elimination of the body

check; and that there are now more women playing than there are men.

Lawn Tennis.

Originally called Sphairistike—or "Sticky" by those who disliked it—Lawn Tennis was invented in the seventies of the last century as a simplified, outdoor version of Real Tennis (q v), using a net, but no walls It is now far more widely played than the parent game, being popular almost all over the world As its name implies, it was originally intended to be played on grass, but it is now also played on hard courts of various surfaces, and indoors on wood.

The court is as shown in the accompanying diagram, the outer long boundary lines being the limitations for doubles, and those parallel to them being the boundaries for singles Both server and receiver score, four points making a game, six games won a set, and two out of three or three out of five sets won a match Game points are scored "15," "30," "40," and "Game" The system of "vantage" games and sets is used This means that, if 40-all—called "deuce"—is reached, a player must gain a clear lead of two points to win the game, the winner of the first point after deuce being said to have the "advantage" If the games reach 5-all, the set continues until one player has a clear lead of two games

When the game began, there was considerable discussion before this scoring, which is taken from Tennis, was given preference over the straightforward one-two-three system of Rackets (*q v*) Much more recently, experiments have been made with the equally straightforward system of Table Tennis (*q v*), but the Tennis system survived these, and remains in force

Service is almost invariably overhand, and the receiver plays the service after one bounce. Thereafter, strokes may be "ground" strokes, played after one bounce, or volleys, played before any bounce In doubles, either partner may play the ball, but each must serve in turn

In addition to being played by thousands of people, Lawn Tennis attracts large crowds of spectators The big annual tournaments, such as Wimbledon, Forest Hills, and Paris, are amongst the major sporting events of the year, as are the Davis Cup competition, open to teams of men from every country in the world, and the Wightman Cup, a women's contest between Britain and the United States. All these events are amateur, but the game also has a top layer of professionals, whose annual world tours are a great attraction.

Marbles. *See* **Old English Games and Customs.**

Modern Pentathlon.

Imagine a king's messenger riding with an important dispatch, and being hotly pursued. His horse is shot, and he has to engage his pursuers, first with his revolver, and then with the sword Eventually, he breaks away, swims a river, and finishes his journey on foot and running

That is the "plot" on which is based one of the most interesting, exciting, and testing of all sporting events, the Modern Pentathlon. Often wrongly thought to be a part of Athletics, the Pentathlon is a separate sport, but one that actually consists of five different sports: the five activities, in fact, of the king's messenger in the story, riding, revolver shooting, fencing, swimming, and running True, the Pentathlon competitor does not have to carry them out one after the other, but he does have to take part in them in that order, one on each of five successive days, both riding and running being across country, the riding on a horse strange to him.

The Pentathlon first appeared in the Olympic Games of 1912, but, in recent years, it has become so popular that, in addition to the Olympic event every four years, there are now annual world championships, as well as national championships in many countries, including Britain The event was originally designed as one suitable for Army officers, and, though present-day Army training is rather different, most Pentathlon competitors are still servicemen, though they are not all officers However, a civilian has won the Olympic event, and, in Britain, the Army authorities are willing to provide training facilities for civilian competitors who show signs of reaching a high standard. Many people believe that the "keys" to success in the Modern Pentathlon are swimming and running, and that competitors who are good at them can be taught the riding, shooting and fencing without too much difficulty.

Morris Dancing. *See* **Folk Dancing.**

Mountaineering.

It is difficult to say when Mountaineering, which is the climbing of mountains, not for any scientific reason, but purely for the sense of achievement and for sport, began, but, by the middle of the sixteenth century, Zürich students had formed an Alpine club, and the value and uses of ropes and even dark glasses were known. Amongst famous peaks, Mont Blanc was first conquered in 1786, the Jungfrau in 1811, and the Wetterhorn in 1854. By then, Mountaineering

was becoming organised, and there were systematic assaults on the Alps; in Norway, the Caucasus, and Corsica; in the Rockies and the Andes; in Japan, New Zealand, and Kenya; and, of course, in the Himalayas, where over thirty years passed between the first assault on Everest and its conquest. There are still unconquered peaks in the Himalayas, but it is not only first ascents that interest mountaineers, who can find exciting sport in many parts of the world.

The way to master Mountaineering is to accompany and watch experts. The essential qualities include perfect physical fitness and perfect nervous fitness, and to them must eventually be added a detailed knowledge of snow, ice, avalanches, glaciers, crevasses, and cornices, as well as of the different techniques of ascending, descending, and traversing. Also to be learned is step-cutting, which is hard manual labour carried out under difficult conditions that are also conditions that make perfect workmanship literally a matter of life and death Clothing, including properly nailed boots, and equipment, including ropes, ice axes, knives, maps, compasses, medical supplies, and a number of other things, must be of the best, and yet, at the same time, it must be light.

Apart from the more obvious dangers, one of the ills to which the mountaineer is heir is mountain sickness, which may take one or more of several forms, including actual sickness, headaches, drowsiness, shortness of breath and palpitations, and general bodily weakness, particularly in the legs These are about the last sensations that a man engaged in an ascent would choose to experience, but, at high altitudes, the only way to avoid them is by using oxygen

Rock-climbing Mountaineering is generally taken to mean snow and ice climbing, but allied to it is Rock-climbing, which demands the same perfect physical and nervous condition, and, in place of knowledge of snow and ice, knowledge of several very different kinds of rock Ascending, descending, and traversing all apply, and so do ropes, and the rock-climber should, in fact, be something of a knot expert Light, rope-soled shoes replace the mountaineer's nailed boots Skye is a favourite haunt of rock-climbers, and, in view of what might justifiably be called the antiquity of climbing, it is surprising to note that the highest peak in Skye, Sgurr Alasdair, was not conquered until 1873.

Netball.

Netball, which is played exclusively by women, is similar to Basketball (*q v*), but it is played seven-aside, does not allow substitutes, and the goals have no backboards. It is almost always played outdoors on asphalt or grass.

Nine Men's Morris. *See* **Old English Games and Customs.**

Old English Games and Customs.

The story of England had its beginnings a very long time ago, and many of England's present-day customs, recreations, sports, and games can be traced far back in that story Some, of course, have undergone very considerable changes, but the links with the past are still clear.

On 1 May, for instance, girls still awake in some villages to the realisation that they are to be May Queens, and to reign for a day, though they may not realise that they are preserving a custom that can point to origins in the days of the Druids, and that, in Tudor times, would have sent them and their fellow villagers out to spend the preceding night in the woods, gathering branches of trees and flowers with which to decorate their houses. Maypoles and morris dancers also belonged to May Day, and they can still be seen in England, and not only on that day.

More local, even quainter, but equally traditional is the trial for the Dunmow Flitch of Bacon in the village of Dunmow in Essex. The original conditions offer this award to any married couple who will go to the twelfth-century Augustinian priory, and there kneel on two sharp-pointed stones and swear that they have neither quarrelled nor repented of their marriage within a year and a day of its celebration. This award has lasted into modern times, not annually, it is true, but then it never was given annually, for it was instituted in 1244, and first claimed in 1445.

One annual event that is as traditional as it is strenuous in the Whit Monday cheese-chase at the village of Brockworth, near Gloucester. Records of this go back to the days of the Stuarts, for that was when they started to keep records of a custom that was already old then: so old that its origins are unknown, though they had to do with the villagers' cattle-grazing rights. A massive round cheese is rolled down nearby Coopers Hill, which has a gradient of one in four throughout its 150 yards; and, with a certain amount of risk to life and limb, the chasers tear down after it, the cheese being the prize for whoever catches it. Sometimes, the cheese hits a bump, and literally leaps out of reach over the hedge at the bottom of the hill, but the chase continues, the prize going to the first pursuer to reach the hedge, where "catchers" wait to halt the headlong rush of the runners Despite the obvious dangers, the records to date mention nothing worse than a sprained ankle.

This brings us to sports and games, and, though today's most popular game, Football, is, in anything like its present form a comparatively recent growth, it can perhaps claim some relationship with Harpastum and Campball, which existed before the Norman Conquest, and it was one of the popular recreations banned in the interests of Archery. The football of those and later days, however, took the form of struggles between whole villages, the players battling *en masse* over a cross-country course of several miles. People past whose houses the battle was likely to rage prudently barred and shuttered all windows and doors, awaited the cessation of hostilities with anxiety, and probably helped to push this particular custom into oblivion

The oldest English games are old indeed, and Cricket, too, had remote ancestors, from which the descent to today can be traced more directly They included Bat and Trap, Creag, Cat and Dog, and Rounders In Bat and Trap, the batsman hit a ball released from a trap between two posts His opponent rolled it back underarm at the trap flap If he knocked it down, the batsman was out if not, the batsman scored one run and had another hit This game is still played in Kent Creag, which was played at the time of Edward II, used a curved stick, called a "crye," as a bat, and a tree-stump as a wicket Cat and Dog, which came later, was a game for three, two batsmen defending holes 13 yards apart, and trying to hit away the piece of wood that the third player aimed at the holes, the bats being the "dogs" and the piece of wood the "cat" It is worth noting that Baseball's accepted ancestors are games called One Old Cat and Two Old Cat, which clearly indicates a common origin for Cricket and Baseball Some of the games in Cricket's ancestry remained popular after Cricket arrived, and Rounders is still a popular children's game.

The beginning of Athletics can also be found in old England Putting the weight and casting the bar, a forerunner of throwing the hammer, were popular with the courtiers in Tudor days, while other events, including javelin throwing, were practised by ordinary people of the same period. Later, the early hammer throwing spread beyond the Court, and was even attempted by women, which modern hammer throwing is not.

Tournaments and jousts were popular from the Middle Ages until Tudor times. These were combats between mounted men, a joust being single combat, while a tournament involved many contestants. They were succeeded by dismounted combats, which still take place today in the sport of Fencing. Those taking part in tournaments and jousts were required to swear an oath to the effect that they were com-

peting purely for sport, and those taking part in the Olympic Games and certain other big sports meetings to-day swear an almost identical oath. Somewhat similar to jousting, but not restricted, as jousting was, to the nobility, was Tilting at the Quintain, which was practised both mounted and on foot, and in which a lance was thrust at a wooden target, which, if not struck accurately, swung round and struck the tilter

Other old games, clearly the ancestors of modern ones, included Handball, which became Fives, but which is still handball in the United States, Battledore and Shuttlecock, still a children's game, but now developed by adults into Badminton, and Shovelboard, an elaborate game, for the nobility, which consisted of sliding weights down a long table marked with lines, and which is certainly a forerunner of Shove-Ha'-penny. Another probable ancestor of Shove-Ha'penny was Squails, in which a coin was placed in the centre of a round table, and players tried to push their "squails," or discs, as close to the coin as possible, distances being measured by an instrument called a "swoggle" Also known as Skayles and Keels, this game appeared in the sixteenth century, lasted into the nineteenth century, and, under the name of Keels, achieved a poetic mention in Sidney's "Arcadia."

Archery Archery goes back hundreds of years, to the days when the bow was the chief weapon of war, and, because of that, practice shooting and contests were officially encouraged encouraged, in fact, to the extent that other popular recreations, like Football, Quoits, and Bowls, that might have interfered with it were banned, though the bans were always largely ignored. Eventually, the bow disappeared from the battlefields, but, to this day, it has remained popular as a means of recreation and sport Through the centuries, archery contests were generally of three kinds: shooting at a mark, or target, shooting purely for distance, though this was more popular abroad, in countries like Turkey, than in Britain, and shooting at "rovers," in which two or three archers would cover a cross-country course, taking it in turns to select a mark at which to shoot To-day, archery, which retains enough of tradition in its terminology to remind the archer that he is following in a very long line, consists of shooting at a target containing rings coloured, going from the centre outwards, gold, red, blue, black, and white, the values being respectively, nine, seven, five, three, and one

Knur and Spell. Knur and Spell belongs to Lancashire and Yorkshire, and originated in a children's game called Trap and Ball The player uses a wooden club, the striking end of which, called the "pommel," is shaped something like a bottle, though it has a flat hitting surface, with which to hit a small ball, which he himself releases from a trap by means of a trigger The ball, which is the "knur," weighs ½ ounce, measures 1 inch in diameter, and was originally wooden, though, later, porcelain was used The trap is the "spell," and consists of a small brass cup with a strong spring, which is kept down by the trigger The fixing of the spell is an elaborate process requiring the use of a spirit level, and, when it is in position, a player is allowed 10 minutes to adjust the tension of the spring Players generally have their own spells. Each player has five consecutive hits, or "rises," and scores one point for every 20 yards covered.

Marbles. Marbles is supposed to have been played in ancient Egypt, but its popularity, with adults as well as children, in the England of the Middle Ages entitles it to count as an old English game. Marbles are often made of clay, but better ones are glass, and the best are pure marble. These are called "alleys," or "alley taws." There are several games of marbles, but they all involve the aiming of a marble at a target, which may be another marble or an opening, by bowling or "shooting" it along the ground. In shooting, the marble is held between the thumb and fore-finger, with the knuckle of the forefinger on the ground, and is then flicked away.

Perhaps the best-known game is Ring Taw, in which players shoot from one circle at marbles placed in another about 6 feet away. Fortifications and Increase Pound use concentric circles, players shooting at marbles in each circle in turn. Three Holes and Handers involve shooting at holes in the ground, Arch Board or Bridge, at arches in an upright board, and Die Shot, at another marble on which a numbered die is balanced.

Nine Men's Morris Nine Men's Morris is a fourteenth-century game for two, usually played outdoors on a diagram marked on the ground, but sometimes played indoors on a board. The diagram consists of three squares drawn inside each other. In addition to the outlines of each square, there are lines from the centre of each side of the inmost square, through the centre of the sides of the middle square, to the centre of the sides of the outermost square. The corner of each square and the centre of each side are the 24 points of importance in the game. Each player has nine men, often counters, and they play in turn, placing a man at an unoccupied point, and endeavouring to place three men in one row, continuing, when all the men are placed, to try to form rows by moving men along the lines. The completion of a row entitles a player to remove, or "pound," one of his opponent's men, the object of the game being either the capture of all the opposing men or blocking them so that they cannot move The game has many variations, and many names, including ninepenny morris, fivepenny morris, for a version played with five men, and merils, marls, marrels, morals, morris and miracles, all for a version played with three men

Pall-Mall Two London thoroughfares, Pall Mall and the Mall, are reminders that Pall-Mall was once popular. Often described as a forerunner of Croquet, it was really more like a form of Golf, a game that arrived at about the same time, both having a common, if remote, ancestor in the Roman game, Paganica In Paganica players walked across fields hitting a small, leather ball at trees with a curved stick, the object being to reach the target in the fewest possible strokes It was played by country people, whereas pall-mall, which achieved rapid popularity in the seventeenth century, was a game for the nobility, though other people played simplified versions of it Pall-Mall was played in special alleys, sometimes ½ mile long, and often surrounded by walls A boxwood ball a foot in circumference had to be played down the alley, in which were a number of iron arches, in the fewest possible strokes. The player drove off as in golf but, on reaching the arches, not only changed his club, but also substituted a small steel ball for the boxwood one

Quoits. Dating back to the fifteenth century, Quoits is one of those ancient games that had the distinction of being banned because its popularity was such that it was believed to be keeping people from archery practice The ban was not effective, and it continues to this day, though it is now less played than it used to be, Scotland, the North of England, and Suffolk being, perhaps, the last main strongholds The pitch consists of two circles or squares of clay, 18 yards apart, and each having in its centre an iron pin, called the "hub," 1 inch of which remains above the surface The quoits are iron rings with a diameter that must not exceed 8½ inches. The weight is not fixed, but is often 3 lb. or more. The object of the game, which can be either "singles" or "doubles," is to throw the quoit over or near the hub from the opposite point, 18 yards away, one point being scored for each quoit nearer the hub than the opponent's quoits, and two being awarded for a quoit that drops over the hub, called a "ringer" No points are awarded if opposing quoits are the same distance from the hub, and none are awarded if each side has a ringer A game is 11 points in "singles," and 15

points in "doubles." Quoits developed from pitching actual horseshoes, and, to this day, some players make their first practice attempts at it with horseshoes. It is, in fact, to the large-scale disappearance of horses, and, therefore of horseshoes, from country life that some people attribute the drop in the popularity of quoits It is interesting to note that, in the United States, horseshoe pitching itself is a game, and one that is still popular.

Shove-Ha'penny. Shove-Ha'penny, an old English game that is still popular, uses a cushioned wood or slate board, divided by parallel lines across it into nine "beds" The "halfpennies" may be actual halfpennies, but are generally round metal discs. The object of the game is to shove the halfpennies into one of the nine beds, the shoving usually being done with the ball of the thumb, though any part of the hand may be used First turn is decided by shoving halfpennies at the number nine bed, the best attempt winning. A turn consists of five halfpennies, and the winner is the first player to shove three halfpennies into each bed, halfpennies that touch the cushion not counting. Should a player place more than three halfpennies in any bed, his opponent can claim the excess, if he needs them, but cannot win the final point of a game in this way Push-Penny, a similar game using three coins is played in some parts of the country, mainly in Lincolnshire

Skittles. There are several variations of the ancient game of Skittles, but all consist of throwing a ball down a level alley at a set of pins The ball is generally a flat-sided wooden object called a "cheese," but some games use a round ball. The number of pins has varied between 3 and 17, but the "normal" number is 9, though some parts of England have always preferred 10 Scoring is by knocking down as many pins as possible in a fixed number of throws, by knocking down 31 in the fewest possible throws, or by knocking down 9 in three or fewer throws In some games, the centre pin must be hit first Skittles became popular in the United States as Ninepins, but was made illegal because of the gambling on it It survived, however, as Bowling, using 10 pins, and this version is now also played in Britain

Stoolball. Yet another ancestor of Cricket, Stoolball is still a popular girls' game The wicket is a board a foot square on a pole 4 feet 8 inches high, the bat has a round striking surface, and the ball is rubber Wickets are 16 yards apart, and ten balls constitute an over.

Parachute Jumping

Parachute jumping is generally regarded as a last-resort safety measure, to be undertaken only in a supreme emergency, and with considerable anxiety; but it is now also a recreation and a competitive sport, practised entirely voluntarily, and for enjoyment. This form of jumping may be said to have grown out of the Second World War, in which jumping was used to a far greater extent than ever before, and not only for escape in an emergency Now, international competitions take place, and the sport has an enthusiastic following in Britain.

Parachute jumping as a sport involves jumps of particular kinds, including landings in a certain area, marked by a circle, and demonstrating turns and body control in the air, the parachutist regulating his direction by pulling down the lines of the parachute. Jumps of this kind may be made from about 6000 feet.

The first point that occurs to many people when they think about Parachute Jumping is that it is extremely dangerous. However, those who jump as a recreation maintain that this is not so, and that it is about as dangerous as skiing. Injuries are few and slight, and, in three years, none of the hundred-odd members of the British Parachute Club, of Fairoaks, Surrey, suffered anything worse than a sprained ankle The parachutes used are so reliable that they still work even if they have been badly packed. A parachute consists of twenty-eight sections, called "gores," each divided into four panels, so that, even if a hole should stretch right across one gore, which is rare, the remainder of the parachute remains intact, and will bring the jumper down safely. As an additional precaution, jumpers wear a small reserve parachute on the chest, but this is hardly ever needed.

Training, which generally takes place at weekends, starts with a period of learning how to fall, how to judge wind direction and speed, and how to pack a parachute. The first actual jumps are from 1500 feet. Both men and women take part in Parachute Jumping.

Party Games

Parties can be for any of quite a number of age groups; and, when it comes to Party Games, it is not easy to say at what age a particular game ceases or starts to be fun However, given a number of games from which to choose, the organiser of a party should be able to select those suitable for the occasion and the guests.

Many years of popularity perhaps confer the right to first mention on a batch of "classic" games suitable for young children, starting with Musical Chairs and a less-well-known variation of it. Musical chairs requires a line of chairs, one facing one way, and the next one the opposite way, and so on Someone starts playing the piano, and the players, who should number one more than the chairs, move round and round them When the music stops, they sit down quickly, the odd one out dropping out. The game continues with one chair removed, and carries on until the last two players are contending for the last chair. The variation is Going to Jerusalem which needs a line of chairs similarly placed, and numbering one less than the players, and also a piano accompaniment. The players start seated, the remaining one walking round and round them, chanting "I'm going to Jerusalem" Every now and again, he knocks on the floor behind a chair, and the player seated there must rise and follow him He carries on, reversing his direction at will, until all the players are following, after which the game is exactly the same as musical chairs

Hunt the Slipper has all the players except one seated in a circle, with their knees raised so that the slipper can be passed underneath them. The extra player stands either outside or inside the circle, and tries to spot the slipper, and tap a player when he is in possession of it For Hunt the Thimble, all the players except one go out of the room while the selected player hides the thimble in such a way that it is visible without anything having to be moved. He then summons the others with the formula, "Hot beans and melted butter, ladies and gentlemen, come to supper" The others then search for the thimble, being told if they are "hot," "warm," or "cold" As each player spots it, he sits down quietly, and lets the others continue their search Up Jenkins has two teams seated on opposite sides of a table, one team having a small coin, which one player holds The leader of the other side then says, "Up Jenkins," at which the first team hold their hands, with fists clenched, above the table Next comes a command, which is either "Smash," at which the hands come down flat on the table, or "Crawl," at which they come down clenched and then slowly spread the fingers, the coin holder always complying, but trying to conceal that he has it. The other side then order various hands to be removed, the object being to remove all but the one with the coin.

In Charades a group of players go out of the room and select a word for the others to guess. This should have two syllables, each itself a word. The group then act three short scenes, the first representing the first half of the word, the second the other half, and the third the whole word. There are several ways of acting Charades. In one, each scene actually represents the word or syllable in some way, in another, it has nothing to do with it, but the word or syllable is mentioned, and in still another, it is both represented and mentioned. In historical Charades a well-known figure of fact or fiction with a name containing about five letters is selected, and short scenes are acted about different characters whose names begin with the various letters in the chosen name Similar to Charades is Dumb Crambo, in which those in the room select two rhyming words, decide on one to be acted, then call in the "actors" and tell them the other. If they start to act a wrong word, the spectators hiss, but, when the right word is reached, they clap Both actors and audience remain silent The similarly named Crambo requires each player to write a noun and a question on separate pieces of paper, put them into two hats, draw another paper out of each, and write an answer to the question on one bringing in the noun on the other. Capping Verses is a rhyming game in which one player invents a line, and the others have to supply a rhyming line in the same metre

Perhaps the most famous of all paper games is Consequences. Each player has a sheet of paper divided into columns, writes an adjective applicable to a man in the first column, folds it over, and passes it on He then writes a man's name in the second column of the paper he receives, folds and passes it, and carries on with an adjective applicable to a woman, a woman's name, a place, a remark by a man, a remark by a woman, what the consequence was, and what the world said, after which, the papers are read out Lost and Found is a variation, in which the items required are the object lost, by whom, when, where, by whom it was found, in what condition, where, and what the reward was A simple paper game is Squares, in which several lines of dots are marked on a sheet of paper. Each player in turn joins two dots with a line, the object being to collect squares, which go to the player who makes the line that completes them Advertisements has sections of well-known advertisements displayed with the name of the product omitted players having to write down as many of the names as they can This is an observation test, as is Kim's Game, in which a number of small objects on a table or a tray are displayed for one minute, after which the players write down as many of them as they can.

Verbal guessing games are numerous In Proverbs, one player goes out of the room while the others choose a proverb, and allocate one word of it to each person The player then returns and asks questions, the answers to which must include the speaker's particular word In Guess Who, a character of fact or fiction is chosen, and has to be guessed by questions that must be answered "Yes" or "No" In How, When, and Where, a noun with several different meanings has to be guessed by questions that are restricted to "How do you like it?" "When do you like it?" and "Where do you like it?" Biographies is a game generally popular with children. An adult tells a brief, but accurate, life story of some famous historical character, omitting any mention of the character's surname The winner is the first listener to interrupt the story by calling out the missing name.

Perhaps the most popular of all question-and-answer games is Murder, which starts with cards being dealt round so that only the recipients can see them. This is to allot the "parts," one particular card indicating the murderer, and another the detective. The detective announces himself at once, but the murderer keeps quiet. All the lights are then turned out, and the players disperse about the house The murderer counts fifty, and then commits his murder by pretending to stab another player, who must stand still and count fifteen before screaming to announce the murder. The scream brings the detective, who puts the lights on, and makes what mental notes he wishes of the various players' positions, which, with the exception of the murderer's, must remain unaltered from the moment of the scream The detective then gathers the players together, and questions them, everyone being compelled to answer truthfully, except the murderer, who can lie as much as he likes, unless he is directly accused by the detective, when he must own up. The detective is allowed three direct accusations. A variation gives an additional part to a detective's assistant, who does the gathering in of the suspects, and reports on their respective positions to the detective

Finally two word games that generally amuse children In What's the Word two players quietly select a word with several meanings, and start to discuss one of its meanings, without mentioning the word, soon switching to another meaning, and then another, or else back to the first. If another player thinks he has guessed the word, he joins in the conversation. He is soon proved wrong or right, and, if wrong, he drops out again, but, if right, he then takes over with a partner whom he chooses Travels gives one player a special part, another acting as an intermediary between him and the others The player whispers to the intermediary the name of a place, which may be anywhere in the world, to which he intends to travel. The intermediary then asks three others, who do not know the place, one question each, these being "How is he to go there?" "How is he to travel about when he gets there?" and "How is he to come home again?" The answers must be methods of transport, and the first player then tells a brief story of his journeys and adventures, during which he must abide by the means of travel suggested.

Patience.

Patience is a card game for one person, and, though there are few different games for one, there are countless different forms of Patience There are some using one pack, and others using two, almost all of them starting with the setting out of the cards on the table according to fixed rules, and having as their object the building up of the four suits on their aces

The game that might almost be called the basic form of single-pack patience starts with a row of seven cards, only the left-hand one being exposed. Underneath this, and overlapping it, comes a row of six cards with the left-hand one exposed, and so on down to a "row" consisting of only a single exposed card, the exposed cards being left uncovered in each decreasing row The object is to take out first the aces, and then the cards from two up to king, building each suit on its ace. From the "lay out," exposed cards can be moved when it is possible to put one on a card one pip higher in value of the opposite colour, when any card left uncovered by an exposed card can itself be exposed The undealt cards can be played three at a time, the top one of each three being "playable," with the one underneath becoming "playable," if the top one is, in fact, played. The undealt cards can be played through three at a time in this manner as often as desired A slight variation of this game allows the undealt cards to be played through one at a time, but this can be done only once

Another single-pack game starts with a row of nine exposed cards, with, below it and overlapping, a row of eight, and so on down to one, all the cards being exposed, and the right-hand one being left uncovered in each decreasing row. The remaining seven cards form a separate row at the bottom The object and the "move" are the same as in the previous game, only one card being moved at a time, and any card being eligible to fill any vacancy that might occur in the top row. Cards in the separate row can be played as required, but, once in the "lay out," they must remain there This game is called King of the Belgians, and the last seven cards are referred to as the Belgian Reserve.

One to Six is a two-pack game. The player deals out a row of four cards, then discards two to a rubbish heap, and carries on like this until all the

cards have been used. If, however, while doing it, he comes across any aces or kings, he takes them out, up to one of each from each suit, subsequently also taking out any that will fit on to these, building up from the aces and down from the kings. Then he goes through the rubbish heap, extracting any cards that will fit on the eight piles. The dealt-out cards, with the rubbish-heap cards, are then dealt again in the same way, the object being to complete the eight built-up suits in three rounds of dealing.

At first sight, it might appear that there is little point in Patience, which does nothing to inculcate "card sense" that might prove useful in ordinary card games. However, the fact that it has its own fascination is shown by the countless thousands who play it at one time or another, and by the virtual inability of anyone seeing a game of Patience in progress to refrain from studying the "lay out," and offering advice There is scope for a certain amount of skill in the management of the cards, as, for instance, in the first two games described above, in which it is advisable to build up the suit-piles fairly evenly, as a long run in one suit will leave a disproportionate number of cards of one colour, thus restricting further moves

Polo.

Polo, one of the oldest of all games, originated in Persia, then spread in one form or another to China, Japan, and India, eventually being brought from India to England by cavalry officers in the second half of the nineteenth century Later, it was enthusiastically taken up in the United States and Argentina Played four-aside, and mounted, on a pitch that should measure 300 yards by 160 yards, its object is to score goals by hitting a 5-ounce ball through goals 24 feet wide with a stick consisting of a long cane fixed at a slight angle into a wooden or bambo striking head. The game is divided into periods, called "chukkas," the number of periods varying slightly, as may be agreed for particular games

Formerly, Polo was a game for the wealthy, for it entailed owning and maintaining a string of trained ponies In recent years, however, certain stables and riding schools have provided facilities for playing and practising Polo, and these facilities include the hiring out of ponies This apparently simple and obvious step is actually quite a revolutionary innovation that has brought Polo within the reach of almost anyone who wants to play, and thereby increased the popularity of an ancient and exciting game that might otherwise have died out because of the expense involved

Pot-holing.

Pot-holing might almost be described as mountaineering in reverse, for it consists of the descent, perhaps to a depth of 80 or 90 feet or more, and probably by a precarious rope-ladder, of pot-holes caused by the action of carbon-charged water on rocks of the chalk or limestone type Pot-holing is pursued as a recreation, but it can also lead to extremely useful geographical and geological discoveries, and it certainly does not lack danger.

Pot-holes are plentiful in Britain, particularly in Derbyshire and Yorkshire, for there are many instances of streams plunging into the earth, to reappear many miles away While underground, they may alter course considerably, even to the extent of turning almost back on themselves, and they may cross other underground streams. Where many of them reappear, or where many of those that appear start from, is still unknown, for the exploration of these underground courses is of comparatively recent origin, and is still far from complete. It is, in fact, exploration of this type that pot-holers undertake, and, if, in doing it, they subject themselves to considerable discomfort and some danger, they also discover a fascinating, and even beautiful underground world. Once below the ground, even quite small pot-holes often lead to winding passages, tunnels, and underground caverns containing icicle-like formations both descending from the roof and ascending from the ground. Called stalactites and stalagmites, respectively, these sometimes meet to form weird columns and pillars, all these and other strange formations being caused by calcium deposits. Seen in the light of the pot-holers' torches, some of these caverns are wonderful sights, and new tunnels and caverns are always being discovered.

For those who have the nerve for it, Pot-holing can be an enthralling, and also useful, recreation, but it is one that the newcomer should practise only in company with experienced pot-holers, and it is one in which the loss of a torch can be a major disaster

Public School Football.

All the forms of football popular to-day grew out of the games played at various English Public Schools a century and more ago These games differed widely, the rules often depending on purely local considerations imposed by the available space. The Rugby game (*q v*) in its modern form is, of course, still played, both at that school and far beyond it, and other games that still survive at the schools that originated them are the Eton Field Game, the Eton Wall Game, the Harrow Base Game, and Winchester College Football.

Punting.

Punting consists of propelling a long, narrow, flat-bottomed boat with a pole, the punter standing up, and it can be either a pleasant, leisurely recreation or a fairly strenuous competitive sport The sporting side is governed by the Thames Punting Club, which has headquarters on the Thames at Staines in Middlesex Women, as well as men, take part in competitive events

Punting as a sport has the unique distinction of being confined, not only to one country, Britain, but to one river, the Thames, though in some parts of the world boats poled from a standing position are used for various purposes There have been rumours that Japan has, or had, a similar sport, but these have never been authenticated

Quoits *See* **Old English Games and Customs**

Race Walking. *See* **Athletics, Walking**

Rackets.

Rackets is a fast, racket-and-ball game, played on a court measuring 62 feet by 31 feet, and using walls A game consists of 15 points, unless 13-all is reached, when the non-server can set the game to 3 or 5, or 14-all is reached, when the non-server can set the game to 3, the game going to the first player to score the prescribed number of points Only the server scores, the receiver taking over service when he makes a winning shot When served, the ball must strike the front wall above a line called the "cut" line before striking any other part of the court, but, in play, it may be played either on the volley or after one bounce If a player impedes his opponent, it is a "let," and the point is re-started

Real Tennis.

Tennis, sometimes called "Real," "Royal," or "Court" Tennis, is a court game played with rackets and balls that has been called the King of Games, and that was once certainly the game of kings. Henry VIII played, and it is mentioned in Shakespeare's *Henry V*, but the first kings to play were of France, where the game originated.

It is a complicated game, and no description could give anyone who had never seen it an accurate idea of what it is like. Most racket-and-ball games use either a net, over which the

ball is hit, or walls, against which it is hit, but Tennis uses both. Also, in most racket games, players change ends after so many games, but, in Tennis, they may do so during a game. Matches are in games and sets, a player winning six games completing a set towards the two out of three or three out of five that will make the match.

There are not many Tennis players in the country—there are only about a dozen courts—and very few women have ever played. People who do play, however, most of whom play other games as well, are almost unanimous in voting it the best of all games.

It is said that the term "love," used in so many games to indicate "nought," comes from Tennis, the original French term being "l'œuf," which, in that language, actually means "egg"—an egg being, of course, something like the figure used for "nought." This derivation is not sufficiently well documented to be accepted as definite fact, but it is interesting to note that, in Cricket (*q.v.*), the term used for a score of "nought" is a "duck," or, in full, a "duck's egg."

Revolver Shooting. *See* **Rifle Shooting.**

Riding and Show-jumping.

The almost complete disappearance of the horse from everyday life has been followed by an increase of interest in Riding as a recreation. This is at least partly due to the great attention paid in recent years by both Press and television to one particular branch of horsemanship, Show-jumping. Before learning to jump, however, it is necessary to learn to ride, and many people never go, and have no wish to go, beyond the ordinary, unspectacular riding for pleasure that is called "hacking."

A great deal has been said and written about "correct" riding style, but, in actual fact, there are many different styles. The cavalryman, for instance, bends the leg to some extent, the Red Indian bends it to a much greater extent, more or less in the style that has been adopted by American jockeys, and the cowboy rides with an absolutely straight leg. Yet all these are expert horsemen. To assist in acquiring the normal English style, which is very close to that of the cavalryman, there is an old jingle that is now much less heard than it used to be, but is probably none the less helpful or accurate for that. It runs: "Your head and your heart keep up. Your hands and your heels keep down. Your knees keep close to your horse's sides, and your elbows close to your own." Old or not, anyone who learns it, and then builds up a certain amount of experience of putting it into actual practice is well on the way to becoming a rider.

It has been said that Riding is excellent exercise for the horse, but, whatever its merits or demerits as a medium of actual physical exercise for the rider, it certainly provides him or her with a delightful and beneficial form of recreation in the open air. For those who like the idea of Riding, no matter how inexperienced they may be, there are "pony trekking" holidays. These take place at fixed centres, where about two days are spent in simple instruction in such elementary things as saddling, mounting, starting, and stopping the horse, after which day expeditions cover the surrounding countryside. Those who feel they would like to combine their Riding with something competitive might start with gymkhanas, which are sports meetings that generally include mounted equivalents of such novelty events as obstacle races and needle-threading races. For the more ambitious, gymkhanas could even be the first step towards the top-class competitive sport of Show-jumping.

Show-jumping. A Show-jumping contest is a mounted competition over a circuit of jumps, which the entrants attempt one at a time, each having the field to himself or herself, and being free to concentrate entirely on the jumps, without having to worry about other riders. The jumps, which have to be taken in a certain order, are of many kinds, including fences, double fences, walls, and water. Scoring is by points against, called "faults," so many being debited against an entrant for falling, knocking down an obstacle or displacing part of it, refusing, and other mistakes. Though the event is in no sense a race, there is normally a time limit that must not be exceeded, and, in some events, bonus points are awarded for fast rounds. Show-jumping is not restricted to riders who own their own horses, for some owners do not want to compete themselves, and are only too pleased to let good horsemen take their jumpers round for them. Incidentally, inexperienced riders taking up jumping for the first time will probably find it advisable to make some slight changes in their method of sitting in the saddle. Jumping needs a firm seat, and the novice rider may find it necessary to shorten the stirrups a little.

Allied to Show-jumping, and coupled with it in the difficult three-day competitions, is dressage. This is simply a mounted display revealing that the horse is obedient, balanced, supple, and, in a word, trained, and is a simplified form of the better-known "haute ecole," or highly-schooled riding. Good riders who seek absolute perfection can, if they are willing to pay for it, take an intensive course of haute école riding and all forms of horsemanship at the most famous of all riding schools, the Spanish Riding School in Vienna. Courses, which are conducted in German, consist of eight hours training a day for six months, and informality is not encouraged, the regulation dress for students being a bowler hat, black jacket, and white breeches. Riders who fall are immediately assisted by an attendant armed, not with a stretcher, but with a clothes brush.

Rifle Shooting.

Considered as a sport, Rifle Shooting, which might almost be called the modern equivalent of archery, had its origins in virtually the same conditions and circumstances that had popularised the older weapon five hundred years previously, though, unlike archery, it did not enjoy legislation aimed at abolishing other recreations in its favour. Both were encouraged because, in their respective periods, efficiency at them meant, not only success in competitions, but also the most effective defence in time of war, the great period of the rifle's encouragement for this reason being the latter half of the nineteenth century. Archery as a sport survives to the present day, and Rifle Shooting as a sport continues, though it can no longer be regarded as the most effective weapon.

With a normal rifle, with a calibre of about ·300 inch, competitive shooting is at ranges from 200 yards to 1000 yards, and there are many competitions, the greatest of them being the annual contest at Bisley, Surrey, for the Queen's Prize. Almost equally popular, however, is small-bore shooting, with a calibre of ·22 inch, and this, too, offers many annual competitions.

Revolver Shooting. Revolver shooting, often called pistol shooting, is also a competitive sport, and a very difficult one. Impressions gained from cinema and television screens might lead anyone who has never fired one to think that the revolver is an easy weapon to fire without fuss and with devastating effect. It is the very reverse of this. It is fired, not from the hip, but with the extended arm raised, which is how, in real life, it was generally fired in the old West. It is extremely difficult to hit even a man-size target at 10 yards, and very few people can call themselves good revolver shots, just as few of the old Westerners were good revolver shots. The difficulty is caused by the tremendous "kick" of a weapon that is held, not by both hands and pressed into the shoulder, as a rifle is, but by one hand. A revolver has sights, but the normal method of aiming is by using the "instinctive pointing sense," which is based on the fact that, if you point your finger at an object in the ordinary way, without, of course, taking a careful sight along it, you will, in fact, be pointing accurately. The same applies when pointing a revolver.

Roller Skating. *See* **Skating.**

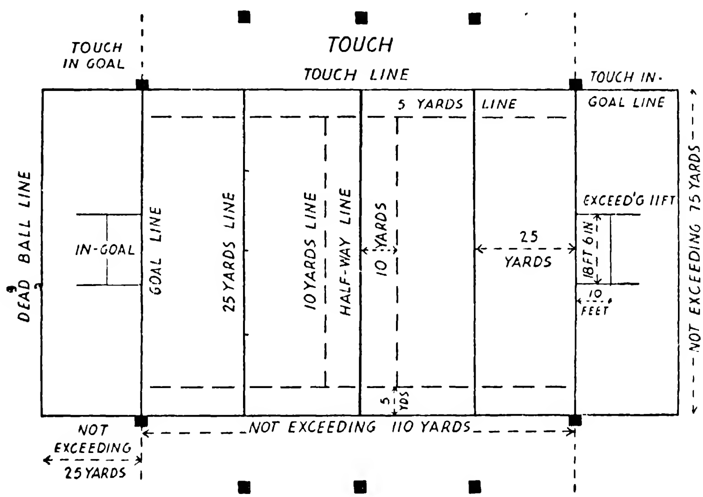
Rowing.

Rowing, meaning simply taking a boat out on the sea or a river for a short period, is a pleasant recreation and a healthy exercise, but competitive rowing is one of the most strenuous of all sports

A racing oarsman either rows, which means that he uses one oar, or sculls, which means two oars. Races are of various kinds, the best-known being

handling the ball, and that handling was subsequently made legal. In fact, handling the ball by catching it was allowed at Rugby before 1823, so, if Ellis was responsible for an innovation, it was not by handling the ball, but by running with it after catching it. Running with the ball certainly became, and remains, the leading feature of Rugby Football, but the story that Ellis was responsible, though commemorated by a plaque at the school, was first heard years after Ellis's death, and he never knew of the fame that became his He was definitely at Rugby at the time, though, and, a few years later, he played in the first-ever Oxford and Cambridge cricket match

The spread of the game beyond the school that originated it has led to, not one, but two games of Rugby Football, Rugby Union and Rugby League. About twenty-five years after the game had become organised, with the Rugby Union



NOTES.—

■ Indicates Post with Flag Length and breadth of field to be as near to dimensions indicated as possible

– – – These broken lines indicate 10 yards and 5 yards from half-way and touch lines respectively

Goal dimensions —10 feet is taken from the ground to the top edge of the crossbar and 18 feet 6 inches from inside to inside of the goal posts.

for crews of eight oarsmen with a cox Then there are races for crews of four with cox, and for crews of four without cox. There are also events for pairs with cox, pairs without cox, double sculls, and single sculls Eights, fours, and pairs row, while double and single scullers, of course, scull. In fours and pairs without cox, and in all sculling, the oarsmen steer themselves.

Race Rowing is mainly a river sport, but there are races on the sea For these, crews are usually fours with cox, and they use heavier boats than the normal racing "shell." (*See also* **Boat Races.**)

Rugby Fives. *See* **Fives.**

Rugby Football.

As its name implies, Rugby Football is based on the game played at Rugby School in the days when football was not organised and various schools played to their own rules. The story of how the Rugby game originated is well known and widely accepted, but it is definitely not accurate and possibly almost entirely apocryphal.

The story is that, in 1823, a boy named William Webb Ellis disregarded the rules of that time by

as its governing body, there was a dispute on the question of legalising payment for time lost from work by players. The Union would not agree to this, so twenty-two clubs, mainly in Yorkshire, seceded and formed the Northern Union, now the Rugby League Both bodies originally played the same game, but now, after over sixty years of independent existence, during which each has made various rule changes, there are some important differences

Rugby was originally played twenty-aside, but it is now fifteen-aside in R U. and thirteen-aside in R.L , the positions being seven backs and eight forwards in R U. and seven backs and six forwards in R L. Played on a pitch marked out as in the diagram, and with an oval ball, Rugby is mainly a handling game, the chief object being the grounding of the ball behind the opponents' goal-line. This is a "try," which counts three points, and entitles the scoring side to an attempt to score a goal by kicking the ball over the crossbar from a point measured in a straight line from where the ball was grounded. Other forms of goal are penalties, which may be awarded anywhere, dropped goals during play, and goals from a "mark," after a player has signalled a "fair catch" of the ball during play by shouting, "Mark." In R.U. goals following tries, called "conversions," count two, and other goals three

In R.L. any goal counts two, but goals from a "mark" are not allowed.

The game is started, and restarted after a score, by a kick-off from the centre, and, thereafter, the ball may be advanced by kicking or carrying. It may also be passed from hand, but not forward Ball carriers may be tackled and thrown down, and they may "hand off" tacklers with the unclenched hand. A frequent method of restarting after a stoppage is the "scrummage," in which the forwards bend down and push against each other, three from each side constituting a front row, and the remainder two subsequent rows The ball is then put into the tunnel between the front rows, the centre man of each, the "hooker," endeavouring to gain possession by hooking it back into, and generally right through, his "scrum." In R L this method of restarting is used whenever the ball goes out over the touch-line, but in R U the ball is thrown in straight along a "line out" of both sets of forwards, unless the side whose throw it is demand a scrummage. In R L kicking the ball straight out over the touch-line is allowed only from a free-kick, the penalty being a scrummage at the point from which the ball was kicked The effect of the differences between the two games is that R L is faster and more open, and the ball is more continuously in play A game lasts for eighty minutes, divided into two halves

In addition to Britain, both forms of Rugby are played in France, New Zealand, and Australia, and R U is played in South Africa Both codes also have other, smaller "outposts" in various European countries, and there are minor R.U. centres in North and South America R U is entirely an amateur game, and R L primarily so, though there is a top layer of clubs using part-time professionals

Sailing.

Mention of Sailing tends, perhaps, to conjure up visions of large, graceful yachts, beautiful to see, but clearly to be owned only by the wealthy Sailing to-day, though, is very different from that It is mainly sailing in small boats, many of them wholly or partly built by their owners At first glance the building of a boat might seem a tremendous and highly skilled task, but, in actual fact, it can be as big and as hard or as small and as easy as the builder wishes Some amateur builders start from the very beginning, acquiring the various materials needed bit by bit, and gradually bringing their boats into being However, those who either lack the time for this or doubt their ability to construct a boat in which they would feel safe on the water can buy complete boat-building kits, and they can buy them at any stage of construction they choose from hardly started to complete except for a coat of paint It is more economical to build a boat than to buy one complete and ready for launching, and the earlier the stage of construction at which the owner takes over, the greater the saving Some owners claim that they enjoy the building as much as the sailing, and it is probably true that the owner who has done some work on his boat, however little, takes more interest and pride in the finished article

The fact that boat-building is now within the reach of practically everyone means, of course, that the end to which it is a means, Sailing, is also within the reach of practically everyone, for few people are far from some suitable stretch of water Where there is sailing, there are clubs, which the boat owner can join for quite reasonable fees, and which provide either sheltered moorings or "dinghy parks" where the boat can be kept.

Eventually, the small-boat owner may want to try racing his craft, and there are many events for boats of all classes and sizes. Racing is an enthralling pastime, for, though races are, of course, tests of speed, they are also very much more than that. There is tremendous scope for tactics, and the sport is in every sense a highly skilled one, as well, incidentally, as one with an interesting history behind it.

Yacht Racing. The first recorded sailing contest was a race from Greenwich to Gravesend on 1 October 1661, between Charles II, who won, and his brother, the Duke of York. In those days, such contests generally took the form of manœuvring for positions of advantage, rather than straightforward racing, for the Royal Navy also relied on sailing, and every privately owned vessel was a potentially useful naval auxiliary a fact that emphasises the appropriateness of the right of England's most famous yacht club, the Royal Yacht Squadron, to fly the White Ensign. The club was founded as the Yacht Club in 1815, becoming the Royal Yacht Club in 1817, when the Prince Regent joined, and taking its present name in 1832 In 1851 the club put up for competition a 137-ounce, 100-guinea cup that has become the most famous trophy in yachting, and one of the most famous in sport.

In that year a schooner of the then famous New York pilot-cutter type, called the *America*, sailed across the Atlantic, and her commander challenged the Royal Yacht Squadron to find a schooner or schooners to race against her. There were no takers, so the *America*'s commander made a more tempting offer Though the schooner rig was considered slow, and was generally given a time allowance in races, he offered to race on level terms against vessels of any rig, and to back his ship for anything up to 10,000 guineas. There were still no takers, so the commander entered for the 53-mile race round the Isle of Wight for the new cup, though he knew that some of the seventeen other yachts in the race were twice the size of the *America*. Despite that, the *America* won by eight minutes.

Subsequently, the *America* was sold to an Englishman, who cut 5 feet off the masts, and then wondered why she did not win races She was rebuilt in a Thames boatyard, and, when the war between the States broke out, became a Confederate blockade-runner, but was trapped in the St John's River, Florida, and scuttled. However, she was raised and repaired, and finished the war as part of the Union Navy, after which she returned to racing, which brings us back to the story of her cup

The cup, now called the *America*'s Cup, had been given to the New York Yacht Club for perpetual competition between different countries, and the first challenge for it came in 1870 The challenger was defeated, and by the *America* To date, there have been eighteen challenges, fifteen by Great Britain, two by Canada, and one by Australia, but not one of them has succeeded Britain's 1958 challenge, which was the seventeenth, pointed the present trend in yachting, which is towards smaller vessels Previously, the America's Cup conditions stipulated that the races must be between very large yachts of the "J" or 21-metre type, and that, if the challenge was from across the Atlantic, the challenger must sail across In 1958, the rule about sailing across the Atlantic was waived, and the event was between yachts of the 12-metre class

Large vessels are still seen in the famous Bermuda Race, but the modern trend is very evident in the growing popularity of the annual Folkestone Dinghy Race across the Channel, which also has a class for catamarans, very fast and very popular boats that consist of two boats side by side joined by a kind of raft

Skating.

At first glance, ice-skating would not appear to be a normal activity for British people, for it is a part of Winter Sports (*q v*), which are possible in Britain only rarely and to a very small extent, and it was formerly restricted to brief periods

when rivers, lakes, and ponds were frozen. Despite this, however, the people of this country have always appeared to possess a natural talent for it, and they have practised it whenever opportunity offered. The history of British Skating goes back a very long way, and includes occasions when Skating was possible, and took place, on the Thames, as well as many, more regular instances in the Fen district and other places. In recent years this wish to skate on ice has been catered for by the opening of many indoor rinks, which make the skater independent of weather and daylight, and enable Skating to be carried on throughout the year.

Many people ice-skate just for recreation, health, and amusement, but anyone keen to carry Skating a stage farther and acquire a higher level of skill can find a wide range of opportunities from which to choose. Figure-skating is very popular and for those anxious to test their skill at it there is a series of medal tests, in which the skater is not in competition with anybody, but is attempting only to reach a fixed standard. Beyond these, there are many competitions and championships. Dancing on skates also attracts many people; and also offers those interested standard medal tests and competitions.

Another popular skating activity is speed-skating, which takes place indoors and, whenever possible, outdoors as well, though the methods and techniques of the two forms of racing differ widely. Outdoors, the skaters normally race in pairs, though each man is timed, and is actually racing against the whole field. Much of the racing is on long, straight stretches of ice. Indoors, skaters race perhaps four at a time, and are directly opposed to those on the ice with them. These races are on small tracks, a lap sometimes being no more than 130 yards. Standard outdoor distances range from 500 to 10,000 metres, while indoor races go from 440 yards to 2 miles. There are also indoor relays, generally of 3 miles, in which teams of four race on the "Madison" method, relieving each other, not at fixed points, but at will. In addition to competitions and championships, speed-skaters also have their standard medal tests.

Ice, however, is not the only surface on which Skating takes place for, following an unusual history roller-skating also maintains a large following. Roller-skating was originally introduced long before the arrival of the indoor ice rinks purely to provide ice-skaters with some kind of substitute when no natural ice was available. It progressed by fits and starts, varying from extraordinary "crazes" when it seemed that everybody was roller-skating, to periods when nobody appeared to be doing so. Eventually, it settled down to a steady existence as a popular recreation in its own right that has in no sense been pushed into the background by the increased facilities for ice-skating. The opportunities it offers are almost identical with those of ice-skating, for they include figure-skating, dancing, and speed-skating, with championships, competitions, and standard medal tests in all branches.

Both forms of Skating also offer a team game, and in both it is hockey. Ice-hockey, which is called simply hockey in Canada, where it originated, and the United States, is played six-aside, with substitutes permitted, and with a rubber disc, called a "puck," instead of a ball. It first began to win popularity in Britain soon after the First World War, and since then has had rather a chequered career, helped forward by the semi-professional players from Canada, who play in the National League teams, and held back by the lack of facilities for British youngsters to practise; for practice sessions mean closing rinks to all the other forms of Skating for certain periods. The game should, however, survive, for there is a definite demand for it.

Roller-hockey, generally known as rink-hockey, bears a closer resemblance to its parent game, outdoor field hockey, than does ice-hockey. It is played with a ball, and is five-aside, with one substitute permitted. Its popularity is such that it is now played throughout the year.

There is a form of hockey on ice that closely resembles outdoor hockey. This is Bandy, which originated in England, but is no longer played here, though it is popular in Sweden and the U S S.R. Some other games have been tried on skates from time to time. One is Badminton, which has been played on ice, but only as a stage exhibition. Basketball on roller-skates has been tried in several countries, and might well develop and spread.

Skating is not so much a recreation, sport, or game as a whole series of different recreations, sports, and games. Each has its following, and, while there are enthusiasts who are interested in both ice- and roller-skating, or in more than one branch of one or both of them, there are many ice-skaters who have no interest in or knowledge of roller-skating, and vice versa, and many keen supporters of just one branch of Skating who hardly know that the many other branches exist. It is, of course, quite possible to take part in both ice- and roller-skating, and in more than one branch of Skating, and greatly to increase one's enjoyment by doing so.

It is not particularly hard to learn to skate. It requires strong ankles, a good sense of balance, and plenty of confidence, and it is possible to start practising, at least to a limited extent, at home, for instance, by getting used to standing on skates. Skating is probably more easily mastered when young, but many adults have successfully taken it up.

Solo Whist.

Solo Whist is a card game for four players, who normally act independently. Play is as at Whist (*q v*), but the cards are dealt in threes, the final round being dealt singly, and the dealer exposing his last card to indicate trumps.

Players then "declare" in turn, starting with the player on the dealer's left. The lowest call is "I propose," which entails making eight tricks with a partner, any one of the other players being eligible to "accept" in his turn. The next call is "Solo," which requires five tricks to be made unassisted. Next comes "Misère," in which every trick must be lost, and then comes "Abondance," in which nine tricks must be made. Higher still is "Misère Ouverte," in which every trick must be lost with the player's hand exposed, and highest of all is "Abondance Declarée," in which every trick must be made. Any player may "Pass," and, once a call has been made, later callers must make a higher call or pass.

Though calls are made with trumps already nominated, certain calls may alter the trumps, and, with regard to these, there are several views, all quite widely held, as to the rules that should apply. A player calling Abondance can choose his own trumps, though Abondance in the nominated trumps—called Royal Abondance—takes precedence over the same call in another suit. In Abondance one school of thought holds that the first round is played on the nominated trumps, while another takes the view that the first card only is played on the nominated trumps. In either of these circumstances a player making this call should not announce his trumps until the round or card has been played, unless it is necessary to announce Royal Abondance to overcall. There is, however, a third view, and it is the view

of the majority of authorities who have actually written about the game, that the new trumps should be announced before the hand starts Also the subject of differing views is Abondance Declarée, one view being that the caller can choose his own trumps, and another that, in this call, there are no trumps, though both views agree that this call confers the right to lead A good player can easily adapt himself to any of these variations the important thing being to check which versions are being used before starting to play On the Misère calls there are no trumps, and in Misère Ouverte the player need not expose his hand until the first round has been played

Speed-Skating. *See* **Skating.**

Squash Rackets.

Squash Rackets was designed as a preliminary preparation for the game of Rackets (*q v*), but it is now a popular game in its own right played by men who have no intention of playing Rackets, and by women who never play Rackets The game is similar to Rackets, but the court is smaller and most matches are singles Doubles, however, can be played, and in the United States there are special doubles courts slightly larger than the normal Squash court

Surf Riding *See* **Swimming**

Swimming.

Swimming is an extremely popular pastime that also shares with walking the distinction of being a perfect exercise for health, as it exercises the whole body, and can be carried out as easily or as strenuously as the swimmer wishes It is also a very useful accomplishment that may at any time put its possessor in a position to save a life

There are several different swimming strokes, the basic stroke being the breast-stroke, now often seen in an alternative method, the butterfly Faster strokes include the side-arm, the overarm, the trudgeon, and the crawl, but each of these attempts to speed up progress through the water has really superseded its predecessor, and the crawl is now almost universal There are also two strokes used in swimming on the back, one being a back equivalent of the breast-stroke, and the other a back crawl It is possible to swim under the water, using the breast-stroke, and to keep the eyes open while doing so It is also possible to swim down through the water to retrieve objects that may have been dropped Ascending through the water is automatic, though it can be hastened by a kick Remaining stationary in deep water can be achieved either by floating on the back or by treading water, which simply means moving the legs gently up and down

It is not difficult to teach oneself to swim, and, like cycling, it is an accomplishment which, once learned, is never forgotten The main thing is confidence, or an absence of any fear of the water Such fears are quite unnecessary, for water is an element that always tends to keep a human being on the surface, and not to draw him under Going underneath the water, and staying underneath, requires a definite physical effort, and, if that effort ceases, the swimmer is automatically brought to the surface again. Many non-swimmers who get into difficulties increase these by struggling wildly, for, by doing so, they may easily take and keep themselves under. If they would make only the gentle movements of treading water, they would both stay afloat much longer and present far fewer problems to any swimmer who might be trying to save them.

Saving life in the water is the object of the Royal Life-Saving Society, which teaches the best methods of bringing people who are in difficulties ashore, and also methods of artificial respiration for use in reviving the apparently drowned. Every swimmer should acquire some knowledge of life-saving, for even a strong swimmer may experience considerable difficulty in saving anyone unless he or she has some idea of the best way of setting about it Many swimmers, for instance, normally use only the crawl and the back crawl, whereas, to save anyone, it is almost essential to use either the breast-stroke or its back equivalent

Swimming has a well-organised competitive side, with many competitions and championships right up to the Olympic Games Most races take place in baths, but there are some river and sea events, and the greatest competitive challenge to any swimmer is, of course, the English Channel Although this has been conquered many times, the swimming of it remains, and will always remain, a wonderful achievement.

Diving Generally accepted as being akin to Swimming, though actually it is quite a different sport, is Diving Competition Diving means using boards of various heights, performing certain set dives, and choosing additional ones from an approved list Diving requires a certain amount of nerve, and also gymnastic ability, including the ability to control the body in the air Whereas strong swimmers are generally fairly big, divers are often much smaller and more compactly built

Water Polo In view of the popularity of Swimming, it is not surprising that there is a water team game, this being Water Polo, in which the object is the scoring of goals, the ball and the goals resembling those used in Soccer, though all shots and passes are, of course, thrown Throughout a history of nearly eighty years, Water Polo has been beset by rule trouble, and has probably been the subject of more codes of rules than almost any other game The difficulty is the detection of fouls under the water, the ideal, a game of the basketball type, free of bodily contact

Surf Riding Though straightforward Swimming, Diving, and Water Polo are the chief competitive water sports, there are other water activities with large and, in some cases, growing followings, some of them also having their competitive side Fairly old-established is the Hawaiian sport of Surf Riding, which has been seen though generally in a rather milder form, in many parts of the world It consists of placing a flat board on the water, and then lying, or, more rarely, kneeling or standing on it, and being carried ashore on the crest of a wave.

Water-Skiing A growing water sport, and one in which contests are held, is Water-Skiing, which is of more recent origin than Surf Riding, from which, in fact, its development can be traced Surf Riding led to Aquaplaning, in which the board was towed by a motor-boat, with the rider standing A further development saw the board giving place to actual skis, and Water-Skiing was born This sport owes some of its popularity in Britain to television, for, when still in its infancy, it was demonstrated on the screen, and this led directly to several new water-skiing centres being opened up in various parts of the country

Underwater Swimming Undoubtedly the fastest growing of all swimming activities is Underwater Swimming, which is a link between ordinary diving and swimming under water, with the swimmer, depending on his own lungs, able to remain below for only a few seconds, and fully-fledged deep-sea diving, with the diver weighed down with equipment and receiving assistance from the surface. The underwater swimmer receives no surface assistance, but he does use

light equipment, consisting of an artificial " lung " and breathing tubes, and also a mask and flippers. This type of swimming developed during the Second World War, in which Naval underwater swimmers, called "frogmen," rendered great services. Frogmen can also render useful services in peacetime, in, for instance, the sometimes necessary searching of rivers and canals, in underwater photography; and in exploring wrecks, and even old, lost cities, now under water. There is also a vast amount of knowledge, excitement, and pleasure to be gained from a "close-up" study of the many fascinating aspects of the underwater world.

It might be thought that the first step towards becoming an underwater expert was to become an expert swimmer, but it is not essential for an underwater swimmer to be a surface swimmer of anything like championship class. There are, of course, dangers, and the newcomer to Underwater Swimming should not go down too deep until he has had a good deal of practice and gained a certain amount of experience. Preferably, the first descents to any depth should not be undertaken alone, and if the swimmer has gone at all deep he should come up slowly, otherwise he risks getting the "bends," which is caisson disease, and means that reduced air pressure has caused nitrogen bubbles to form in the tissues. There may also be danger from large fish, and underwater swimmers should not venture into undersea caverns without a light. It is always advisable to collect as much local information as possible before diving in a strange area. Though all kinds of equipment, including cameras, harpoons, knives, and torches, can be carried, the beginner will make a better start if he dives without encumbrances. Most of the dangers can be avoided or circumvented with care, and the reward for those who master Underwater Swimming is a whole new world to explore.

Table Tennis.

Originally simply an amusing parlour game known as "Ping-Pong," Table Tennis is now a serious, world-wide, competitive sport, with many championships and tournaments, and the ability to attract crowds of 10,000 spectators.

Resembling a miniature game of Lawn Tennis (*q.v.*), the net is set on a table 9 feet long by 5 feet wide, and the ball is a very light celluloid one. Players serve series of five balls in turn, both server and receiver scoring. The service has to bounce first on the server's side of the net, and then on the other, and, thereafter, all strokes are "ground" strokes, volleying not being allowed. A game is 21 points, and matches are usually the best two out of three or three out of five games. "Vantage" games are played, as, if the score reaches 20-all, each player serves once in turn until one has a clear lead of two points. Both singles and doubles are played.

Table Tennis requires perfect fitness and split-second reactions. Many Lawn Tennis players also play Table Tennis, and several of these have found it desirable to retire from the fast table game before giving up the outdoor game.

Traditional Games and Customs.

Traditional and unusual sporting events are plentiful in many parts of the world, but few have a longer tradition behind them than the Calcio in Livrea that can still be seen, over 500 years after its inception, in the Italian city of Florence. It is a version of Football, based on an ancient Greek game called Episkuros and the old Roman game of Harpastum. Played twenty-seven-aside on a pitch rather smaller than an Association football pitch, it was originally restricted to the nobility, and in 1672 a game was cancelled when it was discovered that the selected teams included players who were only "gentlemen." The ordinary people did play, but the game as played by them was called Calcio Divisi, and was not regarded as the same thing. The playing of Calcio in Livrea faded out in 1739, but was revived in 1898, to stop again in 1902, only to be revived once more in 1930. To-day, there are generally two games a year between teams no longer restricted to the nobility and representing the four quarters of Florence. They are wonderful spectacles, for the players, and also numerous officials and attendants, wear fourteenth-century costume, and the games are preceded by ceremonial processions, and by a special address to the most distinguished person present. The trophy for the games is traditionally a white calf.

Another ancient Italian sporting event that still survives is found in Siena, and consists of horse-racing in the city. It is a wild and fierce form of racing in which virtually anything that might further the cause of victory goes on between the riders. Riding events, many of them of great antiquity, figure prominently in countries in which great horsemanship is an age-old tradition. Russia offers Kop-Karri, a fifteen-aside mounted game that is a battle for possession of a sheep's pelt. Riders carry their reins in their teeth to leave their hands free for the fight, and anyone who gets the pelt is soon downed in what is one of the roughest and toughest games of all time. Played now by Kazakhs from the Steppes and Tadjiks from the Afghanistan border, this game originated in China, and was brought out of that country by the riders of the Golden Hordes of Genghis Khan. Also found in Russia is the mounted Kissing Game, in which a galloping male horseman seeks to snatch a kiss from a girl rider armed with a whip.

Horses are also prominent in North American Rodeos, which consist of competitions in cowboy skills, such as riding, roping, steer-wrestling, and chuck-wagon racing, which can still be seen annually in rodeos like the famous Stampede at Calgary in Alberta. Rather different are Chilean Rodeos, which consist mainly of displays involving horses and young bulls, and the Topeadura, in which two mounted teams push against a long log suspended horizontally between them. Chilean Rodeos carefully avoid anything that might harm the animals, which enter into things with excitement and enjoyment. This also applies to the bull races at Pamekasan in the Indonesian island of Madura. Based on the local method of ploughing, these consist of races in which a driver stands barefooted on a small wooden sled harnessed to a pair of bulls, though these need little driving. In India, elephant racing may be as much as a thousand years old, but it is now being allowed to decline because of reputed "feudal" associations. Recently, there was a not-very-serious attempt to introduce it into the United States, which is, however, more at home with events like Florida's Swamp Buggy Derby, in which vehicles carrying two hunters and their equipment must cover a figure-eight course of a mile within ten minutes.

Differing widely from these events in everything but speed is Pelota, or Jai Alai. Played in Spain, France, Portugal, North Africa, and South and Central America, pelota is a traditional Basque game that developed from a mediæval form of handball that was played against village church walls. To this day, many pelota courts, called "canchas," are next to churches, the wall, or "fronton," which is an integral part of the game being that of the church, and the priest very often being one of the best of the local players. The game, which is very fast and exhausting, can be between two players or between teams of two or three, and consists of playing a ball that is rather smaller than a tennis ball against a wall with either the hand or, in the case of the most popular form of the game, the Grand Chistera, with a long, narrow, wicker basket, called a "chistera," that is strapped to the player's hand and arm.

Personal combat sports have always been popular, and Switzerland has a national sport of this type that had its first big tournament in 1905 in Das Schwingen, which means "The Swinging." It is a form of wrestling, in which the contestants,

normally very powerful Alpine herdsmen, wear special belts and shorts by which holds are taken The traditional prize for the winner of the annual Swiss championship is a two-year-old heifer. Iceland has a rather similar form of wrestling, called Glima. Much less similar is the Siamese form of boxing. Competitors in this wear, and use, ordinary boxing gloves, but they are also allowed to use their elbows, knees, and feet, which are bare

Next, a group of recreations in which the feet are used less lethally, starting with the Netherlands, and the Nijmegen Marches. Over half a century old, these are international long-distance walks that are not races, but reliability trials, in which complete teams must start and finish together within a certain time. The marches take four days, the distance to be covered each day varying between 25 and 30 miles according to the class. Classes catered for include men, women, and also police teams, walking in uniform, and military teams, carrying equipment. The walks, which attract over 10,000 competitors every July, are an unusual and colourful spectacle, and the opening ceremony is as well worth watching as that of the Olympic Games British walkers, civilian, police, and military, regularly take part Though called marches, they are really walks; and it is unlikely that many men would consider real precision marching as a recreation However, women do in at least one country This is New Zealand, where marching competitions are held between teams of twelve, with a leader, each team wearing a special uniform, and carrying out a three-minute routine to the music of a pipe band Points are awarded, not only for the marching, but also for the costumes and the leading. Though the competitions are confined to women, teams are generally trained and drilled by men This type of marching was seen in Britain a few years ago, when the Blair Atholl team toured the country giving demonstrations

About fifty years old in its own country, Sweden, and quite likely to spread to other countries in the future is Orienteering, which consists of finding one's way about the country from one control point to another by using maps and compasses. Generally carried out on foot, and in wild country, it can also be done on horses, bicycles, motor-cycles, skis, and skates, and in cars and canoes, and in any kind of country, including urban areas During the Second World War, in which Sweden, though not involved, had to be ready, Orienteering was extensively used in military and civil defence training; and it was then that night Orienteering began, with competitors wearing lamps strapped to their foreheads Probably the most strenuous annual event in Orienteering is the Swedish three-day mountain race, in which contestants, working in teams of two, have to cover 60 miles of mountains, forests, and swamps on foot, carrying equipment that must include tents and food Though mainly confined to Sweden, Orienteering has been successfully tried in Canada and the United States, where it acquired its English-language name.

Non-English recreations that English people do not have to travel very far to see are the many and various activities that go to make up Scotland's Highland Games Highland Games meetings, or gatherings, are sports meetings, but sports meetings with their own definite and extremely colourful and spectacular characteristics The chief sporting events at them are the "heavy-weight" events, including tossing the caber, throwing the hammer in the Scots style, putting and throwing weights of various sizes, and wrestling. In addition, there are competitions in Highland dancing and piping, and often for pipe bands, all playing their parts in a spectacle that can hold its own with any of the many spectacular events that love of tradition and love of sport have combined to produce all over the world. (*See also* **Old English Games and Customs.**)

Tug-of-War.

A Tug-of-War is one of the least complicated and one of the most strenuous events in sport. It consists of eight men pulling on a rope against another set of eight pulling in the opposite direction, each team trying to pull the other forward across a line, and each helped by a coach, who instructs them when to "heave" and when to concentrate on resisting the opponents' heaves. A pull may be over in a few seconds, or it may take many minutes. Contests are generally the best two out of three pulls, and a competition may involve three such contests in one afternoon. Competitions may be at "catchweights," which means that there is no weight limit, or they may restrict the eight men to a total weight of, say, 104 stone or 100 stone The Tug-of-War requires, and will help to develop, great strength.

A popular event that always arouses great enthusiasm amongst the spectators, the Tug-of-War fully merits this position, but it owes some of its success to the fact that it was introduced into the right place at the right time. In the nineteenth century, before athletic sports were really organised, most country sports meetings included events like obstacle races, sack races, and egg-and-spoon races. These, however, though they are found to this day in some children's and local sports, grew less popular, and began to give place to more "serious" ones, a favourite replacement for them being the Tug-of-War. Then athletic sports became organised, and the Amateur Athletic Association was founded, and instituted its famous annual championships, including two Tug-of-War championships that still exist, where, a few years earlier, there might have been obstacle-race and sack-race championships

For years, service units and police forces provided the leading Tug-of-War teams, but, more recently, they have been challenged by teams from big firms. A still later development has been the formation of clubs concentrating entirely on the Tug-of-War Organisations and clubs with Tug-of-War teams now have their own association, and their own annual championship meeting.

Underwater Swimming. *See* **Swimming.**

Underwater Watching.

In recent years there has been a considerable increase of interest in the undersea world; and some participation in this has been brought within the reach of those who are unwilling or unable to take part in underwater swimming and diving by the use of glass-bottomed boats, often boats in which the viewer slides back a wooden panel at his feet to reveal the glass viewing panel Such boats, of course, can only be of use where the water is exceptionally clear and transparent, but, where conditions are suitable, a surprising amount of the life and colour of the world beneath the seas can be seen, and without any of the strain or danger of diving.

Much of the Mediterranean Sea fulfils the necessary conditions of clarity and transparency, particularly, perhaps, the coasts of Corsica, Sardinia, Sicily, and Italy itself. Greek and Egyptian waters are also clear, as are the waters of the Spanish Costa Brava and the Balearic Islands Going farther afield, there are very transparent waters off parts of the Australian coast, and, of course, in the West Indies.

Volleyball.

Long-established in the United States, and played also in some other countries, Volleyball is a comparatively recent arrival in Britain, where it has been encouraged by leading personalities from the sport of Athletics, who saw in it an ideal game for maintaining fitness, and formed a governing body to organise and control it. A league started in London owed much of its early success to players of nationalities other than British, but the game took a big step forward when it was adopted by the London Fire Brigade as an effective method of physical training.

Volleyball might be compared with Basketball (q.v.) in that it is a team game that can be played

indoors, though it can also be played on outdoor courts. The actual game, however, differs widely from Basketball. Played six-aside on a rectangular court that should not exceed 60 feet by 30 feet, it consists of "volleying" an inflated ball across a net 8 feet high with the hands, the object being to make it touch the ground in the opponents' court, while preventing it doing so in your own.

Water Polo. *See* Swimming.

Water Skiing. *See* Swimming.

Walking.

Walking comes so naturally that few people ever think about it. It is, however, worth thinking about, for it is the basis, not only of everyday life, but also of every physical, as opposed to purely mental, recreation, sport, and game, all of which involve if not actual walking, then running, which is an equally natural step beyond walking. It is also the basis of training, either for health and fitness or for a strenuous sport. It has been said that it is impossible to walk too much, and, while those who have done little walking would, of course, have to increase the distance gradually, there is no doubt that a regular, daily two- or three-mile walk would in itself prove an effective method of maintaining health and fitness.

Walking is also a pleasant recreation in its own right, in the form either of long walks or of actual walking tours, on which the walker can regulate the pace, distance, and halts to suit himself. There are different styles of walking, and some are better than others. It is, for instance, better to point the toes straight ahead, or even to turn them in slightly, as the very fit and active Red Indians did, than to turn them out. Everyone, however, has his or her own natural way of walking, and it is probably better to continue walking naturally than to set out deliberately to alter the style.

Something about the opportunities open in race walking will be found under the heading Athletics, but it might be as well to say a few words about race-walking style, and to clear up a popular fallacy. This is that race walking is unnatural, and quite remote from ordinary walking. It is not, and the fallacy has arisen largely because the walking races seen by the largest audiences are the short ones that take place in arenas during athletic meetings. An attempt to walk a short distance as fast as possible does lead to an exaggerated action, and is unnatural to the extent that anyone who really wanted to cover a limited distance as quickly as possible in ordinary life would run. The longer the distance, however, the smaller the difference between race walking and ordinary walking, competitors in, for instance, a 100-mile race being virtually indistinguishable from ordinary "hikers".

If you walk along in the ordinary way, and then try to walk faster and faster, adding to your speed by pointing the toes straight ahead, swinging the arms vigorously, and swinging the hips so that each foot falls more or less straight in front of the other, you are race walking. The official definition of race walking is so uncomplicated that it is contained in a single sentence that simply requires that contact with the ground should always be maintained, as it normally is in all walking.

Weight-lifting.

Weight-lifting is a method of exercising to maintain health and develop strength; a system of training that can usefully be at least a part of the preparation for almost any sport or game; and a highly organised and very popular competitive sport in its own right. Once, quite erroneously, thought to be an over-strenuous and "dangerous" activity, it has now, in more enlightened days, seen the pendulum swing completely in the opposite direction, with professional and amateur sportsmen of all kinds freely admitting how much they owe to it, and a large following of seekers after health and fitness, including women, many of them actresses, models, and others whose work demands a near-perfect figure.

When it is used as exercise and training, the strenuousness of it depends entirely on the wishes of the lifter or his or her adviser, for training with weights does not mean lifting as heavy a weight as possible, but carrying out a certain number of repetitions in various styles with weights well within the lifter's capacity. For those keen to develop the maximum strength of which, according to their build, they are capable, weight-lifting is certainly the quickest, and perhaps the only, way of achieving this. One of the charges levelled against it is that it makes one slow, but this is just another fallacy. It does not; and competitive weight-lifters actually make some of the fastest movements known in sport.

As a competitive sport, Weight-lifting is divided into weight classes, and there are many international and national championships and competitions. The sport is popular almost all over the world, and has been firmly established in Britain for many years.

Strand-Pulling. Akin to Weight-lifting in that it is a method of keeping fit and developing strength that is also a competitive sport is Strand-pulling, using a steel or rubber expander. Various different "pulls" are possible, and the strength and resistance of the expander can be altered at will. Many people use this old-established system of exercising for health and strength, and, for those interested, there are many strand-pulling championships and competitions.

Whist.

Whist might be called the standard card game. It has never excited quite the furore of Bridge (*q.v.*), but it is long established and popular, both at home and at Whist Drives. It is probably the first card game, apart, perhaps, from a few simple games depending on luck, that most people learn, and it provides a sound foundation for the embryo card player.

It is played by four people, two partnerships of two opposing each other, and with a normal pack of cards. The partners sit opposite each other, and the pack is shuffled, cut for trumps, and dealt out singly. The cards are then played out in thirteen tricks of four each, the player on the dealer's left having first lead, and the winner of each trick leading in the next. Ace counts as the highest card—except in cutting, when it counts as the lowest—and it is followed by king, queen, knave, and then on from ten downwards. The higher card of any suit takes the lower, unless it is trumped by a player unable to follow suit, the tricks being gathered up by the winner as made.

It is necessary to concentrate, to watch the cards played, and to endeavour to "place" the unplayed cards. This comes with experience, as does an understanding of such unwritten rules as "Second in hand plays low" and "Third in hand plays high" and a knowledge of when to disregard these.

Three-handed Whist is possible, one suit being discarded.

Winter Sports.

There are few fields of recreational or sporting activity to which, given the opportunity, British people take more eagerly than Winter Sports. Enthusiasts from Britain were going abroad to find, and in some cases start, them before the turn of the century, and to-day there are probably a hundred travellers for every one who went sixty years ago. Most of this tremendous increase has been added since the Second World War, and the numbers grow every year. Switzerland is, of course, the traditional objective, but there is

actually a wide choice, for facilities exist in Norway, Austria, Italy, France, Germany, and Czechoslovakia There are opportunities to suit most purses, and to suit both those who want only sport and those who want sport combined with entertainment

The most popular winter sport is Skiing, and, for those whose time and experience are both limited, it is normally skiing of the downhill variety, rather than the lengthy journeys on the level as well as on hills, and up as well as down, at which many Continental, and particularly Scandinavian, skiers are adept. Greatly increased facilities in the way of ski-lifts enable the holiday skier to work in three times as many descents as the skier of only a few years ago Almost every resort has a ski-school with an English-speaking instructor, and it is always advisable for a novice to join this It is also advisable for novices to start training for a ski holiday some time in advance, both by ordinary physical training and by attending a dry ski-school The air in winter sports resorts encourages more activity than is good for a completely untrained person, and the fitter the skier, the less his chance of being injured. Skiing accidents are plentiful, but many of them could be avoided by the exercise of a few simple precautions Having lessons is one, being fit is another, short skis with safety bindings are still another, and refusing to ski late, which may be any time after four o'clock, is yet another, for, as the light fades, it is replaced by a bluish light that makes uneven patches difficult to see, and the snow tends to ice over Most winter sports equipment can be hired, but hired or bought, and regardless of the extent to which fashionable skiing clothing may be advertised, the most important items are the boots The winter sports season lasts from December until March, but the snow is sometimes late, and, while Christmas and New Year should be safe enough, February offers the certainty of snow, combined with longer days

Ski-jumping is a separate sport, and one for experts The jumper takes-off down a steep slope and over a platform, which he leaves at a speed of about 50 m p h, to land something like 150 feet below his take-off, and more than that distance out in front of it Ski-Joring is really ski-racing behind unridden horses, but the term is also applied to quite gentle ski-trips behind ridden horses, horse-drawn vehicles, and mechanical vehicles

Bobsleigh Riding and Tobogganing consist of riding and racing down ice runs at terrific speeds on sleighs, the bobsleigh being for two, four, or five riders, and the toboggan, which takes its name, not from anywhere in Europe, but from a Red Indian language, being for one rider Bobsleigh crews sit, the first man steering by a wheel or ropes, and the last man operating the brake with which the sleigh is fitted Toboggan riders lie face downwards, and brake through special spikes on their boots Both sports are exceptionally thrilling, and both can be dangerous

At the opposite extreme from the point of view of speed is the 400-year-old Scottish game of Curling, which is played on ice, but not on skates. It resembles Bowls (q v), but the implements used are curling stones weighing about 35 lb, and having handles Slow, but still-moving stones are encouraged by sweeping the ice in front of them with brooms

Not a European winter sport, but nevertheless a snow sport in Canada is Snowshoe Running Like skiing, this is a useful method of travelling about on snow that has been made the subject of races The Canadian side of the Atlantic is also the home of Snow Snakes, a Red Indian game that consists of throwing a polished wooden stick along an ice trough in the snow. These "snakes" have been known to go for over a mile and to travel at 120 m p h. (*See also* **Skating**.)

Wingfield Sculls. *See* **Boat Races.**

Wrestling.

Wrestling, an individual combat in which competitors, using only their bare hands, endeavour to throw each other, is one of the most natural sports, and also one of the oldest It is practised in many countries, and in many different styles, in most of which the wrestlers are divided into classes by weight

In Britain, probably the most popular style is Catch-As-Catch-Can, in which the wrestlers start apart, and may try to throw their opponents by grasping them with the hands or by various kinds of trip During the bout, the competitors may be either on their feet or down on the mat, and the rules contain various provisions to prevent the bout lasting for an indefinite time Wrestlers reaching a deadlock on the mat may be ordered to stand up and start again, and points decisions after a certain time are also possible Certain dangerous holds are barred

Another style is Cumberland and Westmorland Wrestling, which is extremely popular in those counties, and in Scotland In this, the wrestler clasps his hands together behind his opponent's back, and all throwing is done by the legs, the breaking of the opponent's clasp constituting the fall The initial hold is, therefore, of major importance, and the taking of it often takes longer than the actual bout

A further form of British wrestling is Cornish Wrestling, in which the wrestlers wear canvas jackets, by which all holds are taken A similar form of wrestling is found in Brittany

In Græco-Roman Wrestling, which has always been very popular on the Continent, though less so in Britain, wrestlers start apart, and may take hold only above the waist Bouts in this style may take a considerable time. At one time, there were many Græco-Roman handicap matches, in which a top-class wrestler undertook to win a fall, or a number of falls, in a fixed time

Græco-Roman was formerly the style used in professional wrestling, but, in recent years, professionals have used the "Free" or "All-In" style This has rules, but it is not always very clear just what they are, and this, combined with widespread suspicions that bouts are not really genuine contests, has led to the quite large following that it retains going to see it more as an amusing "stunt" than as a serious sporting event In the United States efforts to widen interest in it have taken the form of staging bouts in a ring that has been turned into a sea of mud, or that has been filled with fish All this has, of course, done considerable harm to the reputation of what is really a fine sport and a healthy exercise

Judo Wrestling has been popular for centuries in Oriental countries such as India, China, and Japan Of the various styles, one from Japan has won popularity in many countries, including Britain

This is Judo, which derives from the more elaborate Ju-Jitsu Governed largely by rituals, and with wrestlers graded according to ability, Judo is now an international competitive sport but it is still often taken up as an effective method of defence against a stronger or better-armed attacker Requiring a knowledge of anatomy, it consists partly of defence by knowing how to fall, and partly of attack by locks which give the opponent a choice between capitulation and a broken bone, and by paralysing nerve centres The various locks are potentially dangerous, and, when practising, should be released immediately the opponent requests this. Also developed in Japan, though it originated in China, is Karate, a combat system so potentially dangerous that, when practised as a sport, attacking moves must only be indicated, and never pressed home

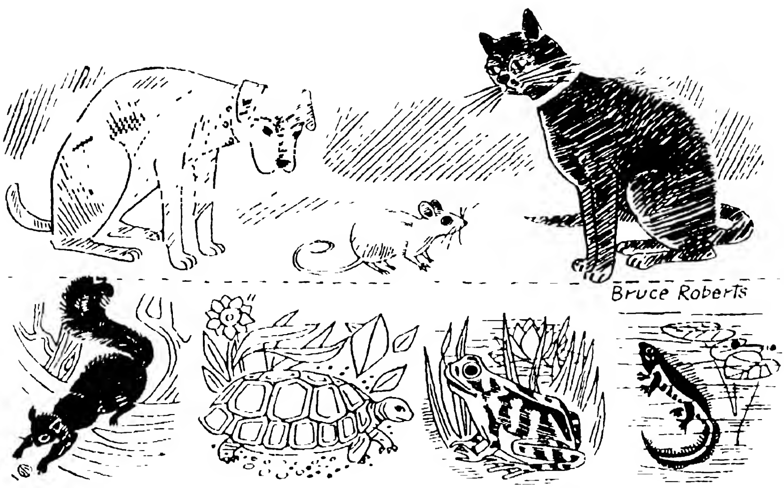
Domestic Pets



Feeding, management and diseases of

Domestic Pets

By ALASTAIR N. WORDEN, M A., (Cantab)., F.R.I.C., formerly Milford Research Professor in the University of Wales.

This section attempts to deal not with all the many hundreds of animals that may be kept as pets, but only with those that are best suited to average homes in Great Britain. The maintenance of monkeys, squirrels, bats, mongooses, and snakes, while quite feasible to those with experience and facilities, requires considerable time and—in some instances—expense Those who contemplate such exotic pets should consult works of reference, study the methods adopted in zoological gardens, and discuss the matter with experts. Even in the case of the more common animals, the information provided in the following pages is to be regarded only as a beginning, to be supplemented so far as possible by practical experience, discussions with more knowledgeable owners, and the study of more detailed writings.

Certain considerations are basic. Never keep a pet unless you are really interested in it and are prepared to give it due—and regular—care and attention. Don't keep a pet you cannot afford to maintain in health and comfort. Scrupulous attention to cleanliness is essential, and wise feeding is one of the most important factors in avoiding illness and loss of condition.

Since the passing of the Veterinary Surgeons Act of 1948 it is illegal for anyone to practise the diagnosis and treatment of animal diseases unless he or she is (1) a veterinary surgeon, or (2) a person whose name has been placed on the Supplementary Veterinary Register. (Certain employees of Animal Welfare Societies are specially licensed, but it is intended that in future all animal treatment shall be given by or under the direct supervision of members of the veterinary profession.) Not even a pharmacist may attempt to diagnose or treat an animal. Anyone may, of course, render "first aid," and an owner may—at his or her own risk—apply treatment. It is, of course, a wise precaution to seek veterinary advice for any ailing animal, and the sooner it is sought the more likely it is that good results will follow.

BREEDS AND VARIETIES OF DOGS.

Of recent years, dog-breeding and showing have become specialised occupations, which average people cannot be expected to take up without having adequate time or resources at their disposal. Any amateur who wishes to breed for profit from pedigree animals should most certainly seek expert advice before attempting to do so.

Dogs which are intended for show or for pedigree breeding must be registered with the Kennel Club, 1 Clarges St , London, W 1 The requisite forms and regulations may be obtained on application to the Secretary.

The breeds of dogs recognised for the purpose of separate Registration and Stud Book entries by the Kennel Club are:—

SPORTING BREEDS.

Afghan Hounds
Basenjis
Basset Hounds
Beagles
Bloodhounds
Borzois
Dachshunds
Deerhounds
Elkhounds
Finnish Spitz
Foxhounds
Greyhounds
Harriers
Irish Wolfhounds
Otterhounds
Salukis
Whippets

Gun-dogs.

English Setters
Gordon Setters
Irish Setters
Pointers
Retrievers
Setters (Cross-bred)
Spaniels

Terriers.

Airedale Terriers
Australian Terriers
Bedlington Terriers
Border Terriers
Bull Terriers
Cairn Terriers
Dandie Dinmont Terriers
Fox Terriers
Irish Terriers
Kerry Blue Terriers
Lakeland Terriers
Manchester Terriers
Norwich Terriers
Scottish Terriers
Sealyham Terriers
Skye Terriers
Staffordshire Bull Terriers
Welsh Terriers
West Highland White Terriers

NON-SPORTING BREEDS.

Alsatians (German Shepherd Dogs)
Boston Terriers
Boxers
Bulldogs
Bull-mastiffs
Chow Chows
Collies
Dalmatians
Dobermann Pinschers
French Bulldogs
Great Danes
Keeshonds
Mastiffs
Newfoundlands
Old English Sheepdogs
Poodles
Pyrenean Mountain Dogs
St Bernards
Samoyeds
Schipperkes
Schnauzers
Miniature Schnauzers
Shetland Sheepdogs
Shih Tzus
Tibetan Terriers
Welsh Corgis (Cardigan)
Welsh Corgis (Pembroke)

Toys.

Black-and-Tan Terriers (Miniature)
Griffons Bruxellois
Italian Greyhounds
Japanese
King Charles Spaniels
Maltese
Papillons
Pekingese
Pomeranians
Pugs
Yorkshire Terriers

A separate register, called the Breed Register, is kept by the Kennel Club for each breed, except in the cases of the following breeds, for which a separate register is kept for each of the varieties of the breed specified

DACHSHUNDS.

Long-haired
Smooth-haired
Wire-haired
Miniature (Smooth-haired) not exceeding 11 lb. for exhibition).
Miniature (Long-haired) (not exceeding 11 lb. for exhibition)

IRISH SETTERS.

Red
White and Red (A.O.V.)

RETRIEVERS.

Curly-coated
Flat-coated
Golden
Labrador
Interbred
Crossbred

COLLIES.

Rough
Smooth

SPANIELS.

Clumber
Cocker
Field
Irish Water
Springer, English
Springer, Welsh
Sussex
Interbred
Crossbred

Bull Terriers.	Poodles.
Bull Terriers	Not under 15 in
Bull Terriers (Miniature).	Miniature, under 15 in
Fox Terriers.	**Toy Spaniels.**
Smooth	Cavalier King Charles Spaniels
Wire	King Charles Spaniels

The Committee of the Kennel Club has decided to classify those breeds which at present have no separate register, but are included under the heading "Any Other Variety" The classification is as follows:—

Hounds.	Non-sporting
Dachsbracke	Bearded Collies
Dachshund Miniature (Wire-haired)	Bouvier de Flandres
Rhodesian Ridgeback	Groenendael
Lion Dog	Husky
Gun-dogs	Leonberger
Chesapeake Bay Retriever	Lhasa Apso
Kleine Munsterlander	Maremma Italian Sheep-dog
Pointer German Short-haired	Norwegian Buhund
Pointer German Long-haired	Polish Sheepdog
Pointer German Wire-haired	Reisenschnauzer
Pointer Griffon Wire-haired	Tibetan Mastiff
Setter German Long-haired	Tibetan Spaniel
Weimaraner	Volpino
Terriers	Wolf Spitz
Soft-coated Wheaten Terrier	**Toys**
Sydney Silkie	Chihuahua
	Penscher Miniature

In the limited space available it is impossible to describe the special characteristics of the different breeds The breeds recognised in Great Britain are subject to constant review by the Kennel Club, and it is probable that the number will continue to be added to from time to time

The dog was probably the first animal to be domesticated in the true sense of the word, and the uses to which he has been put by man are almost legion Throughout the world dogs are employed to help protect herds and flocks, and indeed the dog trained for shepherding plays an integral part in sheep management The names Foxhound, Deerhound, and Otterhound all indicate the specific uses to which dogs have been put in the Chase Greyhounds and Whippets are used in coursing, and work singly or in pairs, rather than in packs. As their names indicate, the various Setters and Pointers are employed to indicate the exact whereabouts of game, and Spaniels also are widely used as gun-dogs. The other uses to which dogs have been put in field sports include hunting over rough and difficult country by small terriers, and going to earth to kill or hold badgers, foxes, and otters Fox Terriers, Dachshunds, Dandie Dinmonts, and Scottish Terriers are among the types which have been so employed. Dogs have played their part also in entertainment. thus there are performing dogs, notably the Poodle, and racing Whippets and Greyhounds, while in former times various types of fighting, including the baiting of bulls by Bulldogs, were to be seen The use of sledge-dogs is well known, while in Belgium and elsewhere dogs were at one time widely used as traction animals. In coaching days, the Dalmatian was a carriage dog, and modern scientists have recently suggested, as a result of experiments, that the position under or behind a coach which a Dalmatian automatically takes is determined by heredity! Perhaps the most exacting use to which man has ever put dog was in China, where the Chow-Chow was once maintained as a source of meat and fur! In Portugal, fishermen employ a race of dog to accompany their fleets. The dogs in question (Portuguese Water Dogs) will dive into the sea to retrieve a broken net or an escaped fish, and will even swim from one smack to another to convey messages! In New Guinea native dogs act as scavengers, while in various countries on the Continent of Europe "truffle dogs" are employed to locate the fungi known as truffles, relished as a table delicacy

The above paragraph is far from exhaustive, and for those who wish to know more of the characteristics of the different varieties of dogs, reference should be made to such volumes as *Book of the Dog* by Brian Vesey-Fitzgerald (Nicholson and Watson, London; 2 guineas) or *Working Dogs of the World* by C L B Hubbard (Sidgwick and Jackson Ltd, London; 16s) For general guidance on dog management, see *The Right Way to Keep Dogs* by R C. G. Hancock (Elliott, Kingswood, Surrey; 5s.)

For present purposes it is, however, as a pet or companion that we are considering the dog and it must be agreed that many of the most successful animals for this purpose are cross-breeds or "mongrels." There are many fallacies or unsubstantiated generalisations regarding the relative merits of pure-breds and mongrels This is in fact an intricate scientific problem, and probably the simplest way of summarising the true position would be to say that, from the point of view of health and temperament, there are good, bad, and indifferent specimens among pure-bred and cross-bred animals It is true that within a breed (or within a local community of mongrels for that matter) certain weaknesses or undesirable traits may arise from hereditary defects

It may be noted that the word "dog" is applied to the whole species, although it is used also to denote the male as opposed to the female, for which the correct term is "bitch" Young animals are referred to as "dog puppies" or "bitch puppies" respectively. A male animal employed regularly for breeding is known as a "stud dog," and the corresponding female as a "brood bitch." In hunting circles the Foxhound is referred to as a "hound," and the term dog and bitch are employed only as prefixes to denote the sex

CHOICE OF DOG.

However attractive the idea of keeping a dog may be, it is unwise and unkind to purchase or to accept one without very careful consideration Dogs require regular feeding, grooming, and exercise and, if they are to be allowed to show their full capabilities, constant companionship and attention Nothing is more pathetic than the unwanted dog, which may have been purchased because of a passing whim, and with which no one appears to have the courage to part If, on the other hand, one is prepared to give all the necessary time and trouble to the proper care of the dog, the reward will be ample

The size of the choice is important Many people keep dogs which are far too large for their houses and for their purses. The smaller the dog, the less food, exercise, and house-room will be need, and the many varieties of terrier provide a range from which suitable choices for most households may be made. In any event, a very large dog should not be chosen unless expert advice has been taken about his feeding and other requirements

Household dogs of six months of age or over must be licensed Licences may be obtained from any post office (7s 6d. at present).

MANAGEMENT OF THE DOG.

Accommodation.—Up till comparatively recently most dogs were kennelled down out of doors. This practice has its advantages, but today the majority of pet dogs are allowed more or less the run of the house A warm sleeping-place, such as a box or basket, should be provided, and should contain removable bedding Newspaper is an excellent non-conductor of heat. It is a very useful material to place at the bottom of a dog's box, and on two or three thicknesses may be placed a rug or blanket on which the animal may lie It is astonishing the amount of grit and dust a dog can bring into a house on his limbs and the lower part of his body. His bedding will require frequent shaking out and renewal, and paper is easily changed. The box or basket in which the

dog lies should be allowed a place free from draughts, and requires airing daily when the dog leaves its bed in the morning. Wood-wool makes excellent bedding in outhouses or where a special structure is provided by way of dog-kennel, but is inclined to be messy about the house, as a dog will draw portions of it about the room as he leaves his bed. If straw is used, it is best stuffed into a sack and made into a kind of mattress An odd piece of linoleum forms an excellent foundation to the dog's sleeping-box or kennel, it does not strike cold to the skin, is a slow conductor of heat, and has the advantage of being easily kept clean, particularly during illness, when there may be discharges and messes to be frequently cleaned up, until the animal can once more go out of doors.

Exercise.—Every dog should be exercised regularly, but there is no need to over-exercise, and the practice of allowing a dog (other than a large and athletic animal) to run behind a bicycle for mile after mile cannot be too strongly deprecated Two or three fairly short walks a day are sufficient for a small terrier, always provided that there is a garden in which he can play on fine days and some open space where he can run freely for a short time. While still in the puppyhood stages, a dog should be trained to walk to heel and to beware of traffic Even so, it is usually safer to put him on a lead in busy thoroughfares One point which, to the annoyance of the public, many dog-owners fail to realise, is that their animals would show much less tendency to fight if allowed to investigate one another off the lead. A dog naturally feels aggressive if put on the lead immediately a rival hails in sight. There are, of course, certain dogs which attack others at sight, these are a public nuisance, and should never be allowed loose on the streets

The practice of allowing a dog to take his own exercise is to be deprecated, especially in towns and suburbs. The animal will be tempted to sniff into dustbins, and, if a male, will tend to follow a bitch in season or to take part in the unsavoury "dog parties" which are so often to be seen Furthermore, such an animal is usually responsible for the disgusting habit of fouling the pavements and gateways. In this connection, it should be emphasised that dogs may quite easily be trained to defæcate in the gutter, or on the grass verge, and so avoid contamination of the pavement or carriage-way In some districts owners are liable to a fine if their dogs foul the pavement

Training.—Patience combined with the gift of putting yourself in the dog's place is the chief requisite for successful education It is most important to encourage regularity of habit, as an animal will obviously learn very much more quickly if his daily walks, meals, and grooming take place at fairly constant times A quiet firmness is the ideal method, and a puppy should learn early that a command *is* a command, and must be obeyed. There is no need to shout and make an exhibition of oneself, or to race in circles after a disobedient puppy; if these things are done, the animal will never become so well trained as it otherwise would. Again, it is rather ridiculous to chastise a puppy *after* he has somewhat belatedly decided to come to heel quite obviously, he will then be liable to think that he has done wrong in actually coming to heel Whatever happens, it must never be that the dog becomes master, there is no more unbecoming sight than that of a person with a frankly disobedient dog, and if the animal be large and powerful it may prove a menace to its owner and to the public

Puppies should be house-trained at an early stage. If care and thought are given to the matter, the animal will soon learn not to make messes in the house. However, it is very stupid to forget all about a puppy or dog for many hours, and then, out of sheer vexation, chastise it for having made a mess. If puppies are let out every two hours or so at first, they will soon learn not to make a mess. Encourage them for performing in the right place rather than scold them for doing so in the wrong one Physical punishment should be administered only where strictly necessary, and then in a sensible fashion. The most effective method is to grasp the dog or puppy by the skin of its neck and to shake it.

Grooming and Washing.—Whilst short-haired breeds need little or no attention to the coat, bar an occasional brisk rub down with a brush or rough towel (which incidentally puts a pleasant gloss on the smooth-haired breeds), yet with the long-haired breeds grooming should be carried out regularly, and if the habit is made a daily one it will not be forgotten so readily. Nearly all dogs love this procedure, and most dogs will actually ask for their daily groom by jumping on the table or bench on which it is carried out Steel combs and brushes are sold by many shops, principally corn chandlers, though some store chemists also provide a suitable range of grooming kit for all breeds. There is a curious fetish current among many breeders that dogs should not be washed. There is no reason why, with a few simple precautions, a dog should not be washed whenever it is socially necessary. The first precaution is to use a soap that does not contain an excess of soda. The strong washing-up soaps, excellent as they are for certain purposes, are too irritant for a dog's skin. While some of the toilet soaps suitable for human use may be employed for dogs, the special dog soaps and shampoos are much better for the purpose. They are more suited to the dog's skin and coat, and have better detergent properties. It is important not to have water that is too hot—as with a baby's bath, it should be possible to dip the point of one's elbow into the water and find that it gives a pleasantly warm sensation but is easily bearable, *i e*, it should not be above 95–100° F On emerging from a bath a dog will shake himself thoroughly, and then, if not curbed, will roll on the floor or ground and speedily cover himself with dust or dirt! It is therefore necessary to give him a brisk rub down with old (but clean) towelling, whereupon he may be allowed to dry off in a warm place free from draughts or, in good weather, put on a lead and taken for a brisk walk. In the case of many of the long-coated breeds it is customary to have them trimmed at the beginning of summer, and this is a sensible precaution that may avoid a good deal of distress during hot weather. The smaller long-haired dogs in particular, such as Scottish Terriers, suffer unduly from the heat if their coats are grown too long

FEEDING OF THE DOG.

Meat, usually beef, is generally regarded as the staple article of the dog's diet. It must be pointed out, however, that although the dog is naturally a carnivore (flesh-eater), ordinary meat (muscle or "flesh") is not a completely adequate diet, and lacks certain factors which the wild dog would find in the blood, bones, liver, and other organs of his prey Furthermore, it has been proved scientifically that dogs can thrive on a meatless diet In spite of these reservations, however, meat must be regarded as an excellent article of food, and if properly supplemented will prove very satisfactory In recommendations which have recently been made in America (Dr S R Speelman, of the U S Department of Agriculture) it is suggested that meat (beef, lamb, mutton, or horseflesh, providing that the last is fed regularly and not spasmodically) or meat substitutes (fish, milk, eggs, etc) should constitute one-half of the daily ration, and that the remainder should comprise approximately equal parts of cereal substances (bread, biscuits) and of vegetables (carrots, spinach, onion, beet, etc)

It is pointed out that many dogs do not accept the vegetable material readily. On this basis, the approximate quantities of food required by adult dogs have been calculated as follows —

Weight of dog	*Total food per day*
1 lb.	2 oz.
10 lb.	12 oz.
25 lb.	1½ lb.
50 lb	2 lb.
75 lb	3¼ lb
100 lb.	4¼ lb
150 lb.	5¼ lb.
225 lb	7 lb

(Weights of up to 10 lb would include the toy breeds, 25 lb. would correspond to a Fox Terrier, Airedale Terriers and Retrievers would fall into the 50–75-lb. class, and the larger weights would be those of the very big breeds, such as the St. Bernard.) The quantities given are, of course, an *approximation* and no more. Dogs which lead a very active life will require more, while those which take little exercise, or which tend to put on fat easily, will require less Common sense is necessary, and great care must be taken not to over-feed or to under-nourish.

Meat is probably best fed raw, or lightly cooked, but many animals appear to have a preference (probably through habit) for well-cooked meat In any event, the meat should not be "over-done," as there is substantial evidence that prolonged heating destroys much of the food value of the meat protein *Fish* is an excellent substitute There need be no anxiety about the greed with which a dog swallows lumps of meat and also neglects to masticate them The teeth of the dog are for tearing meat, he is not concerned with biting his food up small, indeed, his salivary glands contain no digestive ferments, as is the case with some other animals

Milk is almost essential during pregnancy and lactation (see below), and may well be included in normal dietaries. Whether or not *bones* should be fed is a matter which has been hotly debated, but for mature household dogs the evidence suggests that they are unnecessary (The teeth of racing greyhounds, which receive a "sloppy" diet, are quite as good as those of the average household dog) Bone-feeding is responsible for much trouble, including constipation, actual impaction of the rectum, and lodgement of pieces of bone in the mouth or throat The value of bones is, of course, that they contain large quantities of essential mineral substances, and for this reason the inclusion in the diet of bone-meal, or of steamed *bone-flour*, or, preferably, a mineral supplement, is recommended Only very small quantities of these substances are required

Bread is an article of food which is often overlooked in the case of the dog, but there is no doubt that wholemeal bread is very suitable indeed, provided it is not fed to excess

The answer to the question whether a dog requires vegetables is, in the main, no From the Vitamin C standpoint they are quite unnecessary, since it has been shown that a dog manufactures this vitamin for itself, but the fact remains that many dogs, particularly of the toy variety, enjoy a few slices of banana or apple, and there is no harm in letting them pander to their taste Vegetables do help, however, to provide roughage, and cooked (*not* raw) *potatoes* may be used in place of bread or biscuits The dog—like many other animals—cannot digest raw starch properly *Flaked maize* and *oatmeal* are other substitutes, but it must be remembered that the energy value of maize is high and that the dogs must never be overfed *Dog biscuits* are an item that were long in disfavour with some professional people on account of their often having been made from agenised white flour (see section on Canine Hysteria), but now that this factor has been overcome, and the biscuits themselves are being improved in other ways, their use for the non-meat portion of the diet may be recommended

Clean fresh *water* must be provided at all times.

In addition to the diets recommended above, there are on the market several tinned dog foods which claim to be complete, or almost complete, diets for the dog It must be said that many dogs (including those of the writer) have remained in excellent health when receiving one of these foods as a large part of the diet over long periods There is, therefore, little that may be said against the widespread use of the better varieties of such products Again, it is a matter for common sense, if an owner finds that his animal is thriving on such a diet, he is wise to continue to use it

It is customary to give dogs two meals a day. There is no need to give more than two to healthy adults, for the dog's stomach is exceedingly capacious and adapted to long gaps between meals Many dogs thrive on only one meal in twenty-four hours Whatever plan is decided on, regularity should be adhered to, and a meal or meals given at the same times every day. Dogs require vitamins A and D and B complex There are several ways of administering these, but the special commercial preparations, including the modern form of condition-powder tablet, are the most convenient

The *pregnant* and *lactating bitch* require special consideration The food requirements are very much increased in a bitch which is carrying puppies, especially towards the end of the period Normally, appetite is not a complete guide to a dog's food requirements, but in pregnancy and lactation the bitch must not be allowed to go hungry It is quite normal for a heavily pregnant bitch to require over one and a half times her normal amount of food, and in lactation her requirements will increase still further Milk is a most excellent article of diet at this time; indeed, there is no better way (apart from commercial preparations) of replacing the milk which the bitch is giving to her own puppies

Up to the age of three weeks or so, *puppies* need have mother's milk only, but at any time after this it is a sound policy to give them additional food, and so spare the mother and also render weaning (at from six to eight weeks) a *gradual* process At first a little cow's milk or one of the commercial "dog-milk" preparations may be given, and gradually the puppies should be encouraged to eat solid food Eggs (if they can be spared), wholemeal bread in milk, or even finely minced meat may be given, at first in very small amounts but later in larger quantities If this process is carefully carried out, there will be far less trouble at and after weaning time After weaning, puppies should receive five or six meals a day, and this number may be cut down gradually until two or three only are given to the fully grown dog (The smaller breeds are fully grown at about a year) *More* meat or meat substitutes and milk, and *less* cereal or vegetable matter, should be fed to the growing dog as compared with the adult This fact is important, as the substances present in meat and milk are required for laying down the growing tissues Nevertheless, the energy portion of the ration is important, and the cereal or vegetable should be nutritious and not fibrous It is possible to rear puppies by hand from birth if the bitch for any reason should die. It requires great patience for the first two or three weeks, as naturally the puppies will require feeding once or twice during the night Special milks for puppies are to be recommended. Cow's milk requires enriching with fat and sugar to approximate to the composition of bitch's milk Feeding will have to be done at every two or three hours, and a very useful gadget is a fountain-pen filler attached to cycle-valve tubing Very small quantities are required for the first two or three days, and a level teaspoonful of milk is more than sufficient for the average terrier at first Even with the best care in the world hand-fed puppies tend to be weaklings and do not grow as fast as those naturally fed A foster bitch, if obtainable, is much to be preferred.

BREEDING OF DOGS.

It is natural for adult dogs of both sexes to wish to breed, and in the case of the female especially it is an excellent thing if one can arrange for a suitable mating to take place. Bitches come "into season" or "on heat" (lay terms for œstrus) at approximately six-monthly intervals, but it is not advisable to breed from the first season which occurs usually at about eight to nine months of age, but over a wide range of age according to breed and other factors. The periods of season often occur between January and March and in early Autumn, but there is no fixed rule. Each season lasts for three weeks. For the first seven days, approximately (pro-œstrus), a bitch does not permit mating, though during this time she is a source of strong attraction to all males in the neighbourhood At about the seventh to the tenth day the blood-stained discharge, which ushers in the heat, stops; this is usually taken by the breeder as an indication that the bitch will stand to service If possible, it is always better when puppies are wanted to allow mating to occur more than once. Under natural conditions a dog and bitch are usually strictly monogamous and mate for life, and during the period

of œstrus will mate many times A dog and bitch that are kept together all the time will probably behave naturally, but under domestication both dogs and bitches usually become promiscuous. Many bitches will in fact accept service from different males on different days, and the phenomenon of superfecundation, i e., the production of a litter that is fathered by *two* males, may occur. It is therefore wise to retain strict control of the bitch throughout the whole of the three weeks or so she is in season. At the end of season the bitch passes into a state of " metœstrus " if she has not conceived.

If a bitch conceives, she carries her puppies for a period of about nine weeks There is, however, a normal variation of fifty-eight to seventy days, and puppies born before the fifty-eighth day sometimes live. The number of puppies born varies with breed; in the smaller terriers it is usually from four to six, but in Airedales and Alsatians the number may be eight to ten, and the larger breeds tend to have even more offspring at a time. Birth usually takes place fairly easily in the larger breeds, but there is often much difficulty in the case of the short-legged breeds, such as Scottish and Sealyham Terriers, Pekingese and Dachshunds. In some breeds, in fact, the problem is one that is giving serious concern to veterinary surgeons and breeders.

A short while before her puppies are due, a bitch will " make her bed " Owners are often amazed at the destruction of soft furnishings, or even of wall-paper, that a previously well-behaved bitch may carry out at this time. It is therefore by far the best to provide a suitable box (if the animal has not one already) A smooth flooring such as a strip of linoleum serves for the bitch to give birth to her puppies. Her instinct to tear up everything given to her for bedding may lead to suffocation of the puppies by pieces of bedding. Provided labour occurs in a warm room, it is sometimes better—according to the temperament of the bitch—to remove each puppy as it is born, placing a warm bottle underneath, and bring it back to the mother when the last birth has occurred. At this time the bitch should be watched carefully for any discharge from the vulva or for any evidence of straining. If either of these occurs without results, it is advisable to send for help as early as possible, especially in the case of the smaller breeds Many hundreds of bitches are lost through neglect at this time, and usually because it was not suspected that anything was wrong. If the discharge becomes bloody, or green, help should be obtained *at once* if no puppy is delivered. Similarly, any great delay between births is a matter for concern The afterbirth usually follows the puppy within a few minutes, but puppies are sometimes delivered in their fœtal membranes, and in this case the latter should be gently but quickly removed It is quite normal for the umbilical cord to remain attached to the puppy, but the bitch will normally break it by biting through it

The mother will wash and attend to the new born puppies, and after the last is born it is a good idea to burn all the mess and to provide clean newspaper, but do not worry or frighten the bitch more than is necessary. For the care and feeding of the bitch and her puppies see the sections on Management and Feeding Puppies, like kittens, are born with their eyes closed, but open them after about nine days—there again being considerable variation

The phenomenon of pseudopregnancy is common in bitches, and indeed to a minor degree it is probably present in most bitches following an œstrus without conception. In some bitches, however, presumably those with strong maternal drives, the changes in the ovary may be accompanied by external signs of " phantom " or " ghost " pregnancy. These may include not only enlargement but actual functioning of the mammary glands, and the making of a " nest " by the bitch just as if her puppies were really due. The average duration of pseudopregnancy is usually given as about two months, and although variable, it is often sufficiently near to the correct time after œstrus that everyone suspects the bitch to be truly pregnant The condition may be suppressed with the aid of modern drugs, but in some instances it is not realised that the condition is not real. In many cases only professional advice can solve the mystery, and radiographical examinations have often proved necessary to ascertain the truth, particularly in fat bitches of the heavier breeds. It might be well to note, at this point, that there is another condition of the older bitch that is known as *Pyometra*. This condition usually reveals itself at the same time as the ghost pregnancy (and is sometimes a pathological extension of it) but is accompanied by considerable disturbance of health, coupled in many instances with purulent discharge from the vagina. A bitch which is off-colour in the weeks following pregnancy, or which develops a discharge from the vulva (especially one which is dark in colour), may well be a pyometra subject The disease is most serious, and often requires surgical intervention. As the best chance of success is to operate or otherwise deal with early, a veterinary surgeon should be consulted immediately.

DISEASES AND INJURIES OF THE DOG.

Canine Distemper and " Para-distemper " (Including so-called " Hard-pad ").—It has long been recognised that the commonest and most serious disease of dogs throughout the world is canine distemper. Dogs of all ages and breeds are susceptible, and no dog is free from the risk of infection unless it has recovered from the disease or has acquired an immunity for other reasons (*see* **P8**(2). The disease is caused primarily by a minute agent known as a filterable virus (*see* **P7**(2), which may be of varying type in that it will attack the body in different ways. Thus some strains of the virus are known as " neurotropic " because they show an affinity for the nervous system Sometimes a dog will apparently recover from an attack of distemper, only to succumb later to " fits " or other nervous manifestations due to permanent damage to the central nervous system by the virus. Often, however, the virus is not fatal in itself, but will lower the dog's resistance and permit the entry or the activity of bacteria that may lead to pneumonia or other serious effects. These so-called " secondary invaders," as the bacteria are termed, may prove as harmful as the original virus. Indeed, once these bacteria have set to work it is too late to expect the best results from the use of serum, and whether or not the dog will live through will depend upon the severity of the attack, the dog's powers of resistance, and good nursing. It is therefore most important either to prevent the disease by vaccination or to be able to send for veterinary attention (and hence for an injection of serum) *immediately* an attack is suspected Any puppy which is listless or off its food, or which may throw a fit, or which is obviously unwell with other symptoms (*e g*, cough or diarrhœa) may well be in the early stages of distemper, and it is *then* (not the next day) that help should be sought. Many thousands of puppies (and older dogs) that have been injected with serum in the early stages of the disease have become perfectly normal within forty-eight hours. On the other hand, the number of dogs that die in Great Britain alone from distemper and distemper-like infections must assume enormous proportions. Distemper is a highly infectious disease, and it is important that the owner of an infected animal should do his best to avoid contact with other dogs, ferrets, or mink. Ferrets and mink are very susceptible to canine distemper. On the other hand, human beings and cats are *not* susceptible to canine distemper, and the so-called distemper of cats is quite a distinct disease.

A highly satisfactory means of vaccinating puppies against distemper was worked out about 1926–30, and this—named the " Laidlaw-Dunkin " after its two inventors—has since afforded protection to thousands of animals. Modern vaccines are based on a virus which has been modified by growth on developing egg embryos, or, more recently, in tissue culture Puppies should be vaccinated when they are 10–12 weeks, prior to this age the immunity induced by the vaccine may not develop satisfactorily After vaccination the puppy requires some time, possibly 2 weeks, before an immunity is established. Sometimes vaccinated dogs suffer distemper or

distemper-like signs due to "secondary invaders" causing disease on their own account, or because they were already infected when vaccinated Variants of distemper of which "hard pad" is an example may also overwhelm a vaccinated dog's immunity, although this is uncommon with modern vaccines, since several distemper strains are used in their production Hyperimmune serum, which is collected from animals previously hyperimmunised against distemper, is available and can immediately aid the dog suffering from distemper but its effect is short-lived (7–10 days)

Infectious Hepatitis or Rubarth's Disease—Another virus disease of dogs (and foxes) is known as Rubarth's disease, after one of its discoverers, now known as infectious hepatitis This disease has been recognised in Sweden ever since the 1930s, but in Great Britain only since the end of the war The condition is extremely sudden in onset, and an affected dog may be found dead Many cases are, however, mild, and in some instances only one or two out of a large group of dogs have been affected The changes seen after death vary, but the findings in the liver cells are usually characteristic Specific treatment is not yet established as in the case of the distemper-like conditions, although the administration of antibiotics (*see* **P9**) may prevent the effects of secondary infection An effective vaccine is now produced and often combined with the distemper chick embryo vaccine A dog is thereby protected against both these diseases

Canine Hysteria (called "fright disease" or "running fits" in the U S A) is an alarming but not necessarily serious condition (in that it can often be cured very readily) which appears to arise from a variety of exciting causes. The affected animal rushes around wildly, often screaming and howling, and obviously loses all sense of whereabouts or ability to recognise people. After a more severe attack (and there are all degrees up to a full epileptiform fit) the dog may appear quite exhausted, but returns to normal Sometimes there are many attacks in one day The dog will not wilfully attack people during a bout of hysteria—at least, that has been the experience of the writer—but is very difficult to control. Apart from ensuring that the dog does itself no grievous bodily harm, there is little that can be done until the attack has subsided Then the animal should be kept as quiet as possible and given a tranquilliser.

Hysteria may be an hereditary taint, derived from one or other parent. In certain circumstances, however, it may arise in apparently normal animals There are several possible causes (including parasites), but a definite one is the bleaching agent—nitrogen trichloride or "agene"—employed for some years in the manufacture of flour, and hence present in white bread and certain dog biscuits. Indeed, the clear demonstration that agene could set up hysteria in dogs, and subsequent scientific work, has led to the introduction of regulations that have led to its abandonment as a bleaching agent in favour of other methods which have been found not to cause hysteria. There has already been a marked decline in the incidence of hysteria due to dietary factors.

Rabies is a fatal disease of dogs, and is also due to a "filterable virus." It is transmissible to the human being and to many other species, but has fortunately been absent from Great Britain for many years Stringent precautions are taken to prevent its entry, and dogs which are brought into Great Britain must spend a long period in quarantine A vaccine is available and people taking dogs to countries where rabies occurs should have their animals protected. Many countries insist on this prodceure

Tonsilitis appears quite frequently in dogs, and seems in many cases to be part of a more generalised infection. It demands expert treatment, but although it may persist for a long time, it usually yields to treatment.

Nephritis.—Inflammation of the kidneys is unfortunately all too common in dogs, and in adult males in particular there is a high incidence of chronic kidney damage One of the symptoms is a marked thirst. Sometimes this condition is a sequel to an infection known as *leptospirosis*, which calls for prompt veterinary treatment if death or permanent damage is not to follow It is always worth while seeking professional advice for a dog that drinks excessively or has a somewhat characteristic type of bad breath. A vaccine which gives a good immunity against the two common forms of *leptospirosis* is available

Anal Glands, which are found in the dog and in other carnivora, often give rise to trouble. Animals which "rub themselves along the ground" are not necessarily affected with "worms," but with impaction of these two little glands which are situated one on each side of the anus. They secrete a peculiar dark-coloured, very offensive fluid, which sometimes is not discharged properly and causes the animal great discomfort. The glands in such cases should be relieved periodically Those who do not mind this somewhat dirty task may perhaps learn how to do it themselves Occasionally, segments of tapeworm are responsible for the impaction, but usually the trouble has nothing to do with worms Whenever a dog pays considerable attention to his anus, this impaction should be suspected. Actual infection of the glands is also fairly common, and demands expert attention.

Diseases of the Ear, especially of the outer ear, are very common in dogs. The dog's outer ear is somewhat more complicated than is our own, and the drum is set more deeply Hence it is easy for wax and dirt to accumulate, for various parasites to establish themselves, and for inflammatory conditions to result The word "canker" (which has no precise scientific meaning) is sometimes applied by lay people to the more serious or chronic forms of inflammation of the outer ear canal It is not difficult to diagnose "ear trouble," as the affected animal usually shakes its head or worries or scratches its ear and rubs it along the ground. The ears should be inspected regularly to see that there is no great accumulation of wax or dirt Cotton-wool twisted on to the end of a match-stick or orange-stick is quite satisfactory for cleaning out the ear, providing care is taken. A dog which is continually worrying its ear, or which has ears which are obviously diseased, should not be neglected, as the sooner expert treatment is begun the more readily will the condition be cured. Even if the lining of the ear is greatly thickened through inflammatory reaction, and the lumen nearly occluded, it is still possible for a plastic operation to be performed. Many hundreds of such cases have been successfully treated in this way A percentage of inflammatory conditions of the outer ear is associated with ear mange mites. In such an event treatment with modern anti-mange preparations should be carried out.

Deafness in certain white dogs (*e g* , in some Bull Terriers) appears to be hereditary, and is quite incurable. Old dogs often become deaf, and deafness has been produced experimentally in young puppies by feeding them on a deficient diet.

Diseases of the Eye are very common in dogs, and are often the result of injury. Except for minor discharges from the corners of their eyes (and in younger dogs especially it must be ascertained that these are not a symptom of distemper) any eye disease is sufficiently serious to merit professional advice Boracic lotion is not suitable for the eyes of dogs. It is slightly irritant, and dogs are apt to scratch and make the eyes raw after application. Colloidal silver eye lotions and ointments are far more suitable pending the advice of a veterinary surgeon. In eye inflammation avoid sunlight and wind For some days in the early stages of inflamed eyes, the light in the room should be subdued. Pekingese seem to be especi-

ally prone to eye disease, but the remarkably unwholesome appearance of some affected eyes in this breed is not necessarily evidence that recovery is unlikely Steps should be taken to ensure that the dog does not inflict further injury on an already diseased eye. Cat scratches are a frequent source of inflammatory conditions of the dog's eye Eyes must never be neglected, for the consequences are serious

Skin Diseases are common in dogs, and may be contagious Among the common contagious causes of skin disease are lice, mange mites and fleas Lice and mange mites (except for demodex) are killed by modern insecticides such as benzene hexachloride (gammexane) although two applications at a 10–14 day interval are required to destroy the young stages which are within the insecticide-resistant eggs at the first dressing The flea actually on the dog, is only one of four stages in the life cycle of the flea, the others are in the house or dog's bedding Insecticides used for flea control should therefore be applied every week or 10 days during the summer to kill the young fleas as they hatch and infest the dog The dog's bedding should be discarded or cleaned The dog also suffers from other skin diseases caused by systemic disorders for which expert attention is required.

Diseases of the Teeth and Gums are very common in household dogs A serious systemic disease, such as distemper, may leave the enamel of the teeth permanently pitted, hence "distemper teeth." More serious than this, however, is a form of pyorrhoea, which is really a disease of the gums rather than a primary disease of the teeth themselves The margins of the gums become red and swollen, and may bleed easily As the condition progresses the teeth may become loosened. Particles of food become lodged between the teeth or between teeth and gums, and add to the inflammation and to the smell of the breath

This disease may, if unchecked, become very serious. In many cases extraction of one or more teeth is indicated, but unfortunately it is not always possible to do this. The condition demands expert attention

Another common condition of dogs' teeth is the deposition around them of "tartar" This should be removed by scaling or by special use of dental forceps Some breeders and others may themselves have learnt how to carry out these operations with the requisite skill and care, but they are not easy to the amateur, and it is essential that no harm be done to the animal's soft tissues by injudicious use of the instruments Ordinary dog-owners are strongly advised to take their dogs to a veterinary surgeon in order to have the "tartar" removed

Most puppies lose their first or "milk" teeth quite regularly between the ages of three and five months, but sometimes there is difficulty and the primary teeth are not shed properly. These cases should be treated by a veterinary surgeon before the permanent teeth are thrown out of their proper alignment.

One hears very much about "teething fits" in puppies, and while these occur, owners should be *very* careful to ensure that a "teething fit" is not a sign of distemper, which often starts with a fit. As puppies of this age are so susceptible to distemper, it is advisable to seek professional advice should any form of fit occur. It may save much time, money, and trouble, and even the animal's life

Internal Parasites: "Worms."—It is probable that more nonsense has been talked and written about "worms" in dogs than about any other canine subject According to some people, "worms" are the root of nearly all doggy evil, and so long as a dog is regularly "wormed" all will go well with him. These beliefs are frankly absurd. The real facts are very different, and are stated in as brief a fashion as possible in the following sentences. In this country dogs are infested by a species of "roundworm" (a creature which is a dirty-white colour and in shape somewhat resembles the common earthworm) and by several species of "tapeworm," which are also whitish but which are flat and are made up of many small segments joined to a little "head" which is attached to the lining of the gut In spite of all that is said, tapeworms as such are rarely responsible for much harm to the dog, although they can, of course, prove debilitating and should be removed. They are a nuisance, and attempts to remove them should be made by administration of the appropriate drug Occasionally, segments of worm are responsible for impaction of the ducts of the *anal glands* (see above)

The roundworms may be extremely serious in young puppies, in which they cause stunting, "pot-belly," harshness of coat and dangerous or fatal illness Fortunately, modern anti-roundworm preparations are available for animals of this age. Once over the age of 4–8 months dogs rarely suffer serious illness from roundworms, although these may cause occasional vomiting, or even diarrhoea, and some loss of coat and bodily condition It is now known that puppies are infected before birth from their mother It is therefore desirable to keep down the incidence of roundworms in the mother—and in dogs generally—and fortunately the modern preparations are—unlike some of the old-fashioned ones—safe in use and unlikely to cause digestive disturbances. From all that has been said above owners will realise the necessity of taking professional advice about young dogs which are ill, and any signs of "worms" in young puppies—either in the stools or by some obvious intestinal upset or bloated appearance of the belly—should be acted upon. One last word about this aspect of worms—do not assume that your adult dog has "tapeworms" unless you see some evidence in his stools There are so many "signs of worms" that veterinary surgeons must at times get a little tired of being assured that "My dog has worms" because of some trivial habit connected with appetite

There is, however, another side to the study of tapeworms, and one which is not generally realised The tapeworm which is found in the dog represents one stage in the life-cycle The eggs, which are present in the ripe segment passed by the dog, develop, not in the outside world, but in another animal altogether Thus one of the commonest tapeworms in this country has an intermediate stage, as it is called, in the flea, and it is when the flea is eaten by the dog that this intermediate stage develops further to become a tapeworm Another tapeworm has an intermediate stage which develops in the sheep, and a third has one which develops in the ox There is a fourth tapeworm which has an intermediate stage which *may* develop in man, to set up serious diseases in certain cases. Children may become infected through handling the dog, and so picking up the eggs, which may then be eaten through putting the hands in the mouth The dogs which are most likely to be infested are those which have the opportunity to eat freshly killed sheep and other food-animals An ordinary household dog is not likely to be infested, and people should not worry unduly in this connection, provided they do not allow their dogs to stray into the wrong places It is illegal to allow dogs to enter a slaughter-house but unfortunately one often sees dogs in such places The routine worming of dogs is justified if evidence of infection exists, and certainly in country areas where opportunities of tapeworm re-infection may be plentiful.

Tumours, including malignant tumours ("cancers") are relatively very common in the dog—probably as common as in the human subject. Space does not permit of a detailed account, but the following examples of growths may be mentioned. a proliferation of warts on the skin of puppies (usually disappear spontaneously); a true cancer of the tonsil in middle-aged and older dogs of both sexes; cancer of the mammary glands in bitches (both incurable); fatty growths of the vagina of bitches (amenable to operation)

Space does not allow of the discussion of other

diseases, but it should be pointed out that dogs are susceptible to human and bovine forms of *tuberculosis*, especially the former. In a household which contains a tubercular person, the dog should be watched for any signs of illness, and the thought entertained that he might be responsible for the further spread of the disease. For a discussion on ringworm see the appropriate heading in the section on the cat (Z12).

Accidents and Injuries.—In these days of swiftly moving motor transport, street accidents to dogs are extremely common. Many could be prevented by training the animal to walk to heel, by the use of a lead in busy thoroughfares, and by not allowing dogs to roam the streets unaccompanied—a thoroughly bad habit. Sometimes the victim escapes with a scare and a few bruises, and at others death is mercifully swift. In the vast majority of accidents, however, a more or less serious injury is incurred, and if the animal is unable to move, the police should be notified immediately. The dog is best left quiet, and it is not recommended that attempts be made to administer brandy or other supposed "stimulants" unless help is markedly delayed. Excessive hæmorrhage may in some instances be prevented by common-sense application of principles learnt in first-aid courses.

One of the commonest accidents to dogs, especially to young dogs, is a fracture involving the head of the femur, or thigh-bone. Inability to put one of the hind legs to the ground, or to bear any weight on this limb, is an indication of such an injury. (This injury may occur also from falling off a chair or wall.) Professional help is, of course, required in such cases.

Cuts and Bruises, if not serious, may be treated at home as in the case of human beings. The indiscriminate use of tincture of iodine is not to be recommended, and spirit alone makes a more satisfactory dressing in most cases. Simple washing and removal of dirt are usually sufficient, combined, perhaps, with modern antiseptic ointments or other preparations. The dog (and also the cat) are very liable to sepsis, and it is best in such cases to send for proper assistance early, or there may be grave trouble. It is probable that in nature many of the flesh-eating animals end their lives as victims of the sepsis following wounds.

Injuries from cat-scratches are exceedingly common, as are bites from other dogs. These are serious, as they more readily result in septic places. The scratch or bite sometimes penetrates quite deeply, leaving a pocket which fills up with pus. This pus may spread under the skin to form sinuses. Never neglect such places.

Conclusion.—There are a few concluding remarks on the treatment of the diseases of the dog:—

(1) It is not correct that "water should be withheld from a sick dog." It is true that an animal which is using water only to vomit, or which is drinking excessively, should have its water intake restricted, but it is wrong to deprive a dog altogether.

(2) There have been such wonderful advances in the field of veterinary anæsthetics that there is nowadays little to fear in this connection from operations to dogs and cats. The records over the past years at the Royal Veterinary College, London, and at other centres have been most encouraging, and the anæsthetic risk is now small indeed.

(3) When a dog's life is a burden to him, it is unfair to keep him alive, and he should be put to sleep. It must be realised, however, that putting a dog to sleep is a very skilled task. It is made much easier if an owner will allow his veterinary surgeon to administer an anæsthetic and not allow the animal "to come round," and shooting is also straightforward and painless if *skilfully* carried out. There are no "magical ways" of destroying human or animal life, and an owner must not expect his veterinary surgeon to be able to bring about death merely by holding a pad to the dog's face. It is far better that the task be carried out at a veterinary surgeon's own premises, where there is skilled assistance.

CATS.

Many of the general remarks in the preceding section apply equally to cats, and will not be repeated unnecessarily in the following paragraphs.

BREEDS AND VARIETIES OF CAT.

The following breeds and varieties are recognised for registration purposes by the Governing Council of the Cat Fancy:—

Long-haired Cats

Black	Tortoiseshell
White (Blue-eyed)	Tortoiseshell-and-White
White (Orange-eyed)	Blue Cream
Blue	Brown Tabby
Red Tabby	Chinchilla
Red Self	Smoke
Cream	Silver Tabby

Short-haired Cats

Black	Spotted
White	Russian Blue
British Blue	Manx
Cream	Abyssinian
Tortoiseshell	Siamese (Seal-pointed)
Tortoiseshell-and-White	Siamese (Blue-pointed)
Silver Tabby	Siamese (Chocolate-pointed)
Brown Tabby	Burmese
Red Tabby	
Mackerel-striped Tabby	

Pedigree breeding and showing are practised with a very small fraction of the total cat population of Great Britain, and the majority of these remarks will be concerned with the ordinary household cat. Nevertheless, in recent years there appears to have been a considerable increase in pedigree cat breeding. Registration, which is essential for showing and pedigree purposes, is controlled by the Governing Council of the Cat Fancy, of which the secretary (1962) is S. E. Barnes, O.B.E., 4 Elm Court Gardens, London Road, Crowborough, Sussex. Many of the breeds listed above have their own societies, which are affiliated to the Governing Council. The addresses and particulars of these and other cat societies and clubs may be had on application to the secretary of the Governing Council. The two most popular varieties of cat are the Blue Persian and the Siamese, and an exclusive show is held for each of them. In addition to these shows there are five big Championship Shows open to every variety of long- and short-haired cat, while there are classes for cats and kittens at some of the Agricultural Shows.

CHOICE OF CAT.

Although there are, as noted above, many varieties of cat, most people are content to accept an ordinary kitten, and for them the chief points to consider will be (*a*) whether to have a long-haired or a short-haired animal, (*b*) whether to have a male or female, (*c*) whether or not to have the kitten "doctored" (*i.e.*, castrated or spayed). As a general rule, short-haired cats are probably more suitable for the average household, since their fur does not become shed so noticeably and they probably suffer less from "fur-balling." Nevertheless, many long-haired cats are so attractive that they will obviously be preferred, and there is no reason why they should not be chosen. Sex is a rather more important question, although, as may be seen in the section on management, it is possible to have both males and females "doctored." Male cats which are kept as entires are often a nuisance in that they make abominable smells in the house and spend much of their time in fighting. These characteristics are by no means invariable; but they are so common as to justify the castration of the majority of males. Siamese males in particular may be a liability. Females are generally credited with a greater attachment to the home (although they wander when "in season") and with being better mousers. The principal objection to females is that they seem to be bearing kittens almost continuously. In normal circumstances it is, of course, quite impossible to prevent cats from mating by keeping the female in confinement

during her season, a practice which is frequently adopted in the case of the dog. For one thing, most people are never aware when their female cats are in season

Whatever animal is chosen, it is essential to pick a healthy and preferably a fairly young—but *not* too young—kitten. It is best not to accept a kitten under about eight weeks of age.

For those who wish for something a little out of the ordinary, Siamese cats make excellent and highly intelligent pets Siamese kittens are born white, but gradually develop their even pale fawn colour, with cream on belly and chest and with "seal brown" mask, ears, legs, feet, and tail. The coat is very short, and the eyes are blue There has long been a popular belief that Siamese cats are delicate creatures, but the present writer has seen healthy specimens, kept under ordinary household conditions, living to a mature age It is not wise to keep a male Siamese as a household pet. The male is a fierce fighter, and is generally a worse offender in the house than the males of other breeds, and should therefore be castrated if it is to be kept as a pet

Many people find Manx cats attractive. Instead of the normal large number of tail bones, they have but three, and hence appear almost tailless One should beware against fraudulent amputation of the tail of ordinary cats, which are then described as "Manx."

MANAGEMENT OF THE CAT.

The cat is an independent creature, so much so that one may say that to a large extent it manages its own affairs. This, however, is not true of all cats, and every reasonable attempt should be made to provide the cat with a comfortable and friendly home Cats are highly intelligent, and if sufficient patience is exercised they will respond to a very great degree to human attention. Kittens should not be neglected, but should be talked to and played with just as are puppies. Many cats, especially young cats, make excellent playmates for children.

In order to prevent to a large extent their nocturnal wanderings, many cats of both sexes are castrated or spayed (the popular lay expression for this is "doctored"). In the male cat the testicles are removed by an operation which is almost always safe and simple if carried out skilfully. From three to four months is a good age at which to have this done Female cats may also be "doctored." As the female glands or ovaries lie within the body cavity, this operation is a major one, but it is nevertheless quite a straightforward, though a more expensive, procedure if conducted at the right age (about five months) Very many thousands of female cats have been so operated upon and the subsequent health of these cats has been excellent. Indeed, it has been said that a spayed female makes one of the best of all household cats.

Cats may choose to sleep in a variety of places, and will often lie on beds, chairs, mats, and other warm places. It is a sound policy to provide them with a box or basket, and to encourage them to use newspaper as a bedding. Most cats will take well to newspaper. The bed should be placed in a warm site—it is of little use putting it in a cold corner of a room and expecting the cat to lie in it.

Owing to the fact that, even in play, a cat's claws may inflict serious injury, dogs and cats do not always make the best of house companions. Nevertheless, the traditional enmity of cat and dog is often overcome, and if the two are brought up together they often make firm friends, sharing the same basket or hearth-rug and feeding together without serious consequences.

A cat normally attends to its own toilet, and everyone must be aware that a cat devotes long periods each day to cleaning and washing itself. Except in special cases, therefore, bathing is quite unnecessary, while in short-haired cats especially, grooming, too, is superfluous (this does not apply to show-cats) For some reason (and sometimes, apparently, because an owner attempts to assist in the daily grooming) an occasional cat may cease to wash or care for itself. Such an animal is a dejected sight, and should be taken to a veterinary surgeon to have its matted fur cut or combed, and its dirt removed. Such animals (unless they completely re-acquire their self-respect) must be groomed regularly if they are to be kept at all.

All household cats are accustomed to take their own exercise, and it is advisable (except in any special circumstances) to allow them free access to and from the outer world. Do not shut your cat in the house for a long period and then blame it for making a mess. Cats are clean creatures; they normally dig small holes in which to defæcate or urinate, and subsequently cover the deposit with earth. If, therefore, they are for some reason debarred temporarily or permanently from access to a garden, they should be provided with a box or tray containing soil or cinders. Indeed, in many types of houses it is a good plan to encourage kittens to use such a device. (Note the corresponding remarks about puppies)

It is generally stated that "cats never forget a blow," and for that reason it is recommended that cats are not chastised It may be said that, if a cat (or dog) be brought up conscientiously and well, it should never, or very rarely, require such punishment. An animal which has been brought up properly seems to develop a fair sense of what is right and what is wrong.

For pedigree cats, or those kept in confinement for other reasons, see the relevent remarks in the section on breeding.

FEEDING THE CAT.

Although most cats are capable of supplementing their diet by catching small rodents or birds, it is unwise to rely on this as a regular source of food The idea that hungry cats make the best mousers is by no means always correct. Indeed, animals that are in poor condition are less likely to be successful hunters Moreover, while the riddance of pests is an excellent matter from the human point of view—and one of the reasons why the keeping of cats is economically justified—the "cruel" fashion in which most cats tackle their prey is repulsive to most of us.

It is therefore necessary and desirable to provide regular daily feeding Kittens should receive several meals a day, but by the time they are six months old the number of daily feeds should be reduced to one, or at most two Most cats (many Siamese are exceptions) are extremely fond of *milk*, especially if it is creamy, and the cat's love of *fish* is well known. Many *meats*, especially *rabbit meat*, are relished, and a diet high in "animal protein" is indeed the aim, always provided that it contains sufficient "dietary energy." It is significant that cat's milk has a higher content of fat and sugar than cow's milk, *i.e.*, it is a richer source of *energy* Some of the proprietary bitch-milk substitutes are nearer to cat's milk in composition than is cow's milk.

Many hundreds of cats have been reared and bred successfully in experimental laboratories on a diet consisting, in the main, of one part of fish or meat and two parts of *cooked potatoes* This is relatively inexpensive, and may be supplemented by milk and by some of the proprietary cat foods.

Cats are also extremely fond of liver Some of the proprietary cat foods—the better ones of which are excellent—and vitamin tablets contain liver, which is a rich source of the vitamin B complex.

Within reason a healthy kitten should be fed to appetite, always provided good-quality foods are available The amount should be restricted when they are adult, however, except for pregnant and lactating cats, which are sometimes referred to as "queens" as opposed to the male "toms." An average daily allowance of solid food for a healthy non-pregnant adult cat should be of the order of ½ oz. per 1 lb. body-weight.

Cats are fastidious eaters; they usually sniff and examine carefully any strange or doubtful food. At the same time they are often greedy, especially with relished food to which they are accustomed, but fortunately they can, like dogs, vomit very readily. Here, incidentally, is one very good tip—an excellent emetic for both cat and dog is a small crystal of washing-soda, given as a pill. People are usually amazed at the way this simple device results in a dog's or a cat's bringing up undesirable food.

It is important not to overfeed cats, and it is

almost equally important to prepare all food in a clean manner, and to make it as attractive as possible. Cats will greatly appreciate this care While milk is an excellent food for kittens (see under breeding), and is relished by most adult cats, it must be supplemented by solid food.

Clean fresh water should be provided at all times, even if the cat appears to drink it but little.

BREEDING OF CATS

Pedigree animals are normally confined, and their breeding is strictly controlled Ordinary household cats are at the opposite extreme and there is little that can be done to prevent their mating. The length and scope of this article does not permit of a discussion of controlled mating.

Scientifically, there is as yet a good deal to learn about the reproductive behaviour of the cat As an American physiologist has succinctly put it in a description of the reproductive cycle of the female cat, "no two authors agree." In Northern Europe there are two main heat periods a year, in spring and early autumn, but some animals may appear in heat at any time from January to July, and those who keep female cats in confinement describe their charges as "calling" quite frequently if not mated. A cat which is "in season" or "on heat" is often observed to be behaving in a quite characteristic fashion, rolling about on the floor and making peculiar sounds The periods of heat, which commence usually at about eight months of age, may last for several days, and during this time the female will make every attempt to find a mate.

Gestation lasts about nine weeks, as in the case of the bitch, but here again there is a considerable variation As most owners are quite unaware of the time at which their cats were mated, it is difficult to talk of "going overtime," but if there is any evidence of trouble during pregnancy, or at birth, veterinary advice should be obtained As soon as a cat is obviously pregnant, her food allowance should be increased, and she should be allowed plenty of milk It is highly important to increase her food and milk ration still further after the kittens are born, as lactation is a great drain on the mother

Cats sometimes choose strange, out-of-the-way places in which to litter, and many healthy litters are born and reared out of doors. Rats are a source of danger, and will often destroy very young kittens during the mother's absence For this and other reasons it is better in town and suburban areas to have the litter comfortably housed indoors A wooden box containing newspaper is ideal, provided it is kept in a fairly warm place and out of the way of draughts An average litter consists of three to six kittens, which are born blind, but which normally open their eyes after eight or nine days There is no need to be alarmed if the eyes remain closed for a few days longer Kittens which are born dead should be removed and buried or burnt If the whole litter is born dead, the mother's food supply should be cut down considerably, and little milk given for a few days If the mamary glands become inflamed, they may be bathed in a cold solution of alum. The glands normally return to their former size within a short space of time if they are not milked, but if there is persistent trouble veterinary advice should be sought

While many pedigree owners wean kittens at four to five weeks of age, it is strongly advised that the household cat be allowed to continue to feed her family for a longer period, and eight weeks is not too long if the mother is still in good bodily condition. She *must*, however be well fed and be allowed plenty of milk As in the case of puppies, it is an excellent idea to provide the kittens with a little solid food as from a few weeks of age It is very wrong to remove a kitten from its mother too early, and such an animal is often weakly, develops an intestinal infection, and dies as a miserable bedraggled creature. Moreover, during the period following weaning the mother educates her offspring in the art of living, particularly ratting and mousing.

As many litters are unwanted, some people get rid of all the kittens as soon as possible after birth. Drowning is frequently practised, but it is not recommended as a merciful death. Indeed, a hard blow on the back of the head is more humane if given accurately. It is much better to take the kittens to a veterinary surgeon or clinic

DISEASES AND INJURIES OF THE CAT.

The principal infectious diseases of cats are still in need of much scientific study. It is now clear, however, that there are at least two major cat plagues Both have been given many names, and there is much confusion between them

Feline Enteritis or Panleucopenia.—This is a highly infectious disease, due to a filterable virus. The symptoms include loss of appetite, sometimes accompanied by a rise in body temperature, followed by listlessness, usually vomiting, sometimes diarrhoea, and a marked tendency to show tenderness or pain on being handled. This tenderness or pain is due to a developing peritonitis. The poor animal may become seriously ill, with loss of water from the tissues or dehydration, prostrate and dead within 48 hours or less from the time of the first symptoms. The incubation period of the disease is believed to be from 4 to 8 days, or sometimes longer There is a fall in the white-cell count of the blood, hence the term "panleucopenia." Some cats recover, the recovery rate in different outbreaks that have been studied ranging from 30 to 80 per cent, and recovered animals are probably immune to further attacks Cats that are able to take a little food during the early stages of recovery have the best chance of recovery, but require careful nursing There may be complications during the convalescent stage due to secondary bacterial infections or to vitamin deficiency, and a light nourishing diet, combined with vitamin preparations, is recommended. Fleas may transmit the disease to other cats, as may contact with infected materials It has been shown that bedding and dirt trays from sick cats were infectious for other cats for up to 16 days. The disease is not transmissible to dogs or to human beings There is nowadays a protective vaccine, and it is a wise precaution to have your pet vaccinated

Feline Pneumonitis.—This disease is sometimes called "cat distemper"—as indeed is feline enteritis—but it has no connection with dog distemper, and is not transmissible to dogs or to human beings Both mild and severe forms occur, and the incubation period varies from 5 to 8 days The mild form may seem like a cold, and there is a weeping from the eyes and a varying degree of conjunctivitis. There is a thin, clear discharge from the nose, with a characteristic sneezing Provided that the animals can be made to continue eating, and are kept in warm and dry but ventilated conditions, recovery may be rapid and not entail serious loss of condition. The eyes should be treated with a suitable preparation, such as silver vitellin. There may be secondary bacterial infection in cases that are neglected

The severe form of the disease has similar, although more severe, commencing symptoms, but the nasal discharge becomes purulent and there is often profuse salivation, with much spreading of the long ropes of saliva. The cat is listless, dislikes strong light, and seems to resent being disturbed It loses its appetite, and rapidly becomes thinner over a period of from 2 to 5 days or so Breathing becomes laboured, and a bronchopneumonia develops. There may be a high death rate in young kittens, and pregnant females may abort. Recovery tends to be slow, and is often complicated by bacterial infection Some of the modern antibiotics appear to be highly effective in the treatment of many cases of this disease, but they must, of course, be given under veterinary supervision

Tuberculosis.—The cat, like the dog, can contract tuberculosis, but so far as is known only the bovine form has been known to infect it, The infections usually comes, of course, from milk, and the elimination of bovine tuberculosis from this country will stop the incidence of the disease

in cats. The disease commences in the abdomen, but may spread to the lungs. There is general wasting.

Skin Diseases.—As in the case of the dog, skin disease in the cat is usually of parasitic origin, and fleas and mange mites are again the chief source of trouble in Great Britain. Cats do so much of their own toilet that the average household cat has probably a cleaner skin than its canine counterpart. When skin disease does develop, it is strongly advised that the animal be taken to a veterinary surgeon for appropriate treatment. As a rule cats greatly resent the interference which must accompany any attempt to bathe or dress an affected place, and for this reason it is usually unwise for an owner to attempt to do other than make an inspection. Very small patches of skin eruption may clear satisfactorily if the surrounding hair is clipped away with curved scissors, but generally speaking skin disease calls for professional attention. The cat flea has a similar life cycle to the dog flea (*see* Z8).

Diseases of the Ear.—The outer ear of the cat is frequently affected, and in a great many cases a form of mange mite is responsible. The animal provides evidence of the trouble by scratching and shaking its ear and generally showing its discomfort. It will not always be possible for an owner to make a thorough examination, as in many cases the cat objects, but if it is possible to look inside the ear it will be seen that there is a dirty and usually brownish mess of tissue, sometimes mixed with dried blood or pus. Not all cases are as bad as this, of course, but if a cat persistently worries its ear it should be taken to a veterinary surgeon. There are satisfactory dressings for this condition, and owners will be able to dress their cats if the latter are docile. Otherwise it is necessary to have the ears dressed by a veterinary surgeon or by one of his staff.

A cat's ear is frequently the site of a blood blister, or hæmatoma. This is usually the sequel to a blow, such as a slamming door, and shows itself as a large, tense swelling, which when opened by the surgeon proves to be an accumulation of serum usually tinged with blood. Some cases become infected at the time of injury, some after with the patient's rubbing. With the greatest surgical skill in the world one must expect a slight deformity, and the cat develops a puckered ear, much the same as the human boxer.

Disease of the Bladder.—The bladder is a common seat of disease in cats, and is frequently affected through the blocking of the natural water-passage by small sand-like calculi. Naturally, male cats are more often affected, as the terminal end of the urinary tracts is wider and more dilatable in females. The urine is unable to escape, and the bladder becomes filled with a mixture of urine and the sandy calcular matter. The condition may be diagnosed quite readily, as the cat usually collapses, or partially collapses, and one may easily feel the distended bladder through the walls of the abdomen (belly). It is necessary to send for professional help immediately, and, while no relief can be guaranteed, it is often possible to relieve the condition by judicious manipulation. Owners should not attempt to do this themselves (unless help cannot be obtained), as they may easily burst the bladder. As the animal is usually in a state of collapse when the condition is discovered, it makes a bad risk for actual operation, and relief by *skilled* pressure is usually to be recommended.

Ringworm.—There are two common kinds of ringworm in the cat (a third, which may also infect the dog, is more rare; it is the trichophyton which is usually found on cattle). The first kind is acquired from rats and mice, and is most commonly to be found at the bases of the claws, from where it may spread to the ears and face. The individual lesions are circular and yellow in colour, and consist largely of a scabby material. This kind of ringworm is known as "favus."

The second type of ringworm (microsporon) is more important, because it is more readily transmissible to human beings. Whereas this form usually sets up circular scaly lesions in the dog, it often infects cats without there being much naked-eye evidence of its presence. Indeed, in the cat the condition is often unsuspected until the owner himself becomes infected and consults his doctor.

Ringworm should be treated or dealt with by a veterinary surgeon, who will also confirm or refute by special methods the presence of microsporon in cats.

Intestinal Parasites—"Worms."—The cat also is subject to both roundworms and tapeworms. The roundworm which parasitises cats in this country is similar to that of the dog (although a different species) and is also much more harmful to the young than to the adult animal. In kittens the symptoms are a general unthriftiness, staring coat, and in some cases diarrhœa and a "pot-bellied" appearance.

The commonest cat tapeworm in this country is one which passes its intermediate stage in the rat or mouse, or sometimes in other rodents. The tapeworm, which, as mentioned under the section on dogs, is dangerous to man, is sometimes found in the cat also.

Accidents and Injuries.—Despite their sagacity and alertness in many ways, cats seem curiously unable, in many instances, to acquire road-sense. They are dazed by a car's head-lights, while if a motorist sounds his horn they tend to stop still in their tracks.

Injuries from traps, *e.g.*, gin-traps, are very common, and it is probable that many thousands of cats annually are maimed in this fashion. Cats suffer injury from shooting, from stoning, and from blows with sticks. Since they are predatory animals, they have often to pay the penalty inflicted on them by wrathful people. Needless to say, cats which survive to return home usually require expert treatment.

Poisoning may be included under this heading. Although there are doubtless many deliberate attempts to poison marauding cats, alleged "poisoning" is often no more than a case of feline enteritis, and owners should not claim glibly that their cats have been poisoned until they have expert evidence to back their judgment.

Fur-balling, as it has been termed, may be mentioned here. Cats, especially the long-haired varieties, must often ingest hair during their toilet, and occasionally serious trouble (a stoppage of the bowels) is brought about by a mass of such hair which has collected in a part of the bowel. There is constipation, loss of condition, and often evidence of considerable pain. Such cats should be taken to a veterinary surgeon.

Bites and scratches are even more common in the cat than they are in the dog, and subsequent sepsis is equally likely.

FERRETS.

Description.—The ferret is probably a domesticated form of the pole-cat (*Mustela putorius*), and is known sometimes by that name and sometimes as *Mustela furo*. Most tame ferrets have pink eyes and yellowish-white fur, but there are darker forms believed to have resulted from crossing in previous generations with wild pole-cats. Indeed, these darker forms are popularly termed "pole-cat ferrets." They are of two main kinds, the first having creamy under fur and black guard hairs, and the second being a chocolate-brown colour, with brown upper parts and black under parts, and a few scattered light hairs on the face.

Ferrets are long creatures in relation to their body weight, and when fully-grown may have a body 14 in. long or more and a tail of 5 in. Some strains grow appreciably larger. The main use of the ferret is, of course, in rabbiting, for which purpose they have been employed for many centuries. Although they can become fierce if not accustomed to regular handling or kind treatment, and are capable of inflicting a nasty bite, they may nevertheless be made into docile and highly intelligent pets. It is most important to win their confidence from the beginning and to accustom them to regular handling from the time they are young "kittens."

Accommodation.—Ferrets must have dry, clean accommodation in a room free from draughts but well ventilated. Wood is warmer than metal, but more difficult to clean, and is best lined with hard asbestos sheeting, which is resistant to water. The most suitable accommodation comprises a sleeping compartment of similar proportions to a small kennel, leading by a small doorway or "pop-hole" to a wire-netting exercising run, which should be as large as possible compatible with cleanliness. It is a good idea to have a means of closing the doorway so that the ferret or ferrets may be confined within the sleeping-compartment if necessary. Wood-wool makes an excellent bedding, but if difficult to obtain newspaper may be provided for the ferret to lie on. The floor of the run may have a false bottom or may be sprinkled with sawdust. It is imperative to keep the whole of the accommodation clean and dry, not only to avoid smell but also to prevent the ferrets from developing a very serious necrotic infection of the feet known as "foot-rot".

Feeding.—Many ferrets are unfortunately not fed adequately. It must be appreciated that basically they are carnivorous animals, and that their food requirements are more similar to those of the dog and cat than those of rodents. Indeed, many of the general remarks made about the principles of feeding dogs and cats apply to ferrets also.

Most ferrets like bread-and-milk, and while this is an excellent article of diet, it is in itself inadequate. Up to about 4 oz. of raw meat (minced for younger animals) daily is an excellent basis, and this may be replaced by fish. Liver, especially raw liver, is an excellent source of many factors, and there is good reason to provide some at least weekly if it can be obtained. Failing this, it is advisable to add 1–2 per cent. of whole dry liver to the diet. Once ferrets are grown, one feeding daily—at a fixed time—is sufficient. The female (jill) should have ample supplies of milk just prior to the birth of her young and while she is suckling them.

Breeding.—In the northern hemisphere the female ferret usually comes into œstrus (season) in early March of the year following that in which it is born. If the jill does not conceive during this œstrus she will have a further œstral period in July or August. The desire of the jill to mate is very strong, and if not allowed to do so, some animals sometimes have been found to waste and pine. The act of mating is prefaced by very vigorous behaviour on the part of the male (hob), and anyone not appreciating the performance might think that he was out to kill his mate! The mating act itself is usually prolonged, and may take up to three hours. If left together the hob and jill will probably mate from two to four times during the course of a couple of days. As in the cat and rabbit, ovulation or the shedding of the egg from the ovary takes place as a result of mating, and not spontaneously. The period of gestation is forty-two days, and the numbers of young born usually varies from five to thirteen, the average litter being six to eight. Pseudo-pregnancy occurs if the jill is not mated, and may become outwardly obvious as in the case of certain bitches.

Males also have a seasonal rhythm, their capacity to fertilise being greatest from early March to August. Young hobs seem to be active about a month earlier than older ones. The length of daylight or, rather, the incrementation in light from day to day, has an important bearing on breeding capacity in both sexes, and by the use of artificial light it has proved possible to induce either œstrus or male activity at different times of the year.

The young are hairless and blind, and weigh on the average under ½ oz. at birth. Their eyes open at about four weeks, and they can then commence to eat small pieces of solid food to supplement their mother's milk. They may be weaned at from six to eight weeks.

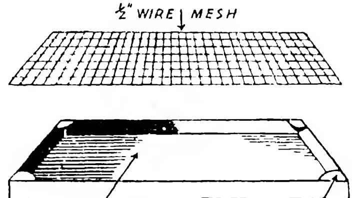
Diseases.—The most serious disease of ferrets is *canine distemper*, and the variant known as "hard pad" (see under dog) is equally capable of infecting ferrets. Such infections can wipe out entire stocks, and every care should be taken to prevent their spread from dogs to ferrets—and vice versa. A veterinary surgeon should be consulted immediately when a ferret becomes ill or out of sorts. Ferrets are also susceptible to some strains of *human* influenza, and should not be tended by persons with colds or with any indications of "flu". The feeding of infected milk may give rise to *tuberculosis* (now unlikely in Britain). *Foot-rot* has already been mentioned, and must on no account be neglected. *Mange* or "scabies" of the back and tail region should be dealt with promptly, employing modern preparations. Abscesses of the neck region are often encountered, and should receive professional treatment if they do not clear up rapidly, for they may spread with dire consequences.

RATS.

Description.—Tame rats are domesticated varieties of the wild Norway or "brown" rat (*Rattus norvegicus*). Such rats are usually albinos or black-and-white, although other colours have been bred. The hooded varieties are those in which the head and fore parts are mainly black or chocolate and the remainder of the body, apart from small patches the same colours as the hood, is white. Tame rats differ materially from wild ones in disposition, and properly managed are extremely tractable. Healthy specimens accustomed to handling bite only when frightened, *e.g.*, when a sudden movement is made in front of them. Males appear to live longer than females, but three years is a good age.

"Black" rats, *i.e.*, the species (*Rattus rattus*) sometimes known as the ship or Alexandrine rat, have been bred in captivity, but tame strains are not generally available.

Housing.—Tame rats require a warm, even temperature—65–70° F. all the year round—and draughts or lowered temperature may precipitate lung diseases or other disorders. It is best to have a complete spare set of boxes or cages, and to change to fresh quarters weekly except when the females have unweaned young with them. Empty cages should be cleaned and disinfected thoroughly before being used again. Provided the temperature conditions are suitable—and this is essential—metal cages of the types employed in scientific laboratories are best, with wire-mesh false bottoms and trays containing sawdust to catch the droppings. Accommodation should be

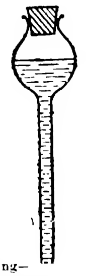


ample, and even for a pair of pet rats the cage should measure about 30 in. × 18 in. × 18 in. If wooden boxes are employed it may be desirable to line them with hard asbestos sheeting or galvanised metal to prevent damage from gnawing.

Small, dark "shelters" and exercising devices, *e.g.*, wheels or ladders, are appreciated by the rats, but must be kept clean. Wood-wool makes the best bedding.

Feeding.—Rats may take a wide variety of foods, including many of our own, and there are

several successful ways of feeding them, including the provision of specially formulated "rat-cubes," of the same type as that described below for mice. A good daily diet is wholemeal bread, mixed cereals (*e.g.*, oats, wheat, hempseed), with about



WATER BULB SUITABLE FOR USE WITH PET RODENTS

5 per cent. dried brewers' yeast and milk either fed separately or mixed with the rest of the food Twice weekly each rat should be given up to ½ oz. or more of meat, liver, fish, or other "animal protein" A little fresh greenfood (even grass) is appreciated, and in winter especially some supplement containing vitamins A and D is desirable. Expectant and nursing mothers should have as much milk as they require Never overfeed or allow uneaten food residues to remain in the cage. Fresh water (preferably in bulbs or bottles) should be available at all times. Far cleaner than open dishes are the special but simple type of water bulbs suspended on or in front of the cage or box so that the rat can drink from the rounded end of the spout A simple substitute is a medicine "flat" bottle—or even a ¼- or ½-pint milk-type bottle. This should be fitted with a cork—or, better, a rubber bung—pierced for a piece of bent glass tubing. Provided that the free end of the glass tubing is not sharp, and is chosen so that the aperture is considerably smaller than that of the tube itself, the water will not run out unless sucked out by the rat. The spout should, of course, be within easy access of the rat, which will soon learn to drink from it

Breeding.—Rats can breed at quite a young age (usually being capable of mating when fifty to sixty days old), but it is better to separate the sexes within a fortnight or so of weaning (weaning being usually at twenty-one days of age) and to mate at about 100 to 120 days of age onwards the female rat has an œstrous cycle lasting just over four days. One male (buck) may be mated to one female (doe)—this is probably best in the case of pet rats—or with two or three females if preferred, but it is unwise to keep more than one adult male in the presence of females The gestation period is twenty-one to twenty-two days or occasionally a few days longer The number born varies considerably, but often it is best to try to rear only six to eight young The young have their ears open at 2½ to 3½ days, cut their incisor teeth at eight to ten days, can find their way to their mother at about the same time, open their eyes at fourteen to seventeen days, and may leave the nest at twenty-one days. In the case of pet rats it is probably best to leave the young with the mother for up to a week or so longer. Breeding can occur all the year round, but takes place less readily in winter.

Handling.—Rats should not be "tailed," or the skin may slough off. Regular handling after weaning is excellent and promotes docility. The weight of the body should be supported.

Diseases.—On the whole rats are much less liable to disease than mice, provided temperature conditions are suitable. The commonest infection is *broncho-pneumonia*, often precipitated through draughts or cold. *Mange* (especially of the ear) and infestation with *lice* may occur, and should be dealt with promptly by means of modern insecticides. Avoid contact with wild rodents, or the use of food or bedding that may have been contaminated by wild rats and mice.

MICE.

Description.—Tame mice are descended from the common house mouse (*Mus musculus*), and it is believed that mice have been domesticated for over 3,000 years. Apart from albino or "white mice," there are many varieties that have been bred by the extensive "mouse fancy," and there is a wide range of coat colour and also different types of coat, *e.g.*, long-haired, short-haired, and rex "Waltzing mice" have an abnormality of that part of the inner ear concerned with balance Mice may live up to thirty months, and in exceptional cases attain the age of three years or more

Housing.—Although strains vary, most tame mice require a warm even temperature and the same general remarks concerning temperature range, bedding, and wooden or metal cages apply as in the case of rats. If a solid floor is used, this should be covered with clean sawdust. It is a good plan to change to a clean cage regularly, except when the female (doe) is nursing her young If the cage is large (as in the case of pet mice it should be, with a floor space of say 24 in. × 12 in. × 12 in. for a group of mice), inner nest-boxes should be provided—one for each doe if breeding is taking place, although two does will often share the same nest-box (In changing to fresh cages the nest-box, with mother and young inside, may, of course, be moved over) A "two-storey" cage, with a ladder or "staircase" to the upper part, is an attractive variation, although difficult to keep clean. Mice should be kept well out of reach of wild rodents, from which they may all too readily contract disease

Feeding.—Mice have not quite such a wide dietary range as rats, but there are several different ways of feeding them, including the provision of special "mouse cubes" These mouse cubes are of varying composition One of the most successful, devised by workers in the Medical Research Council's laboratories, is known as "Diet 41" and is made up of the following parts by weight· wholemeal flour, 45, Sussex ground oats, 40, fish meal, 8; dried yeast, 1; dried skimmed milk, 3, cod-liver oil, 1, and common salt, 1 Diet 41 has also been employed for rats and monkeys, although for the latter particularly it requires supplementing It is perhaps worth emphasising that cod-liver oil must not be fed in excess (½% of the diet is quite sufficient, and should not be exceeded), or it may prevent breeding and possibly have other harmful effects Cubed diets are best fed from a wire basket through which the mice enjoy gnawing and eventually pulling out the pieces. Wholemeal bread is excellent if not allowed to become stale, but it should not form the sole article of diet, and it is a good idea to feed it alternately with a grain mixture (made up of rolled oats, wheat and other cereal grains, or mixed bird seed) Up to about 5 per cent dried brewers' yeast is excellent, and so is fresh or dried milk, especially for mothers that are carrying or nursing young. Cheese is relished, but may smell if not fed carefully. Mice sometimes like an occasional pinch of marmalade, and it is a good idea to provide lettuce or other greenfood every week or so There should be a constant supply of fresh water, preferably from bulbs or bottles as described for rats

Breeding.—Young mice may be weaned at twenty-one days, although it is usually preferable to leave them with their mother for a further week. The age at which mice are capable of mating varies considerably from one strain or individual to another, and while the average is six to eight weeks, it may be much younger. It is therefore desirable to separate the males from the females at or shortly after weaning

Mice may be mated up at two to three months of age, and the best arrangements are one male (buck) to one or two females. A pair of mice or a "bigynous trio" makes a successful combination. The œstrus cycle is similar to that of the rat, but its length appears to vary with coat colour, being longest in the brown mice and shortest in blacks and albinos. The gestation period is usually from eighteen to twenty days, but may be prolonged if the female was still suckling her previous litter when she conceived. There may be up to twelve or more young in a litter, but the average litter size is from five to seven. The second litter is usually the largest, and subsequent litters tend to decrease in numbers, so that the sixth is usually smaller than the first. Breeding may take place all the year round, although, as with rats, fertility is higher during the summer months.

Handling.—Any rapid or rough movement may frighten mice and cause them to bite through fear. Mice should be lifted by the tail—not too near the tip—and may be held in the palm of the hand, where they may be suitably restrained by keeping the tail between two fingers.

Diseases.—Mice are unfortunately prone to many diseases, although the risks will be much lower if they are kept in suitable surroundings, great care is taken to avoid infection, scrupulous cleanliness is observed, and the standard of feeding is good. One common source of infection is the presence of the excreta of wild rodents on bedding or foodstuffs. A common disease is that sometimes called "*mouse typhoid*," caused by organisms of the Salmonella group. Although some mice recover, they may remain carriers of infection, and once this disease is diagnosed it is best to destroy the affected mice and those in contact with them, and not to employ any of the cages or utensils for fresh mice without adequate sterilisation. There are other septicæmia diseases of mice, and also virus diseases, including certain types of *pneumonia* and a condition known as *infectious ectromelia*. The accurate diagnosis of these calls for expert opinion and often for special bacteriological or other examinations. The mouse-owner should, however, be able to recognise signs of ill-health or departure from normal, one of the commonest being loss of appetite. In young mice the coat should be smooth and glossy. As mice get older there may be loss of pigmentation (in coloured mice) or even loss of fur. A sick mouse usually sits hunched up and has a ruffled coat, while the eyes may be partially closed or have some discharge. A healthy mouse will usually catch on to suitable objects when held by its tail and is capable of pulling quite hard, whereas the pull of a sick mouse is much weaker. If one or more mice die it is best to destroy at once any cage-mates that appear seedy. As in the case of rats, external parasites should be dealt with promptly with the aid of modern insecticidal preparations.

GOLDEN HAMSTERS.

Description.—There are many species of hamsters in the world, and more than one kind can now be bred in captivity. The one referred to, however, is the Golden Hamster (*Mesocricetus auratus*), a delightful little creature of which a full-grown female (females are larger than males) rarely exceeds 7 in. in length. This history of the domestication of the golden hamster is quite remarkable, for prior to 1930 only museum specimens were known. In that year a mother and her twelve young were dug up in a field near Aleppo and were taken to the Hebrew University, Jerusalem, and from that one family have been bred the hundreds of thousands of golden hamsters now employed as pets or as laboratory animals in many parts of the world. The species has taken well to captivity and, although capable of inflicting a nasty little bite if frightened or handled roughly, becomes docile and friendly when properly cared for. Characteristic features are the soft, smooth fur, the large black eyes, the "cheek pouches" in which food is stored and which may become enormously distended after a meal, the short, stumpy tail, and the extremely loose skin, inside which the hamster can turn round to a considerable degree.

Housing.—The same remarks about accommodation, environmental temperature, freedom from draughts, fittings, and other general considerations (including cleanliness) apply as in the case of rats and mice. For breeding purposes a dark inner chamber or nest-box is desirable. Several hamsters may be kept together, but the introduction of a stranger (or even the re-introduction of a former cage-mate that has been removed for some time) may lead to fighting.

Feeding.—Satisfactory diets include the following: (1) rat cubes (*e.g.*, "Diet 41"), carrots, greenfood, and milk, (2) cereal grains and/or wholemeal bread, carrots, greenfood, and milk, (3) steamed Rangoon beans, wheat, maize meal bread, a little Marmite, and milk. Care must be taken not to allow storage of excess food, which will deteriorate and cause a smell. Grass is a suitable source of greenfood during its growing season. Apples and other fruits are often relished. Water, preferably in bulbs or bottles as described for rats, should always be available.

Breeding.—Golden Hamsters attain puberty at from ten to fifteen weeks of age, or even younger, males being usually earlier. Generally speaking, it is best to defer breeding until after fifteen weeks of age. There is an œstrus cycle of about four days, and the gestation period is very short, averaging sixteen days, although sometimes up to nineteen days. Mating not followed by conception results in phantom or pseudopregnancy. Litter size varies from one to fifteen, but the average is six to seven. Not many females have more than four litters and although both sexes may live up to two years, breeding by the female is rare after nine months. The young are naked and blind at birth. Hair first appears at five days, and covers the whole body at eight days. The eyes open at about eleven days, and soon after this the young begin to take food for themselves and may be weaned at three to four weeks. Care must be taken that the female does not injure the male, and for safety's sake it is probably better to keep only one female and one male together and to remove the male before the young are born.

Handling.—Gentleness is essential, and sudden movements should be avoided. The tail is much too short to use, and the easiest way is to lift them by the loose skin over the back and shoulders. As already noted, they can twist easily within their skins, unless a substantial amount is taken in the hand. After picking up they may be allowed to sit on the palm of the hand.

Diseases.—Several diseases of hamsters are now known, and, like most rodents, they are susceptible to *Salmonellosis* (see notes under "mouse typhoid" and "paratyphoid" in guinea-pigs). One of the most prevalent conditions is *ear mange*, in severe cases of which the condition spreads from the ears to other parts of the body. Modern anti-mange preparations are highly effective.

CAVIES (GUINEA-PIGS).

Description.—Cavies or guinea-pigs (*Cavia porcellus*) are rodents, and are descended from one or more of the several kinds of wild cavy found in South America. They are believed to have been domesticated by the Incas long before Europeans "discovered" that part of the world. They make excellent pets, but are easily frightened, and should be treated gently and quietly. They usually behave quietly, although there may be fighting between adult males ("boars"), while the arrival of food—or the entry of a person into a room, which fact is obviously connected with feeding time—usually sets up a chorus of churrup-

ing squeaks. There is to-day a considerable cavy "fancy" in Great Britain and other countries, and many varieties are recognised, including rough-coated and smooth-coated types. Among recognised colours are the agouti (banded hairs), brindle, cinnamon, tortoiseshell (tricoloured), and Himalayan (white with attractive black points). The long-haired Peruvian and rosette-haired Abyssinian breeds are popular. Guinea-pigs may live up to two to three years. There is a small tail (composed of from five to seven caudal vertebræ), but usually this is so short that it does not project outside the body. There are four toes on each of the fore-feet and three on each hind foot. An adult guinea-pig may measure up to 10 in. or more in length, and sometimes its weight is well over 2 lb.

Housing.—Guinea-pigs may be kept outside or inside. If outside conditions are favoured, great care must be taken to protect them from dogs, cats, and rats. The last-named may be a danger also in conveying disease. The run should be in a sheltered position away from wind and direct summer sunlight. Tent-shaped waterproof shelters, with wooden floors covered by cleaning trays, have been found satisfactory. Another method is to keep them in hutches of the same type employed for rabbits and when conditions are suitable to let them out into a temporary run on the lawn surrounded by ½ in.-mesh wire-netting that is at least 12 in. high. (N.B. This will keep dogs or cats out.) Guinea-pigs will crop the grass and help to keep the lawn smooth. Great care should be taken not to allow the ground or floor to become so contaminated by guinea-pig excreta that it conveys disease from one animal to another.

If indoor methods are selected, an even, preferably warm temperature is desirable, and there should be freedom from draughts. Guinea-pigs have been found to thrive best at about 65° F. with a humidity range of 45–55 per cent. Provided warm conditions are available, metal cages are easier to keep clean than wooden ones, while a false bottom of wire mesh, above the cleaning tray, is helpful. Wood-wool is again the best bedding. Cages must not be too small, and a pair of pet guinea-pigs should have about 14 sq. ft. of floor space. It is a sound principle, as with rats and mice, to change frequently to a clean cage, the used one being cleaned and disinfected thoroughly before being used again.

Feeding.—Guinea-pigs, like human beings, apes, and monkeys, require a source of vitamin C (ascorbic acid). Normally they obtain this from greenfood, but in winter especially they may not secure enough in this way. The daily requirement of an adult guinea-pig is about 2 milligrammes, and supplies can be obtained from a chemist's shop.

There are many different methods of feeding guinea-pigs. Among cubed or pelleted diets is that known as "Diet 18," which is employed also for rabbits. It contains the following parts by weight: wheat feed, 15; grass meal, 30; decorticated groundnut meal, 15; linseed cake, 10; barley meal, 20; common salt, 1; and chalk, 1. This is fed together with fresh greenfood to supply vitamin C. For feeding without the use of compressed diets a good plan is to provide a daily "concentrate ration" of about 1 oz. per head of a mixture of 2 parts bran and 1 part crushed oats, and to feed in addition ample amounts of cabbage, lettuce or other greenfood, meadow hay of good quality, grass, and raw vegetables. Although guinea-pigs normally derive moisture from fresh greenfood, and may appear to take little or no water for long periods, it is a mistake not to provide a fresh supply, preferably from water bulbs, or from inverted bottles fitted with a stopper and drinking-spout. A little dried brewers' yeast makes an excellent addition to the diet, while for females ("sows") when pregnant or lactating, milk is excellent. Dead foliage should be removed from greenfood, and soil and dirt cleaned off. Frosted greenfood should be soaked in warm water before it is given to guinea-pigs. Unfortunately, hay may be contaminated by wild rodents, but it forms an excellent article of diet. Never allow food residues to remain in the cage.

Breeding.—The lactation period of the guinea-pig is a short one. The gestation period averages sixty-three to seventy-five days, although variations of fifty-eight to seventy-two days are known, and the young are born in an advanced state, with their eyes already open. They can run freely with their mother shortly after birth. They are able to nibble a little food as early as the second day, and by the time they are two to three weeks old they are completely independent and are neglected by their mother. A sow will often mate again the day the young are born, or shortly after, so that a rapid succession of litters often occurs.

Guinea-pigs are capable of mating from about fifty-five days of age, or even younger in certain circumstances, which include the provision of a high plane of nutrition. The œstrous cycle averages fifteen to seventeen days, although it may vary from thirteen to twenty-five days. The actual period during which mating may occur usually lasts only from about six to eleven hours. One boar may run with as many as twenty sows if so desired, but in the case of pets it is much more interesting to run a boar with only one sow, in which case she need not usually be removed to a separate cage before the young are born. The young guinea-pigs should be separated from the older ones shortly after weaning, and the sexes separated at four to five weeks of age if they are not to breed prematurely. It is better to wait until the animals are approaching six months of age or so before they are mated, for they do not become fully grown and "filled out" until they are between six and nine months.

Handling.—Guinea-pigs are timid creatures, and should be handled gently. They are best picked up with both hands. If a guinea-pig is to be held in order to examine it for any purpose, a good method is to place one hand over the animal's shoulders, with the fingers and thumb around its neck, and to extend its hind limbs with the other hand.

Diseases.—The most important infectious disease of guinea-pigs is, like "mouse typhoid," caused by organisms of the Salmonella group, and it may be contracted from wild rodents or from food or bedding contaminated by them. In guinea-pigs the disease is known usually as "*paratyphoid*" (or sometimes as "*salmonellosis*") and it may take an acute form, causing death within a few days, or a more chronic form in which many animals recover to become symptomless carriers of disease. Outwardly healthy, they may infect susceptible guinea-pigs with which they are placed. Cold or other environmental variations, and faulty feeding, can help to set off an outbreak, for there are few stocks in which the organisms are not lurking in some "latent carriers." *Coccidiosis* is common, but is a much less serious threat than in the case of rabbits. It has been set up in infected stocks by feeding inadequate diets, and provided that nutrition and hygiene are adequate there is rarely serious trouble from this disease. *Infections of the respiratory tract* may occur, but are uncommon except when there is overcrowding, high humidity, or damp bedding. Sometimes organisms of the Pneumococcus group cause not only disease of the respiratory tract but also a generalised infection of the serous membranes of the body. When this disease occurs it may produce death without much warning. It is possible that the infection sometimes comes from human beings. The disease known as *pseudotuberculosis*, and described under rabbits, occurs in guinea-pigs also. Again, environmental conditions and faulty feeding may predispose towards active infection.

With good fortune and sound management, trouble from these serious infections may never occur. *External parasites* should be dealt with promptly by insecticides. Sometimes *non-parasitic skin disorders* occur when the diet is faulty, *e.g.*, too dry or lacking in sufficient fresh greenfood of good quality.

RABBITS.

Description.—Domesticated varieties of the wild European rabbit (*Oryctolagus cuniculus*) are now kept in many countries The wild rabbit is believed to have been introduced into Great Britain in the 12th cent. Tame rabbits have been bred for centuries, and the breeds and strains produced differ appreciably in size, colour, and habits from the common wild form Some breeds have been specially bred for table purposes, while others (*e.g.*, the Angora, Sitka, and Argente de Champagne) have been developed for their fur In addition, many varieties are produced for show purposes by the extensive rabbit "fancy." The small hardy Dutch rabbit (usually black and white) is one of the kinds suitable for beginners Among well-known categories are the English, Japanese, Himalayan, Belgian Hare (really a rabbit) Flemish Giant, Beveren, Blue Imperial, Polish, Havana, Lop, Half-Lop, Chinchilla, and New Zealand White. The Copenhagen rabbit appears to be identical with the New Zealand White The smaller breeds weigh only 4–6 lb when fully grown, whereas some specimens of some of the giant breeds attain a weight of 20 lb or more

Rabbits and hares were formerly classified with the rodents, but are now placed in a separate Order of mammals, known as the Lagomorphs. Young rabbits (in contrast to leverets or young hares) are blind and helpless for some time after birth. Tame specimens may live for 4–5 years, and individuals have lived for up to 13 years

Housing.—Since rabbits are kept for commercial purposes, various systems have been devised, including the use of movable ark-huts, with covered runs, that can be moved regularly to fresh ground If kept indoors rabbits do not need special heating, but freedom from draughts, damp, excessive cold, and access by wild rodents is most desirable. A garage is regarded as an unsuitable place, owing to the susceptibility of rabbits to exhaust or engine fumes. One of the great difficulties of rabbit-keeping is coccidiosis, which is a serious disease in rabbits and hares (European hares could never be bred successfully in captivity until means of overcoming coccidiosis were discovered) With young rabbits especially (*i e*, those that have left the nest and are able to run about freely) it is a sound principle to move them to a clean floor or fresh ground every two days, so as to "break" the life-cycle of the coccidial parasite One way of doing this is to have "back-to-back" cages or hutches, from one to the other of which the rabbits may be transferred easily The empty cage or hutch may then be cleaned and disinfected thoroughly and allowed to dry out before the rabbits are returned to it Wood-wool makes a suitable bedding material, although the female (doe) will pluck her own fur to line the nest when her litter is due to be born Wire-mesh floors with a tray beneath are convenient, but if solid floors are used these should be sprinkled with fresh sawdust daily or every other day Provided the standard of hygiene can be maintained, cages or hutches and their runs should be large. The absolute minimum is "1 sq ft of floor space for each 1 lb weight of adult rabbit," *i e*, if there are two rabbits totalling 12 lb in weight there must be at least 12 sq ft of floor space. If cages or hutches are stacked one on top of the other the lowest should be well clear of the ground, and if there is only one hutch this, for convenience and safety from wild rodents, should be 2–3 ft off the floor

Feeding.—The wild rabbit grazes at dusk and dawn, and it is preferable to feed tame rabbits twice daily, while pregnant or lactating does and young rabbits benefit from three meals a day As in the case of guinea-pigs, the ration may be thought of as consisting of two parts, a concentrate portion and a portion consisting of greenfood and other succulent material The concentrate portion consists usually of a mixture of cereal grains or of some other form of mash. Successful mashes, of which there are many, include (1) a mixture of 4 parts cereal grains and 1 part dairy cake; (2) equal parts of bran, weatings, flaked maize—or barley meal—and fish meal. This second is useful for breeding. If materials for the mash are in short supply they may in part be replaced by cooked potatoes An average daily food allowance for a resting (non-breeding) adult of medium size would be: greenfood (grass, clover, weeds, lettuce, etc) and/or roots, 12–16 oz , hay (good quality), 2–3 oz ; and concentrates (cereal grain or meal mash), 2 oz If cooked potatoes are used they should be fed at the rate of 4 parts to each 1 part of cereal that they replace For a doe nursing her litter a suitable diet would comprise greenfood to appetite, hay (good quality and preferably containing clover or other legume), 2–4 oz , concentrates (preferably with fish meal or some other suitable source of "animal protein"), 4–6 oz , and common salt at the level of up to 1 per cent of the ration A mineral mixture is preferable to salt alone Excessive greenfood, especially in the form of cabbage and other Brassica plants, may cause polyuria, *i e*, the passage of excessive quantities of urine No matter how much fresh greenfood rabbits may have available, a supply of fresh water should always be provided The daily water requirement of the rabbit is quite high, and certain bad habits such as urine drinking or even cannibalism may result from an inadequate intake of water Pots that cannot be overturned or, preferably, water bulbs or bottles as described for guinea-pigs, are the most suitable means of providing water.

"Diet 18," described under guinea-pigs, is one of several types of compressed diet successfully employed for rabbits Fresh greenfood is preferably fed in addition, while the water requirement with diets of this kind is considerable.

Breeding.—The age of puberty varies with the breed, and also with the time of year at which the individual rabbit was born. Rabbits born in spring are usually capable of breeding at a younger age than those born in the autumn In Great Britain the wild rabbit has a fairly sharply defined main breeding season, lasting from January to June, but some degree of "out-of-season" breeding may take place at almost all other times Tame rabbits may not breed freely during the winter months, especially if environmental conditions are cold Mating may take place as early as four months of age, and although this does not often result in pregnancy, it is accompanied by competition and fighting between individuals of the same sex Males (bucks) and females should therefore be separated at weaning, or at least before they are four months old Fertile matings may occur at from about 5½ months of age onwards, but it is wise to defer breeding until later—say seven to eight months for most breeds The female does not ovulate or shed her eggs from the ovary spontaneously as do most domestic mammals, but, like the cat and ferret, does so in response to the act of mating or some other strong stimulus. Even playing between two does may precipitate ovulation, in which case a so-called "phantom pregnancy" (pseudopregnancy) may result, the doe that has ovulated appearing pregnant and even developing lactating mammary glands There is not therefore an obvious regularly recurring oestrus cycle as in the domestic rat, mouse, and guinea-pig, and in summer at least the doe may be ready to mate at almost any time Observation suggests however, that there are fluctuations in the desire to mate. The act of mating in rabbits sometimes causes alarm that all is not well to those that have not hitherto witnessed it, for the buck usually emits a peculiar cry and loses his balance to fall over sideways It is usually best to separate the buck from the doe before the young are born The gestation period is usually thirty to thirty-two days. In wild rabbits a high percentage of embryos die and are "resorbed," and are therefore never born. In some populations it appears that about two-thirds of all rabbits conceived (including about 60 per cent of total litters) are lost before birth in this way. Losses from this cause are probably much less common in domesticated rabbits, especially when the standards of feeding and management are high Litter size is variable, and depends in part on the breed or strain. In some strains mean litter sizes up to eight or nine have been obtained, but a mean of four or so is more common Does that do not prepare the nest or

rear their young properly should not be selected for further breeding. The doe with her new-born litter should not be disturbed unduly, or she may desert her young, which are blind and helpless at birth and are entirely dependent on her for at least three weeks, after which they begin to nibble food to supplement the milk that they receive from her. The eyes open at about fourteen days. Weaning should be carried out at between six and eight weeks of age, by which time the young should be able to tend for themselves completely

Handling.—Rabbits should never be lifted by the ears alone One good way of lifting them is to grip the ears firmly but gently with one hand and to place the other hand under the rump to take the weight of the rabbit's body. Alternatively, one hand may be placed flat under the rabbit's belly, but this requires more care, and may be a risky procedure with pregnant does. Another convenient way to handle rabbits, especially young ones, is to lift them by the loose skin over the shoulders. Rabbits can inflict quite nasty scratches with the nails of the hind feet. It is incidentally a good plan to examine the nails of all four feet and to trim them if they are too long. A stout pair of scissors, or preferably a pair of clippers, is used, and care should be taken not to cut back as far as the "quick," *i.e.*, the bluish portion at the base of the nail that contains blood vessels and will bleed freely if damaged.

Diseases.—As already indicated, *coccidiosis* is a highly important disease of young rabbits. It may be either of the "hepatic type," affecting principally the liver, or the "intestinal type," affecting principally the gut Even in the case of the hepatic type, however, the coccidial parasites are picked up by mouth and after penetrating the intestinal walls make their way via the blood-stream to the liver. Hygienic measures are the best means of preventing the disease (see under **Housing**), but should it break out, prompt treatment with certain sulphonamides or other anti-coccidial drugs may prove effective. In certain rabbitries in which coccidiosis is a constant problem, protection has been obtained by feeding a dilute solution of one of the soluble sulphonamides in place of drinking-water. There are certain types of digestive disturbance that may resemble coccidiosis, and one of these, the cause of which has not yet been established with certainty, is known as *mucoid enteritis* Some such cases are probably variations of "*bloat*" ("the blows") a condition the cause of which is again not fully established, although there may in fact be several factors A rabbit may, of course, "blow" after eating fermentative food, but cases of "bloat" can occur independently of this, and some may be due to a virus "*Snuffles*" is characterised by a nasal discharge, and is not always associated with the same organism In its milder forms it is not a severe disease, but with the more chronic forms the nasal discharge becomes marked and gives rise to a typical snuffling noise. Severe chronic cases become progressively worse and die of a terminal pneumonia. There is also a severe acute form, in which the rabbit dies so rapidly that the condition is sometimes not recognised. Acute cases that are treated in time with certain sulphonamides may respond well, but chronic snufflers are difficult to treat and go on spreading the infection, and hence are better destroyed. Correct environmental conditions are a great help in preventing this disease. A chronic type of infection is known as *pseudotuberculosis*, which is usually acquired from eating material contaminated by wild rodents or by other infected rabbits It is caused by quite a different organism from that of true tuberculosis, which is much rarer in rabbits. Clinical cases should be killed, and prevention lies in hygienic measures Infected wounds or skin abscesses may lead to a disease caused by the "necrosis bacillus" (*Fusiformis necrophorus*) and known sometimes as *necrobacillosis* It is usually characterised by subcutaneous swellings distributed irregularly over the head and body. Although in the early stages the affected rabbit may remain in apparently good health, the spread of the disease is insidious and usually fatal, and in most instances it is kinder and safer to destroy a case before it progresses too far. There are unfortunately several other infectious conditions occurring in rabbits, but all call for expert help in diagnosis and treatment. Generally speaking, it is a bad policy not to cull an ailing rabbit immediately, and one that is ill should certainly be isolated at once and not fed or tended before the person looking after it touches the healthy rabbits

Among non-infectious conditions *pregnancy toxæmia* is not uncommon in does during the very late pregnancy, and usually proves fatal within two to three days It is a "metabolic disorder," *i.e.*, it is associated with some functional derangement of the endocrine or ductless glands or with the inability to control properly the utilisation of its food Faulty feeding is probably a contributory cause. Diseases of the *heart and blood* may arise occasionally, and can be aggravated by faulty feeding.

Among external parasites, *ringworm* is not common, but may be acquired from rodents. Affected rabbits that are to be treated must be isolated. *Ear mange* (known usually as *ear canker*) is common, and may be treated by strict attention to hygiene, with thorough disinfection of the hut or cage, and by dressing with a modern anti-mange preparation. *Body mange* is much less common but far more difficult to treat.

Among internal parasites, so-called "*bladder worms*" *i.e.*, the larval stages of two dog tapeworms (*Taenia pisiformis* and *Taenia serialis*) are quite common, although rarely fatal. The feeding of grass or other greenstuff to which dogs have had access should be avoided, as well as the contamination of the drinking-water with dog fæces

Domestic rabbits are susceptible to myxomatosis, and it is a wise precaution to have them vaccinated The vaccine is inexpensive, and may be obtained through veterinary surgeons and pharmacists.

HEDGEHOGS.

Description.—The European hedgehog (*Erinaceus europaceus*), found throughout Great Britain, belongs to the Order Insectivora, of which moles and shrews are also members. Its diet is, however, by no means restricted to insects, although in nature a considerable portion is probably made up of small invertebrates. There is a good deal of prejudice against them as pets, owing to the fact that freshly caught specimens are usually infested with fleas or other external parasites. The spines of the hedgehog, being well-spaced, make the presence of external parasites more obvious than is the case in animals with a coat of close fur. The hedgehog's spines form its defence, and its capacity to roll up into a prickly ball at the threat of danger is well known. This defence reaction is unfortunately of no avail to it when the danger is an oncoming car or lorry, and thousands of hedgehogs die every years as a result of being killed by vehicles on the roads Many other species of mammals wander on to the roads, but most attempt to flee when they sense the approach of a vehicle. The capacity to roll up is not secure defence even against animal enemies. There are some foxes, dogs, and cats that have learned to "uncurl" a hedgehog, and subsequently eat it

Provided that care is taken, a hedgehog makes an excellent pet, especially if given a suitable enclosure in the garden. For a variable time during winter hedgehogs hibernate, and during this time they must not be disturbed. Should they emerge at any time however, food must be provided Some specimens have lived for five years or more in captivity.

Accommodation.—The most satisfactory way to maintain a pet hedgehog is to provide it with a large "run" in part of the garden. If wire-netting is employed it should be sunk under the ground to a depth of several inches, or the hedgehog will burrow underneath and escape The top of the run must be wired in, or alternatively

there must be a "baffle board" or wire-frame (at least 9 in wide) near the tope of the sides to prevent escape that way, for hedgehogs can scale wire-netting—and some other types of fence—with ease. There should be a warm, dry box for shelter, containing wood-wool or other bedding material. A simple but suitable shelter may be made out of a soap-box, preferably lined with asbestos sheeting or some other material impervious to water. A shallow sunken bath in the enclosure may be of interest for hedgehogs take well to water, but the edges should be such that the hedgehog can get out easily

If it is decided to keep a hedgehog indoors, then the best accommodation is probably similar to that described for ferrets

Feeding.—The simplest diet consists of milk, some bread, and minced lean meat. Cooked meat is preferred to raw, but raw liver should be given occasionally. Another satisfactory diet comprises meat offals, "root" vegetables (*e g*, carrot, potato, and swede), and wheaten wholemeal biscuit, steamed together until cooked, and then mixed and minced with a small proportion of raw liver A small quantity (say 1-2 per cent) of mineral mixture is also desirable, and milk should be given freely. Although hedgehogs appear to drink but little water, a fresh supply should always be provided

Breeding.—During the breeding season marked changes occur in both males and females, and the structures associated with reproduction increase enormously in size from about March onwards. The female is capable of having two litters a year, the first in May or June and the second in August or September. The period of gestation has not been determined exactly, but is believed to be thirty-five days, possibly with variations of up to well over forty days During the breeding season the males are very pugnacious towards each other if females are with them, and may do each other considerable damage. (The mixing of strange hedgehogs is often a difficult procedure anyway, for they often fight and inflict nasty bites on one another's feet)

The litter size is usually four to six, and the young, which have "soft" spines, are suckled by their mother for nearly six weeks The young can partake of some solid food at about three weeks, and there is some evidence that if left with their mother for longer than six weeks she may compete unfairly with them for food'

Diseases.—Hedgehogs in captivity are susceptible to *respiratory infections*, and can sometimes contract certain strains of *human influenza* They are susceptible also to *Salmonellosis* (see under mice and guinea-pigs) Fleas and other external parasites have been mentioned; these often disappear spontaneously as the hedgehog begins to thrive in captivity, but if not they should be dealt with by modern methods The nails of a hedgehog may need trimming. (*See* **Rabbits.**)

LAND TORTOISES.

Tortoises are popular pets, but although many are kept with great success in Great Britain the majority of those that are imported each year are never looked after adequately, or fail to thrive for other reasons.

Most land tortoises that are imported into Great Britain for sale through dealers are. (1) the Spur-thighed Mediterranean Land Tortoise (*Testudo graeca*), commonly known as the "Moroccan tortoise" and sometimes as the "Iberian" or "Algerian"; or (2) Hermann's Tortoise (*Testudo hermanni*) The second is distributed in Southern France, Southrne Italy, the larger islands of the Western Mediterranean, and parts of Yugoslavia, Albania, and Greece. There is a species found in Greece, the Margined Tortoise (*Testudo marginata*), but while adaptable to life in Great Britain, it is more difficult to acquire. The two common species differ in several ways, the "Moroccan tortoise" having a small bony spur on the back of the thigh (The upper part of the shell is termed the carapace and the ventral portion the plastron.)

In selecting a tortoise one should ensure that the animal appears healthy. It should be active and withdraw quickly into its shell on being disturbed Its legs should be firm and not limp, and there should be no abnormal discharge from the eyes or nostrils The shell and limbs should be uninjured. Females are generally larger and have a shorter tail than the male. The shield above the tail is flat in the former and curved in the male. It is a good idea to obtain a pair or more of tortoises, but not more than can be looked after with care. On being purchased they should be washed in tepid water.

Many tortoises are given free range in gardens, but this is not advised with all, as they eat a wide variety of vegetables and young plants, and being wandering animals are liable to get lost if the garden is not completely fenced or walled. They should be provided with as large a "pen" or "run" as possible, the walls or wire netting of which should be high enough to prevent their climbing over The practice of tethering tortoises by a hole in the shell should be discouraged They should always be provided with a box or shelter, the cheapest form being a wooden soap box turned on one side and with a sufficiently wide entrance, the wood being creosoted and covered with roofing felt. It can be lined with asbestos sheeting if desired, and have its floor covered with dry leaves or other bedding material Some other shelter should also be provided in the run. The tortoises should be bathed during the hot weather The occasional application of olive oil will keep the shell polished.

Land tortoises must be fed daily, and it is important to allow them to build up good reserves to enable them to hibernate through the winter successfully. Suitable foods include lettuce, young cabbage, peas, clover, dandelions, and a wide variety of green plants and ripe, sweet fruits Generally bread and milk should be avoided For young tortoises especially, it is recommended that once weekly or so the food should be sprinkled with powdered cuttlefish bone, or better still a small quantity of powered calcium gluconate or cod-liver oil Fresh water in a shallow tray, or even a saucer, should always be provided.

One of the most difficult problems in tortoise keeping is hibernation Some persons avoid allowing their pets to hibernate by transferring them to a warm place, such as a heated greenhouse, if this is done they must be kept well fed and their place maintained at a summer temperature It is imperative to do one thing or the other—the half-torpid tortoise that is neither hibernating nor kept at summer temperature will die Moreover, a tortoise that is allowed to hibernate must not be disturbed

Signs of pending hibernation, including sluggishness and lowered appetite, are usually evident late in September or early in October. Tortoises living in the garden may commence to bury themselves If this is allowed they must be well covered, else they may be killed by the ensuing frost It is, though, more convenient and perhaps provides a greater chance of survival, due to the changeable winter conditions in Britain, to place the animal in a large box, which should be packed with straw, leaves, or hay The box should be stored in a cool but frostproof place, such as out-building, cellar, or attic It is important not to create conditions that will awaken the tortoise or tempt it to emerge before the following spring Rats have been known to attack hibernating tortoises, and so due precautions should be taken

On emerging from hibernation the eyes and nostrils are somewhat sealed, and should be released by bathing with a 4 per cent. boric acid solution and warm water

Recently imported female tortoises frequently lay eggs, but it is not a common occurrence for pairs to breed freely in Britain. During the early part of the summer the male is sometimes seen butting the shell of the female, this being a courtship action. If eggs are laid it is unlikely that they will be fertile, and less likely that they can be hatched. They have been hatched by placing them on damp sand and storing them in a warm place—a heated greenhouse or airing cupboard. The eggs should not be disturbed or "turned" once incubation has commenced

Tortoise ticks are often present on freshly imported specimens, and may best be removed by

damping the tick with paraffin or methylated spirits and then removing it gently with tweezers Round worms are very numerous in tortoises, and should they be seen in the faecal matter the remainder may be eliminated by sprinkling up to one grain of powdered santonin on the food once a week for six weeks. Possibly, some of the newer, safe anthelmintic preparations containing piperazine derivatives may be equally effective Eye infections are common, and are usually remedied by bathing the eye well with a 4 per cent. boric acid solution or warm cod-liver oil. Continuous discharge from the nose indicates lung infection, and as a primary measure the animal should be kept warm Bleeding can be stopped by using Friar's Balsam, and care should be taken to prevent insects settling on open wounds

WATER TORTOISES (TERRAPINS).

In Great Britain the tortoises that have become adapted to life in ponds and rivers are usually termed "terrapins," the name turtle being applied to marine forms. In the U S A. and Canada, however, not only the marine species but also terrapins and tortoises are all termed "turtles"

Several kinds of terrapin are available and capable of thriving in Great Britain These include several American species, the European Pond Tortoise (*Emys orbicularis*), the Spanish Terrapin (*Clemmys leprosa*), the Caspian Terrapin (*Clemmys caspica*), and the Reeves' Terrapin (*Chinemys reevesii*), which hails from China and Japan.

The ideal place in which to keep terrapins is a garden pond within an enclosure The pond should contain an "island" of dry ground on to which the animals can climb easily The water should vary in depth and at one point be at least 2 ft deep. Provided that there is a suitable "island" the boundary walls of the pond can be upright to prevent escape The final coat of cement should be smooth and mixed with a waterproofing agent Shade should be available not only on the island but also in some parts of the water. This may be provided by suitable plants

Terrapins are almost entirely carnivorous, although the young of some species may take a little lettuce or other vegetable food Suitable foods include *small* pieces of raw meat, raw liver (this should certainly be given from time to time), fish, and earthworms Terrapins prefer to take their food in the water, and it is best to feed them individually if there are several, to ensure that each receives his proper share

Water tortoises also hibernate Some bury themselves in mud or sand at the bottom of their ponds, others will dig themselves into the earth in the island or banks of their pond, while others again may go to sleep in the box that, as in the case of land tortoises, should preferably be provided for them on part of their "land" Should they sleep at the bottom of the pond, it is as well to prevent freezing of the water One means of doing this is to leave a log or logs floating on the surface. Moving these logs on cold mornings will help to break any ice formed and to prevent total freezing.

AQUARIUM FISH.

There are two types of aquaria—the cold-water, for fish from this and other temperate countries, and the heated, for tropical varieties of fish Apart from the fact that a suitable heating mechanism—usually electric, with thermostatic control—has to be maintained for tropical aquaria, the general principles governing the two types are much the same There is a certain amount of additional initial expense in setting up a heated aquarium—the running costs are not high—but in some respects tropical fish are easier to maintain than many of the cold-water varieties.

It should be emphasised at the outset that those who want to keep fish should invest in a proper aquarium and not in a "goldfish bowl," unless the latter be very large in relation to the fish to be kept. Far too many fish suffer from overcrowding or from lack of sufficient water surface. In the case of cold freshwater fish such as carp and goldfish (which need quite different conditions from tropical fish) it has been calculated that every "1 in. of body" requires 1 sq. ft. of water surface in order to obtain sufficient oxygen for respiration. Thus a fish the body of which (i e., the length minus the tail fins) is 4 in. will require at least 4 sq. ft. of water surface, i e , an area of 2 ft. × 2 ft Two such fish will require twice this area, and so on. In *The Right Way to Keep Pet Fish* by R. Dutta (6s), it is pointed out that a goldfish should normally live for twenty five years in a suitable pond, and grow to its full length of over 14 in There are few indoor aquaria capable of supporting many full-grown goldfish in adequate conditions, and indeed it is recommended that domestic varieties of goldfish such as shubunkins, fantails, veiltails, and orandas, which grow more slowly, are far better adapted to cold-water aquaria. Tropical fish of the varieties kept in aquaria are usually much smaller, differ in their oxygen requirements, and can be kept in more crowded conditions Many have an average body length of only about 1½ in , and eighteen such fish may be maintained in a suitably heated tank with an area of water surface of 18 in × 12 in.

A beginner should not only read good books on the subject (including *Water Life* publications) but also consult experts and his local aquarist or dealer Whatever aquarium is chosen, the conditions should be correct *before* any fish are introduced. Should fish be suddenly acquired, before a proper aquarium has been fitted up for them, they should be kept in some temporary (but sufficiently capacious) quarters until the aquarium is ready

The instructions for installing and fitting up an aquarium are usually supplied, and should be followed carefully The sand that is usually placed on the bottom should be thoroughly washed, and is best put in a little at a time. Make sure that the inside of the aquarium is thoroughly clean before anything at all is put into it Ornamental rocks may next be introduced, and great care should be taken to ensure that these are of the correct type, unlikely to harm the fish physically or chemically. Water is then added very gently indeed, and suitable plants set In the case of large tanks the planting is best done when the tank is only partly filled with water, but in any event the plants themselves should be kept wet all the time, or they may quickly shrivel up In the case of cold-water aquaria everything may now be left for a few days—preferably a week or more—to ensure that all is well, and to allow certain micro-organisms that help form the food of the fish to develop In the case of heated aquaria it is necessary also to ensure that the thermostat is working correctly and that the temperature is remaining constant or within very narrow limits Here again it is advisable to wait at least a week before introducing any fish Should conditions "go wrong" before or after the fish are introduced, it is best to start filling the tank all over again.

Fish should not be overfed, although regular feeding is essential. Attention must be paid to the feeding instructions issued with prepared fish foods, and to details given by the supplier of "live" foods Provided fish are neither overcrowded not overfed, the amount of sediment that accumulates in the tank will not be excessive, but it should be siphoned away gently every month, or more often if necessary. Water lost by evaporation should be replaced, and in the case of heated tanks especially, it is most desirable that the added water be of the same temperature as that already in the tanks

Certain species of water snail are often placed in aquaria to act as scavengers. It is necessary to ensure that, if snails are kept, they are of the right type, and it is important to consult experts on this matter.

Breeding is an interesting topic, there being both egg-laying and viviparous or "live-bearing" fish The beginner is well advised to learn first how to keep fish in healthy condition in his aquarium before indulging in any planned breeding, and he should study the relevant information in books on the subject.

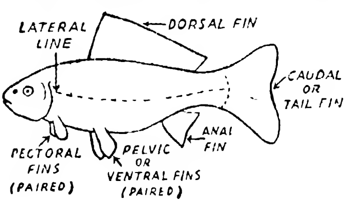
An aeration plant is often recommended on the grounds that it will increase the fish-carrying

capacity of the aquarium This is true up to a point, but overcrowding may bring other troubles besides those connected with lack of sufficient oxygen, and the golden rule is never to keep too many fish for the size of aquarium in question. Another factor to be remembered is that should the aerator break down it may leave the fish with less oxygen than their proper requirement It has been recommended that an aerator is best thought of as a stand-by, to be employed only in emergencies, *e g*, when for some reason extra fish have to be added to a tank already holding all or almost all its proper capacity

There are unfortunately many diseases of fish, and as yet scientific knowledge concerning many of them is far less detailed than it should be It is clear, however, that environmental factors are responsible for many deaths or cases of unthriftiness, and among the factors concerned may be listed overcrowding, overfeeding, the provision of a diet that is qualitatively inadequate, lack of "balance" in the aquarium leading to unsuitable conditions, dirt, too strong light, lead paint and noxious substances, that may somehow have come into contact with the water (*e g*, from the hands of the person tending them) or been absorbed from the atmosphere One must be careful of such things as disinfectants, soaps, petrol, etc In the case of tropical fish the temperature of the water may be incorrect. Should fish troubles occur, therefore, it is as well to consider these various possibilities, although one should not hesitate to seek professional advice where there appears to be a case of infectious disease An ailing fish should certainly be removed from the tank (assuming that there are other fish present) and given separate quarters of its own if such a course is feasible.

It is not intended to provide a description of the separate diseases, although it may be mentioned that such signs as the appearance of material resembling cotton-wool (actual fungal growths) and "rotting" of the tail or fins, are among those that should lead the owner to isolate affected fish and to seek help immediately

No attempt is made here to describe any of the many different species and varieties of fish suitable for private aquaria Some of the "points"



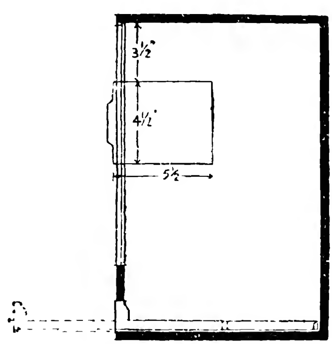
of a fish are shown in the accompanying illustration Great care must be taken in mixing species, *e g*, "hard mouthed" and "soft mouthed" kinds should not be kept together The temptation to put other species (*e g*, newts) with aquarium fish must likewise be avoided

CAGE BIRDS.

Very many species and varieties of birds are now maintained successfully in captivity, and there exists in Great Britain a large and expanding "cage-bird fancy," that caters for a considerable proportion of the smaller birds adapted to cage or aviary life The increase in the numbers of budgerigars since the end of the Second World War has been phenomenal, and it was estimated during 1957 that the numbers of the species alone in the United Kingdom exceeded 6 millions, the corresponding figure for the U S A —where the popular name is "parakeets"—being over 18 millions

The different types and sizes of birds have different requirements, and in the space available it is not possible to do more than cover the general principles and to deal briefly with the special characteristics of the management of the more easily maintained species. The beginner is advised to restrict his attention to one of the better-known species, *e g*, canaries or budgerigars, and not to attempt to maintain exotic varieties until he has acquired considerable experience.

Most species thrive best in aviaries, which may be indoor, outdoor, or of the combined "outdoor-indoor" type An indoor aviary is usually all-wire and portable The criticism of many such aviaries is that they tend to be high and narrow, whereas a fairly large floor-space is desirable They should not be placed in cold or draughty places, nor too near a fire If sited so as to receive much direct sunlight they must have adequate shelter The wires must be close together, especially if smaller species are kept, a distance between them of about ⅜ in being generally suitable. An outdoor aviary—suitable only for some species or at certain times in the case of others—should occupy a sunny position, although it too must include shade, and must be protected from winds There ought in fact to be a sheltered portion, dry and well protected from the elements The aviary must be strongly made and safe from all predators, including rats and mice. While it is often considered desirable to allow herbage to protrude through the wire-mesh floor, it is essential that the birds are never in close contact with wild rodents or their droppings Most birds are highly susceptible to some forms of *salmonellosis* (see under mice and guinea-pigs), and can contract them in this way It is advisable also that the roof of the aviary is solid corrugated asbestos sheeting, projecting well clear of the edges of the uprights so as to prevent water and other matter from entering the interior, is excellent The droppings of wild birds may be a potent source of bacterial infection or of internal parasites To prevent close contact otherwise with wild birds, the wire or wire-netting "walls" of the aviary may be double If an "outdoor-indoor" aviary is employed, there is usually an indoor flight cage, separated from the external portion either by a very light hanging door of suitable size, through which the birds can easily push their way, or by a sliding partition that the owner can operate as required

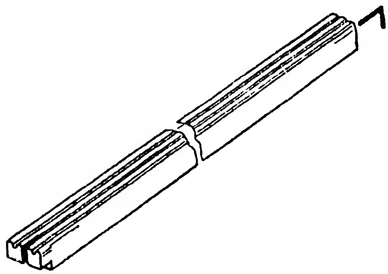


SECTION THROUGH CAGE

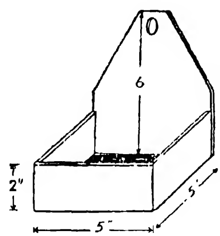
If an aviary is out of the question, then a suitable cage should be purchased or constructed The cage need not be ornate - indeed simplicity of design usually facilitates the highly important task of keeping everything clean—but it must be large enough A cross-section through a breeding-cage suitable for canaries, and for many other species, is shown in the accompanying illustration. Such a cage should measure about 40 in in length × 12 in. wide × 18 in high. It is constructed of wood or some suitable sheeting except for the front, which consists of vertical wires with horizontal stays, and can be divided into two parts by means of a suitable partition containing a removable section made of wire By this means the cock and hen canaries can be introduced into the separate sections and develop a courtship before being allowed to be together for actual mating The cross-section indicates the site and size of the removable portion of the partition, and it shows also the removable tray that is such an

excellent fitting for almost any type of cage, and which greatly facilitates cleaning.

Whether an aviary or a cage is employed, it is essential to have proper fittings, including conveniently placed drinking-troughs, feeding-trays and bird-baths, and good perches. Much unnecessary discomfort is brought about through the use of unsuitable perches, or ones that are incorrectly situated or not sufficiently "firm."

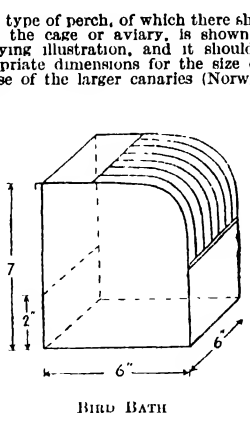


PERCH



NESTING-BOX WITH PLAIN WOOD BOTTOM

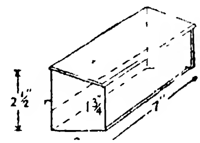
A suitable type of perch, of which there should be several in the cage or aviary, is shown in the accompanying illustration, and it should be of the appropriate dimensions for the size of bird. In the case of the larger canaries (Norwich and Yorkshire), *e.g.*, the sectional measurements should be $\frac{5}{8}$ in. × $\frac{3}{4}$ in., whereas for a smaller canary (Border) they should be $\frac{1}{2}$ in. × $\frac{3}{4}$ in. The type of perch shown is easy to clean and does not possess awkward corners in which parasites may be harboured. The dimensions of a nesting box, a bird-bath, and a feeding-tray suitable for canaries are also given in the accompanying illustrations.



BIRD BATH

While wood is a convenient material for aviary and cage construction, it has, of course, several disadvantages. Out of doors it is best creosoted (lead paint must never be used for places in which birds or other small animals are kept), and indoors it is better lined with hard asbestos sheeting. Metal is suitable—provided that it does not rust or corrode and that the environmental conditions are warm enough.

In all cases a supply of clean, fresh water should be available. Strict cleanliness should be observed, and professional advice taken immediately if a bird is not thriving.



SEED TROUGH.

CANARIES (*Serinus canarius*).—These are domesticated forms of the race of wild serin found in the Canary Islands, and may live up to twenty-five years. Many varieties are known, and although most individuals are "canary yellow," other colours have been developed by fanciers. Many books have been written about the canary, although there is still much to be learned concerning its feeding and diseases—as is indeed the case with almost all cage-birds. The system of feeding generally recommended is based upon a mixture of 2 or 3 parts of canary seed (which is rich in energy, and which is sometimes mixed with a little millet seed) to 1 part of summer rape seed, which is high in fat and protein. There seems to have been some difficulty in obtaining suitable rape seed in some areas since the war. The best is German summer rape or Rubsen rape. Other seeds are employed as substitutes, or for special purposes, *e.g.*, niger is usually added at breeding time, and linseed if there is any indication of premature or soft (out-of-season) moult. Good proprietary seed mixtures are available. A little greenfood should be provided twice weekly, and a piece of cuttlefish bone placed between the wires is a suitable source of calcium. Soft-bill food (containing boiled egg, dried egg yolk, dried flies, and ants' pupæ) is also recommended by many breeders, while others give chopped egg alone. Others again favour milk, especially for young birds.

Breeding is usually started late in March or early in April, but not unless the daily shade temperature is at least 50° F. The pairs should be selected earlier than this and transferred to breeding-cages, with the partition in position. By the middle of February the wire partition may be installed so that the two birds can see one another. A little niger seed is usually added to the diet, while finely ground oystershell or eggshell may be sprinkled on the floor. (Otherwise the floor may be covered with washed sand that is not too fine and is free from dust.) When the birds begin to feed one another through the wire they are ready for mating, and the partition may be removed. The nest-box can then be inserted and suitable nesting materials, *e.g.*, cow hair and moss, placed in the cage. The incubation period is thirteen to fourteen days. After the eggs are laid some owners prefer to separate the cock and the hen, but allow him to rejoin her after the young are all about eight to nine days old and have opened their eyes. If it is desired that all the chicks be batched together, then one can remove the first three eggs that are laid—usually one egg is laid daily—and keep them in a box at room temperature, substituting dummy eggs for them in the nest-box. On the afternoon of the third day of laying they are returned to the nest-box in place of the dummies.

When the young chicks are able to feed for themselves they should be provided with special food, such as egg and bread crumbs and a little cracked canary seed. If the cock bird interferes with them, or causes the hen to neglect them, he must be returned to his own section. Usually, however, all goes well, and the hen will go to the nest again when the first chicks are almost sixteen days old. Some three or four broods may be raised in a season.

WAXBILLS, FINCHES, AND OTHER SEED-EATERS.—The canary is of course a finch, but most of the other "foreign finches" are considered by dealers and writers together with other types of seed-eating birds. Well over 30 species of *Avadavats*, *Buntings*, *Mannikins*, *Cardinals*, *Whydahs*, *Weavers*, and *Finches* of various descriptions have been maintained successfully in captivity in Great Britain. One of the most popular is the *Zebra finch* (*Taeniopygia castanotis*), from Australia, which has bred so successfully in this country that supplies no longer depend upon fresh importations, and which is already appearing in several varieties. The native bird, and many of its descendants, are grey and white, with red beaks. The male bird has orange cheek-patches, and orange flanks with white markings. The throat has black barring on a white background, and indeed the characteristic markings of the male have been the subject of interesting behaviour studies. The female lacks these special markings. The species is hardy, and is capable of living in outdoor aviaries all the year round, so long as it has shelter from draughts or strong winds and adequate facilities for roosting. If provided with nest-boxes, the birds will attempt—often successfully—to breed all the year round, so to avoid overbreeding it is better to remove these boxes in winter. A mixture of millet and canary seed forms the basis of their diet, which should be supplemented with fresh greenfood, millet sprays, fine grit, and cuttlebone—and, of course, fresh water should be available. Another bird suitable for the relatively uninitiated bird-keeper is the *Bengalese* (a domestic variety of *Munia striata*). It seems that these birds are the result of careful breeding by the Japanese, and may be regarded as fertile hybrids. Three main forms, the Chocolate-and-White, the Fawn-and-White, and the White, have been developed. These birds will thrive in cages or in aviaries. As in the case of Zebra Finches, they will attempt to breed all the year round if provided with nest-boxes. Bengalese are sociable birds, sometimes known in the U S A. as Society Finches. They appear to require less additional food than most species, thriving on a mixture of canary and millet seed, together with grit, cuttlebone, and an occasional millet spray or item of greenstuff.

For details of these birds, and of the many others from which a selection may be made, works of reference should be consulted. Three very useful books, all published by Cage Birds, London, are *Foreign Bird Keeping*, by Edward J. Boosey (63s.), *Foreign Birds for Beginners*, by D. H. S. Risdon (10s. 6d.), and *Foreign Birds for Garden Aviaries*, by Alec Brooksbank (10s. 6d.)

BUDGERIGARS.—The increase in the popularity of this bird has been phenomenal, although to those who have experience of other birds as pets the reasons are soon fairly obvious. Apart from the capacity to talk, shown by many birds—especially males—kept alone and trained, there is a liveliness, almost a "cheekiness," and an apparent like of human companionship. The wild green budgerigar (*Melopsittacus undulatus*) exists in large numbers in the grassland and desert shrub regions of Australia. The usual colour is grass green—it is frequently known as the Grass Parakeet—with a yellow mask, with three black spots on either side. As a result of intensive breeding, a considerable number of colour varieties has been produced, and the genetics of colour are a constant source of interest to budgerigar breeders. A vast budgerigar "fancy" has been built up in the United Kingdom, the U S.A., and other countries and World Budgerigar Congresses are held every few years. Budgerigars will thrive in outdoor aviaries all the year round, but the vast majority are kept as indoor pets in cages or small aviaries. The cages can be similar to those used for canaries, and care should be taken that the perches are of the correct diameter. If nest-boxes are put up, and the environmental conditions are suitable, budgerigars suitably paired will breed at almost any time of the year. It is customary, however, to restrict breeding to the spring, summer, and early autumn. Overbreeding may lead to difficulties, including the production of "runners" or "French moult." The sexes may normally be distinguished, at any rate in mature individuals, by the colour of the cere at the base of the beak, which is blue in males and brown in females. Males may lose their colour if not in good condition and for other reasons.

There are now many proprietary seeds mixtures, but some owners prefer to make up their own mixtures of millet (usually mixing small yellow and large white varieties) and canary seed. Millet sprays, fresh greenfood, good grit, and cuttlebone are all desirable, and it is important that the correct size and consistency of grit be chosen. Variety in "extras" to the basal seeds diet is probably important, for the captive bird has not the same opportunities as its wild ancestors for ranging widely for, possibly, important trace items of food. Breeding birds secrete a "milk," comparable with the crop milk of pigeons and some other birds, and this is of importance in the early feeding of the young.

Most healthy budgerigars seem to live to the age of 5–7 years or more, and considerably greater ages have been attained in captivity.

Such is the development of the budgerigar fancy that most equipment as well as food can be obtained ready for use. The playful habits of budgerigars have led to their being given table-tennis balls or a variety of small toys to play with, while some forms of food are supplied as budgerigar bells or otherwise in special shapes that seem to amuse the birds as they take the constituent seed from them.

The study of budgerigar diseases is in its infancy, but already some important facts have become realised. *French moult* is certainly reproducible by overbreeding, and may be linked with deficiencies in the ability of the parent birds to feed their young—or to hand over to them at the time of laying sufficient nutritional reserves to carry them through hatching and parental feeding until the time that they can fend for themselves. A deficiency in the "milk" has been shown in some cases, and may be generally true. Large chicks can be produced by killing off or removing all but a single member of the clutch, and allowing the parents to deal with it alone.

A mite infestation, due to *Cnemidocoptes pilae*, may give rise to *Scaly face*, *Scaly beak*, or *Scaly leg*, for which veterinary treatment is now available. Another condition, known as *Brown hypertrophy of the cere*, is characterised by thickening and darkening of the surface of the cere. In the early stages it is sometimes thought that the bird is changing its sex. There is no known successful treatment at the time of writing, and if the overgrowth is cut away it will only reform. There are various disturbances of the *digestive tract*, and some of these may be associated with inability to stand properly.

There are many treatises on the budgerigar. A useful little work is *Budgerigar Guide*, by Cessa Feyerbrand (Fond du Lac, Wisconsin: All-Pets Magazine).

LOVEBIRDS AND PARROTLETS are also members of the parrot family, and while they are unlikely to equal the budgerigar in popularity, they are nevertheless interesting birds that are being kept in increasing numbers as pets. Lovebirds, of the genus *Agapornis*, are African in origin, and some six species are commonly kept in captivity. Parrotlets derive from South America, the commonest species being the Guiana Parrotlet, *Forpus passerinus*. Both types of bird are relatively simple to maintain in aviaries or large cages, and their basal diet (which should be supplemented widely) is a mixture of millet and canary seed. They are hardy and vigorous creatures, many details of which are to be found in condensed form in *Lovebirds and Parrotlets*, by C. P. Luke (London: Cage Birds, 8s. 6d.)

CALENDAR FOR 1963.
